The elevated-junction premium in §9.1 covers the viaduct + upper deck at interchanges; the table above covers the at-grade lower platform, ground-level pedestrian access, and protected crossing equipment where needed. Overbridges, lifts, and stairs are not the standard station assumption; they are carried only by elevated/stacked sites or local road-barrier overrides.

## 9.3 Depots (RFC 0014 archetype catalogue)

| Archetype | USD planning-grade |
|---|---|
| `main-heavy` | 8 000 000 |
| `secondary-medium` | 3 000 000 |
| `layup-minimal` | 400 000 |

These rates assume RFC 0014 distributed overnight stabling: healthy trainsets may sleep at powered passenger stations and layups, so the main-heavy no longer carries parking capacity for every train every night and `layup-minimal` is a powered-station stabling/isolation kit rather than a small standalone yard.

## 9.4 Rolling stock (RFC 0008 local-owner production × fleet count)

Rolling-stock city CAPEX uses a local-owner trainset-family planning unit, not an inflated per-car multiplier and not the raw marketplace BOM floor. The unit includes direct material, local assembly/labour, nominal per-train QA/acceptance evidence, and modest local handover logistics. Fixtures/tooling live in the railway production plant line; warranty, spares, and routine commissioning support are OPEX.

| Family | USD / trainset local-owner unit |
|---|---|
| `urban-shuttle-1car` | 280 000 |
| `tram-2car` | 560 000 |
| `light-metro-3car` | 900 000 |
| `metro-4car` | 1 120 000 |
| `metro-6car` | 1 680 000 |

Fleet count = peak-revenue + spare + cold-reserve per RFC 0014 §4.

## 9.5 Railway production plant

Each country carries one lean shared railway production-plant setup allowance for all city fleets it will build or assemble locally. Cities do not duplicate this asset in city CAPEX. The national factory is sized to the largest single-city fleet programme, costed per supported vehicle/car module, reused through a phased rollout, and kept separate from rolling-stock procurement.

| Item | Planning-grade basis |
|---|---|
| Base local plant setup | 60 000 USD / vehicle-car module |
| High sensitivity check | 120 000 USD / vehicle-car module |

The allowance covers reusable 1 m fiberglass panel moulds, clip/drill gauges, basic steel fixtures, plant services, commissioning bay setup, material handling, and production-readiness work. It excludes a full-length body mould and production adhesive cure hall. Six parallel two-person crews can install and release a three-car exterior body in one eight-hour shift after painted-frame dimensional release; doors, glazing, equipment, bogies, commissioning, homologation, and first-article testing remain separate work. Distributed overnight stabling reduces the number of depot-centred commissioning and parking bays needed in the production/depot complex. A three-module increment of supported factory capacity therefore carries 180 000 USD of base plant allowance, while the high sensitivity is 360 000 USD.

## 9.6 Systems

| Item | Planning-grade basis |
|---|---|
| Residual train-control wayside (RFC 0015 GoA 4) | 50 000 USD / route-km |
| Station/depot charging microgrid interfaces | 120 000–1 000 000 USD / stop, by station archetype |

RFC 0015 mandates battery-electric operation with station charging: there is no overhead catenary, third rail, feeder substation, or route traction-power budget. The energy infrastructure bucket covers the conductive chargers, local switchgear, inverter interface, and station/depot microgrid tie-in. PV/storage quantities are sized in the energy-site catalogue rather than as a continuous per-km rail-power system.

### 9.7 EPC overhead

Integration + project management is 7 % of the subtotal across §9.1 – §9.6.

Rates are deployment-localised via the `country-costs.toml` template (labour, materials, finance cost adjustments). The base rates above are what the upstream catalogue quotes; actual numbers in any given deployment can be ± 40 %.

`total_usd` is the procurement-basis headline per city. `total_eur` is also emitted for compatibility with earlier generated schemas.

## 10. Constructability constraints

- Concrete supply. Precast concrete yards exist in every target region; the Pi section needs a supplier-designed railway prototype and a reusable long-line mould fabricated from established formwork systems (PERI, Meva, Doka). Operators without a nearby precast yard bootstrap one — a 5 km² yard with 20 formworks produces enough girders for 50 km of viaduct in 18 months.
- Steel reinforcement. All target regions have domestic rebar mills in the 12–40 mm range we use.
- Post-tensioning tendons. Commodity; local supply exists in every target region.
- Lifting and transport. Pi25 is 2.9 m wide and targets 65–75 t. The project must release the route, transporter, lifting points, portal/launcher or actual crane load chart, synchronized lift controls, ground pressure, wind limits and contingency landing method.
- Launching. Where full-span access is constrained, OSR-US uses match-cast 2.5–3.0 m segments, post-tensioning, and an overhead launcher with specialist geometry, epoxy-joint, tendon-grouting, and staged-load QA.

No restricted-export equipment. No bespoke machinery. The construction envelope matches what a mid-size regional civil contractor can mobilise.

## 11. Pitfalls and decisions

- No tunnels is the non-negotiable decision. An operator who believes their corridor absolutely requires a 3 km tunnel under a city centre has exactly two options: (a) deviate the alignment; (b) fork the project. Upstream stays on the at-grade / elevated / bridge envelope.
- Choose the civil mix from the actual corridor. Use at grade where land, access and geometry permit. Controlled central viaduct concepts trade higher civil costs for more direct routes and fewer street conflicts. Report the resulting quantities, property needs and whole-scope costs; the earlier 70% at-grade aspiration is retained as a comparison assumption.
- Use the controlled viaduct families. OSR-Pi20/Pi25 decked beams are the primary products; OSR-US match-cast segments and OSR-SP special crossings address project constraints. Product geometry, complete lift masses, load combinations and independent checking remain release gates.
- Special crossings are separate products. OSR-Pi25 is not stretched to 40 m. OSR hands off to OSR-SP or a local engineering tender at the approach.
- Noise mitigation is structural, not operational. Acoustic screens on viaducts > operational speed restrictions. A 2 m concrete panel costs almost nothing and avoids a permanent speed-limit loss. Operators sometimes skip this; upstream builds it in.
- Seismic detailing is per deployment. The reference viaduct envelope handles PGA ≤ 0.3 g; above that, the deployment's structural team ups the rebar + bearing spec per EN 1998. The shape stays the same.

## 12. Rollout

| Phase | Deliverable | Dependencies |
|---|---|---|
| v0 | This RFC ratified | — |
| v1 | `osr-routing::civil` updated to drop tunnel classes (in this RFC's commit) | v0 |
| v2 | Emit `[costs]` block (at_grade / elevated / bridge / total_eur) per city in the auto-gen output, using the §9 rate table (done 2026-04-22) | v1 |
| v2.1 | Extend `[costs]` to the full CAPEX stack — stations (RFC 0010 archetypes), depots (RFC 0014 archetypes), rolling stock (RFC 0008 families), GoA 4 onboard autonomy/residual wayside train control, station/depot charging microgrids, and EPC overhead. USD is the procurement basis and EUR values are explicit converted views. | v2 |
| v2.2 | Move the source cost basis to USD direct-procurement planning rates, add `*_usd` fields, keep `*_eur` mirrors, and drop EPC overhead to 7 % (done 2026-06-04). | v2.1 |
| v2.3 | Add the railway production-plant setup bucket, now 60 000 USD per vehicle/car module with 120 000 USD retained as a high sensitivity check after 1 m clip-on fiberglass body and distributed-stabling scope reductions (updated 2026-08-15). | v2.2 |
| v2.4 | Replace duplicated city production plants with one shared national factory sized to the largest city fleet programme; city CAPEX is zero for this bucket and national briefs carry the asset once. Add imported-value and local-capital financing boundaries. | v2.3 |
| v3 | Parametric OSR-Pi20/Pi25 decked beams, transportable OSR-ST6 panels, 3.5 m elevated track centres, 6.5–7.5 m hollow caps, soil/access foundation catalogue, geometry-derived quantities and resource-driven production equations are controlled under `design/component-catalogue/src/osr_mech/civil/`. Legacy U-troughs remain special products; OSR-US and OSR-SP cover exceptional geometry. The controlled design-basis, load, egress, movement, erection, first-article, foundation, production and quantity packages live under `docs/civil/`. | v0 |
| v4 | Surveyed civil design package for the first pilot line, generated from the current city model | v3, RFC 0003 |
| v5 | First-article viaduct erected for a deployment instance | v3 |

## 13. Relationship to existing work

- `lib/templates/structures.toml` — the Lego-block schema. v1 of this RFC removes the `cut-and-cover-tunnel` and `bored-tunnel` entries.
- `crates/osr-routing/src/civil.rs` — the inference function. v1 of this RFC collapses the top threshold to `Elevated` (was `BoredTunnel`) and removes the `CutAndCoverTunnel` and `BoredTunnel` variants from `CivilClass`.
- `crates/osr-design/src/emit.rs` — the quality YAML emitter. v1 stops counting tunnel length (always zero now) and adds the elevated-fraction soft gate.
- RFC 0009 §5 and RFC 0010 §13 reference tunnel alignment / stacked-underground interchange respectively — both amended in this commit to match the no-tunnel invariant.
- `lib/templates/platform-doors.toml` references "tunnel stations"; that line is updated to describe full-height PSDs as an optional upgrade for climate-sealed stations regardless of civil class.

## 14. Open questions

1. Grade-separated level crossings — a road underpass below an at-grade rail corridor counts as a structure; does it get its own civil class? v1 folds it into the road authority's scope, not rail's.
2. Cut-and-fill extent limits. 3 m is arbitrary. Real deployments in hilly terrain may need 5 m cuts. Revisit with a hilly-pilot case study.
3. Acoustic screen effectiveness in hot climates. Concrete screens expand/contract; joints need seasonal inspection. How does that feed the CBM schedule? Candidate `osr-cbm-*` extension.
4. Wooden / bamboo viaduct for ultra-low-cost deployments? Real regional-rail projects in parts of South and Southeast Asia have used timber structures historically. Out of scope upstream; a local fork can layer that on.
5. Green-roof viaducts — planting integrated into the deck for heat-island mitigation. Candidate v4 addendum.

## 15. Done criteria

- [x] Two classes only — at-grade + elevated — with bridges narrow (§1)
- [x] No-tunnel rationale explicit with cost comparison (§3)
- [x] At-grade envelope specified (§4)
- [x] Elevated envelope specified, one reference girder (§5)
- [x] Bridge class as a viaduct variant (§6)
- [x] Stations-as-structures mapping (§7)
- [x] Civil inference updated (§8)
- [x] Cost anchors named (§9)
- [x] Constructability constraints stated (§10)
- [x] Pitfalls + alternatives (§11)
- [x] Rollout ordered (§12)
- [x] Relationship to existing code + templates (§13)

The next session picks up at v2 — cost estimates in auto-gen output (a short follow-on to the v1 tunnel-removal already landed in this commit).

# RFC 0012 — Switches & Crossings (Physical)

Repository source: `docs/rfcs/0012-switches-and-crossings.md`

Status: Draft — planning only, no mechanical drawings ship with this RFC Date: 2026-04-22 Depends on: RFC 0009 Track Design Standard, RFC 0011 Civil Infrastructure Design Standard

## 1. Summary

OpenSourceRail commits to three turnout tangents (1:9, 1:14, 1:18.5) across every deployment. This RFC fixes the physical hardware standard — switch machine, stretcher bars, detectors, frog, heating — that the `osr-wayside-points` controller operates.

| Tangent | Divergent speed | Preset | Use case |
|---|---|---|---|
| 1:9 | 40 km/h | `standard-urban`, `standard-metro` (station ends) | The bread-and-butter metro turnout |
| 1:14 | 60 km/h | `standard-metro` (mainline crossovers), `mainline-mixed` | High-speed crossover between parallel tracks |
| 1:18.5 | 80 km/h | `mainline-mixed` only | Reserved for shared-corridor operation |

Minimise switch count. Prefer trailing-point moves over facing-point moves wherever possible. Every switch is a maintenance liability; every facing-point switch on a revenue corridor is a SIL-4-rated safety asset.

## 2. Non-goals

- Not a rail-industry standards body. References EN 13232 (turnout geometry), EN 13145 (sleepers), EN 13146 (fastening tests). No new ones published.
- Not a level-crossing-gate policy manual. Legal requirements for warning times, signage, barrier type vary per country; this RFC specifies the equipment envelope the deployment chooses from.
- Not a points-heating policy for arctic climates. Target regions hit ≤ 0 °C briefly in some mountain areas; a simple resistive points-heating circuit is specified. Sub-arctic deployments customise locally.
- Not a ballast-cleaner or tamper spec. Maintenance-of-way equipment is separately sourced; the turnout standard doesn't constrain its choice.

## 3. Why three tangents, not a continuum

Picking three standard turnout geometries covers the full operational envelope while keeping tooling, inspection, and spares repeatable:

- 1:9 handles every station-throat and depot turnout. 40 km/h divergent speed is plenty for a metro that dwells 30 s at every stop.
- 1:14 handles mid-line crossovers on dedicated metro ROW where the trailing-point move is routine.
- 1:18.5 handles the shared-corridor edge case (`mainline-mixed` preset). Operators never specify intermediate tangents (1:7, 1:10, 1:12). Simplicity pays: one turnout mould, one stretcher-bar part number, one switch-machine part number per tangent; three total across the whole project.

# 4. Switch architecture

## 4.1 Mechanical

| Aspect | Choice |
|---|---|
| Rail type | UIC60E2 (60 kg/m) for 1:9 / 1:14 / 1:18.5. Matches the parent rail profile from RFC 0009. |
| Switch blade | Flexible switch blade, continuous machined profile; no bolt-on tip. The controlled planning envelopes are 7.8 m for 1:9, 11.8 m for 1:14, and 16.2 m for 1:18.5; the supplier drawing freezes the final machined length. |
| Stock rail | Standard-profile rail for length of the switch panel, bolted to the next panel. No welded joints inside the switch area. |
| Slide chair | Self-lubricating (graphite-filled bronze) — no daily greasing. Inspection every 30 days. |
| Stretcher bars | Two stretcher bars per switch (front + heel). Front bar integrates the position detector per §5. |
| Frog | Cast manganese steel, 13 % Mn, no moveable-point frog upstream — adds complexity and a failure mode without enough speed gain at our tangents. Swing-nose frog is an opt-in v2 extension for 1:14 / 1:18.5. |
| Check rails | Bolted to the running rail opposite the frog. Fixed-gap (no cold-weather compensation). |
| Sleepers | Pre-stressed concrete switch sleepers per EN 13145; spacing compressed from the 600 mm mainline standard to 540 mm through the switch panel. |

## 4.2 Switch machine

Single vendor / single machine family across every deployment:

| Aspect | Choice |
|---|---|
| Type | Electro-mechanical, BLDC motor + planetary gearbox + crank. No hydraulic switch machines — hydraulic packs are top-quartile maintenance items. |
| Throw force | 6 kN nominal, 12 kN peak (matches standard metro load at ≤ 25 °C ambient). |
| Throw time | ≤ 3 s from rest to locked, including detection settling. |
| Detection | Dual-redundant position sensors (A + B, 2oo2 agreement) at the front stretcher bar. Integrated with `osr-wayside-points`'s `SwitchObservation` reporting. |
| Locking | Mechanical lock at the tip via the front stretcher bar; blade cannot move when locked. No electrical-only locking. |
| Heating | 3 kW resistive heating strip along the slide chair + blade foot, thermostatically switched at +5 °C ambient. Powered from the trackside 230 V AC supply; dropped to LVDC aux in depot areas. |
| Cabinet | IP67 aluminium enclosure matching the W-SBC form factor (RFC 0007 §6). Motor + controller share the cabinet. |

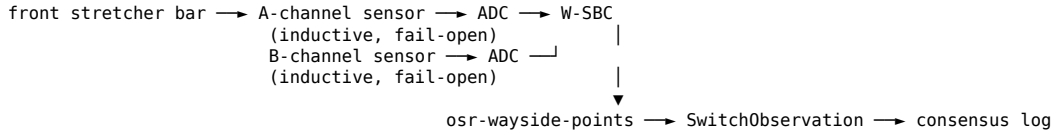
## 4.3 Facing vs trailing

- Facing-point switch (FPS): a switch the approaching train has to trust to guide it onto the right track. SIL-4 asset. Every FPS is a permanent W-SBC deployment (`osr-wayside-points`) with consensus-log-backed position observation.
- Trailing-point switch (TPS): a switch a train merges into from one of two converging tracks. The train flips the blade on its way through; no pre-positioning required. SIL-2 asset — the controller still reports position for dispatch awareness, but the safety case doesn't rely on it being at any specific position when a train approaches.

Every deployment counts and minimises FPSes. A typical linear deployment instance (RFC 0003) has 0 FPSes on a linear line (only crossovers at depot entry, which are TPSes on the way in and FPSes only if an operator reverses a train on the mainline — normally handled by the turnback at the terminal station). Any deployment with > 8 FPSes per line is a design red flag.

# 5. Position detection + integration

Per RFC 0007 §6, every wayside site including switch sites hosts a W-SBC. The switch-detection chain is:



Two channels are redundant by construction. Any disagreement, or either channel reading "indeterminate," yields `DetectedPosition::Unknown` — the fail-restrictive behaviour already encoded in `osr-wayside-points`'s W2 proptest + Kani property.

No track circuits in the switch zone. Detection is by dedicated stretcher-bar sensors. Axle-counters sit outside the switch panel as a redundant train-detection sensor — not as the switch-position detector.

# 6. Level crossings

Level crossings remain a specific category handled by `osr-level-crossing`. The physical equipment envelope:

| Element | Spec |
|---|---|
| Barrier type | Half-barrier, counterweighted, 4 m arm length (8 m arm at 2-lane crossings). Pneumatic or electro-mechanical drive; no hydraulic. |
| Barrier descent time | 8–12 s (meets UIC 762 and most national rules). |
| Warning lights | Alternating red flashers + audible warning bell, 30 s pre-barrier activation. |
| Road approach warning | 150 m advance warning sign + surface markings. |
| Train detection | Redundant axle-counter pairs at entry + exit; feeds `osr-level-crossing`'s five-state FSM. |
| Emergency stop strip | 600 mm rubber strip on the road at the rail approach — survives being struck, triggers an emergency barrier lift only via a dispatcher OK. |
| Canopy / shelter | Optional on the road side for the approach warning cabinet; not on the rail side. |

Approach warning time is 30 s minimum, per `osr-level-crossing`'s invariant, irrespective of design speed. Operators who want a longer approach configure per-crossing; upstream defaults to 30 s.

# 7. Crossings (diamonds)

Rail-on-rail diamonds (one track crossing another at grade) are not in the standard catalogue. They are:

- Expensive to maintain (high impact load at the flangeway gaps).
- A top-quartile derailment site.
- A needless complication on a new-build corridor where junctions are trivially re-routed around parallel alignments.

If a deployment's geometry seems to demand a diamond, the alignment should be revisited. Grade-separated crossings (elevated over at-grade) are the catalogue answer. Per RFC 0011 §5 those are standard viaduct spans.

# 8. Turnout geometry table (per tangent)

Planning-grade per EN 13232. Exact radii / lead lengths per manufacturer's standard drawing.

| Tangent | Angle | Switch lead length | Total envelope | Blade envelope | Through-radius | Turnout sleepers | Divergent speed |
|---|---|---|---|---|---|---|---|
| 1:9 | 6.3° | 23 m | 27 m | 7.8 m | 190 m | 42 | 40 km/h |
| 1:14 | 4.1° | 37 m | 43 m | 11.8 m | 500 m | 68 | 60 km/h |
| 1:18.5 | 3.1° | 49 m | 60 m | 16.2 m | 900 m | 94 | 80 km/h |

Any deployment using a non-listed tangent is outside the upstream envelope.

# 9. Auto-gen pipeline

At deployment-generation time, the emitter needs to know where switches go. Today's pipeline:

- Terminal stations: the emitter already tags first/last stations as `terminal` (RFC 0010 §12). A future v2 of the emitter can emit a `turnback_switch` entry at every `terminal` using tangent 1:9.
- Depot entries: the `depot-terminal` archetype gets a depot fan of 1:9 turnouts. The fan geometry is parametric in the depot stall count (see RFC 0014).
- Interchange stations: no switches. Lines cross grade- separated; see RFC 0011 §7.

Emitter v2 work is the short follow-on that pairs with RFC 0010 v2 / RFC 0011 v2.

# 10. Pitfalls and decisions

- Only three tangents in the catalogue. A deployment team pushing for a 1:10 or 1:12 to "match their legacy network" is asking for bespoke mould work. The cost math almost always favours standardising on 1:9 + slightly-reduced divergent speed where needed.
- Electro-mechanical switch machines, not hydraulic. Hydraulic is smoother and quieter; it is also top-quartile for maintenance and has a top-quartile environmental liability (pack-oil leaks into track ballast). Electro-mechanical wins the mission alignment.
- Fixed frog, not moveable-point. Moveable-point frogs are smoother at 80 km/h+; at our tangent speeds they don't pay back the complexity. Opt-in at 1:14 / 1:18.5 in v2 if the acoustic argument becomes dominant.

- No diamonds. Grade-separate, or re-route. Operators used to network-style legacy rail sometimes push for diamonds on psychological grounds ("my country's rail has them"); we do not.
- Level crossings are a necessary evil. Every road-rail level crossing added is a maintenance, safety, and service-punctuality liability. The auto-gen emitter counts them per km of line; deployments with > 3 level crossings per km are flagged as a soft gate for review.

## 11. Rollout

| Phase | Deliverable | Dependencies |
|---|---|---|
| v0 | This RFC ratified | — |
| v1 | `lib/templates/switches.toml` updated to match this RFC | v0 |
| v2 | Emitter emits turnback at every terminal archetype + one `no-9-mainline` per stall at every `depot-terminal` (yard fan) (done 2026-04-22) | v0, RFC 0010 v2 |
| v3 | Reference CAD drawings for the 1:9 turnout under CERN-OHL-S v2 | v1 |
| v4 | Generated switch-bill for the current pilot city model, including terminal turnbacks, depot fans, and any required mainline crossovers | v1, RFC 0003 |

## 12. Relationship to existing work

- `lib/templates/switches.toml` — the Lego-block schema. v1 amends to drop any non-catalogue tangents.
- `crates/osr-wayside-points` — the W-SBC software controller. Already W1–W6 verified (RFC 0004 §M4 work). No software change for v0 of this RFC.
- `crates/osr-level-crossing` — the level-crossing 5-state FSM. Already deployed; this RFC pins the physical equipment envelope that feeds it.
- `crates/osr-interlocking` — consumes `SwitchObservation` log entries. Semantics unchanged.

## 13. Open questions

1. Swing-nose frog opt-in rule. At what line speed / ridership does the acoustic / rail-wear benefit cross over the added mechanical complexity? Revisit at v3.
2. Shared-corridor freight impact. On `mainline-mixed`, a freight train's 22.5 t axle load over a 1:9 switch daily accelerates wear substantially. The catalogue's assumption is that shared corridors use 1:14 minimum. Verify with a real mixed-corridor pilot.
3. Seasonal-heated switches in hot climates. +50 °C summer ambient can rail-expand beyond the standard switch tolerance. Temperature-compensated switch geometry is a future addendum for deployment-scale turnout counts.
4. Single-vendor switch-machine risk. The project's simplicity bet locks the fleet to one machine family. What happens if that vendor exits the market? Mitigation: the reference drawings under CERN-OHL-S v2 let any replacement machine vendor fit into the footprint.

## 14. Done criteria

- [x] Three (plus tram) tangents committed (§1)
- [x] Switch architecture (§4) + detection chain (§5)
- [x] Level-crossing equipment envelope (§6)
- [x] Diamonds out of scope with rationale (§7)
- [x] Geometry table per tangent (§8)
- [x] Auto-gen implications (§9)
- [x] Pitfalls + alternatives (§10)
- [x] Rollout ordered (§11)
- [x] Relationship to software + templates (§12)

The next session picks up at v1 — `lib/templates/switches.toml` update, a short editorial PR.

# RFC 0013 — Operations Rulebook

Repository source: `docs/rfcs/0013-operations-rulebook.md`

Status: Draft — planning only Date: 2026-04-22 Depends on: RFC 0008 Rolling-Stock Reference Design, RFC 0009 Track Design Standard, RFC 0010 Station Design Standard, RFC 0011 Civil Infrastructure Design Standard, RFC 0012 Switches & Crossings

## 1. Summary

Every OpenSourceRail deployment inherits one baseline operations rulebook — the standing rules for drivers, dispatchers, station staff, and maintenance workers. The rulebook is deliberately short (target ≤ 60 pages in the rendered PDF) and shared across deployments. Operators adapt it for national regulatory overlays but do not re-invent it.

This RFC fixes the rulebook's table of contents and the governing rule-granularity principle. The rule text itself lives in markdown under `docs/operations/` and is owned by a standing committee once the project has one; until then, the project maintainer ratifies additions.

## 2. Non-goals

- Not a national regulatory document. Every country that adopts OSR has a national rail safety authority (NRSA or equivalent) that must accept the rulebook. This RFC produces a baseline that a deployment's local legal counsel adapts.
- Not a driver training manual. Training content comes from the rulebook, but the pedagogy (lesson plans, sim scenarios, exam questions) is a per-deployment deliverable handled by workforce materials (`lib/templates/workforce.toml`).
- Not a safety-case evidence file. The rulebook is an operational artefact; the safety case (`docs/safety-case/`) references rules as supporting evidence, not the other way around.
- Not an incident-response playbook. Playbooks are scenario- specific and owned per-deployment (fires, passenger illness, derailment, signal failure); this RFC specifies the categories each playbook must exist for, not the specific response.

## 3. The simplicity principle

Every rule in the rulebook must pass this test:

> A new driver who has never seen this system before can read the whole rulebook in one morning and have an accurate enough mental model to operate safely under supervision by the end of the day.

This means:

- Every rule is one sentence, one decision. No compound rules.
- Every rule has exactly one author (the project maintainer until the standing committee exists).
- Every rule is numbered; operators cite rules by number in incident reports.
- Every rule has a why: a short justification paragraph. No rule is an unexplained ritual.

The target is a ≤ 60-page PDF. Rail industry rulebooks that hit 200 + pages are artefacts of 150 years of accretion — we're not accruing that.

## 4. Table of contents — one section per role

The rulebook is organised by role, not by scenario. A driver reads one section; a dispatcher reads another; the sections overlap only where the roles interact.

### 4.1 Dispatcher rulebook (target ≤ 15 pages)

| Section | Scope |
|---|---|
| S1 | Shift start — OCC login, fleet inventory check, schedule ready |
| S2 | Routine dispatching — route grants, timetable adherence, headway maintenance |
| S3 | Incident handling — single-train fault, section unavailable, mass-casualty |
| S4 | Weather and environmental — dust storms, heatwave, flood warning |
| S5 | Maintenance interlock — work-on-track grants, blocking a section from revenue |
| S6 | Shift end — handover, outstanding-event log, system state summary |
| S7 | Intrusion response (RFC 0016) — track-patrol dispatch, return-to-service gating, sustained-Unknown escalation |

## 4.2 Station staff rulebook (target ≤ 10 pages)

| Section | Scope |
|---|---|
| T1 | Station opening — power up, PIS check, fare-gate test |
| T2 | Passenger boarding — platform supervision, PSD status, wheelchair assist |
| T3 | Passenger incidents — medical, fare dispute, unattended item |
| T4 | Fare enforcement — inspector on-board, non-payment, appeal |
| T5 | Station closure — evacuation, power down |

## 4.3 Maintenance worker rulebook (target ≤ 10 pages)

| Section | Scope |
|---|---|
| M1 | Depot safety — hazard awareness, PPE, lone-worker protocol |
| M2 | Work-on-track authorisation — formal blocks, protection signals, access to active ROW |
| M3 | Routine track inspection — walking the line, visual checks, GPM/RECD recording-car cadence (per RFC 0009 §9) |
| M4 | Switch maintenance — blade lubrication, detection-sensor cleaning, 30-day check |
| M5 | Fleet maintenance at depot — inspection intervals (daily / 7-day / 30-day / overhaul) |
| M6 | Incident site access — derailment response, fire site, crane operations |
| M7 | Wayside sensor maintenance (RFC 0016) — 30-day walkthrough, post-weather inspection, sensor replacement + calibration |

## 4.4 Control-centre rulebook (target ≤ 5 pages)

| Section | Scope |
|---|---|
| C1 | OCC watch roles — dispatcher, supervisor, engineer-on-call |
| C2 | Communications — radio discipline, PA authority, external-party notifications |
| C3 | Shift handover — written log, outstanding items, emergency-on-call list |

Total target: 40 pages across four sections.

# 5. Degraded-mode operations — the important part

Modern CBTC metros routinely run in "normal mode" (full ATO under a fresh MA) and have short, mission-critical manual-restoration procedures when the signalling degrades. OpenSourceRail keeps exactly three degraded modes:

| Mode | Trigger | Operator action |
|---|---|---|
| M1 — Automated restricted MA | ATO is healthy and ATP can enforce a shortened MA | OCC authorises reduced-speed automatic movement; ATP remains fully active and speed is capped at 80 % of normal. |
| M2 — Controlled stop | Consensus cannot issue a trustworthy MA | Every affected train remains stopped while OCC establishes a work block and restores the signalling quorum. No written order may bypass ATP. |
| M3 — Protected depot shunt | Movement is required inside an isolated depot worksite | An authenticated local maintenance pendant requests automatic movement at ≤ 15 km/h under ATP, direct CCTV observation, and a locked work zone. |

No intermediate modes. No "sort-of-ATP" states. Either the safety envelope holds (modes M1 / M3) or the train remains stopped (mode M2). This is a forcing decision: ambiguous degraded modes are the dominant cause of metro-world incidents.

# 6. Weather-dependent rules

Target regions routinely experience weather conditions that challenge legacy rolling stock:

- Dust storm (haboob): visibility < 100 m  automatic speed cap at 50 % (`osr-ato` enforces). Dispatcher issues a network-wide speed restriction at the OCC. Passenger announcements via `osr-pis-onboard`. See also `lib/templates/climate-adapters.toml`.
- Heatwave (> 45 °C sustained): rail-expansion risk triggers a pre-emptive 15 % speed cap on `mainline-mixed` and `standard-metro` presets with continuous-welded-rail. Switch detection sensors recalibrate at dawn.
- Flooding: any rainfall > 50 mm / h triggers immediate inspection of at-grade segments; the dispatcher can preventively block sections via `osr-interlocking`'s maintenance-override. Elevated segments per RFC 0011 §5 are unaffected by surface flooding — deliberate design bet.
- Lightning: nearest-strike distance < 2 km  Cat.22 5G backhaul and LoRa backhaul are both watched for outage; if both fail for > 10 s the operator notifies the OCC and cooperates with `osr-atp`'s default fail-restrictive MA.

# 7. Incident categorisation

Every incident fits one of six categories. This drives the notification chain and the regulatory report:

| Category | Example | Dispatcher action |
|---|---|---|
| I1 — fleet self-recovery | Door interlock fault on a single train, resolved at next terminal | Log in event recorder; notify depot; no regulatory report. |
| I2 — service disruption | Single-train immobile; next train coupled to rescue it | Passenger PA, timetable recovery plan; 24h incident report. |
| I3 — short safety event | Emergency brake triggered by spurious trip; no injury | Log, investigate root cause, 72h report. |
| I4 — passenger injury | Slip, fall, medical emergency on board | Medical call, depot handover; formal incident report to NRSA within 7 days. |
| I5 — collision / derailment | Train-to-train, train-to-obstacle, train off-rail | Full network shutdown of affected line; NRSA notification within 2 hours; incident-site preservation. |
| I6 — mass-casualty / fire | Onboard fire not extinguished, large-scale passenger injury | Immediate evacuation protocol; emergency services; NRSA + national media escalation. |

The categories map directly to `osr-event-recorder` tags, so the post-incident analysis starts from the same data the categories describe.

# 8. Training and recurrent qualification

- Initial driver qualification: 4 weeks classroom + 2 weeks simulator + 4 weeks supervised revenue service. Final qualification exam in written + simulator + on-road segments.
- Recurrent: 2 days refresher every 12 months + 1 simulator session per quarter.
- Degraded-mode drills: every driver runs modes M1 / M2 / M3 in the simulator every quarter. The `osr-sim` sim is the primary training platform.
- Dispatcher qualification: 8 weeks OCC-side classroom + simulator + supervised desk time.
- Maintenance: role-specific certification per EN 50126 / per national NRSA rules.

Training content is a deployment deliverable; this RFC fixes the minimum hours + structure.

# 9. Auto-gen implications

The rulebook does not directly feed the corridor-generation pipeline — but it does feed two outputs:

1. Depot capacity: `osr-sim`'s fleet-sizing needs to include enough spare trains for the rulebook's degraded-mode operations. A deployment with 10 trainsets on rostered revenue needs ≥ 1 spare in depot for maintenance (M5) and ≥ 1 cold- reserve for I-category incidents. See RFC 0014 §4 for the formula.
2. Workforce sizing: the driverless financial model supplies group FTE; `lib/templates/workforce.toml` allocates those totals into city roles, skills and tasks. The city delivery generator writes the organisation and spreadsheet. Named duty/leave cover must still be checked against the rulebook's shift structure (§4.5).

Changing this prose does not change software parameters automatically. Update the controlled model/template inputs, regenerate and check fleet and workforce evidence when operating rules change.

# 10. Pitfalls and decisions

- One rulebook across deployments is a big bet. Legacy metros each have their own 200-page rulebook; consolidating to one is the simplicity gain. National NRSAs will initially resist. The counter: the process of NRSA approval works on a per-document basis, not per-system basis — a shorter document approves faster. The operator carries the regulatory overlay in a thin appendix.
- Six incident categories, not more. Operators unused to this regime sometimes want a I7 or I8 for niche scenarios. We absorb niche scenarios into the existing six rather than proliferate.
- Paper written orders are allowed in mode M2. This is not anti-digital — paper is explicitly the fallback when the digital system degrades. Written orders remove ambiguity about authority when the digital system can't issue it. Rare enough that the paperwork tax is tiny.
- No "caution mode" between M1 and M2. Legacy metros have a smorgasbord of half-ATP-half-manual modes; every one is a source of operator confusion. We commit to the hard boundary.
- ≤ 60 pages is a hard target. The rulebook is reviewed on every minor-version bump; if it exceeds 60 pages, something gets cut. Adding text is easier than subtracting.

## 11. Rollout

| Phase | Deliverable | Dependencies |
|---|---|---|
| v0 | This RFC ratified | — |
| v1 | `docs/operations/` scaffold with per-role stub files for dispatcher, station staff, maintenance, and control-centre roles, each with scope + cross-refs + proposed rule outline (done 2026-04-22) | v0 |
| v2 | Full unattended-operations rulebook drafted across all four role families. Every rule is one sentence + a `Why :` paragraph, cross-referenced to the relevant crate and safety-case solution. Practising-operator review is v2.1 per-deployment work. | v1 |
| v3 | NRSA submission pack for Samawah (rulebook + safety case cross-reference) | RFC 0003 §5, v2 |
| v4 | `osr-sim` scenario library covering every degraded-mode scenario for operator refresher training | v2 |

## 12. Relationship to existing work

- `lib/templates/workforce.toml` — shift-structure + headcount inputs. v3 of this RFC aligns the two documents.
- `lib/templates/service-hours.toml` — service hours drive the rosterable workforce; the rulebook sets the rostering envelope.
- `docs/safety-case/` — references specific rulebook rules as "solution" evidence for goals around fail- restrictive operation, evacuation readiness, and training competence. GSN goals for "operational fail-restrictive behaviour" land in v4.
- `crates/osr-occ` — the dispatcher's OCC UI embeds the dispatcher rulebook's decision-support prompts. Software change in v3.

## 13. Open questions

1. Bilingual rulebooks. Every target-region deployment operates in at least one local language plus English. Do we maintain both upstream? v2 commits on this: likely yes, with English as the canonical and translations as separate branches in `docs/operations/<lang>/`.
2. Printable-PDF vs living-document. Rail NRSAs typically want a static PDF they can archive. The project wants a live document. Compromise: every minor-version bump produces a sealed PDF, and the commit hash is the canonical reference.
3. Simulator-based competence testing. `osr-sim` can evaluate driver actions against MA envelope in software. Can NRSAs accept simulator certification in lieu of on-road supervised hours? Per-country, probably not at v1.

## 14. Done criteria

- [x] Table of contents per role (§4)
- [x] Degraded-mode operations (§5)
- [x] Weather rules (§6)
- [x] Incident categorisation (§7)
- [x] Training envelope (§8)
- [x] Auto-gen implications (§9)
- [x] Pitfalls (§10)
- [x] Rollout ordered (§11)
- [x] Relationship to existing work (§12)

The next session picks up at v1 — `docs/operations/` scaffold, short editorial PR that seeds the per-role files. Actual rule text lands in v2.

# RFC 0014 — Depot Design Standard

Repository source: `docs/rfcs/0014-depot-design-standard.md`

Status: Draft — planning only, no site drawings ship with this RFC Date: 2026-04-22 Depends on: RFC 0008 Rolling-Stock Reference Design, RFC 0010 Station Design Standard, RFC 0011 Civil Infrastructure Design Standard, RFC 0013 Operations Rulebook

## 1. Summary

The current city catalogue adopts one full-fleet planning depot per line, sized to that line's complete stock and actual train length. Storage tracks and workload-sized maintenance bays are separate quantities. Depot PV/storage is priced once; property, access alignment, yard topology, installed quotations and morning launch capacity remain releases. The controlled generic quantities are in `city-operating-scope.toml` and each city's `engineering/line-depots/summary.json`. Baghdad retains its dedicated revised scope and financing ledger.

The distributed-stabling pattern below is retained as the earlier reference and simulation comparison. Its passenger-platform parking assumptions do not reduce the current full-fleet depot capital requirement.

### 1.1 Retained distributed-stabling reference

OpenSourceRail commits to three depot archetypes covering the full range of deployment sizes. Every deployment has exactly one main depot plus optional secondaries and layups. The main depot co-locates with a `depot-terminal` station (RFC 0010 §1).

The default operating pattern is distributed overnight stabling: clean, telemetry-healthy trainsets may finish service at powered passenger stations or layups near their first morning trip instead of all running empty to a terminal depot. This reduces depot stall requirements, avoids wasteful dead mileage, and lets first departures begin across the line at the same time. The main-heavy remains the maintenance authority. Defective trains are held and recovered to a service point on their own line; maintenance planning must not assume an interline rail connection. Two revenue trains per selected station form the morning launch stock; remaining revenue trains and reserves stable at a powered service point on their own line. Storage tracks are sized separately from workshop bays, using reusable depot/layup blocks.

| Archetype | Catalogue max stalls | Heavy maintenance | Overhaul throughput | Notes |
|---|---|---|---|---|
| `main-heavy` | 20 | Yes — overhaul bay, wheelset lathe | ≤ 40 trainsets | Larger workshops require a controlled site-specific extension |
| `secondary-medium` | 12 | Light only — brake disc, door actuator, HVAC modules | — | Second depot on a long line |
| `layup-minimal` | 6 | None — overnight stabling only | — | Remote-terminal layup |

The catalogue max is the reference layout envelope. The per-deployment workshop requirement comes from §4 (`max(4, ceil(fleet × 0.15))`). It is not an overnight parking allowance. Requirements beyond that envelope need an explicit site design; a template ceiling must not silently truncate them.

Plus one optional type for edge cases:

| Archetype | Purpose |
|---|---|
| `training-wing` | Co-located operations-training facility — OCC dispatcher-console simulators, maintenance-technician workshop mock-ups, and recovery-mode-crew briefing rooms. OSR is GoA 4 driverless (RFC 0015), so there are no revenue-service drivers to train — the wing exists for dispatchers, maintainers, station staff, and the recovery-mode crew who operate the manual-fallback joystick (RFC 0015 §8.2). Opt-in on `main-heavy`; not a standalone depot. |

All depots are at-grade. Per RFC 0011 §1 depots are never elevated — the footprint is too large to economically put on viaduct. A deployment that can't site its depot at-grade has an alignment problem, not a depot problem.

## 2. Non-goals

- Not a workshop management system. How the depot schedules its work — CMMS, parts management, labour planning — is owned by the operator and overlays with the `osr-cbm-backend` output.
- Not an off-line overhaul facility. Major overhauls (wheel reprofiling at 150 000 km, bogie overhaul at 600 000 km, body overhaul at 10 years) happen in the `main-heavy` depot's overhaul bay. Deployments without a main-heavy either contract overhaul out or depot-trip their fleet to a sister network.
- Not a yard-design manual. Track yard geometry within the depot boundary uses RFC 0009's `standard-urban` or (for large shunting yards) a depot-specific geometry variant. Detailed yard layout per facility.

- Not an HR / workforce document. Shift patterns and headcount from the ops rulebook (RFC 0013) and the workforce template.
- Not a brownfield-rehabilitation scope. Where a deployment inherits an existing rail workshop (Samawah, Khartoum-Atbara, Karachi Cantt, Maputo Machava, etc.), RFC 0027 governs the conversion of the existing site into an OSR depot. This RFC's archetypes are the greenfield envelope; the brownfield path swaps greenfield depot CAPEX (use the current cost template and reconcile energy inclusions) for workshop rehabilitation (~$0.5–2 M building + $1–3 M new OSR-specific tooling) — an order-of-magnitude saving that the per-deployment plan should commit to whenever assets are real.

## 3. Why three archetypes

Depots are where the simplicity bet pays off most. The three- archetype set covers:

- `main-heavy` — the one non-negotiable facility per deployment, where heavy maintenance happens.
- `secondary-medium` — for deployments whose geography makes defect and light-maintenance access to the main depot impractical.
- `layup-minimal` — storage at a line's powered service location for stock beyond the two-train station provision; no separate heavy workshop or interline connection is implied.

The catalogue provides reference envelopes. A workshop exceeding the reference bay count needs a controlled extension at the deployment main depot, including access, equipment and staffing capacity.

## 4. Fleet-sizing formula

Historical distributed-stabling comparison. The workshop and overnight allocation formulas below belong to the earlier reference. Current full-fleet line depots use the workload, storage and price controls linked in §1; the current Samawah quantities are generated in RFC 0003.

Workshop bays are sized for concurrent maintenance and inspection. Two revenue sets stable at each selected powered passenger station where fleet permits; remaining revenue trains and reserves use separate depot stabling tracks:

```
main_depot_workshop_bays = max(4, ceil(total_fleet × 0.15))
secondary_depot_bays = site-specific exception
service_rotation = 0  # depot service is prohibited in peak windows
total_fleet = peak_revenue_trainsets + service_rotation + spare + cold_reserve
station_overnight_positions = 2 × unique_selected_station_count
depot_overnight_trainsets = total_fleet - station_overnight_trainsets
```

The two-train station provision is an overnight allocation constraint. Allocate remaining revenue trains and all reserves to same-line storage, preserving total fleet inventory. Depot storage positions and usable track lengths are sized separately from workshop bays. The earlier Samawah comparison allocated 40 trains to stations and 68 to storage on their own lines: 37 on Line 1, 16 on Line 2 and 15 on Line 3. These comprise 57 revenue, eight spare and three cold reserve trains. The storage requirement totals 4,046 m of usable slots at 59.5 m per train, separately from the existing 17 main-depot workshop bays. Lines 2 and 3 reuse their powered service terminals. Local storage layouts need detailed design; interline depot connections are not part of the operating requirement.

- `peak_revenue_trainsets` = what the schedule requires at peak. Sized from the physical round-trip cycle vs. the peak headway:

  ```
  traversal_energy_kwh = line_length_km × cars × 2.4 × 1.25 × 1.25
  charging_dwell_s = ceil_30s(3600 × traversal_energy_kwh / sum(charger_kw))
  charging_dwell_s = clamp(charging_dwell_s, 120, 600)
  added_dwell_min  = charging_stops × max(charging_dwell_s / 60 - 1, 0)
  stop_count       = station_count - 2  # radial; station_count for a ring
  one_way_min      = (line_length_km / cruise_speed_kmh) × 60
                     + stop_count × stop_penalty_min
  radial_cycle_min = 2 × one_way_min + 2 × 3 + 2 × added_dwell_min
  ring_cycle_min   = one_way_min + added_dwell_min
  peak_revenue_trainsets = max(2, ceil(cycle_min × recovery_factor / headway_min))
  ```

  Current native emitter parameters:

  | Family | Cruise km/h | Stop penalty min | Recovery factor | 500 kW cabinets per powered station |
  |---|---|---|---|---|
  | tram-2car | 48 | 1.45 | 1.10 | 1 |
  | light-metro-3car | 62 | 1.35 | 1.62 | 1 |
  | metro-4car | 72 | 1.30 | 1.30 | 3 |
  | metro-6car | 72 | 1.30 | 1.45 | 4 |

  Radials use a three-minute peak headway and a three-minute turnback at each end; rings use a six-minute peak headway. The stop penalty includes the one-minute reference dwell, and only charging dwell above that reference is added. The energy balance uses a 25% climate uplift and a separate 25% charging margin. The larger recovery factors include the emitter's retained onboard-energy resilience allowance; they are planning assumptions requiring city-specific service and energy evidence, not a uniform 10% timetable margin.

These parameters replace the former written 35 km/h proxy and uniform 1.10 recovery factor. Existing city fleet inventories remain declared inputs; reconcile regeneration changes with timetable, energy, cost and physical stabling evidence before adopting a different count. This formula does not enforce two trainsets per station. Station capacity must be checked separately.

- `spare` = max(1, floor(peak_revenue_trainsets / 10)), for planned maintenance rotation.
- `cold_reserve` = 1 per line, for unplanned incidents per RFC 0013 §7.
- `service_rotation` = zero dedicated sets. Depot service is prohibited in the 3-minute peak windows and uses surplus peak-fleet capacity when the timetable relaxes to 6 or 12 minutes.

The 12-minute service happens at one designated service depot per line only in lower-frequency windows. During 07:00–09:00 and 15:00–17:00, trains make the normal quick terminal turnback, can use the platform connector, and may deplete the battery further while the 20% section-entry reserve remains mandatory. Interior cleaning, exterior/running-gear walk-around, door, coupler and emergency-equipment release checks, fault-log download, and a 150 kW low-C recharge run concurrently. A red defect removes the set from rotation and uses a planned spare; a clear inspection releases it straight back to revenue service. The opposite terminal may still top up or stable a train, but does not repeat the full inspection on the same round trip.

The 15% workshop concurrency allowance covers overhaul, defect repair, incoming inspection, and planned maintenance. Growth beyond the 20-bay catalogue envelope requires a controlled workshop extension; it does not restore fleet-wide depot parking.

Distributed overnight stabling does not increase the service-rotation fleet. End-of-service dispatch assigns healthy trainsets to powered stations with CCTV monitoring, remote isolation, and at least low-C charging access capped by installed equipment. The 150 kW rate is a top-up target, not a minimum station rating. Morning dispatch releases those sets from their stabled stations so outer stops do not wait for trains to run out from the terminal depot. The main-heavy stall formula remains sized for maintenance, inspection, overhaul, spares, and growth rather than for parking every healthy set every night.

Historical Samawah comparison (September 2026, 3-min peak headway):

- The earlier figures are retained in the historical Samawah reference. The current city summary adopts the full-fleet line-depot requirement.
- The September 2026 design has fleets of 53, 28 and 27 trainsets: 108 total. The depot reconciliation derives initial placements and slot-length requirements from the stored scenario. Physical overnight allocation remains unverified.
- `design.toml` emits the depot archetype, terminal assignment, and `fleet_stalls` as workshop/inspection bays from the same run. Older 1.25× fleet-parking examples and hand-calculated 6/4/8 trainset examples were removed from the docs and must not be copied into current deployment documents.

The emitter (RFC 0014 v2) computes this from the design.toml's `fleet_sizing` block.

# 5. `main-heavy` envelope

## 5.1 Functions

- Workshop holding for inspection, scheduled work and defective trainsets (bay count per §4); overnight fleet allocation requires a separate plan.
- Daily inspection of every incoming trainset.
- Weekly inspection (7-day service).
- 30-day inspection (A-class service per EN 50126).
- Light repair (door actuator, HVAC module, brake-disc replacement, battery module swap).
- Heavy overhaul: bogie swap, wheel reprofiling on depot lathe, body-work repaint.
- Wash: automated two-pass wash track.
- Battery-module inspection, coolant service, and sealed-module exchange.

## 5.2 Physical layout

| Area | Target footprint (per consist bay) |
|---|---|
| Stabling track | 1× consist length + 5 m clearance at each end |
| Daily-inspection bay | Roofed, pit-equipped, overhead power, compressed air, data sync drop (TCN-E monitoring) |
| Weekly bay | Pit + roof walkway for upper-body access |
| Overhaul bay | Pit + overhead crane (40 t) + wheel-lathe trench |
| Wash track | Two-pass automatic with water recycling |
| PV canopy | 4 000 m² reference allowance; full operating PV inventory needs additional located area (§5.3) |
| Classroom + office | ≥ 200 m² for operators + trainers |
| Stores | ≥ 600 m² with rack storage for spare modules |

Total `main-heavy` footprint: ~5 000 m² gross for a 10-stall facility, ~8 000 m² for a 20-stall. These historical workshop envelopes do not include the complete operating PV/storage inventory and cannot be used as total deployment land requirements.

## 5.3 Energy

- `depots.toml` selects the canonical `energy-sites.toml` tier. `main-heavy` uses `depot-main`: 5,000 kWp PV and 40,000 kWh storage, comprising 80 × 500 kWh stationary modules. Scenario, BOM and layout requirements resolve the same inventory; explicit site overrides must remain traceable. These are retained operating assumptions, not validated depot sizing. Reassess energy duties with distributed overnight station charging before freezing procurement or depot land requirements.
- The old 4,000 m² / 600 kWp / 2,000 kWh scope is a reference allowance. At the catalogue density of 0.15 kWp/m², 5,000 kWp requires 33,333 m² of modules, before access, setbacks and packing. Additional land/canopy and the battery compound are not yet located by the reference CAD.
- Annual PV generation must come from the city energy study with declared weather and loss assumptions. A nameplate rating alone is not annual yield.
- Stationary storage feeds the RFC 0021 DC charging system. Supplier dimensions, conversion/protection equipment, fire separation and installed cost require explicit reconciliation with the fixed depot allowance.
- Grid import/export must satisfy the declared connection limits and utility study. Per RFC 0002, every depot is one physical `osr-energy-site`, including when co-located with a passenger station.

## 5.4 Signalling

- A single W-SBC plus an interlocking zone boundary at the depot entry.
- Inside the depot, speed limit 15 km/h, manual operation under mode M3 (RFC 0013 §5).
- Shunting signals at each stall entry — mechanical dwarf signals driven by `osr-wayside-points` extensions.
- No ATP envelope inside the depot; `osr-atp` disables below 15 km/h in depot-tagged geofence, per a safety-bounded configuration. The operational safety envelope inside the depot is line-of-sight + hand-signal coordination.

## 5.5 Access

- Personnel access: turnstile-gated with ID-card entry, separate from the fleet access.
- Fleet access: one track connection to the line, TPS-style merge per RFC 0012 §4.3 (trains go in — it's a trailing move).
- Road access: for parts delivery, emergency services, depot staff parking. Minimum one 4 m-wide road connection.
- Rail access for deliveries of new trainsets is via the same line connection (new rolling stock rolls in on its own wheels).

# 6. `secondary-medium` envelope

- Functions: overnight stabling for ≤ 16 trainsets, daily inspection, weekly inspection, light module swap.
- No overhaul bay. No wheel lathe. No bogie-lift. Anything heavier is trips back to the main-heavy.
- Footprint: ~2 500 m² for 8 stalls.
- Reference PV canopy: 1,500 m² / 225 kWp, with 500 kWh baseline storage.

- Operating `depot-secondary` tier: 1,500 kWp PV and 5,000 kWh storage (10 × 500 kWh modules); additional placement and installed cost remain open.
- Signalling: same as main-heavy but smaller zone.
- Classroom: none. Reuse the nearest `major` station's community room if needed.

## 7. `layup-minimal` envelope

- Functions: overnight stabling, low-C top-up, cleaning, and a ground-level safety-release walk-around. Trainsets drive in at end of service, can pass through the same 12-minute turnaround service if the site is designated for its line, sit overnight, and drive out at morning service start. There is no pit inspection, repair work, or heavy maintenance.
- Footprint: ~1 000 m² for 4 stalls.
- PV canopy: 600 m²  90 kWp.
- Operating `depot-layup` tier: one 150 kWh stationary package for opportunity charging during dwell; the main-heavy is primary.
- Train top-up: 150 kW low-C per occupied stabling road, used while a set is held between duties and overnight; passenger-platform fast charging remains a separate terminal function.
- Signalling: single W-SBC at the layup entry; rest is manual line-of-sight.
- No personnel on-site overnight; the OCC monitors via CCTV.

## 8. Integration with the auto-gen pipeline

Today's emitter picks one `depot-terminal` archetype (`crates/osr-design/src/emit.rs`, `compute_archetypes`, priority rule). That choice is where the main-heavy sits. v2 of the emitter extends this:

1. Main depot: co-located with the longest radial line's far terminal. The station archetype is `depot-terminal`; the depot archetype is `main-heavy`.
2. Powered station stabling: every other terminal and selected intermediate powered stations receive healthy sets overnight; they do not emit depots.
3. Secondary/layup exception: emit only after a site-specific security, utility, access, or defect-recovery study shows station stabling is not viable.

Every depot writes a record into `design.toml`:

```
[[depots]]
station          = "line-a-east"
archetype        = "main-heavy"
fleet_stalls     = 4  # illustrative workshop bays; calculate per §4
energy_site_tier = "depot-main"  # optional: selected by the archetype
```

The scenario generator resolves depot energy tiers into `[[sites]]` and operating service settings into the simulator input. The simulator (`osr-sim`) models service countdowns and energy flows. A future physical distributed-stabling model must satisfy these requirements:

- Charges each trainset at depot pad power while held and overnight.
- Treat powered passenger stations and layups as valid overnight stabling points when the distributed-stabling policy is enabled in `lib/templates/depots.toml`.
- Holds a returning train for the configured clean/inspect/recharge slot at one designated depot per line and emits service-start/service-complete evidence.
- Preserves the zero dedicated service-rotation policy and distinguishes planned spares and cold reserve from revenue fleet requirements.
- Feeds the depot battery bank into the network-wide energy balance.

## 8.1 Executable station-stabling candidate

The simulator supports `station_stabling = true` in scenario `[[fleets]]`, with selected powered-station `dispatch_points`. Stations may use solar/storage without grid import. Waiting trains use up to 150 kW, capped by installed station and shared cabinet/source limits, for low-C top-up to 95% SoC; after closing, returning trains hold at selected stations and resume under schedule, energy and movement-authority gates. This does not require returning healthy trains to the main depot. Before departure, a distributed train must retain the 20% reserve over the route to the next selected charging station, including unpowered stops and terminal reversals. A failed pad or unavailable energy source excludes a destination. A grid outage alone does not disable a battery-backed charger. The gate checks current source availability; it does not reserve future energy against other arrivals. Actual charging debits shared storage, and each next departure rechecks the onboard reserve. Continuous replay verifies the duty. Optional `spare_count` and `cold_reserve_count` are included in each fleet's total inventory and default to zero. Candidates use the city's declared counts; these trains remain parked and can charge without routine dispatch.

The distributed-stabling workflow generates separate candidates for all catalogue cities and records the Samawah overnight comparison, checking each planned line/station/direction at opening. Plans compare allocated train lengths with the reference platform envelope. The planning/replay acceptance gate also limits overnight allocation to two trainsets per selected station, including reserves. Shared station IDs count once; a four-berth reference platform does not override this provision. The simulator exposes over-capacity queues for diagnosis, and the combined replay fails even when holding, charging and morning departures otherwise pass. Verified physical slots, security, inspection release, reserve activation, defective-train routing, full-day energy duty and deployment acceptance remain open.

# 9. Pitfalls and decisions

- At-grade only, per RFC 0011. Depots are large; elevating the footprint is prohibitively expensive. The auto-gen emitter rejects depot siting on an elevated section.
- One reference `main-heavy` everywhere. Operators with unique geography (coastal, mountainside) will push for bespoke depots. The upstream catalogue stays at one shape; the deployment's civil team handles the site-specific adaptation.
- Wheel lathe at the main-heavy only. Decentralising lathes is tempting (saves depot-trip time) but the operator depth for wheel-reprofiling is thin in target regions; centralising at one site lets that thin team do all the work.
- No pit at `layup-minimal`. A pit adds cost, safety maintenance, and lighting — just for overnight parking. Skip.
- Depot simulation in `osr-sim`. The sim models depot top-up while held plus an explicit service countdown at the designated depot. Cleaning, release inspection, diagnostics, and recharge are concurrent; deeper maintenance remains a separate availability/CMMS model.
- Distributed stabling is not distributed maintenance. Overnight passenger-station stabling is allowed only for healthy sets with remote isolation and CCTV. Any trainset needing inspection beyond the daily release walk-around, fault rectification, wheel work, or battery-module exchange goes to the main-heavy.

# 10. Rollout

| Phase | Deliverable | Dependencies |
|---|---|---|
| v0 | This RFC ratified | — |
| v1 | Shared energy tier, BOM quantities and layout requirements reconciled (2026-09-09); full equipment placement and installed cost remain open | v0 |
| v2 | Retained Rust seed and distributed-stabling studies; catalogue post-processing now prices one full-fleet depot per line | v0, RFC 0010 v2 |
| v3 | `osr-sim` turnaround-service state (clean / inspect / diagnostics / recharge), service countdown and event evidence (done 2026-08-12) | v2 |
| v4 | Accepted site/access/topology plans for all current Samawah line depots, with separately verified launch and maintenance capacity | Current full-fleet scope, v3 |
| v5 | Reference depot CAD under CERN-OHL-S v2 | v4 |

# 11. Relationship to existing work

- `lib/templates/depots.toml` — schema this RFC ratifies.
- `crates/osr-design/src/emit.rs` — auto-gen emitter. `depot-terminal` detection today; the `[[depots]]` block emission is v2.
- `crates/osr-energy-site` — every depot is one `osr-energy-site` instance; existing integration holds.

- `crates/osr-sim` — modest extension for v3; charging semantics already work.
- RFC 0010 `depot-terminal` archetype pairs 1:1 with this RFC's `main-heavy` or a mix of main-heavy + layup.

## 12. Open questions

1. Co-located vs detached training wing. Some operators prefer the training simulator in a quiet city building (closer to drivers' homes). The catalogue default is co- located with the main depot; per-deployment override.
2. Decentralised battery swapping. A future opt-in where trainsets exchange their battery pack at depot instead of recharging — halves the charging-pad occupancy. Out of scope upstream until battery-swap mechanical designs mature.
3. Night-shift head count. Ops rulebook §4.5 (RFC 0013) fixes the shift structure; what's the minimum overnight staff headcount at a `layup-minimal`? Currently zero (CCTV-monitored); confirm when the first `layup-minimal` deploys.
4. Depot expansion path. A `secondary-medium` that outgrows its 8 stalls — does it upgrade to `main-heavy` in place, or is a second-depot-nearby preferred? Likely the latter given construction-on-live-facility complexity.

## 13. Done criteria

- [x] Three archetypes committed (§1)
- [x] Fleet-sizing formula (§4)
- [x] Main-heavy envelope (§5) + secondary-medium (§6) + layup-minimal (§7)
- [x] Auto-gen pipeline integration (§8)
- [x] Pitfalls (§9)
- [x] Rollout ordered (§10)
- [x] Relationship to existing software + templates (§11)

Next: locate the full PV/storage inventory, reconcile installed cost, and provide track-by-track overnight allocation and conflict-aware run-in/run-out evidence. The quantity contract alone does not satisfy those release gates.

# RFC 0015 — Driverless operation (GoA 4) as the sole train profile

Repository source: `docs/rfcs/0015-driverless-operation.md`

Status: accepted · 2026-04-22. Authors: OSR project. Superseded: nothing (new). Amends: RFC 0008 (cab), RFC 0007 (hardware), RFC 0005 (crate map), RFC 0013 (operations).

## Current development amendment

Train-centred control retains onboard ATP, obstacle, emergency brake and physical departure functions. The new reference exercises existing ATP/ATO/brake evaluators; it does not demonstrate the complete GoA 4 sensor/door/PSD stack or approve driverless operation. OCC intentions and local privileged stopped recovery cannot bypass physical protection. See RFC 0033 for the proposed responsibility map, evidence boundaries and release gates.

## 1. Purpose

Every OpenSourceRail deployment ships as a GoA 4 (Unattended Train Operation, UTO) system from day one. The rolling stock has no driver cab and the operations model has no driver role.

This RFC sets the safety, hardware, and operations envelope for that commitment — specifically, the onboard obstacle-detection sensor suite + ECU that lets a trainset run without a driver's eyes in the loop.

## 2. Why driverless by default

Three non-novelty reasons:

1. Lower total cost. A cab costs ~$270k per trainset when wiring, cab displays, HVAC, controls, and emergency exits are summed. Over a 40-trainset fleet that is ~$11 M of capex. Drivers cost ~$110 k/year fully loaded; a 50-driver roster for round-the- clock operation is ~$5.5 M/year in wages alone.
2. Simpler trainset. Removing the cab takes out roughly 40 kg of wiring, four cab HMIs (status, mirror monitors, rear-view, comms), the master controller + dead-man handle, cab HVAC, cab door + exit, and all the diagnostic plumbing that terminates in the cab. The nose becomes a sensor cowl plus a coupler; the floor plan becomes full passenger capacity end-to-end. ~5 % more seats per trainset.
3. Simpler operations. Safety responsibilities are assigned directly to OCC, station staff, maintenance, and the onboard automation stack; the repository carries no train-driver procedure family.

The tradeoff is concentrated in the obstacle-detection problem: what a driver's eyes used to do, a sensor suite must now do. The rest of this RFC is mostly about that.

## 3. Scope

In scope of this RFC:

- Obstacle-detection sensor suite (ultrasonic + radar + camera, LIDAR optional) and the onboard ECU that fuses them.
- Removal of cab-only software and interfaces.
- New operations primitives: remote assist, platform staff role expansion, passenger emergency intercom.
- Amendments to RFC 0008, 0007, 0005, 0013.

Out of scope:

- Cab-retained variants. They are outside the project scope.
- Passenger-facing accessibility (covered by RFC 0010 §7 and not changed by driverless).
- Cybersecurity of the obstacle-detect data path (covered by the pending `osr-secbus` RFC).

# 4. What goes away

| Removed | Reason | Replacement (if any) |
|---|---|---|
| Driver cab + windscreen | No driver | Nose-cone sensor cowl |
| Cab touchscreen | No driver | Remote-assist web console (OCC) |
| Master controller + dead-man | No driver | ATO + emergency plunger (intercom-triggered) |
| Cab HVAC + cab door | No driver | — |
| Cab-to-ground radio handset | Voice comms are now OCC-mediated | Cabin PA + passenger emergency intercom |
| Train-driver procedures | No driver | Dispatcher S1–S7 + Station-staff T1–T5 absorb |
| Dead-man controller | No driver to monitor | — |
| Driver display software | No driver to display to | Passenger PIS already exists |

# 5. What becomes required

## 5.1 Obstacle-detection sensor suite

Two identical sensor packs per trainset — one behind each nose panel. The trainset has no permanent "leading end" — either end can lead on the current run. The active pack is always the one facing the direction of travel; the trailing pack self-tests continuously and stands ready for the return trip.

Each pack contains:

| Sensor | Role | Range | Update rate | Unit price (2026) | Why |
|---|---|---|---|---|---|
| 4 × ultrasonic (Murata MA40H1S-R or equivalent, 40 kHz) | Close-range safety belt | 0.2 – 20 m | 20 Hz | ~$25 each | Platform gap, depot yard, emergency crawl — cheap, solid-state, unaffected by darkness, failure mode self-detectable from echo pattern |
| 1 × solid-state LIDAR (Livox HAP / Tele-series / RoboSense M1 / Leishen CH-series — all Chinese OEMs now in the $550–2,200 bracket) | Mid-range 3D primary | 5 – 200 m | 10 Hz | $550 – $2,200 | 3D point cloud, day/night, 150–300 m published range, IP67 industrial variants available |
| 1 × mmWave radar (TI AWR1843 or eq., 77 GHz) | All-weather validation | 5 – 200 m | 20 Hz | ~$550 | Penetrates dust, fog, and the sandstorms the LIDAR point cloud degrades under — independent physics for a true disagreement vote |
| 1 × stereo camera pair | Object classification | 0 – 100 m | 30 Hz | ~$325 | Distinguishes human / animal / debris; informs verdict severity, not primary safety |

The suite is multi-sensor by design — obstacle detection is too consequential to rest on a single physics. A sensor-disagreement verdict is explicit in the evaluator (§10.1) and fail-restrictive.

### 5.1.1 Degraded-sensor speed policy

The evaluator exposes a dedicated `RestrictedSpeed` verdict so that partial sensor failures produce a smooth speed reduction instead of an EB:

| Configuration | Verdict (no obstacles detected) | Effect |
|---|---|---|
| Ultrasonic + LIDAR + radar all healthy | `Clear` | Full MA-permitted speed |
| LIDAR offline / stale · radar healthy | `RestrictedSpeed` | ATO caps at 40 km/h (the ultrasonic-safe envelope) |
| LIDAR healthy · radar offline | `Clear` | Full speed — radar is a validation channel, not primary |
| Both long-range offline · train ≤ 40 km/h | `RestrictedSpeed` | ATO holds ≤ 40 km/h |
| Both long-range offline · train > 40 km/h | `EmergencyBrake` | No coverage beyond ultrasonic band at this speed — full EB |
| Any ultrasonic channel stale / faulted | `EmergencyBrake` | Ultrasonic is always required (close-range safety belt) |
| Peer 2oo2 channel disagrees | `EmergencyBrake` | Fail-restrictive |

The policy is asymmetric on purpose: LIDAR is the primary long-range channel; radar is its all-weather validator. Losing LIDAR restricts speed; losing radar (while LIDAR still sees 3D at 5–200 m) does not. Both gone  EB if speed would outrun the ultrasonic envelope.

Why LIDAR failing caps at 40 km/h rather than EB. At 40 km/h the stopping distance is ≈ 18 m, inside the ultrasonic reliable band. The trainset keeps moving (avoiding a stranded-passengers incident) but at a speed that ultrasonic can safely cover if radar also fails in the next tick. Braking smoothly with the service brake to 40 km/h from mainline speed is a passenger-comfort decision that costs no safety — the remaining sensors still cover the revised stopping distance.

Why ultrasonic is primary for the close-range envelope. Ultrasonic transducers are the cheapest, simplest, and most failure-predictable sensor in the suite. A quadrant (four transducers with overlapping cones) costs ~€100, draws < 1 W, and has a failure mode that is detectable from its own echo pattern. For the platform-approach envelope (< 40 km/h, < 20 m stopping distance) it is sufficient on its own — which is why RFC 0015 makes it the primary safety belt for that speed band. Depot and workshop movements run permanently inside the ultrasonic band.

Why LIDAR is primary mid-range, not optional. The 2025– 2026 market shift in Chinese solid-state LIDAR put the Livox-class unit (150–300 m range, IP67, automotive-grade) into the $550–2 200 bracket — an order of magnitude below where it was three years ago. At that price, LIDAR becomes the cheapest way to cover the 20 m – 200 m obstacle envelope with full 3D range data; it displaces radar as the primary mid-range sensor and pushes radar into the all-weather-validation role. Any target-region dust-storm event (see RFC 0013 S4.1) degrades LIDAR point density, which is exactly when the radar's mmWave penetration matters.

Why radar stays in the suite even with LIDAR promoted. The point of the multi-sensor architecture is that each sensor fails under a different physics. LIDAR fails in heavy dust or direct sun; radar fails on small stationary objects; ultrasonic fails at speed; cameras fail at night. A 2oo2-style safety vote across independent physics is stronger than any one sensor's specified SIL rating.

Why cameras are classifier-only. Cameras inform the severity of a detection (human vs. animal vs. debris) which feeds the verdict severity (`CrawlOnly` for a paper bag, `EmergencyBrake` for a person). They are not the safety-primary channel for detection — detection comes from ultrasonic / LIDAR / radar. Cameras are included at cheap cost ($325/stereo pair) because classifier data improves operational availability (fewer spurious EBs on windblown debris).

## 5.2 The T-OBS ECU

A new onboard host class: T-OBS (Train Obstacle-Detection ECU). Architecture mirrors T-ECU/S:

- 2 × Raspberry Pi RP2350 in a 2oo2 composite fail-safe voting arrangement, each running identical `no_std` Rust obstacle-detection code.
- 1 × Raspberry Pi CM5 app processor for sensor fusion and classifier inference (non-safety path).
- Inputs: 4 × ultrasonic (analog-in per channel), radar (CAN-FD), stereo camera (MIPI-CSI to CM5), LIDAR (Ethernet, optional).
- Outputs: a single `ObstacleVerdict` bus message published every 50 ms, evaluated into the main T-ECU/S 2oo2 chain as a brake-demand input. Verdict `Emergency` EB via the same 2oo2 AND-gate relay stage as the ATP.

Two T-OBS modules per trainset, one at each end. Only the leading end's verdict is active; the trailing module self-tests and publishes an `Inactive` status.

Detailed hardware spec lives at `control-electronics/t-obs/schematics/v2-spec/` (scaffold only; v3 KiCad capture per RFC 0007 v3 rollout).

## 5.3 Passenger emergency intercom

Every car carries at least 4 passenger emergency intercoms (one per car end, both doors). Pressing an intercom:

1. Triggers an immediate brake application to 50 % braking effort (not EB) — the trainset slows to a controlled stop at the next station.
2. Opens an audio + video channel to OCC remote-assist.
3. Logs the event to `osr-event-recorder` with timestamp, car id, and intercom id.

OCC can release the hold and resume normal operation remotely, or escalate to full EB if the situation warrants.

Why braking to the next station, not EB: unplanned EB in a driverless trainset with no driver to manage the aftermath strands the passengers between stations — a self-inflicted mass-incident risk. Braking controlled to the next station puts the passengers where they can be helped.

## 5.4 Platform screen doors upgraded to mandatory

Earlier station concepts made PSDs optional for `halt` archetypes. Under GoA 4, PSDs are mandatory at every station with passenger boarding — no driver means no human last-line- of-defence between a passenger and the track. RFC 0010 v2.1 will reflect this.

Exception: `depot-terminal` platforms accessible only by staff do not require PSDs; staff training (M1) substitutes.

### 5.5 Enhanced CCTV coverage

Every car carries at least 4 cabin cameras, live to OCC. Platform cameras already exist per RFC 0010; coverage is now contiguous end-to-end so OCC can see any point in the system on demand.

## 6. Safety case

### 6.1 Equivalence claim

The driverless trainset makes its safety case through:

- SIL-4 obstacle detection replacing driver's-eye detection, with a lower false-negative rate on rail-relevant obstacle classes (validated against a 10 000-object test set during type certification).
- Lower reaction latency (radar-to-brake ~50 ms vs typical driver reaction of 1.5 s).
- No fatigue, no distraction, no panic. Driverless trains don't miss red signals because they were texting. The statistical argument is well-established in global metro operations (including DLR, Copenhagen, and Singapore NSL).

### 6.2 New SIL-4 claims for the safety case

RFC 0015 adds five safety goals to the `osr-safety-case` GSN tree:

| Goal | Claim | Evidence |
|---|---|---|
| G15 | `osr-obstacle-detect` produces a restrictive verdict when any sensor reports an obstacle inside the current stopping-distance envelope; confident light-debris classifications may downgrade to `CrawlOnly`, all other in-envelope detections produce `EmergencyBrake` | O1 Kani harness + proptest |
| G16 | Sensor disagreement between the 2oo2 channels produces `Emergency` (fail-restrictive) | O3 Kani harness |
| G17 | Stale sensor data (> 100 ms since last update) produces `Emergency` | O2 Kani harness |
| G18a | With every long-range sensor offline above 40 km/h, the verdict is `EmergencyBrake` | O4a Kani harness |
| G18b | With LIDAR offline (radar healthy), the verdict is at least `RestrictedSpeed` and never `EmergencyBrake` from the O4 branch alone | O4b Kani harness |
| G19 | Passenger-intercom-triggered stop is delivered within 3 s of press | `osr-passenger-assist` state-machine tests + `osr-sim` intercom-to-brake integration test (one simulation tick) |

### 6.3 Residual risks explicit

Driverless operation carries residual risks that must be handled without an onboard operator. Each one is explicitly acknowledged:

- Obscured obstacle above sensor plane (e.g., a person standing upright but only the torso is visible above the platform edge): mitigated by PSD mandatory (§5.4) + ultrasonic under-body sweep at platform approach.
- Suicide on track: the most common rail-fatality mode in the industry, driverless or not. Not uniquely worsened by driverless; PSDs eliminate the station-platform variant entirely.
- Slipping rail, wheelspin: detected by `osr-odometry` slip-flag, triggers EB. No driver judgement involved.
- Terrorism / sabotage on track: track-intrusion detection at wayside (out of RFC 0015 scope; RFC 0016 candidate).
- Passenger medical emergency mid-journey: intercom to OCC; OCC dispatches medical assistance to the next station.

### 6.4 Certification pathway

Type certification to EN 62267 (UGTMS — Urban Guided Transport Management + Command/Control Systems) at GoA 4 is the target. Each deployment additionally certifies to the local regulator (NRSA equivalent).

The certification package draws from the existing safety-case tree plus the five new goals in §6.2.

## 7. Operations implications

### 7.1 Unattended roles only

RFC 0013 assigns all operational decisions to the onboard automation, OCC dispatcher, station staff, maintenance, or control-centre roles. It contains no onboard train-driver role or mixed-fleet procedure set.

## 7.2 OCC role expands

The OCC gains two new staff roles (amendment to RFC 0013 §4.5 C1):

- Remote-assist operator. Handles passenger intercom calls, takes manual override of a stopped trainset if needed, and coordinates with emergency services for on-board medical events. One operator per 5–10 trainsets in service.
- Fleet-health supervisor. Monitors the live CCTV + sensor feeds for trainset anomalies (smoke, unusual passenger behaviour, unattended items) that a driver would previously have noticed.

## 7.3 Station staff role expands

Station-staff T2 (Passenger boarding) gains two additional responsibilities:

- Platform dispatch ready-check. Staff confirm PSD closed + platform clear before the dispatch signal is released. This substitutes for the driver's final platform check (D4.5).
- Boarding assistance. Staff are now the sole human presence during boarding; wheelchair assist, passenger inquiries, and boarding-rate management all sit at platform level.

## 7.4 No loss of safety personnel — they move where risk is

The driverless pivot does not reduce safety staffing. The heads-per-hour shifted from driver-in-cab to OCC + platform: same people, different posts, generally safer posts.

# 8. Rolling-stock implications (amends RFC 0008)

## 8.1 Cab eliminated

- Front wall: just a nose cone with the §5.1 sensor cowl + a coupler interface.
- No windscreen, no cab display, no master controller, no cab door, no cab HVAC, no rear-view mirror.
- Both ends of the trainset are symmetric — no leading / trailing distinction at the rolling-stock level.

## 8.2 Recovery-mode lockable cabinet

Every trainset retains a recovery-mode keyswitch cabinet — a steel-locked enclosure behind the nose, accessible only with a physical key held by depot recovery crew. Inside:

- A wired pendant with: forward / reverse select, 0–15 km/h movement request, emergency stop.
- The keyswitch enables a slow-speed (≤ 15 km/h) protected shunt under ATP supervision — used only to position a stopped trainset for rescue coupling inside an isolated work zone.

This is the only manual-control path. It is physical, locked, slow-speed, and single-purpose. No full cab required.

## 8.3 Floor plan extends to both ends

Passenger seating extends to the full car length. The additional ~3 m × 2.4 m of floor at each end of the lead + rear cars = about 14 extra seats per trainset on the `light-metro-3car` family.

## 8.4 Mass + capex savings (per trainset)

Rough figures for the `light-metro-3car` reference:

| Item | Saved mass (kg) | Saved capex (USD) |
|---|---|---|
| Cab structure (front wall, door, windscreen) | ~800 | ~$33 000 |
| Cab controls + displays + wiring | ~150 | ~$87 000 |
| Cab HVAC | ~120 | ~$16 000 |
| Cab seat + interior trim | ~80 | ~$9 000 |
| Mirror / wiper / horn package | ~40 | ~$4 000 |
| Cab lighting + accessories | ~20 | ~$3 000 |
| Total | ~1 210 kg / cab × 2 cabs | ~$150 k × 2 |
| Added (T-OBS + sensors + intercoms) | ~60 kg × 2 ends | ~$27 k × 2 |
| Net | ~2 300 kg saved | ~$250 k saved |

# 9. Hardware implications (amends RFC 0007)

A new host class T-OBS joins the palette:

| Class | SoC | Role |
|---|---|---|
| T-ECU/S | 2× RP2350 + RPi CM5 | Train safety kernel (ATP, brake, etc.) |
| T-ECU/A | RPi CM5 | Train application (TCMS, PIS, TCN) |
| T-OBS | 2× RP2350 + RPi CM5 | Obstacle detection + sensor fusion |
| W-SBC | Radxa CM5 | Wayside |
| S-SBC | RPi CM5 | Station |

T-OBS is two modules per trainset (one at each end). Architecture and PCB family are re-used from T-ECU/S; only the carrier board (sensor breakouts, CAN-FD transceiver, analog-in front-end, MIPI-CSI camera headers) differs.

# 10. Software implications (amends RFC 0005)

## 10.1 New crate

`osr-obstacle-detect` — pure-function SIL-4 evaluator. Runs on T-OBS. Takes a `SensorFrame` (ultrasonic ranges × 4, LIDAR return list, radar return list, camera classifier output), current train speed, current Movement Authority end, and the peer-channel clear bit, and returns an `ObstacleVerdict`:

```
enum ObstacleVerdict {
    Clear,
    RestrictedSpeed,   // ATO caps at 40 km/h (LIDAR degraded)
    CrawlOnly,         // ATO caps at 15 km/h (soft obstacle)
    EmergencyBrake,
}
```

Verdicts are strictly ordered by severity: `Clear < RestrictedSpeed < CrawlOnly < EmergencyBrake`. A detection inside the envelope can only escalate severity; a clearer sensor frame can only de-escalate.

Five SIL-4 safety properties (O1, O2, O3, O4a+O4b, O5) mapped to Kani harnesses; proptest coverage across the same properties.

## 10.2 Exclusive unattended train image

`osr-trainset-image` is the single onboard integration entry point. It re-exports the GoA 4 stack (ATP, ATO, brake, derailment, door control, fire safety, obstacle detection, odometry, passenger assistance, and TCMS). There is no cab feature flag, driver-display crate, or dead-man controller in the workspace.

# 11. Rollout

| Phase | Deliverable | Dependencies |
|---|---|---|
| v0 | This RFC ratified | — |
| v1 | `osr-obstacle-detect` crate at `crates/osr-obstacle-detect/` — SIL-4 pure-function evaluator with O1/O2/O3/O4a/O4b/O5 Kani harnesses + 8 proptests (26 tests total); GSN safety-case goals G15–G19 at `docs/safety-case/gsn/60-obstacle-detect.toml` close against real Kani + proptest evidence (done 2026-04-22). | v0 |
| v2 | `osr-sim` shadow onboard stack now calls `osr_obstacle_detect::evaluate` at every tick: each `OnboardShadow` carries an `obstacle_out` field, feeds an all-clear synthetic `SensorFrame` into the evaluator, threads `ObstacleVerdict::EmergencyBrake` through `BrakeInputs::obstacle_emergency`, and feeds `RestrictedSpeed` / `CrawlOnly` into the ATO cruise target as 40 km/h / 15 km/h caps. Per-verdict tick counters roll up in `OnboardSummary::total_obstacle_{restricted,crawl,emergency}_ticks`; the simulator summary prints them under "Onboard shadow stack". `BrakeInputs`, `EmergencySources` (in both `osr-brake` and `osr-tcms`), and the brake evaluator carry `obstacle_emergency` end-to-end. v2.1 (2026-04-23): scenario-driven sensor-fault injection — four new `FaultKind` variants (`LidarOffline`, `RadarOffline`, `UltrasonicChannelStale`, `ObstaclePeerDisagreement`) with per-train + fleet-wide scope; parser in `scenario_file.rs`; a demonstrator fault-injection scenario exercises every O-series path through the shadow stack. Run confirms RestrictedSpeed / EmergencyBrake verdicts fire without invariant violations. (done 2026-04-23) | v1 |
| v3 | T-OBS v2 schematic specification at `control-electronics/t-obs/schematics/v2-spec/` — block diagram + per-rail power budget + safety-nets with 2oo2 AND-gate design + RP2350 A/B pinouts + 12-entry M12 connector table (done 2026-04-22). KiCad capture is v3.1, deferred alongside the RFC 0007 hardware KiCad rollout. | v0 |
| v4 (v1) | Type-certification pre-submission pack at `docs/certification/` — README + system-description + safety-requirements (SR-01..SR-24) + hazard-log (17 hazards, 7 classes) + evidence-register + EN 62267 clause-by-clause compliance-matrix. Every SR cross-referenced to a Kani harness / proptest / GSN goal / rulebook rule. Remaining for v4.1 (open): residual-risk narrative, per-clause compliance prose for §5–§9, and independent-assessor review (deployment-partner scope). (done 2026-04-23) | v2, v3 |
| v5 | First driverless revenue service on an OSR deployment instance | v4 |

# 12. Relationship to existing RFCs

- RFC 0003 (Samawah context and pilot rationale) — shows how one city can instantiate the GoA 4 operating model.
- RFC 0005 (SBC software architecture) — crate map amended in §10.
- RFC 0007 (control-electronics reference designs) — new T-OBS class in §9.
- RFC 0008 (rolling stock) — cab elimination in §8.
- RFC 0010 (station design standard) — PSDs become mandatory (§5.4); v2.1 amendment.
- RFC 0013 (operations rulebook) — OCC and station staff own the operational responsibilities (§7).

# 13. What this RFC does NOT include

- Automated track-intrusion detection at wayside — covered by RFC 0016.
- Autonomous platform-side boarding (still a human station-staff function; automation would require RFC 0015.1).
- Autonomous depot shunting under GoA 4 (treated as a separate RFC scope because the obstacle-detection envelope at depot speeds is different).

# RFC 0016 — Wayside track-intrusion detection

Repository source: `docs/rfcs/0016-wayside-track-intrusion.md`

Status: accepted · 2026-04-23. Authors: OSR project. Complements: RFC 0015 (onboard obstacle detection). Amends: RFC 0005 (crate map), RFC 0007 (hardware palette adds one SKU variant), RFC 0001 (interlocking consumes intrusion state).

## Current development amendment

Resource ownership never substitutes for an intrusion verdict. Asset-scoped infrastructure observations remain independent inputs to the interlocking; unknown or missing required proving restricts movement. The process reference supplies synthetic independent sensor ports. Hardware common causes, observation age and qualified physical detection remain explicit acceptance gates. See RFC 0033 for the proposed responsibility map, evidence boundaries and release gates.

## 1. Purpose

Driverless trains (RFC 0015) detect obstacles in their own path with the onboard `osr-obstacle-detect` evaluator. This RFC complements that with wayside track-intrusion detection — fence-line + ROW-mounted sensors that detect people, animals, debris, or vehicles entering the track envelope before a train arrives.

The goal is not redundancy with the onboard detector. The two systems serve different safety arguments:

- Onboard detector sees what's in front of the moving train, reactively — once something enters the current envelope, brake hard.
- Wayside detector sees what's in the ROW at any time, proactively — if the section is not clear, the interlocking withholds Movement Authority and the train never arrives at the obstacle.

Wayside detection is what lets the interlocking say "this section is safe" rather than "this section was safe the last time a train passed through." In GoA 4 operation, with no driver to see irregularities between trains, this is a necessary safety property — not a nice-to-have.

## 2. Why now, not in RFC 0015

RFC 0015 §13 explicitly listed "automated track-intrusion detection at wayside" as a future RFC candidate. The two RFCs partition cleanly:

- RFC 0015 owns the onboard sensor suite, the T-OBS ECU, and the driverless rolling-stock profile.
- RFC 0016 owns the wayside sensor suite, a new `osr-intrusion-detect` evaluator on the W-SBC host class, and the feed into `osr-interlocking` that withholds MA on intrusion-flagged sections.

Splitting keeps each RFC focused on one SIL-4 evaluator + one host class, matching the RFC-per-crate-family pattern of the project.

## 3. Scope

In scope:

- Wayside sensor-suite spec (fence contact, ROW LIDAR, ROW radar, CCTV AI).
- `osr-intrusion-detect` evaluator: per-section `IntrusionVerdict` (Clear / Unknown / Present), with fail-restrictive on Unknown.
- Integration with `osr-interlocking`: intrusion state is a new gating input alongside switch-position and block-occupancy.
- Operations amendments: how the dispatcher handles a section under active intrusion.

Out of scope:

- Fencing construction (deployment-partner civil scope).
- Video-analytics AI model training (training data is deployment- specific; the classifier runs as a black box per §5.3).
- Long-range perimeter surveillance outside the ROW (deployment partner's security concern, not rail safety).

# 4. What the wayside sensor suite looks like

Per-section sensor pack (one pack per `[SEC]` id in the interlocking). Installed at ROW junction boxes; each junction box feeds a W-SBC running `osr-intrusion-detect`.

| Sensor | Role | Typical unit | Unit price (2026) | Why |
|---|---|---|---|---|
| Fence-line contact | Perimeter breach | Vibration + cut-wire sensor (e.g., Senstar FlexZone) | $325–550 / 100 m | Instant alarm on fence cut or climb; mature tech, low false-positive rate |
| ROW LIDAR (pole-mount, every ~200 m) | 3D silhouette in ROW | Livox Mid-360 (360° FoV, 70 m range) or equivalent | $875–1 300 | 3D presence detection, day/night, IP67 industrial — same supply-chain story as RFC 0015 §5.1 |
| ROW radar (pole-mount, every ~500 m) | All-weather presence | TI AWR1843 or eq. 77 GHz | ~$550 | Penetrates fog/dust that degrades LIDAR; redundant physics |
| CCTV with AI classifier | Classification + human oversight | Commodity 4 K IP camera + edge TPU (Google Coral or eq.) | $435–875 per camera | Per-station already required by RFC 0010; AI classification reuses existing cameras |

Sensor spacing is driven by section length (RFC 0001):

- `at-grade` sections: LIDAR every 200 m, radar every 500 m, fence-line continuous.
- `elevated` sections: LIDAR every 200 m; fence-line not applicable (viaduct edge is the barrier); radar optional.
- `bridge` sections: LIDAR at each end + mid-span; no fence-line applicable.

A typical `standard-urban` 1 km `at-grade` section carries: 5 LIDAR + 2 radar + 1 CCTV + 1 km fence-line. Total hardware cost ≈ $7 600 per section — small fraction of the $3.0 M per km civil cost.

# 5. The `osr-intrusion-detect` evaluator

## 5.1 Pure-function API

```
pub fn evaluate(
    frame: &WaysideSensorFrame,
    now_ns: u64,
    params: &IntrusionParams,
) -> IntrusionOutcome;
```

Inputs:

- `WaysideSensorFrame` — one tick of sensor data per section: fence-line state, LIDAR detection list (range + lateral), radar detection list, camera classification + confidence.
- `now_ns` — sim / system time for staleness checks.
- `IntrusionParams` — per-deployment thresholds (lateral rail- profile width, freshness timeout, classifier confidence floor).

Output:

- `IntrusionVerdict` — `Clear` / `Unknown` / `Present`.
- `TriggerReason` — which sensor + which class, for logging.

## 5.2 The three verdicts

- `Clear` — the section has no detected intrusion. MA may cross this section.
- `Unknown` — at least one safety-primary sensor is stale or offline, and no `Present` detection is confirmed. MA is withheld (fail-restrictive). This is the crucial property: a broken sensor does not imply safe track.
- `Present` — an intrusion is confirmed by at least one sensor of sufficient confidence. MA is withheld; dispatcher is alerted.

## 5.3 Safety properties (I1–I5)

Paralleling the O-series from RFC 0015:

| Property | Claim |
|---|---|
| I1 | Any LIDAR detection inside the ±1500 mm rail profile `Present`. |
| I2 | Any sensor frame stale beyond `MAX_SENSOR_STALE_MS` `Unknown` (not `Clear`). |
| I3 | Fence-line breach `Present` regardless of other sensor state. |

| Property | Claim |
|---|---|
| I4 | Camera classifier alone (no LIDAR / radar corroboration) cannot emit `Clear` — the safety-primary physics must be alive. |
| I5 | Refreshing a sensor never moves the verdict in a less-restrictive direction (monotone under freshness). |

Each property anchors a Kani harness + a proptest — same pattern as the O-series.

### 5.4 Integration with `osr-interlocking`

A new `SectionIntrusion` entry on the consensus log carries the verdict per section. `osr-interlocking::section_available_to` reads this alongside the existing gates (block occupancy, switch position) and refuses to grant MA across a section whose latest `SectionIntrusion` is not `Clear`.

This is a v2 deliverable of this RFC; v1 scaffolds the evaluator and a first Kani suite.

## 6. Hardware implications

`osr-intrusion-detect` runs on the W-SBC (Radxa CM5 RK3588S) per RFC 0007. No new host class — the W-SBC already hosts `osr-interlocking` and `osr-wayside-points`, so adding intrusion-detect is a same-crate-family deployment.

Baseboard additions per junction box:

- 8× fence-line contact inputs (optically isolated).
- 2× CAN-FD (radar + spare).
- 1× 1000BASE-T to LIDAR.
- 1× MIPI-CSI to CCTV edge-TPU (or Ethernet if the TPU is separate).

No change to the T-ECU/S or T-OBS boards — this is purely a wayside addition.

## 7. Operations implications

### 7.1 Dispatcher (S rulebook amendment)

A new rule group S7 — Intrusion response:

- S7.1 On first `Present` verdict, the dispatcher holds the section and dispatches track-patrol within 10 min.
- S7.2 On `Unknown` verdict persisting > 5 min, the dispatcher treats it as a functional failure of wayside equipment and opens a work ticket; trains are held or diverted.
- S7.3 A section cleared by track-patrol and returned to `Clear` may re-enter revenue service.

### 7.2 Maintenance (M rulebook amendment)

- M7 Wayside sensor maintenance: 30-day walk-through inspecting each LIDAR/radar housing, cable runs, fence contacts. Same cadence as M3 track inspection.

Rulebook text added when RFC 0016 v2 lands.

# 8. Rollout

| Phase | Deliverable | Dependencies |
|---|---|---|
| v0 | This RFC ratified | — |
| v1 | `osr-intrusion-detect` crate at `crates/osr-intrusion-detect/` — pure-function evaluator with 5 Kani harnesses + proptest properties I1–I5. GSN safety-case file at `docs/safety-case/gsn/70-intrusion-detect.toml` closes against real evidence (done 2026-04-23). | v0 |
| v2 | Integration with `osr-interlocking`: `EntryPayload::SectionIntrusion` and `IntrusionState` (`Clear`/`Unknown`/`Present`) feed gate (d); only `Clear` permits movement, while `Present`, `Unknown`, or a missing verdict withhold MA. | v1, RFC 0001 |
| v3 | Sim integration: `FaultKind::WaysideIntrusion { section, state }` emits committed consensus entries. A demonstrator scenario stages Present / Unknown / Present events across three sections without any train entering a flagged section. | v2 |
| v4 | Rulebook amendments — dispatcher S7 at `docs/operations/dispatcher/s7-intrusion-response.md` (5 rules: S7.1 track-patrol, S7.2 sustained-Unknown, S7.3 return-to-service, S7.4 multi-section escalation, S7.5 no-override) and maintenance M7 at `docs/operations/maintenance/m7-wayside-sensor-maintenance.md` (5 rules: M7.1 30-day walk, M7.2 post-weather, M7.3 sustained-Unknown ticket, M7.4 replacement calibration, M7.5 fence continuity test). RFC 0013 §4.2 and §4.4 indices updated. (done 2026-04-23) | v2 |
| v5 | Deployment at Samawah: first-article sensor packs at 3 sections on Line 1 | RFC 0003, v2 |

# 9. Relationship to existing RFCs

- RFC 0001 (consensus) — adds `SectionIntrusion` log entry.
- RFC 0005 (software architecture) — adds `osr-intrusion-detect` to the W-SBC crate map.
- RFC 0007 (hardware) — junction-box baseboard adds sensor headers; no new host class.
- RFC 0013 (operations) — S7 + M7 rule groups (v2+).
- RFC 0015 (driverless) — complements onboard obstacle- detect; the two-layer defence (wayside proactive, onboard reactive) is the full GoA 4 safety-envelope story.

# 10. What this RFC does NOT include

- Passive fence line without contact-sensor instrumentation — standard civil scope.
- Personnel-identification against a whitelist (crew vs. intruder) — handled by CCTV + human review at the OCC, not automated in this RFC.
- Anti-climb / anti-cut physical deterrents on the fence — civil scope per deployment-partner security spec.
- Section-level live-radar tracking of authorised track workers (under a `MaintenanceOverride`, RFC 0013 S5 rules apply; the intrusion-detect evaluator flags `Present` and the dispatcher cross-references against the active work-block manifest).

# RFC 0017 — Cybersecurity: message authentication on the safety log

Repository source: `docs/rfcs/0017-cybersecurity-message-authentication.md`

Status: accepted · 2026-04-23. Authors: OSR project. Complements: RFC 0001 (consensus), RFC 0005 §4.9 (crate map). Amends: `osr-crypto` (adds ed25519), `osr-interlocking` (envelope on `Entry`), consensus wire format.

## Current development amendment

The process reference reuses Ed25519/secbus and signed consensus proposals, with role/asset permissions, exact configuration hash, registered session, durable sequence/replay fences, freshness and size bounds. All position/protection events are Safety. Public deterministic test keys are synthetic and unsuitable for operation. A signed voter view assumes crash-fault behavior, not Byzantine quorum certification; authenticated erroneous observations remain in the FMEA. See RFC 0033 for the proposed responsibility map, evidence boundaries and release gates.

## 1. Purpose

Every entry on the track-state consensus log carries safety-critical authority — a forged `MaintenanceOverride` or `SectionIntrusion::Clear` could unlock a blocked section and put a train in front of a work crew. Today the protobuf schema reserves a `leader_signature` field but the code path that would verify it is not implemented: entries are trusted because they came from a running process in tree.

This RFC closes that gap. Every entry on the committed log is signed by the originating entity (train, wayside controller, dispatcher console) and every consumer verifies the signature before applying the entry to derived state.

## 2. Threat model

In scope:

- Forged entries. An attacker with network access to the consensus cluster proposes a crafted `SectionIntrusion::Clear` or a fake `SwitchObservation` hoping the interlocking accepts it.
- Replay. An attacker re-submits an old legitimate entry to confuse the derived state (e.g., replay a `RouteRelease`).
- Key compromise. A single wayside box is physically captured; its key is now under the attacker's control.

Out of scope for v1:

- Side-channel attacks on the signing key (handled at hardware level by the ATECC608B trust anchors on T-ECU/S, W-SBC, S-SBC).
- Quantum-era attacks. Ed25519 is 128-bit-classical-secure; a post-quantum migration is an RFC 0017.1 candidate once NIST finalises a PQ signature scheme in the rail-relevant performance bracket.
- TLS session setup on TRG and backhaul links — that's RFC 0018 (not yet drafted).

## 3. Design

### 3.1 Signature scheme

Ed25519 — curve25519 in the twisted-Edwards form, per RFC 8032.

- 64-byte signatures, 32-byte keys. Small enough to attach to every consensus entry without bloating the wire format.
- Batch verification available — a consensus cluster can verify N entries in sub-N time when under load.
- Deterministic signatures — no per-signature nonce required (eliminates the ECDSA Sony-PS3 class of bugs).
- Open-source reference implementations — `ed25519-dalek` in Rust is widely audited and actively maintained.

### 3.2 Entity keys

Every entity (train, wayside box, station, OCC console) holds one long-lived ed25519 keypair in its ATECC608B secure element. Public keys are published in a per-deployment key registry at bootstrap; private keys never leave the secure element.

Key ids mirror the existing `EntityId` scheme so the `Entry.leader_signature` maps one-to-one to `Entry` authorship.

## 3.3 Envelope

A signed entry is encoded as:

```
SignedEntry {
    entry_bytes: Vec<u8>,   // serde-json serialisation of Entry
    issuer: EntityId,       // which entity signed
    sig: [u8; 64],          // ed25519 signature over entry_bytes
}
```

Verification:

1. Look up `issuer` in the `KeyRegistry`. If absent → reject (`VerifyError::UnknownIssuer`).
2. Verify `sig` over `entry_bytes` with the registry's public key. If invalid → reject (`VerifyError::BadSignature`).
3. Otherwise return OK, and only then deserialise and apply the entry.

Verification is before deserialisation so a hostile payload can't exploit a parser bug before the signature check.

## 3.4 Replay protection

Each `Entry` already carries `entry_id` (monotonic) and `timestamp_ns` (PTP-synced). The derived-state fold is idempotent in `entry_id`: an entry already applied is a no-op when re-applied. Replay does not trick the derived state into a bad configuration.

The `osr-secbus` v1 crate does not perform this freshness check: it authenticates opaque bytes against a deployment key registry before deserialisation. The consensus wire integration in rollout v2 is responsible for deserialising verified entries, checking monotonic `entry_id`, and rejecting entries whose `timestamp_ns` is more than 60 seconds older than the cluster's current leader clock.

## 3.5 Key rotation (v2)

v1 treats keys as long-lived. v2 introduces a `KeyRotation` entry type that transfers authority from an old key to a new one; the registry follows the latest rotation. Deferred because it adds operational complexity that is not needed for first-article deployment.

# 4. What this RFC delivers (v1)

- `osr-crypto` extended with ed25519 sign + verify primitives.
- `osr-secbus` — new SIL-2 crate with `KeyRegistry`, `SignedBytes` envelope, and the verification API.
- Three SIL-2 properties (S1–S3) with Kani harnesses + proptest.
- GSN goals G25–G27 on the safety case, anchored to the properties.

# 5. Safety properties (S1–S3)

- S1 (deterministic verify): `verify(pk, msg, sig)` is a pure function — identical inputs → identical output.
- S2 (reject bad signature): any single-bit mutation of `sig` causes `verify` to return `false`.
- S3 (reject missing issuer): a `SignedBytes` whose `issuer` is not in the `KeyRegistry` rejects with `VerifyError::UnknownIssuer`.

# 6. Rollout

| Phase | Deliverable | Dependencies |
|---|---|---|
| v0 | This RFC ratified | — |
| v1 | `osr-crypto` ed25519 primitives + `osr-secbus` crate with key registry, envelope, verify; S1–S3 Kani + proptest; GSN G25–G27 close. (done 2026-04-23) | v0 |
| v2 | Authenticated consensus application ingress signs entry id, timestamp, category, and track-entry bytes as one body; the leader rejects unknown, forged, malformed, stale, future, replayed, and metadata-mismatched proposals before append; committed consumers independently verify the stored envelope and signed category before deserialising the track entry. (done 2026-08-11) | v1, RFC 0001 |
| v3 | `osr-sim::ConsensusBackend` uses the authenticated proposal and committed-consumer paths. End-to-end tests cover forged signature, altered payload, replay, stale/future timestamp, unknown issuer, metadata mismatch, and category downgrade. (done 2026-08-11) | v2 |
| v4 | Key rotation (`KeyRotation` entry type) + deployment tooling to mint and distribute keys | v2 |
| v5 | Hardware integration: ATECC608B provisioning pipeline; per-entity key generation + transfer at factory | v2, RFC 0007 |

# 7. Relationship to existing RFCs

- RFC 0001 (consensus) — adds the verify step between receive and apply; no changes to Raft itself.
- RFC 0005 (software architecture) — `osr-secbus` joins the Phase 2f infrastructure crate family alongside `osr-crypto` and `osr-historian`.
- RFC 0007 (hardware) — the ATECC608B role is already in the T-ECU/S + T-OBS + W-SBC specs; this RFC defines what that chip actually signs.
- RFC 0015 + RFC 0016 — every `SectionIntrusion` and `MaintenanceOverride` is now signed by its issuing W-SBC (RFC 0016) or OCC console (RFC 0013 S5). Prevents the forged- `Clear`-verdict attack that would otherwise defeat the safety gate.

# 8. What this RFC does NOT include

- TLS on TRG radios or OCC backhaul — RFC 0018 candidate.
- Encryption of the log at rest — the entries are integrity- protected; confidentiality is not claimed.
- Perfect-forward-secrecy session keys — long-lived ed25519 keys are sufficient for entry authentication; PFS is a session-layer concern (RFC 0018).
- Post-quantum migration — deferred pending NIST standardisation in a performance bracket suitable for embedded rail controllers.

# RFC 0018 — Operator GUIs: simulator + operations control

Repository source: `docs/rfcs/0018-operator-guis.md`

Status: accepted · 2026-04-23. Authors: OSR project. Complements: RFC 0003 (sim scenarios), RFC 0013 (OCC procedures), RFC 0017 (entry authentication).

## 1. Purpose

Two human-facing GUIs that have been implicit in the project but not built:

- Simulator GUI (`osr-sim-gui`) — runs `osr-sim` against a scenario TOML, renders the network + trains + MAs + faults live, and lets a designer inspect any entity by click-through. The audience is the deployment engineer validating their design.toml before commissioning, and the OSR developer verifying new scenarios.
- Operations-control GUI (`osr-occ-gui`) — the dispatcher console that RFC 0013 §4.2 has always assumed exists. Renders the live network state (from the consensus log), shows every RFC 0013 alert (S3 incident categories, S4 weather overlays, S7 intrusion verdicts), and exposes the specific actions the rulebook allows a dispatcher to take (route grant, MaintenanceOverride, degraded-mode transition).

## 2. Non-goals

- Passenger-facing displays. PIS rendering is `osr-pis-onboard`
  - `osr-pis-station` — separate codepath, separate build.
- Maintenance workbench GUI. CBM dashboards are a v2 scope of `osr-cbm-backend`, not this RFC.
- Mobile apps. Neither GUI needs to run on a phone.
- 3D rendering. 2D network schematic is sufficient — legacy metros have proved that.
- Legacy CBTC operator-console emulation. OSR operates its own consensus log; there's no back-compat requirement.

## 3. Technology stack

egui (+ eframe) in pure Rust.

Why:

- Type-consistent with the rest of the workspace. One language from SIL-4 kernel to dispatcher console; fits the project's ethos of no-JavaScript-stack, no-proprietary-SCADA.
- Immediate-mode rendering matches the per-tick update cadence of the sim + consensus log — redraw cheaply, don't reason about widget state machines.
- Works natively + WebAssembly. A deployment partner can host the OCC GUI as a web app for remote supervision without rewriting it.
- Conduction-cooled SBC friendly. egui renders at 10 Hz on a 400 MHz single-core ARM — not that we need that, but it guarantees the OCC GUI runs on any reasonable workstation.
- No Electron. An Electron OCC app would pull in 200 MB of Chromium; egui's eframe binary is ~30 MB static-linked.

Rejected alternatives:

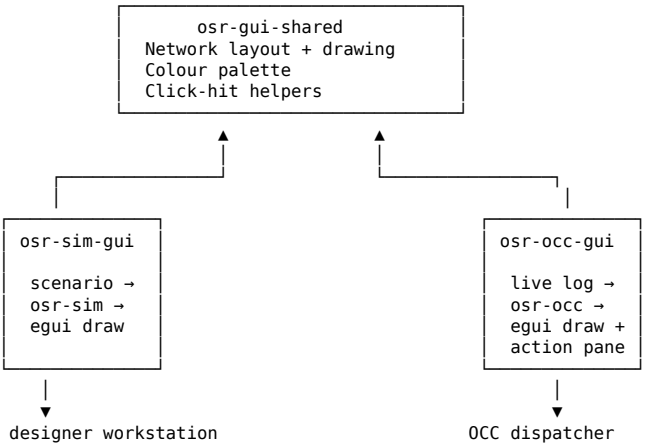
- React/Vue + Tauri — excellent for complex UIs, but adds a full JavaScript toolchain to the build + another set of security primitives to audit. Tauri remains a fallback if egui runs into a specific limitation.
- Iced / Slint — also pure Rust, but egui's immediate-mode model is a better fit for the "redraw the whole network each tick" workload than retained-mode widget trees.
- GTK / Qt — C/C++ deps outside the project's sandbox.

## 4. Architecture

Three new crates:

- `osr-gui-shared` — library. Network-layout + drawing primitives + colour palette. Consumed by both GUI binaries so the two have a consistent look. Not intended for direct use outside the GUIs.

- `osr-sim-gui` — binary. Wraps `osr-sim` + `osr-gui-shared`. Loads a scenario TOML, runs the sim per-tick in the same thread as the UI, renders the state each frame.
- `osr-occ-gui` — binary. Wraps `osr-occ` + `osr-gui-shared`. Reads from a live `ConsensusBackend`, renders the latest derived state, exposes dispatcher actions via modal dialogs that emit signed consensus entries (RFC 0017).



## 5. Shared rendering — `osr-gui-shared`

Scope:

- `NetworkLayout` — per-line horizontal strip, stations placed along the strip by cumulative distance. Same layout strategy as the existing HTML `osr-vis`, reused so dispatchers
  - designers see an identical schematic.
- `draw_network` / `draw_train` / `draw_section_state` — egui paint helpers that take a `Painter`, a `NetworkLayout`, and the current state to render.
- `Palette` — colours for every train phase, section state, intrusion verdict, obstacle verdict, fault state.

## 6. `osr-sim-gui`

Minimum viable feature set:

- Scenario loader. Filebrowser  pick a `scenarios/*.toml` load.
- Playback controls. Play / pause / step / speed (1×, 10×, 100×).
- Network render. Generated Samawah schematic with every train drawn as a dot at its current `station_m`, colour-coded by phase.
- Inspector pane. Click a train  sidebar shows ATP verdict, brake cmd, SoC, obstacle-detect verdict.
- Event log. Scrolling list of `EventKind` emissions — Dispatched, ArriveStation, DepartStation, etc.
- Fault indicators. Active faults from the scenario's `[[faults]]` section render as coloured badges on the affected station / section / train.

Post-v1 (deferred):

- Timeline scrubber for replay
- Record / export runs
- Differential compare of two scenarios side-by-side
- Remote-monitor mode (read the sim from another host)

## 7. `osr-occ-gui`

Minimum viable feature set for v1:

- Log-source selector. Pick a file replay (for exercises) or connect to a live `ConsensusBackend`.
- Network render. Same layout as the sim GUI.

- Section-state panel. `SectionIntrusion` verdicts from RFC 0016, colour-coded; click a section to see the latest `MaintenanceOverride`, `RouteGrant`, or `SectionIntrusion` on that section.
- Train panel. List of every train under the dispatcher's control, with the same colour coding as the sim GUI.
- Alert feed. Intercom presses, EB events, weather overlays, CBM red alerts.
- Action modal stubs. The four dispatcher actions from RFC 0013 §4.2 (issue route grant S2.1, commit `MaintenanceOverride` S5.1, extend dwell S2.3, declare degraded mode) exist as modal dialogs that validate the input but emit no-ops for v1.

Post-v1 (deferred):

- Live command emission to the consensus cluster with RFC 0017 signed envelopes
- Multi-operator role partitioning (dispatcher vs supervisor vs engineer-on-call) with per-role action gates
- Full audit-log display
- Video feed from station CCTV + cabin CCTV (RFC 0015 §5.5)

# 8. Security model

The OCC GUI is a privileged actor. Its action emissions must be signed by the logged-in dispatcher's personal key (RFC 0013 S1.1, RFC 0017). v2 of this RFC wires the signing key  OCC UI login flow; v1 is read-only so the security model is trivially "read-only view of committed log."

# 9. Rollout

| Phase | Deliverable | Dependencies |
|---|---|---|
| v0 | This RFC ratified | — |
| v1 | `osr-gui-shared` network renderer + `osr-sim-gui` + `osr-occ-gui` scaffolded; both compile cleanly in the workspace, open an egui window, render the Samawah network, and expose the v1 minimum feature set listed above. | v0 |
| v2 | `osr-sim-gui` full sim integration (live tick stream, click-to-inspect) | v1, RFC 0003 |
| v3 | `osr-occ-gui` live consensus integration (read + write via RFC 0017 signed envelopes) | v1, RFC 0017 v2 |
| v4 | WebAssembly builds for remote access to both GUIs | v2, v3 |
| v5 | First OSR deployment instance uses `osr-occ-gui` in revenue service | v3 |

# 10. What this RFC does NOT include

- PIS (passenger-facing) displays. Separate `osr-pis-*` crates.
- CBM / maintenance dashboards. Separate `osr-cbm-backend` UI.
- Electron / web-framework-native versions. egui's WASM target covers the "browser access" use case.
- 3D rendering. Schematic 2D is explicitly the goal.
- Mobile apps. Not a target deployment form factor for either audience.

# RFC 0019 — DIY plug-and-play electronics

Repository source: `docs/rfcs/0019-diy-electronics.md`

Status: accepted prototype integration path; hardware and operational qualification open. Review: 3 October 2026 — corrects the April candidate wiring and price assumptions. Amends: RFC 0007.

## 1. Purpose

Commodity modules provide a useful bench and first-article integration path for T-ECU/S, T-ECU/A, T-OBS, W-SBC and S-SBC. A custom PCB is optional for a bench prototype. The accepted path does not release a railway control assembly, a safety integrity level, a complete BOM or a bootable target image.

The detailed host requirements, reference integration source and release checklist control the current design stage. Exact supplier, pin, power and environment data must be frozen and tested before an operator can use the hardware.

## 2. Host classes

| Host | Bench reference | Integration work still required |
|---|---|---|
| T-ECU/S | Dual evaluator channels and optional application carrier | External bus controllers, separately protected power/watchdogs, output feedback and real field-input mapping |
| T-ECU/A | CM5-compatible application carrier | Peripheral/modem compatibility, protected power, network/radio and thermal design |
| T-OBS | Dual evaluators, application carrier and sensor candidates | Sensor/harness choice, corrected startup power, timed ingress and measured fault/coverage tests |
| W-SBC | Commodity wayside controller | Cabinet mains/DC/UPS, earthing, field I/O, output and resource-control qualification |
| S-SBC | Commodity station controller | Station services, UPS, network, AFC/PIS/SCADA and degraded-operation design |

## 3. Candidate components and corrected interfaces

Exact order codes, lifecycle, alternates and prices remain unverified in the historical candidate catalogue. Use vendor documentation and a complete board/harness BOM before ordering.

| Earlier assumption | Required correction |
|---|---|
| CM5/CM5IO codes SC1124/SC1125 released as exact selections | Freeze actual memory/storage/carrier variant and vendor order code |
| USB isolator for SPI or two Pico USB-device endpoints | Directionally correct isolated SPI with controller/peripheral roles and separate supplies |
| Native Pico CAN-FD or Ethernet/RMII | External controllers/transceivers and measured bus/deadline budget |
| TPS3701 heartbeat watchdog | Voltage detector only; separate external heartbeat watchdog functions |
| HDR-60-24 powers 5/12 V from a 24 V onboard bus | AC/high-voltage DC input to 24 V output; protected onboard DC/DC branches required |
| ADS1115 captures HC-SR04 digital echo | Timer/PIO capture with voltage conversion; raw piezo requires excitation/receiver AFE |
| Murata raw piezo labelled rail-grade plug-in replacement | Candidate-specific driver, lifecycle and environmental qualification; no rail-grade claim |
| HAP USB/Gigabit/12 V PoE interface | TX uses 100BASE-TX; T1 uses 100BASE-T1; vendor 9–18 V supply/cable separately |
| Relay board proves 2oo2 safety | Bench simulated load only; driver/contact feedback, welded faults and common-cause analysis required |

The CM5 carrier alone has a 25 W input envelope. The T-OBS bench candidate calculation allocates 71.5 W simultaneous output and 99.31 W input capacity with efficiency/margin, selecting a 100 W reference envelope. This is sizing rather than measured sustained consumption; no fuse or converter part is thereby qualified. Exact power and thermal behaviour must be tested on the selected revision.

## 4. Procurement and cost

The former DIY/custom price comparison and host subtotals are withdrawn as complete assembly comparisons. They omitted DC/DC conversion, watchdogs, output feedback, external controllers, harness/connectors, enclosure thermal provisions and qualification. A low-price module does not price the installed system. Keep unknown costs open and reconcile a quoted complete BOM against the city allowance before changing CAPEX or finance.

The Baghdad detailed register allocates reference quantities and Iraqi integration routes for the six-car fleet. These are nested engineering requirements, not additional purchases on top of complete priced assemblies or live ERP Items.

## 5. Assembly and evidence

1. Freeze host/board revision, vendor interfaces, exposed/package pins and supported peripheral resources.

2. Complete load, inrush, protection, isolation, thermal and EMC calculations.
3. Issue a cavity-by-cavity harness, terminal/wire list, enclosure and simulated-load output truth table.
4. Build and inspect a bench unit; measure voltage domains, boot/default outputs, power loss, heartbeat failures, peer faults and contact feedback.
5. Bind actual HAL/drivers, protocol/configuration and signed image to the revision; test stale data, timing, environmental exposure and recovery.
6. Close the appropriate release checklist and independent assessment before any field or train actuation.

Production SD images remain absent. Software/library tests, the same MCU silicon or a relay schematic do not prove qualified hardware independence. Do not connect a bench assembly to real brake/traction actuators as a result of this RFC.

# RFC 0020 — Crashworthiness (EN 15227)

Repository source: `docs/rfcs/0020-crashworthiness.md`

Status: Draft — parametric spec only, no FEA ships with this RFC Date: 2026-04-24 Depends on: RFC 0008 Rolling-Stock Reference Design, RFC 0015 Driverless Operation

## 1. Summary

Every OSR trainset must survive the EN 15227 crash-reference scenarios C-I (train-to-train) and C-III (train-to-obstacle) without passenger-compartment intrusion. Because OSR is cabless (RFC 0015 §5.1), the impact-absorption zone that commercial cabbed designs put in the driver's cab has to live somewhere else. This RFC publishes the energy-absorption-zone allocation that replaces it — the values the design/component-catalogue parametric car body tracks and that vendors must meet when supplying an OSR-compatible shell.

The current published baseline still does not ship a full finite-element crash simulation. What it ships is:

- A parametric energy budget per consist family.
- An allocation of that budget to three absorption zones on each end of the trainset.
- A published set of geometric constraints (crumple-zone length, anti-climber interface height, under-frame load path) the car body must honour.

A deployment must commission an EN 15227-certified FEA vendor to verify the final design; this RFC gives that vendor a well-defined target rather than a moving spec.

## 2. Non-goals

- Not an FEA solver. We specify targets; we do not solve the dynamics. Simcenter / Abaqus / LS-DYNA remains the right tool.
- Not a material choice. The body material is aluminium per RFC 0008 §3.2; the RFC applies to any ductile alloy that meets EN 15085 weld class CP-C.
- Not an obstacle-deflection spec. Track-clearing plough (EN 15227 §6.5) lives in `osr-obstacle-detect`'s physical hardware spec, not here.

## 3. Reference scenarios

| Scenario | Description | Closing speed | Target |
|---|---|---|---|
| C-I | Collision with an identical trainset on tangent track | 36 km/h | No passenger-compartment intrusion; decel ≤ 7.5 g peak |
| C-III | Collision with a 15-tonne rigid obstacle (road vehicle at a level crossing) | 36 km/h | No passenger-compartment intrusion; anti-climber engages |
| C-IV (informational) | Collision at a level crossing with a light road vehicle | Not binding on urban metro per RFC 0013 §9 | — |

Scenarios C-II (obstacle on track) and C-V (tram-style) are covered by deployment-specific assessments. Every OSR trainset must certify C-I + C-III.

## 4. Energy budget per consist

Under the C-I scenario, two identical trainsets close at 36 km/h relative closing energy is $0.5 \cdot 2 \cdot m \cdot v^2$ where $m$ is the consist mass and v is 5 m/s per trainset. For the reference families (RFC 0008 §3.3 seated + standing + interior fit-out):

| Consist | Mass tare + 6 p/m² | C-I closing energy |
|---|---|---|
| tram-2car | ~66 t | 1.65 MJ |
| light-metro-3car | ~120 t | 3.00 MJ |
| metro-4car | ~160 t | 4.00 MJ |
| metro-6car | ~240 t | 6.00 MJ |

These totals govern the absorption-zone sizing in §5.

## 5. Three-zone absorption layout

Each end of the trainset splits its contribution to the closing energy across three sequential zones, each contributing a known fraction of the total. This is the standard EN 15227 arrangement; what's specific to OSR cabless is that zones 1 + 2 previously lived inside a driver's cab and now live in the sensor- cowl + forward under-frame section.

| Zone | Location | Share | Mechanism |
|---|---|---|---|
| Zone 1 — Sacrificial cowl | Sensor cowl front + anti-climber | 30 % | Controlled-crush foam + metal honeycomb within the cowl; sensors are lost but absorb ~0.45 MJ per end for a 3-car consist |
| Zone 2 — Under-frame crumple | Forward 2.5 m of under-frame between cowl and first bogie | 40 % | Tubular steel crumple cans; cuts into depot access but stays clear of passenger envelope |
| Zone 3 — Anti-override interface | End wall between under-frame crumple and first door | 30 % | Reinforced bulkhead; redistributes remaining energy into the body torsion ring |

Each end of every consist must provide the summed per-end budget (half the closing-energy total for C-I, full for C-III).

## 6. Parametric geometry constraints

The design/component-catalogue car body + sensor cowl enforce these constraints via the `Crashworthiness` helper in osr_mech.rolling_stock.car_body (added in v0.1). The CAD geometry reserves the zone envelopes — vendor-supplied shells that fit in must meet the mechanical targets below.

| Constraint | Value | Rationale |
|---|---|---|
| Zone 1 crumple length (sensor cowl) | ≥ 900 mm | Honeycomb deceleration band at 150 kN/m² crush stress |
| Zone 2 crumple length (under-frame) | ≥ 2 000 mm | Tubular can progressive collapse |
| Anti-climber pin height above rail | 760 mm (± 25) | EN 15227 §6.4 pin-on-pin interface |
| End bulkhead thickness | ≥ 40 mm aluminium or equivalent | Load-path continuity |
| Passenger compartment survival space (post-crash) | Body length ≥ 95 % of original | Egress path integrity |
| Peak longitudinal decel (passenger floor) | ≤ 7.5 g | EN 15227 occupant criterion |

## 7. Verification path

1. Parametric check (in-repo, pytest): the car body geometry reserves the Zone 1 + Zone 2 volumes. `test_tier1_additions.py` covers the envelope reservation.
2. Static FEA (external): linear analysis of the crumple-zone load paths by a licensed FEA vendor. Outputs: peak stress, first-yield energy.
3. Dynamic FEA (external): LS-DYNA / Abaqus explicit for each scenario. Outputs: decel curves, crush displacement, passenger- envelope intrusion check.
4. Full-scale test (per EN 15227): one test specimen per consist family, at the closing speed. Carried out by the type-approval authority; pass/fail gate for revenue service.

The current baseline closes step 1 and documents the plan for steps 2–4. A deployment budget must include the external FEA + physical-test cost — typically EUR 1.5–3.0 M per consist family, amortisable across every trainset in the family.

## 8. Non-OSR obstacle-plough interface

The obstacle-deflection plough (EN 15227 §6.5) fits onto the sensor-cowl front within the Zone 1 envelope. The plough's 6° deflection angle + 200 kN rating clears track-level debris without triggering the cowl's sacrificial crush zone. Interface:

- 4× M24 bolts on a 400 × 200 pattern, pre-tapped in the cowl front.
- Plough mass ≤ 120 kg (included in Zone 1 budget).
- Catch-pan and drain geometry to be frozen in the controlled vehicle drawing release; it is not yet a released manufacturing artifact.

## 9. Deployment checklist

- [ ] Commission an EN 15227 FEA analysis from a certified vendor (Politecnico di Milano, Newrail, Bombardier Legacy, or equivalent) against the §5 zone allocation.
- [ ] Confirm the vendor's crumple-can dimensions fit inside the parametric Zone 1 + Zone 2 envelopes.
- [ ] Budget for one full-scale test per consist family.

- [ ] File the type-approval evidence pack with the national rail regulator before first revenue day.

## 10. Revision history

| Date | Version | Change |
|---|---|---|
| 2026-04-24 | v1 | Initial draft. Three-zone layout + energy budget + parametric constraints. |

# RFC 0021 — 800 V-Class LFP Battery and Traction Architecture

Repository source: `docs/rfcs/0021-battery-traction.md`

Status: Current reference architecture Date: 2026-08-14 Depends on: RFC 0008, RFC 0020, RFC 0024, RFC 0026, RFC 0028

## 1. Decision

OpenSourceRail uses one catenary-free, 800 V-class LFP architecture. The promoted three-car train operates at approximately 650–700 V nominal and has:

- 675 kWh gross / 540 kWh routinely usable LFP;
- three independently serviceable 225 kWh gross car packs;
- two contactor-isolated strings per car, subject to the final pack study;
- six heavy-commercial-vehicle PMSMs and six matched controllers;
- 2.1 MW installed short-duration capability with a 1.8 MW control cap;
- direct-HV DC HVAC and isolated 110/48/24 V DC/DC domains;
- one protected roof-PV MPPT per car; and
- no traction transformer, train-wide auxiliary AC bus, or continuous wayside electrification.

Named products are RFQ reference candidates, not sole-source selections or proof of railway suitability. Supplier qualification, railway environmental tests, integration evidence, warranty, spares, and delivered scope remain mandatory.

## 2. Per-car topology

```
roof PV -> MPPT -------------------------+
station contact -> protected DC interface +--> 225 kWh LFP car pack
regenerative braking ---------------------+          |
                                                      +-> controller -> PMSM axle 1
                                                      +-> controller -> PMSM axle 2
                                                      +-> isolated LV DC/DC
                                                      +-> direct-HV DC HVAC
```

Each car protects and reports its own HV source. Train-level software may coordinate power limits but cannot replace local BMS protection or assume that either neighbouring car pack is available.

Required interface values include minimum/nominal/maximum voltage, continuous and pulse current, regeneration overvoltage margin, contactor interrupt rating, precharge energy, insulation thresholds, creepage/clearance, cooling duty, EMC, and 50 °C derating. The provisional normal upper voltage is 740 V until the selected controller and switching transients are qualified together.

## 3. Reference traction candidates

- EVE-class liquid-cooled high-power/railway LFP cells and modules;
- Inovance HM47-class PMSM and LD32-class controller, one controller per motor; and
- Longertek-class direct-HV DC rail HVAC.

Equivalent equipment is acceptable when it satisfies the OSR interface control document and qualification plan.

The gearbox ratio is derived from the selected motor torque-speed map; no historic ratio is inherited. Acceptance covers AW0–AW3 acceleration, grade, wet-rail adhesion, wheel wear, motor/controller overspeed, regenerative braking, one-channel unavailable operation, and repeated-stop thermal duty at 50 °C ambient.

## 4. Station DC architecture

```
PV -> MPPT DC/DC -> station DC bus <-> 500 kWh LFP module(s)
grid AC -> rectifier --------------------^
                                         |
                              500 kW DC/DC --+--> interlocked platform contacts
```

The normal three-car station starts with one 500 kWh gross stationary-LFP module, one 500 kW bidirectional DC/DC cabinet, and two mechanically separate contacts sharing that single cabinet budget. Terminals use the same hardware with longer dwell. At 700 V, 500 kW is about 714 A; at 650 V it is about 769 A. Power, current, efficiency, cable/contact loss, temperature

derating, battery charge acceptance, and simultaneous arrivals are enforced together.

A 60-second charge adds approximately 8 kWh after loss. It is a top-up, not a full recharge. The onboard pack absorbs route-to-route imbalance and terminal or depot dwell restores the daily energy balance.

The reference station power stage is a SINEXCEL PDS1-750K-H-class bidirectional DC/DC converter configured to 500 kW. The station separately provides isolation/earthing, insulation monitoring, cooling, contactors, emergency isolation, and safe contact sequencing.

Four-car high-throughput deployments use three complete 500 kWh storage modules and 500 kW cabinet/contact units; six-car deployments use four. The counts are the lowest standard-module quantities that keep the canonical large-city EOL-battery and maximum-climate simulations within their service floor. Storage power and the grid interface scale with the repeated modules; generated CAPEX carries every module. High-throughput fleet sizing also retains the aggregate onboard reserve demonstrated by the degraded-energy suite rather than shrinking solely because charging dwell becomes shorter. This is replication of one standard module, not a separate 1 MW product tier.

# 5. Battery fire protection

IEC 62928 is a design and test input. Each under-seat module has a fire-resistant enclosure, outward gas vent, temperature monitoring, and off-gas detection. The pack must limit propagation for the required evacuation interval.

Each car has an independent localized cooling system:

```
water reservoir -> monitored DC pump -> stainless distribution pipe
                -> battery-compartment mist nozzles
```

The mist cools adjacent modules and restricts propagation; it does not claim to stop cell-level thermal runaway. Passenger saloons have no automatic sprinklers or CO2 flooding. Controllers, DC/DC equipment, and HVAC electronics use fire-resistant metal enclosures, detection, and electrical isolation.

The staged response is:

1. Validate the event and inhibit charging.
2. Isolate the affected string or car pack according to the proved topology.
3. Restrict traction, alert TCMS/OCC, and request the nearest safe platform.
4. Discharge localized mist around the affected compartment.
5. Apply emergency braking if containment or essential control is lost.
6. Release doors only where the train/platform hazard assessment permits.

Reservoir level, pump current, line pressure, flow, nozzle continuity, sensor disagreement, and isolation state are diagnosable.

# 6. Body and service interfaces

The welded S355 underframe and spaceframe carry bogie, coupler, crash, anti-climber, and longitudinal loads. Composite side, portal, skirt, nose, ceiling, and roof cassettes use:

- 3-2-1 datum location with an asymmetric anti-reversal key;
- standardized captive fasteners;
- a controlled adhesive/sealant groove plus mechanical retention;
- defined bonding points; and
- keyed service connectors.

Composite cassettes may contain empty HVAC ducts, drains, cable raceways, clips, and equipment bosses. Cables, pipes, sensors, fans, filters, evaporators, dampers, and lights remain removable through access covers and are never encapsulated in laminate.

# 7. Procurement targets

Planning targets, pending comparable delivered-scope RFQs:

| Equipment | Target |
|---|---|
| Complete 675 kWh traction-battery system | 65–80 kUSD/train |
| Six motor/controller sets | 48–72 kUSD/train |
| HV distribution/contactors | 8–12 kUSD/train |

| Equipment | Target |
|---|---|
| LV DC/DC equipment | 5–10 kUSD/train |
| Roof-PV MPPT/DC equipment | 2–4 kUSD/train |
| 500 kWh stationary-LFP module, BMS/cooling/enclosure/protection | 35–40 kUSD/site |
| 500 kW DC/DC power stage | 10–20 kUSD/site |
| Contact/protection/control package | 10–15 kUSD/site |

These are affordability gates, not quotations. RFQs separate hardware, qualification, software/interface support, warranty, spares, delivery, and local integration.

# 8. Release gates

The architecture is not released for manufacture until these close:

- cell/string count and voltage/transient margin;
- isolation, earthing, HVIL, precharge, and fault interruption;
- gearing, acceleration, adhesion, grade, overspeed, and thermal duty;
- dwell charging, simultaneous arrivals, charger outage, low-solar days, terminal balancing, and minimum route SOC;
- propagation, vent routing, mist flow/pressure, failed-suppression behavior, detection latency, and evacuation time;
- composite fire/smoke/toxicity, insert pull-out, bond durability, water ingress, module-removal time, and repair method;
- mass, centre of gravity, axle load, crash load path, and FEA; and
- supplier RFQs and qualified-equivalent interface evidence.

# RFC 0022 — Bogie and Traction Drive

Repository source: `docs/rfcs/0022-bogie-traction-drive.md`

Status: Current Depends on: RFC 0008, RFC 0021

## 1. Decision

Each car has one two-axle powered bogie and one two-axle trailer bogie. The powered bogie carries two independent heavy-commercial-vehicle-class PMSM and controller channels. The promoted three-car train therefore has three powered bogies, six powered axles, and six controllers.

## 2. Reference envelope

| Parameter | Reference |
|---|---|
| Gauge | 1,435 mm |
| Wheelbase | 2,100 mm |
| Wheel diameter | 760 mm new / 680 mm worn |
| Candidate motor | Inovance HM47-class or qualified equivalent |
| Candidate controller | Inovance LD32-class or qualified equivalent |
| Candidate short peak | 350 kW per motor |
| Train installed peak | 2.1 MW |
| Initial control cap | 1.8 MW |
| DC operating range | 650–700 V nominal, 740 V provisional upper limit |

The bogie frame, suspension, brake mounts, axlebox, wheelset, and carbody interfaces are common wherever axle load and kinematic-envelope evidence permit.

## 3. Gearbox

No fixed ratio is released. The integrator selects the ratio from the actual motor torque-speed map, new/worn wheel diameters, 90 km/h service speed, overspeed margin, grade, acceleration, adhesion, and thermal duty. Packaging CAD values are explicitly non-authoritative seeds.

## 4. Acceptance

Evidence covers frame static/fatigue load, wheel/axle/bearing qualification, AW0–AW3 acceleration, wet/dry adhesion, wheel-slip protection, braking blend, regen at high SOC, motor/controller thermal soak, one-channel unavailable operation, ride dynamics, noise, ingress, EMC, lubrication, and wheel-lathe access.

# RFC 0023 — Door System Reference Design

Repository source: `docs/rfcs/0023-door-system-reference-design.md`

Status: Current — v2A architecture, certification evidence open Date: 2026-04-26 Depends on: RFC 0008 Rolling-Stock Reference Design, RFC 0015 Driverless Operation, RFC 0007 Control Electronics Reference Designs

## 1. Summary

RFC 0008 §3.3 commits each 16.5 m car to two large double-leaf plug-door cassettes per side: twelve exterior cassettes, twenty-four leaves, and a nominal 1 500 mm clear opening per cassette on the `light-metro-3car` consist. It did not previously specify the door operator — the electromechanical actuator that opens, closes, locks, and senses obstruction. This was a meaningful omission. Door operators are a top-three reliability and operating-cost item on every metro, and the rail-certified vendor market (IFE / Knorr-Bremse, Faiveley / Wabtec, Nabtesco) prices a single operator at $20 k–$40 k per cassette at OECD list — $120 k–$240 k per `light-metro-3car` consist, of which 60–70 % is certification margin re-billed to each operator.

This RFC commits an electric linear-actuator door operator built from commodity industrial silicon, certified once at the project level under EN 14752, and integrated with `osr-door-control`.

## 2. Non-goals

- Not a pneumatic door system. Pneumatic plug doors (the legacy default) require a compressor + air-treatment loop; the rolling-stock design (RFC 0008 §3.2) has already removed pneumatics from the brake system, and adding them back for doors would re-introduce the maintenance line item we eliminated. Electric only.
- Not a sliding-pocket-door design. OSR commits to plug doors per RFC 0008 — this RFC covers the operator, not the door geometry.
- Not a platform-screen-door (PSD) interface spec. PSD coupling protocol stays in `osr-psd`.

## 3. Architecture

| Aspect | Choice | Rationale |
|---|---|---|
| Actuator | 24 V DC brushless linear actuator, 900-1 200 mm stroke, 3-5 kN continuous | Commodity industrial silicon (Thomson PC-series, Festo EPCO, SKF CASM, regional copies). Single-vendor risk avoided by spec'ing to interchangeable form factor. |
| Drive | Cog-belt + slide-rail, no pneumatic | Same architecture as modern electric metro plug doors at the mechanical level; the complexity is in EN 14752 certification, not in the parts. |
| Controller | BLDC servo controller, CAN-FD interface to `osr-door-control`, hardwired closed-and-locked loop to T-ECU/S | Roboteq / RoboClaw class for pilot; in-house RFC 0007-class board for production. Safety output does not depend on CAN alone. |
| Obstruction detection | Light-curtain across opening (Banner / SICK rail-grade) + pinch-current sensing in actuator | Two independent detection paths; either alone halts the close. |
| Lock | Mechanical hook lock at full-close, monitored by independent micro-switch | EN 14752 mandates positive-locked status sense. |
| Emergency egress | Manual unlock handle inside + outside, mechanical override of lock | EN 14752 + UIC 560. |
| Position sense | Linear encoder on actuator + redundant Hall on the lock cam | Dual-channel agreement to `osr-door-control` over CAN-FD. |

## 4. Interface Contract

| Interface | Requirement |
|---|---|
| Structural aperture | Door cassette installs into the side-frame portal defined by `LM3-DOOR-200`; supplier changes may not move primary steel datums |
| Power | 24 V DC control power plus protected motor feed from the car auxiliary cabinet |
| Data | CAN-FD command/status to `osr-door-control`; diagnostic Ethernet optional |
| Safety loop | Independent hardwired closed-and-locked contact per cassette, wired into the train safety chain |
| Drainage | Threshold tray drains outside the saloon; drain path must remain inspectable after interior trim installation |
| Emergency release | Interior release at the doorway and exterior release behind a tamper-evident cover |
| Gap filler | Door-sill flap/skirt permissive is interlocked with door-open command and platform-side selection |

## 5. Certification

EN 14752 (Bodyside doors for rail vehicles) is the governing standard. The certification surface is real but is a one-time engineering item: the project absorbs it once and amortises across every deployment, in contrast to the current commercial-vendor model where every operator re-pays the certification load embedded in the per-door price.

Certification artefacts land under `docs/certification/door-system/`. The release gap is tracked in `docs/certification/release-gap-register.md`.

## 6. Cost model (indicative, 2026, USD OECD-base)

| Component | DIY-path BOM | Vendor reference |
|---|---|---|
| Linear actuator | $400 | (bundled) |
| BLDC servo controller | $250 | (bundled) |
| Slide rail + cog belt + carrier | $300 | (bundled) |
| Light curtain | $400 | (bundled) |
| Lock + position-sense + harness | $400 | (bundled) |
| Integration + harness + commissioning | $250 | (bundled) |
| Per-door total | ~$2 000 | $20 k–$40 k |

`light-metro-3car` consist (12 exterior cassettes): ~$24 k DIY operator BOM vs $240 k–$480 k vendor before certification and qualification overhead. Country-cost multipliers from `lib/templates/country-costs.toml` apply to the labour share downstream.

## 7. Release Checklist

| Gate | Closure artifact |
|---|---|
| Door envelope freeze | Supplier drawing proving the cassette fits `LM3-DOOR-200` without primary steel changes |
| EN 14752 plan | Notified-body or assessor route, test plan, acceptance criteria, and sample count |
| Lock-loop validation | Tests proving a false closed-and-locked status cannot be produced by one sensor fault |
| Obstruction validation | Light-curtain, current-sense, reopen timing, force limit, and degraded-mode tests |
| Emergency release | Interior/exterior release force, tamper evidence, reset procedure, and signage |
| PSD/platform interface | Door-side select, platform-screen-door interlock, gap-filler permissive, and failure states |
| Environmental tests | Heat, dust, rain ingress, washer/cleaning chemical compatibility, and low-temperature grease variant |

## 8. Open questions

1. EN 14752 certification path — UK / EU notified-body engagement vs self-certification by the project consortium.
2. PSD interfacing — does the actuator need to expose a hardline interlock to the platform PSD, or is the CAN-FD bridge through `osr-psd` sufficient?
3. Cold-climate variant — at the ≤ −25 °C end of the rolling-stock envelope (RFC 0008 §3.5), actuator grease and light-curtain fogging are open issues.
4. Recovery path on actuator failure — whether the door reverts to manual-only or whether a redundant secondary actuator is mandated.

## 9. Revision history

| Date | Version | Change |
|---|---|---|
| 2026-04-26 | v0 | Stub. Architecture sketch, BOM model, certification frame. Detailed elaboration pending. |
| 2026-05-20 | v1 | Added interface contract and release checklist. |
| 2026-08-14 | v2 | Aligned the RFC with the promoted 16.5 m car and twelve-cassette trainset layout. |

# RFC 0024 — LFP Thermal Design for High Ambient Temperature

Repository source: `docs/rfcs/0024-battery-thermal-high-ambient.md`

Status: Current Depends on: RFC 0021

## 1. Envelope

The reference train and station equipment must operate in 50 °C ambient and survive the deployment's declared parked/solar-soak condition. Supplier cell, module, controller, converter, HVAC, coolant, and enclosure limits replace generic curves before release.

## 2. Thermal architecture

- Every 225 kWh car pack uses monitored liquid cold plates.
- Each car can isolate its pack and cooling branch.
- Stationary 500 kWh modules use their qualified enclosure cooling system.
- Pumps, fans, valves, pressure, flow, coolant temperature, and leak detection are diagnosable.
- Battery cooling is preserved ahead of comfort HVAC during load shedding.
- Fire-mist water and battery coolant are separate circuits.

## 3. Control rules

Charge and discharge current are derated from measured cell temperature, coolant state, SOC, and supplier limits. Charging is inhibited before any qualified cell-temperature ceiling is crossed. A failed cooling branch cannot be hidden by train-level averaging.

The simulator applies ambient/HVAC energy uplift and converter derating, but does not substitute for cell electrothermal modelling or a climatic-chamber test.

## 4. Evidence

- selected-cell electrothermal model correlated to supplier/lab data;
- repeated acceleration, regen, and 500 kW dwell-charge duty at 50 °C;
- parked solar soak and restart;
- loss of pump, fan, flow, coolant, sensor, and station cooling;
- thermal propagation and outward-vent interaction;
- passenger-surface temperature and saloon heat ingress; and
- cooling energy, mass, service access, and leak containment.

# RFC 0025 — DIY Switch and Point-Machine Production

Repository source: `docs/rfcs/0025-diy-switch-and-point-machine.md`

Status: Draft — extends RFC 0012 §4 Date: 2026-04-26 Depends on: RFC 0012 Switches & Crossings, RFC 0007 Control Electronics Reference Designs

## 1. Summary

RFC 0012 §4 already commits a non-proprietary switch architecture — flexible machined switch blade, cast-manganese frog, electro-mechanical BLDC + planetary-gearbox + crank point machine, 2oo2 detection. What it does not commit is a production path for that architecture in target regions, nor specific commodity SKUs for the actuator. The result in practice: deployments still buy $120 k turnouts from VAE / Vossloh / Schwihag because RFC 0012 is silent on the make-vs-buy decision.

This RFC commits a regional switch-shop bootstrap as the primary production path, with vendor procurement as the alternate for deployments that don't have the volume to justify the shop.

For a 100 km deployment with ~80 switches, the procurement-vs-DIY delta is ~$8–10 M USD, the largest single affordability lever in any OSR civil build.

## 2. Non-goals

- Not a re-spec of RFC 0012 geometry. The three turnout tangents (1:9 / 1:14 / 1:18.5) and the switch architecture remain canonical.
- Not a re-spec of `osr-wayside-points`. The detection, observation, and consensus path stay in `osr-wayside-points`.
- Not a re-spec of the safety case. A DIY switch and a vendor switch carry the same SIL-4 safety case — the SIL-4 logic lives in software (`osr-wayside-points` + `osr-interlocking`), not in the actuator. The mechanical part is below SIL.

## 3. Switch-shop bootstrap (primary path)

### 3.1 Tooling and capex

| Equipment | Spec | New | Used |
|---|---|---|---|
| CNC milling machine | 4 m × 1.5 m × 1 m bed, 3-axis minimum | $200 k | $80 k |
| Plate-cutting (plasma or fibre laser) | 4 m × 8 m bed | $80 k | $30 k |
| Forge press | 200 t hydraulic | $80 k | $35 k |
| Heat-treatment furnace | 2 m × 1 m, 1 200 °C | $60 k | $25 k |
| Welding bay | MAG/MIG to EN 15085 CP-C2 | $30 k | $15 k |
| Inspection table + CMM | 4 m × 2 m granite + portable CMM | $50 k | $25 k |
| Misc tooling, jigs, fixtures | — | $80 k | $30 k |
| Total switch-shop CAPEX | | ~$580 k | ~$240 k |

### 3.2 Output and unit economics

- Production rate: ~2 switches/week steady-state, ~100/year.
- Per-switch BOM (1:9 turnout):
  - Switch blades (machined from rail blank): $1 800
  - Stock rails: $1 200
  - Stretcher bars (forged): $400
  - Frog (cast manganese, sub-contracted to regional foundry): $1 500
  - Check rails: $300
  - Switch sleepers (per RFC 0009): $2 000
  - Point machine assembly (per §4): $2 200
  - Heating + cabinet + harness: $800
  - Total BOM: ~$10 200
- Vendor 1:9 reference: $120 k (matches `lib/templates/switches.toml` `kits.no-9-mainline` `cost_usd`).

- DIY savings per 1:9: ~$110 k.
- 80 switches: ~$8.8 M saved, vs ~$580 k shop CAPEX  ~15 × payback.

### 3.3 Reference designs

Switch-blade and frog geometry are public at AREMA standard or UIC 60E1 equivalent. Drawings circulate in the public domain and cover every tangent in RFC 0012.

## 4. Point machine — commodity actuator

The RFC 0012 §4.2 architecture (BLDC + planetary + crank, 6 kN nominal / 12 kN peak, ≤ 3 s throw) is satisfied by commodity industrial linear actuators with no rail-specific silicon:

| SKU class | Vendor | Stroke | Force | List | Notes |
|---|---|---|---|---|---|
| PC-Series | Thomson Linear | 200 mm | 5–10 kN | $1 800 | IP67, BLDC+planetary, regional distributor everywhere |
| EPCO | Festo | 150–300 mm | 5–8 kN | $2 000 | Same |
| CASM-100 | SKF | 200 mm | 8 kN | $1 600 | Same |
| LinMot P10 | LinMot AG | 240 mm | 5 kN | $2 200 | Direct-drive linear (no gearbox) — alternate |
| Regional copies | Various Chinese / Indian | 200 mm | 5–10 kN | $700 | Need qualification testing — see §6 |

Vendor-branded rail point machines (Siemens M3, Alstom M58 EBI Switch, Schwihag): $25 k–$45 k each.

Per OSR switch: ~$1 800 vs $25 k  $23 k saved per switch on the actuator alone.

## 5. Detection and integration

Unchanged from RFC 0012 §5 and `osr-wayside-points`. The DIY switch reports position over the same 2oo2 channel as a vendor switch; the W-SBC (RFC 0007 §6) sees no difference.

## 6. Qualification and safety

The DIY-switch SIL-4 case is the same as the vendor-switch case because:

- Position sense, locking confirmation, and FPS observation are all in `osr-wayside-points` (already SIL-4 qualified).
- The mechanical interlock is via the front stretcher bar, identical to the vendor architecture.
- The actuator below the lock has no SIL claim — it is "best effort" with the SIL-4 verdict coming from sensed position, not commanded position.

What does need a per-design qualification:

1. Throw force margin — proof test to 12 kN peak with a 1.5 × safety factor (18 kN ultimate).
2. Throw time — measured throw time ≤ 3 s from rest to locked per RFC 0012 §4.2.
3. Endurance — $10^6$ cycles at full force without lock failure (industry standard for points: ~3-month bench test).
4. Environmental — IP67, −25 °C to +55 °C operation.

These are mechanical qualifications, not safety-case qualifications. A regional university mechanical engineering department can run them in 6 months.

## 7. Procurement alternate

For deployments with < 20 switches/year volume, vendor procurement remains the right answer. Alternate suppliers in priority order:

| Supplier | Region | Notes |
|---|---|---|
| Voestalpine VAE | Austria / Brazil / India | reference, premium pricing, MENA distribution |
| Vossloh Cogifer | France / Germany | reference |
| AnaSteel / Texmaco Rail | India | mid-tier, good for South Asia + East Africa |
| CRRC Yangtze | China | volume, ~50 % of European pricing |
| Voestalpine VAE Brasil | Brazil | regional Latin America |

## 8. Open questions

1. Manganese-steel frog foundry — does the project source a regional foundry per deployment, or maintain a small list of qualified foundries?
2. Switch-blade-stock supply — head-hardened 60E1 rail blanks need to come from one of the rail mills in RFC 0009.
3. Whether the actuator qualification (per §6) is a per-deployment activity or a one-time project-level activity.

## 9. Revision history

| Date | Version | Change |
|---|---|---|
| 2026-04-26 | v0 | Stub. Switch-shop CAPEX model, commodity actuator SKUs, DIY-vs-vendor unit economics, qualification frame. |

# RFC 0026 — Automated Conductive Charging Interface

Repository source: `docs/rfcs/0026-charging-connector-reconciliation.md`

Status: Current Depends on: RFC 0010, RFC 0021

## 1. Decision

The standard passenger interface is an automated side conductive contact fed by the 500 kW station DC/DC cabinet. Up to two platform contacts share one cabinet budget. Terminals use identical hardware with longer dwell.

Depot maintenance stalls use a separate low-C plug-in service connector for balancing, diagnostics, and long holds. It is not a passenger-platform power tier and does not define the train DC architecture.

## 2. Electrical interface

| Parameter | Reference |
|---|---|
| Train voltage | 650–700 V nominal |
| Normal cabinet power | 500 kW total |
| Cabinet current ceiling | 825 A |
| Contacts per cabinet | 2, interlocked |
| Planning efficiency | 98% |
| Normal dwell transfer | approximately 8 kWh in 60 seconds |

Four-car high-throughput deployments use three complete storage/cabinet/contact modules and six-car deployments use four. Aggregate power is never represented as a different converter product.

## 3. Sequence

1. Train proves stopped, correctly aligned, braked, and movement-inhibited.
2. Wayside and train exchange identity, voltage, SOC, temperature, and charge limits over the safety-related control link.
3. Protective earth/bond, insulation, HVIL, and contact-clear checks pass.
4. The mechanism closes, weld detection and precharge complete, then the BMS permits current.
5. Either side can abort; current reaches zero before mechanical separation.
6. The mechanism proves stowed before movement authority can be released.

## 4. Mechanical and safety requirements

The interface is touch-safe when open, tolerant of the qualified alignment envelope, protected against water/dust/debris, guarded from passengers, and replaceable without civil reconstruction. Breakaway, welded-contact, unexpected-voltage, comms-loss, train-movement, emergency-stop, and two-train contention cases fail safe.

## 5. Acceptance

FAT and SAT cover voltage/current, insulation, earthing, temperature rise, contact resistance, cycle endurance, alignment, contamination, ingress, emergency isolation, aborted sequences, vehicle movement interlock, simultaneous arrivals, cabinet outage, and rescue/recovery access.

# RFC 0027 — Brownfield Pilot: Existing-Asset Recovery & Workshop Integration

Repository source: `docs/rfcs/0027-brownfield-pilot-asset-recovery.md`

Status: Draft — proposed Date: 2026-04-26 Depends on: RFC 0003 Samawah Context And Pilot Rationale, RFC 0008 Rolling-Stock Reference Design, RFC 0014 Depot Design Standard, RFC 0022 Bogie + Traction Drive, RFC 0025 DIY Switch and Point-Machine

## 1. Summary

Most OSR target countries — Iraq, Sudan, Pakistan, Mozambique, Angola, Venezuela, several CIS states — already own large quantities of dormant Soviet-era / British-era / American-aid-era rolling stock and rail workshops, mostly stored or partially functional. RFC 0003's Samawah context is the worked example: satellite imagery identifies 300–800 wagons stored in the rail yards adjacent to Samawah Train Station, plus a rolling-stock workshop building (historically the target of a 2011 Iranian Waxon Park rehabilitation deal whose outcome is unclear).

Stored fleet + dormant workshop + active mainline through the city could make Samawah a brownfield pilot rather than a greenfield one. This RFC commits a systematic doctrine for converting brownfield assets into OSR-compatible production capacity, and is intended to apply to every deployment that begins with an existing asset stockpile.

The doctrine has three phases:

| Phase | Scope | Duration |
|---|---|---|
| P1 — Asset assessment | Site visit, fleet inventory, workshop tooling audit, bogie/wheelset NDT sample, IRR/national-rail-authority disposition negotiation | 3–6 months |
| P2 — Component recovery | Strip 50–100 wagons for wheelsets, axleboxes, selected brake hardware, fasteners, and couplers; sell scrap steel; train workforce on the strip operation | 6–12 months |
| P3 — First-article OSR trainset | Build fresh OSR powered/trailer bogie frames (RFC 0022 §2.2) + accepted wheelset components recovered in P2, OSR car body (RFC 0008 Track A or B), commission at the rehabilitated workshop. Workshop becomes the regional rolling-stock factory. | 12–24 months |

This RFC does NOT replace any greenfield-spec RFC. It runs in parallel to RFC 0008 / RFC 0014 / RFC 0022. Where a deployment has no brownfield assets, the greenfield path remains the default. Where it has them, this RFC is the contract for converting them.

## 2. Non-goals

- Not a wagon-acquisition policy. The legal framework for buying, leasing, or jointly operating recovered wagons is per-deployment and lives in RFC 0029 (operator-financial model, separate).
- Not a replacement for RFC 0008. OSR rolling stock is still the light-metro / metro families per RFC 0008 §1. Recovered wagons are donor stock — the OSR trainset is built fresh, using recovered components.
- Not a heritage-preservation effort. Wagons that are historically significant should be retained for museum/preservation use; this RFC's scope is the operationally serviceable bulk remainder.

## 3. Why brownfield pilots beat greenfield where assets exist

| Asset class | Greenfield CAPEX | Brownfield CAPEX | Saved |
|---|---|---|---|
| Wheelsets (760 mm forged, refurbished) | $2 800–4 200 / pair (RFC 0022 §10 tier-2 sourcing) | $300–800 / pair (NDT + reprofile) | ~$2 500 / pair × 4 pairs / consist = ~$10 k / consist |
| Bogie machine tools (CNC mill 4 m, jig table, MAG welder bay, plasma cutter) | $400 k–700 k for greenfield switch shop (RFC 0025 §3.1) | $50–200 k for tool refurbishment + commissioning at existing workshop | ~$250–500 k per shop |
| Workshop building (10 000 m² portal-frame industrial shed, pit tracks, traverser foundations, crane gantries) | $5–8 M for greenfield depot (RFC 0014) | $0.5–2 M for rehabilitation of dormant workshop | ~$3–6 M per workshop |
| Rail-grade structural steel (recoverable from non-restorable wagon bodies) | $1 100–1 400 / t (RFC 0009 sourcing) | $150–250 / t scrap-recovery cost | ~$900 / t × ~5 t / wagon × 200 wagons = ~$900 k |
| Coupler / brake hardware (SA-3, vacuum / air-brake fittings) | $5 k–12 k / unit | $200–500 / unit (refurbish or scrap) | Highly site-specific |
| Trained workforce (rail mechanical fitters, welders, machine operators) | 18–24 months training pipeline (RFC 0027 — workforce plan, planned) | Existing workforce continues + cross-trains on OSR-specific kit | Salary-savings + early-deployment time-savings of 1–2 years |

For a brownfield starter pilot (for example 16 trainsets, a single light-metro line, and one main depot), asset recovery saves on the order of $8–15 M in mechanical/civil capital plus 18–24 months of schedule — a meaningful fraction of the RFC 0021 §6

€435 M total CAPEX, and an even larger fraction of the time budget which is usually the binding constraint.

# 4. Phase 1 — Asset assessment (3–6 months)

## 4.1 Required deliverables

| Artefact | Owner | Scope |
|---|---|---|
| Fleet inventory | OSR design team + national rail authority | Wagon-by-wagon list with VIN, year, type (covered / hopper / flatbed / passenger coach), recorded last service date, structural condition (1–5 scale), owning entity, legal disposition status |
| Workshop tooling audit | Mechanical engineering team (local + visiting) | Per-tool register: machine type, capacity envelope, last calibration / operation date, replacement/repair cost, missing components |
| Bogie / wheelset NDT campaign | Independent NDT contractor | Magnetic-particle inspection on a representative ~5 % sample of stored wheelsets; ultrasonic testing on a ~2 % sample of axles. Report flaw severity per EN 13262 class. |
| Civil survey of workshop site | Local civil engineering firm | Foundation condition, water/sewer connections, electrical-supply capacity, road/rail access, contamination assessment |
| Disposition framework | Government-relations lead | Memorandum-of-understanding draft with national rail authority covering ownership, lease terms, joint-venture options, indemnity for legacy environmental liabilities |

## 4.2 Sample budget

Phase 1 typically runs $200 k–500 k depending on stockpile size. Major line items:

| Line item | Sample cost |
|---|---|
| Fleet-inventory team (4 engineers × 4 months on-site) | $80–120 k |
| NDT contractor (sample wheelsets / axles) | $40–80 k |
| Workshop tooling audit + civil survey | $30–60 k |
| MoU legal / negotiation support | $20–60 k |
| Per-diem, travel, equipment hire | $30–80 k |
| Contingency 20 % | $40–80 k |

This is a small fraction of the total project CAPEX and the findings feed directly into Phase 2 / Phase 3 sizing.

# 5. Phase 2 — Component recovery (6–12 months)

## 5.1 Recovery operation

The recovery operation runs at the existing workshop, using the existing workforce. Wagons are pulled into the workshop one at a time, stripped to component level, and the components are sorted into:

- OSR-reusable components (wheelsets, axleboxes, bearings, brake cylinders, coupler bodies, structural-steel sections, hand brakes, electrical contactors, lighting fixtures).
- Resale components (couplers + drawgear in working order go to freight operators in the region; HVAC and water systems if any).
- Scrap stream (steel body sheets, broken castings, weather- damaged wood).

## 5.2 Wheelset recovery — the highest-value stream

Per RFC 0022 §3, OSR uses 760 mm new / 680 mm worn wheelsets. Iraqi Republic Railways (IRR) and most former-Soviet-aligned networks use 920 mm / 1050 mm wheelsets — these are NOT directly OSR-compatible. However, the axleboxes, bearings, springs, and brake gear are reusable, and the axles themselves can be re-machined to OSR diameter if their rough-bar diameter is above the 130 mm minimum.

So the recovery yield is:

- Wheelsets directly usable: ~5–10 % (where rolling stock was already 760 mm, e.g. some passenger-coach trucks)
- Axles re-machinable: ~50–60 % of stored stock
- Axleboxes / bearings / spring sets: ~70–80 % (subject to NDT)
- Brake hardware (cylinders, slack adjusters): ~60–70 %
- Couplers (SA-3 + drawgear): ~70 % directly resaleable to legacy freight operators in the region

Strip rate at a properly tooled workshop is ~1 wagon per crew per shift. With two crews and a single shift, ~10 wagons / week  250 / year. This is sufficient to support a 16-trainset OSR fleet at 4 wheelsets / car × 3 cars / consist × 16 = 192 wheelsets, with the wheelset balance going to the spares pipeline and to subsequent deployments.

### 5.3 Coupler retrofit — the catch

OSR commits to Scharfenberg Type 10 automatic couplers per RFC 0008 §3.1. Recovered wagons use SA-3 (former-Soviet automatic) plus screw/buffer. These are incompatible, so the brownfield path does NOT involve re-coupling recovered wagons into the OSR consist directly. Every OSR car ships with new Scharfenberg couplers; the recovered SA-3 couplers go to the resale stream.

This is correct: a brownfield recovery should NOT compromise the single-coupler-standard discipline that lets any OSR consist rescue any other OSR consist on the network.

## 6. Phase 3 — First-article OSR trainset (12–24 months)

The recovered components feed forward into the standard OSR build process:

| OSR component | Source from recovery |
|---|---|
| Bogie frame (RFC 0022 §2.2) | New, fabricated in the rehabilitated workshop using its CNC + welding capability |
| Wheelset (RFC 0022 §3) | Recovered axle + new (or refurbished 760 mm) wheel forging press-fit at the workshop |
| Axlebox + bearing | Recovered housing only if NDT/metrology pass; bearing replaced or re-certified by supplier, with new gaskets / seals |
| Primary suspension (chevron rubber) | New (RFC 0022 §5.1) — recovered rubber elements are usually weathered |
| Secondary suspension (air-spring) | New (RFC 0022 §5.2) — recovered air-spring assemblies are usually leak-prone after >5 y storage |
| Traction motor (PMSM) | New (RFC 0022 §4.1, sourced from RFC 0022 §10 tier-2 supplier) |
| Inverter (SiC) | New (RFC 0008 §3.2 DIY path or RFC 0022 §4 sourced) |
| Brake disc + caliper | New (per RFC 0022 §6) — recovered cast-iron discs are usually unsuitable for the regenerative-friction blend RFC 0021 expects |
| Body shell (alu-extrusion or steel space-frame) | New (RFC 0008 §3.1 Track A or RFC 0023 §1.1 Track B) — built in the workshop |
| LFP battery and per-car fire-control package | New per RFC 0021 |
| Electronics (DIY safety stack) | New per RFC 0019 |
| Coupler | New Scharfenberg (RFC 0008 §3.1) |
| Lighting / interior | Mix — recovered wiring harness + COTS interior per RFC 0008 §3.3 |

In other words: the brownfield component recovery yields ~30–40 % of the per-consist mechanical mass and ~$30–60 k per consist in saved component cost, but the OSR architecture is preserved verbatim. No SA-3 couplers, no 920 mm wheelsets, no Soviet-era electrical systems on the OSR consist itself.

## 7. Workshop conversion — what stays, what goes

The Samawah workshop is presumed to have:

| Existing capability | OSR fit | Action |
|---|---|---|
| Wheelset turning / re-profiling | Direct fit | Keep + commission to RFC 0022 NDT spec |
| Bogie pit tracks | Direct fit | Keep + extend to OSR bogie wheelbase (2 100 mm — RFC 0022 §3) |
| Overhead bridge crane | Useful but RFC 0014 prefers stinger track | Keep where existing; RFC 0014 stinger-track is a greenfield-only choice |
| Steam + diesel locomotive shed equipment | Not applicable to OSR (battery-electric, RFC 0021) | Decommission or convert to general-purpose mechanical workshop |
| SA-3 coupler tooling | Not applicable | Decommission or repurpose for resale-stream operations |
| Air-brake testing rig | Compatible if convertible to electric brake | Repurpose for OSR EP-brake commissioning (RFC 0008 §3.2) |
| Wagon-frame welding line | Direct fit | Keep + commission to EN 15085 CP-C2 (the lowest rail welding class — fits the existing workforce) |
| Painting + livery shop | Direct fit | Keep + retrain on RFC 0008 §3.5 livery scheme |

The conversion isn't free — typically $0.5–2 M for the rehabilitation itself plus $1–3 M for net-new tooling required for OSR-specific operations (PMSM/controller commissioning, 800 V-class DC test rigs, LFP battery pack assembly). But that's an order of magnitude less than greenfield `main-heavy` depot CAPEX of $12.0 M (RFC 0014).

# 8. Risk register

| Risk | Likelihood | Mitigation |
|---|---|---|
| Phase 1 inventory reveals stored fleet is too degraded to recover | Medium | Phase 1 cost is bounded ($200–500 k); decision-gate at end of Phase 1 — abandon brownfield if NDT pass-rate < 30 % |
| National rail authority refuses to negotiate disposition | Low–medium | Pre-screen via diplomatic + technical-community channels before committing to Phase 1 |
| Workshop legacy environmental liability (asbestos, lead paint, fuel-tank contamination) | Medium | Civil survey in Phase 1 explicitly includes environmental scoping; remediation cost goes into the disposition negotiation, not the project budget |
| Workforce knowledge gap on OSR-specific equipment (SiC inverters, PMSM motors, DIY safety electronics) | High | Cross-training in Phase 2, with project-funded secondment of OSR-experienced engineers from earlier deployments. RFC 0027 (workforce plan, planned) will own this. |
| SA-3 coupler resale market dries up before recovery completes | Low | Resale stream is a bonus, not a critical path. Scrap value remains. |
| Recovered axles fail post-machining NDT | Medium | Build Phase 3 demand schedule against the post-NDT survival rate, not raw recovery numbers. Carry a 30 % buffer. |
| Mid-project change of national-rail-authority leadership delays disposition | Medium–high | MoU should commit ownership at Phase 1 close, before Phase 2 capital is exposed |

# 9. Applicability beyond Samawah

This RFC's Samawah example is illustrative. The same doctrine applies wherever a country has:

- An active mainline running through (or near) a candidate OSR deployment city.
- A dormant rolling-stock stockpile of standard-gauge (1 435 mm) freight / passenger stock — even if the stock is otherwise incompatible with OSR.
- A rail workshop / depot building, even partially functional.
- A national rail authority capable of negotiating disposition.

Cities with documented brownfield potential (preliminary, not verified):

| City | Country | Stockpile rumour / status |
|---|---|---|
| Samawah | Iraq | Confirmed by 2026-04-26 satellite review — 300–800 wagons, workshop building |
| Khartoum | Sudan | Sudan Railways stored fleet at Atbara workshop (Sudan Railways / Sudan Railway Workshops) |
| Karachi | Pakistan | Pakistan Railways Karachi Cantonment yard — large freight stockpile |
| Maputo | Mozambique | CFM stored fleet at Machava |
| Luanda | Angola | CFL stockpile (Caminho de Ferro de Luanda) |
| Tashkent | Uzbekistan | UTY workshops at Tashkent + significant Soviet-era stockpile |

Each of these warrants a city-specific Phase 1 assessment before greenfield-vs-brownfield decision. The decision should default to brownfield where assets are real and recoverable.

# 10. Open questions

1. IRR (Iraqi Republic Railways) disposition framework — ownership of stored stock, lease terms, joint-venture options for the Samawah workshop. Requires direct contact with the Iraqi Ministry of Transport ( ) and IRR / .
2. Waxon Park 2011 deal outcome — did the Iranian rehabilitation agreement complete? What was delivered? Is the equipment intact?
3. Wagon-by-wagon census — currently we have a satellite-image estimate of 300–800 wagons. A real census on the ground is the single highest-value Phase 1 deliverable.
4. Environmental liability assessment at the workshop — historical diesel + steam-loco operations may have left contamination that needs remediation before OSR commissioning.
5. Legal pathway for Iraqi (or other national) rolling-stock transfer to a project-controlled vehicle — sovereign-immunity, competition law, public-procurement compliance.

# 11. Revision history

| Date | Version | Change |
|---|---|---|
| 2026-04-26 | v0 | Stub. Three-phase doctrine (assess / recover / build), Samawah worked example, applicability matrix. Triggered by 2026-04-26 operator review identifying the Samawah rail-yard stockpile + workshop from satellite imagery. |

# RFC 0028 — Construction Quality Assurance System

Repository source: `docs/rfcs/0028-construction-quality-assurance.md`

Status: Draft — proposed Date: 2026-06-12 Depends on: RFC 0008 Rolling-Stock Reference Design, RFC 0009 Track Design Standard, RFC 0010 Station Design Standard, RFC 0011 Civil Infrastructure Design Standard, RFC 0013 Operations Rulebook, RFC 0014 Depot Design Standard, RFC 0015 Driverless Operation, RFC 0021 Battery Traction, RFC 0022 Bogie + Traction Drive, RFC 0023 Door System Reference Design, RFC 0029 Maintenance Schedule System

## 1. Summary

OpenSourceRail commits to an owner-controlled construction QA system for both locally built rolling stock and fixed infrastructure. The system is gate-based: a package cannot move to the next stage until the relevant hold point is released by the owner, owner engineer, or named acceptance board.

The machine-readable gate register is `lib/templates/construction-qa.toml`. Generated city READMEs render the same register so every deployment shows the required evidence before passenger opening.

This is deliberately not a vendor warranty model. OSR assumes local production, local ownership, and local maintenance. The quality system therefore makes the owner the evidence holder from day one.

## 2. Non-goals

- Not a replacement for local law or regulator approval. Local building, railway, labour, fire, and electrical approvals still apply.
- Not a standards rewrite. Welding, civil, electrical, fire, accessibility, and software standards are referenced by the component RFCs and local authority requirements.
- Not a paperwork-only system. A hold point is only released when physical inspection, test evidence, and open-defect disposition agree.
- Not a reason to inflate train CAPEX. Per-train QA/acceptance is a small nominal production cost; fixtures, tooling, calibration systems, and commissioning bays sit in the railway production plant or OPEX.

## 3. Quality Record Structure

Every QA record uses the same minimum fields:

| Field | Requirement |
|---|---|
| Asset id | Trainset, car, bogie, station, span, switch, charger, W-SBC, or package id |
| Drawing/config version | Released drawing, firmware hash, test procedure, template id |
| Inspector | Named person and organisation |
| Result | Pass, pass with minor defects, hold, reject |
| Evidence link | Test sheet, photo, measurement file, certificate, log export |
| Defect id | Required when result is not clean pass |
| Release authority | Named role that accepted the hold point |
| Handover target | Operations, maintenance, safety case, or asset register |

The evidence register in `docs/certification/evidence-register.md` is the safety-case view. The construction QA register is the production view. The two must cross-reference each other but do not duplicate every line item.

## 4. Gate Register

The mandatory gate ids are:

| Gate | Scope | Release condition |
|---|---|---|
| `qa-00-design-freeze` | Whole railway | Drawings, interfaces, hazards, inspection/test plans, and supplier/material registers baselined |
| `qa-10-carbody-structure` | Carbody, underframe, crash structure, coupler pockets | Weld/material traceability, dimensional survey, NDT, coating, and load evidence accepted |
| `qa-11-bogie-wheelset` | Bogies, wheelsets, suspension, brake rigging | Bogie NDT, wheel/axle inspection, bearing certificate, brake static test, and torque logs accepted |
| `qa-12-traction-brake-battery` | Motors, inverters, brake blending, onboard battery, thermal system | Bench and trainset functional tests accepted before dynamic movement |
| `qa-13-passenger-systems` | Doors, HVAC, lighting, interiors, accessibility, passenger information | Door cycles, HVAC performance, PRM check, emergency equipment, and saloon inspection accepted |
| `qa-14-onboard-control` | TCN-E, ATP/ATO, odometry, radios, sensors | Hardware identity, firmware hashes, authentication, simulator replay, and trainline tests accepted |

| Gate | Scope | Release condition |
|---|---|---|
| `qa-15-first-article-trainset` | Complete trainset | Static, dynamic, endurance, braking, charging, evacuation, rescue, and maintainability acceptance complete |
| `qa-20-survey-geotech` | Alignment, ROW, utilities, geotechnical | Survey, utility, borehole/test-pit, drainage/flood, and ROW constraints accepted |
| `qa-21-earthworks-drainage` | Earthworks, subgrade, drainage, fencing | Compaction, material, drainage, culvert, and fence/gate evidence accepted |
| `qa-22-trackform-rail` | Slab track, rail, welds, fasteners, turnouts, crossings | Geometry, weld NDT, fastener torque, turnout detection, and crossing tests accepted |
| `qa-23-structures` | Viaducts, bridges, bearings, expansion joints, parapets, walkways | Concrete/rebar, bearings, joints, drainage, access, and structural inspection accepted |
| `qa-24-stations-depots-plant` | Stations, depots, production plant, public realm | Platform gauge, canopy, fire/life safety, accessibility, depot bay, and tool calibration accepted |
| `qa-25-power-energy` | PV, stationary storage, chargers, grid/PPA tie, earthing | PV string, BESS, charger, relay, earthing, isolation, and islanding tests accepted |
| `qa-26-wayside-comms-safety` | W-SBCs, switches, intrusion sensors, comms, fare/PIS/CCTV | Identity register, coverage, switch proof, sensor calibration, passenger-system, and cyber tests accepted |
| `qa-30-integrated-trial-running` | Whole railway | Trial running, degraded modes, emergency exercise, maintenance handback, and safety release accepted |

# 5. Rolling-Stock QA

Rolling-stock QA is organised by trainset, car, and replaceable module. The owner must be able to trace a defect from service all the way back to the production record that released the affected component.

## 5.1 Carbody and Crash Structure

Required records:

- Material certificates for underframe, side frame, roof, end cowl support, crash-energy components, coupler pocket, and door posts.
- Weld map and welder qualification record.
- Dimensional survey after welding and after bogie marriage.
- NDT sampling plan and results.
- Corrosion protection, paint, and sealant record.
- Static proof or calculation pack for AW3 loading, jacking, lifting, and recovery tow cases.

## 5.2 Bogie, Wheelset, Suspension, and Brake

Required records:

- Bogie frame weld and NDT pack.
- Wheel, axle, bearing, and axlebox certificates.
- Wheel profile and back-to-back measurement.
- Torque records for suspension, brake, axlebox, and motor mounts.
- Brake static and dynamic test records.
- Post-run inspection after the first dynamic movement.

## 5.3 Traction, Battery, and Thermal System

Required records:

- Motor and inverter factory acceptance or bench-test result.
- Insulation resistance and protective bonding result.
- BMS cell map, serial numbers, initial capacity sample, and contactor test.
- Thermal soak result for high-ambient operation.
- Charging interface test with station/depot chargers.
- Brake blending and regenerative-friction transition curves.

## 5.4 Passenger and Accessibility Systems

Required records:

- Door-cycle counter test and obstacle detection.
- HVAC cooling/heating result for the deployment climate preset.
- Emergency lighting, PA, passenger information, CCTV, and call-point test.
- PRM bay, tactile, grab-pole, wheelchair, and boarding-gap checklist.
- Fire-load and interior-material compliance evidence.

## 5.5 Onboard Control and Software

Required records:

- Hardware serial register.
- Firmware hash and signing record.
- Message-authentication configuration.
- TCN-E continuity and latency test.
- Odometry, sensor, and degraded-mode simulation replay.
- Cybersecurity checklist before line testing.

## 5.6 First Article and Batch Release

The first trainset of each local production run must complete:

- Full static acceptance.
- Full dynamic acceptance.
- Braking curves in dry and reduced-adhesion proxy conditions.
- Charging at representative station and depot chargers.
- Rescue/coupling drill.
- Passenger evacuation drill.
- Maintainability demonstration for battery module, door actuator, brake pad, HVAC filter, and W-SBC/onboard computer replacement.
- At least 1,000 km fault-free trial running before series release.

Series trainsets may use a reduced evidence pack only after the first article is accepted and the production process is unchanged.

# 6. Infrastructure QA

Infrastructure QA is organised by physical work package and asset id. Every station, line section, switch, structure, energy site, and systems cabinet must enter the asset register before handover.

## 6.1 Survey, Geotechnical, and ROW

Required records:

- Survey control and alignment setout.
- Utility scan and clash register.
- Borehole or test-pit log by geotechnical zone.
- Flood path, drainage, and culvert basis.
- Cadastral and ROW constraint register.

## 6.2 Earthworks, Drainage, and Fencing

Required records:

- Subgrade and capping-layer compaction tests.
- Material gradation and source record.
- Drainage as-built and flow direction.
- Culvert inspection and cover level.
- Fence, gate, and intrusion-risk punch list.

### 6.3 Trackform, Rail, Turnouts, and Crossings

Required records:

- Slab/plinth pour records.
- Fastener torque logs.
- Weld NDT and rail-stress record.
- Track geometry run before trial service.
- Turnout detection and point-machine proof.
- Level-crossing barrier, warning, and obstacle-detection test where fitted.

### 6.4 Structures

Required records:

- Concrete, reinforcement, precast, and post-tensioning records.
- Bearing installation and survey.
- Expansion-joint record.
- Drainage, parapet, walkway, and access inspection.
- Bridge scour check for water crossings.

### 6.5 Stations, Depots, and Production Plant

Required records:

- Platform gauge and boarding-gap survey.
- Canopy, roof PV, drainage, and fixings inspection.
- Fire/life-safety signoff.
- Accessibility audit.
- Depot pit, stinger, wash, lathe, lifting, and isolation checks.
- Production plant fixture and tool calibration.

### 6.6 Energy, Signalling, Comms, and Passenger Systems

Required records:

- PV string test, BESS commissioning, charger load test, relay settings, earthing, and emergency isolation drill.
- W-SBC identity register and switch proof test.
- Radio coverage and backup-link test.
- Intrusion sensor calibration.
- OCC, passenger information, fare, CCTV, and public-address tests.
- Cybersecurity closeout and firmware baseline.

## 7. Nonconformance Control

Defects are classified:

| Class | Meaning | Rule |
|---|---|---|
| NCR-A | Minor quality note | May be accepted with owner engineer approval and logged for future maintenance |
| NCR-B | Correct-before-next-stage | The package cannot pass its current gate until reworked and re-inspected |
| NCR-C | Safety or configuration blocker | The asset is rejected or isolated until root cause, corrective action, and re-test are complete |

Repeated NCR-B or any NCR-C triggers a production pause for the affected process. The pause is local to the process, not necessarily the whole programme, unless the defect indicates a shared design or supplier failure.

# 8. Trial Running and Opening

Passenger service is not allowed until `qa-30-integrated-trial-running` is released. Minimum evidence:

- Timetable trial running over representative service hours.
- Emergency exercise with local responders.
- Degraded-mode drill for OCC, station staff, and maintenance.
- Possession and handback demonstration.
- Maintenance defect response demonstration.
- Open-defect register showing no safety blockers.
- Safety-case release note referencing the accepted evidence.

# 9. Samawah Application

For Samawah, the QA system applies to:

- 96 locally built 3-car trainsets.
- 58.4 km of generated route.
- 31 unique stations.
- Station/depot charging microgrids and the dedicated solar plant/PPA interface.
- The brownfield yard/workshop conversion if RFC 0027 Phase 1 confirms usable assets.

The first-article trainset and first completed station should be treated as programme learning gates: they set the acceptance standard for the remaining batch.

# RFC 0029 — Maintenance Schedule System

Repository source: `docs/rfcs/0029-maintenance-schedule-system.md`

Status: Draft — proposed Date: 2026-06-12 Depends on: RFC 0008 Rolling-Stock Reference Design, RFC 0009 Track Design Standard, RFC 0010 Station Design Standard, RFC 0011 Civil Infrastructure Design Standard, RFC 0013 Operations Rulebook, RFC 0014 Depot Design Standard, RFC 0016 Wayside Track Intrusion, RFC 0021 Battery Traction, RFC 0028 Construction Quality Assurance System

## 1. Summary

OpenSourceRail commits to a single maintenance schedule system for rolling stock, stations, track/civil works, structures, energy assets, signalling/comms, depots, and the railway production plant.

The system has three layers:

1. Baseline intervals by asset class, stored in `lib/templates/maintenance-schedule.toml`.
2. Condition-based escalation from telemetry, inspections, and defect reports.
3. Work-order closeout that proves the asset is safe to return to service.

Generated city READMEs render the baseline schedule with that city's fleet, station, route-km, and train-km context.

## 2. Non-goals

- Not a CMMS product choice. A deployment may use open-source CMMS, a national operator system, or a simple database during pilot service.
- Not a parts catalogue. Spare parts lists live with the asset and BOM documents.
- Not a replacement for inspections mandated by local law. Local statutory inspections are additive.
- Not a vendor maintenance contract. OSR assumes the owner maintains the railway; outside specialists can support but do not own the maintenance evidence.

## 3. Asset Register

Every maintainable asset must have an id before revenue service:

| Asset class | Minimum id structure |
|---|---|
| Trainset | trainset id, car ids, bogie ids, battery pack ids, major module serials |
| Station | station id, platform ids, canopy/PV id, public systems, emergency equipment |
| Track section | line id, chainage range, civil class, drainage and fence assets |
| Switch/crossing | switch id, point machine id, detection channel ids |
| Structure | span id, pier id, bearing id, expansion joint id |
| Energy site | PV strings, BESS rack ids, charger ids, protection devices |
| Signalling/comms | W-SBC id, radio/cabinet ids, sensor ids, firmware baseline |
| Depot/plant | bay id, pit id, tool/fixture id, lathe/lift/calibration device id |

The construction QA system in RFC 0028 creates the starting asset register. This RFC keeps it alive through operations.

## 4. Work-Order Rule

Every maintenance action produces a work order with:

- Asset id.
- Trigger: calendar, km, cycle count, telemetry, defect, event, or regulatory inspection.
- Task procedure/version.
- Findings and severity.
- Parts used and removed.
- Test/inspection evidence.
- Return-to-service authority.
- Next due date or next due km/cycle.

No asset returns to service after a red defect without a signed return-to-service record.

# 5. Baseline Schedule

The baseline schedule is:

| Group | Cadence | Scope |
|---|---|---|
| Rolling stock | Daily / each depot return | Walk-around, wheel/tread visual, doors, HVAC, coupler face, saloon damage, emergency kit, fault-log download |
| Rolling stock | 7 days | Wheel wear, brake pads, BMS cell spread, harness chafe, roof/PV cleaner, door obstruction sensors |
| Rolling stock | 30 days | BMS deep scan, motor-bearing vibration, inverter thermal log, HVAC filters, PIS/CCTV, firmware inventory |
| Rolling stock | 150,000 km or wear limit | Wheel reprofiling |
| Rolling stock | 600,000 km | Bogie overhaul |
| Rolling stock | 10 years | Body/interior/HVAC/cable overhaul |
| Stations | Daily | Cleaning, lighting, platform edge, PA/PIS/fare equipment, CCTV, emergency equipment |
| Stations | 7 days | Canopy/fixings, drainage, accessibility path, charger cabinet visual, extinguishers, signage |
| Stations | 30 days | Emergency lighting, fire alarm, UPS, lift/escalator where fitted, access control, comms cabinets |
| Stations | 12 months | Structural survey, canopy PV fixings, drainage capacity, accessibility audit, passenger-flow review |
| Track/civil | 7 days | Track walk, fasteners, slab cracking, drainage, fencing, vegetation |
| Track/civil | 60-90 days | Geometry run and trend comparison |
| Switches/crossings | 30 days | Point closure, detection, lubrication, bolts, weld cracks, drive inspection |
| Structures | 12 months | Viaduct/bridge visual inspection, bearings, joints, parapets, walkways, drainage, scour |
| Energy | Daily remote | SCADA alarms, charger availability, SOC/temperature, PV yield anomaly, grid import/export |
| Energy | 30 days | Charger sample load test, BESS thermal inspection, PV soiling, cabinet seals, protection status |
| Energy | 12 months | Relay test, earthing resistance, emergency isolation drill, BESS capacity sample, PV insulation |
| Signalling/comms | Daily remote | OCC/W-SBC health, radio alarms, time sync, authentication failures, CCTV/fare/PIS fault queue |
| Signalling/comms | 30 days | Switch proof test, sensor calibration sample, comms cabinet inspection, backup link, UPS |
| Signalling/comms | 90 days | Firmware inventory, vulnerability review, backup restore, degraded-mode drill, simulator replay |
| Depot/production plant | 30-180 days | Tool calibration, lifting equipment, pits/stingers, wheel lathe, welding fixture survey |

The calendar intervals are the floor. Hot desert, monsoon, flood, coastal corrosion, dust, high ridership, or poor grid quality can only shorten intervals, never lengthen them without owner-engineer approval.

# 6. Condition-Based Escalation

Telemetry and inspection findings override the calendar:

| Condition | Response |
|---|---|
| Green | Continue normal service; next baseline interval applies |
| Amber | Schedule work within 7 days; asset may stay in service if risk assessment permits |
| Red | Hold asset out of service or isolate the affected section until rectified |
| Unknown on safety asset | Treat as red when the asset protects movement authority, intrusion, braking, switching, charging isolation, or emergency response |

Examples:

- Battery cell spread over amber limit schedules a 7-day intervention; red limit holds the trainset.
- Sustained intrusion-sensor `Unknown` holds or restricts the affected section per RFC 0016 and the operations rulebook.
- Track geometry trend that crosses amber schedules possession work; red geometry holds the track section.
- Charger insulation or earthing failure isolates that charger until re-tested.

# 7. Rolling-Stock Maintenance

Rolling-stock maintenance is depot-led:

- `main-heavy` performs daily, weekly, monthly, wheel reprofiling, bogie overhaul, body overhaul, and major component rebuild.
- `secondary-medium` performs daily, weekly, monthly light work and module swaps.
- `layup-minimal` performs visual checks and fault reporting only.

The maintenance reserve in `lib/templates/fleet-sizing.toml` exists so scheduled work can happen without cancelling service.

## 8. Stations and Passenger Assets

Station maintenance covers public safety and revenue equipment:

- Platforms, tactile paving, ramps, edge markings, lighting, signage.
- Canopy, roof PV, drainage, gutters, fixings.
- PA, passenger information, CCTV, fare validators/gates, Wi-Fi where fitted.
- Fire extinguishers, emergency lighting, call points, first-aid kits.
- Lifts/escalators only where the station archetype requires them.

Station staff perform daily observations. Maintenance staff perform the weekly/monthly technical checks. The owner engineer performs or accepts the annual structural/accessibility condition report.

## 9. Track, Civil, and Structures

Maintenance of way covers:

- Track walks and defect classification.
- Geometry measurement and trend comparison.
- Switches and point machines.
- Drainage, culverts, vegetation, and fencing.
- Viaducts, bridges, bearings, expansion joints, parapets, walkways, and bridge scour.

Post-weather inspections are additional to the baseline schedule. Flood, dust storm, heatwave, lightning, collision, derailment, trespass, or reported structure strike triggers event-based inspection before normal speed resumes.

## 10. Energy and Charging

Energy maintenance covers:

- PV strings and cleaning/soiling checks.
- Stationary storage, thermal management, racks, contactors, and BMS.
- Train chargers and charger rails/connectors.
- Protection relays, earthing, isolation, and grid/PPA interface.
- Daily SCADA review for yield, SOC, temperature, charger uptime, and grid import/export anomalies.

Energy defects can affect both service and safety. Charger faults may reduce timetable capacity; earthing, isolation, or BESS thermal faults hold the affected energy site.

## 11. Signalling, Comms, and Software

Systems maintenance covers:

- OCC health, dashboards, logs, backups, and time sync.
- W-SBCs, switches, sensors, cabinets, UPS, and comms links.
- Radio coverage and backup communications.
- CCTV, passenger information, fare systems, and platform systems.
- Firmware inventory, vulnerability review, restore drills, and simulator replay.

Software maintenance is not casual patching. Any firmware or safety software change requires a versioned work order, rollback plan, replay test, and updated configuration baseline.

## 12. Depot and Production Plant

Depot and plant maintenance covers:

- Pit tracks, stinger supply, isolation equipment, wash plant, stores, compressed air, cranes/lifts where fitted.
- Wheel lathe and measuring equipment.
- Welding fixtures, jigs, calibration tools, torque tools, test benches.
- Lifting equipment statutory inspection.
- Production plant fixtures and commissioning bay equipment.

Tool calibration defects can block new train acceptance and heavy maintenance release. The production plant is therefore part of the railway asset base, not a one-off construction convenience.

## 13. Samawah Application

For the current Samawah generated instance, the maintenance system starts with:

- 96 trainsets: 86 peak-revenue, 7 planned spares, and 3 cold reserves; depot turnaround service uses peak-fleet surplus in off-peak windows.
- 31 stations.
- 58.4 route-km.
- 29,515 scheduled train-km/day before depot/deadhead factor.
- 29 station/depot energy sites plus the dedicated solar plant/PPA interface.

The daily service intensity makes train-km and telemetry-based triggers as important as calendar triggers. The battery adequacy warning in the Samawah README should also be tracked as a maintenance-risk item: operating near reserve limits increases charger, battery, and timetable discipline sensitivity.

# RFC 0030 - Manufacturing Schedule System

Repository source: `docs/rfcs/0030-manufacturing-schedule-system.md`

Status: v2 accepted project-twin baseline

## 1. Decision

OpenSourceRail uses one generated manufacturing schedule system for locally built trains and infrastructure. The same city asset register that feeds QA and maintenance also feeds production work packages for:

- trainsets
- waypoints / W-SBC nodes
- track sections
- switches and crossings
- stations
- depots and the railway production plant
- energy sites
- station systems and signalling/comms nodes
- whole-system baseline and trial-running release

The authoritative template is `lib/templates/manufacturing-schedule.toml`. The generated, spreadsheet-friendly city outputs are created by `tools/automation/generate-qa-maintenance-data.py`. They include the schedule, material/BOM control rows, stage QA verification, finite resources, CPM, procurement requirements, schedule of values, cashflow and visualization events.

## 2. Why

The project is an owner-builder system, so manufacturing cannot be treated as a black-box supplier milestone. A city needs a practical schedule that answers:

- what is being built
- which asset id it belongs to
- where the work happens
- which crew roles are accountable
- what staff tasks must be completed
- what materials, inputs, and predecessors are required
- what evidence is needed for QA and commissioning
- which rows should become work orders

The system is deliberately lighter than ERP/MES software. It is designed to be useful on day one in a local railway production plant, depot, station site office, or owner engineer console.

## 3. Data Model

Each generated manufacturing row contains:

| Field | Purpose |
|---|---|
| `manufacturing_uid` | Stable city + asset + package id |
| `asset_id`, `asset_name`, `asset_type`, `line` | Links work to the generated asset register |
| `package_id`, `phase`, `sequence` | Work package and ordering |
| `work_center` | Plant, depot, site, bench, or crew location |
| `duration_days` | Calculated or fixed planning duration |
| `duration_model` | `fixed-days`, `route-metres`, or `single-track-panels` |
| `quantity_basis` | Auditable quantity/resource equation used for the duration |
| `resource_count` | Crews, gantries, rigs or other parallel-resource basis where rate-derived |
| `planned_start_day`, `planned_finish_day` | Project-day schedule window |

| Field | Purpose |
|---|---|
| predecessors, predecessor_uids | Package dependencies and resolved predecessor rows |
| work_order_title, work_order_detail | Text used when opening an Ops Core work order |
| staff_roles, staff_tasks | Crew accountability and task detail |
| bom_refs, material_count, material_status | Controlled material/BOM references and generated kit status |
| materials_or_inputs, deliverables | Human-readable material/input summary and produced output |
| evidence_required | QA, commissioning, or handover proof |
| release_authority | Person/role allowed to release the work |
| qa_gate_hint, qa_uid, verification_uid | Link to the relevant construction QA action and verification row |
| priority, status | Work-order priority and schedule state |

The generator also emits:

| Table | Purpose |
|---|---|
| manufacturing_materials | One controlled material/BOM row per manufacturing package reference, including BOM source, line id/category, description, quantity basis, cost basis, traceability requirement, and receiving evidence. |
| manufacturing_verifications | One QA hold-point row per manufacturing package, linked to the generated QA action by qa_uid, with required result, release authority, evidence, and successor-blocking rule. |

Rolling-stock packages reference the generated BOM files:

- build/bom/rolling_stock_bom.csv
- build/bom/rolling_stock_cots_fitout_bom.csv

Infrastructure packages use controlled project_kit:* references until detailed civil, station, depot, wayside, switch, and energy BOM files are added. They still produce material-control rows and traceability evidence.

# 4. Scheduling Rule

The baseline schedule uses project-day offsets from notice-to-proceed. Those offsets are placeholders until a city baseline is approved; they can be converted to real dates in a spreadsheet or future calendar view.

The accepted dependency graph is scheduled from project day zero into finite lanes for each work centre. Capacity is controlled in the same TOML template. Resource-lane predecessors are made explicit, then a backward pass calculates late dates, total float and critical tasks. Unresolved external decisions are reported as baseline release gates instead of silently receiving zero duration.

The schedule remains a deterministic planning baseline, not a contractor's approved programme. A city must replace planning capacities and calendars with its accepted delivery resources before construction release.

# 5. Work Orders

The Operations Portal has a Manufacturing tab. Any row can be opened as an Ops Core work order with:

- source type manufacturing
- source uid equal to manufacturing_uid
- owner from release_authority
- priority from the package
- asset id and asset type from the asset register
- title from package_id plus work_order_title

Once opened, the work order follows the same lifecycle as maintenance and QA work:

```
open -> assigned -> in_progress -> ready_to_close -> closed
```

It can also be placed on hold, receive evidence records, create defects/NCRs, and appear in the audit trail.

The portal enforces two release rules:

- A manufacturing work order cannot be opened while resolved predecessor manufacturing rows have not been closed with pass evidence.
- A manufacturing work order cannot move to ready_to_close or closed until it has pass evidence and material/BOM references.

# 6. SQLite Storage

Manufacturing work orders are stored in the existing Ops Core SQLite tables. No separate manufacturing database is required.

The server creates the database automatically at:

```
var/ops-core.sqlite3
```

If a browser is used offline or through a static server, local records can later be reconciled into SQLite through the Storage Reconciliation panel.

# 7. Waypoints

The generator now creates `waypoint` assets for route sections. These are the practical W-Node / W-SBC production units used by wayside safety, radio, beacon, intrusion, and section-state functions. They receive:

- manufacturing packages
- QA coverage through `qa-26-wayside-comms-safety`
- maintenance coverage through systems maintenance intervals

Waypoint install packages resolve their track-section predecessor where the generated asset relationship identifies the parent track section.

# 8. Commercial and Actual Records

The generated twin creates planned order candidates, not issued orders. It calculates required-on-site and order-by days, exposes supplier anchors or the local-equivalent rule, carries controlled COTS/RFQ candidate IDs and selection states, and marks rows requiring quotations. The source register and first-article execution pack are hashed twin inputs. City CAPEX becomes schedule-of-values contracts with task-linked milestone cash requirements.

Ops Core stores actual-side purchase orders, deliveries, invoices, payments, progress updates and project revisions separately. This preserves deterministic regeneration while allowing planned-versus-actual comparison. Payroll, stock decrementing, tax/customs calculation, bank integration and approved supplier terms still require the city's real commercial data.

# RFC 0031 — OSR City Studio and Git-Based Design Revisions

Repository source: `docs/rfcs/0031-city-studio-git-revisions.md`

Status: accepted, initial vertical slice implemented · 2026-08-26
Authors: OSR project
Complements: RFC 0018 operator GUIs, RFC 0028 construction QA, RFC 0029 maintenance schedules, RFC 0030 manufacturing schedules

## 1. Decision

OpenSourceRail will provide OSR City Studio, a browser-accessible design and service-planning environment over the existing deterministic generator, GIS sidecars, simulator, engineering toolchain, CAD generators, and operations packages.

Git is the authoritative revision and approval history. The Studio edits small, reviewable project-intent files. It never treats its working database, browser state, or generated build directory as the source of truth.

The generated city design.toml remains a compiler output. Interactive edits are recorded as intent overrides, constraints, geometry locks, and service plans. This prevents the next catalogue regeneration from silently replacing an accepted station movement.

## 2. Goals

- Reproduce a city revision from versioned inputs without hidden GUI state.
- Edit station intent and service levels by line, day type, and time window.
- Preserve stable object ids through manual review and regeneration.
- Preview changes before accepting a candidate.
- Pin source data, tool versions, parameters, and generated artifact hashes.
- Review revisions through ordinary GitHub branches and pull requests.
- Publish approved revisions as signed or protected tags/releases.
- Keep planning changes outside the live safety-critical OCC command path.

## 3. Non-goals of the initial slice

- Reimplement FreeCAD, QGIS, or detailed B-rep editing in the browser.
- Send route grants or other safety-critical commands to a live railway.
- Automatically push branches, open pull requests, or create remote tags with a user's GitHub credentials.
- Commit every pointer movement or autosave.
- Store raw imagery, solver scratch directories, or large simulation traces in ordinary Git history.

## 4. Project package

Each city has a committed package under cities/workspaces/<slug>/:

```
cities/workspaces/<slug>/
├── project.osr.toml
├── sources.lock.json
├── network/
│   └── overrides.toml
├── services/
│   └── service-plan.toml
├── coordination/
│   └── issues.toml
├── demand/
│   └── od-matrix.toml
├── approvals/
│   └── reviews.toml
└── revisions/
    ├── README.md
    └── osr-<content-hash>.json
```

project.osr.toml declares identity, paths, planning assumptions, the default branch, revision policy, and approved tag prefix. Paths are resolved relative to the project package so a checkout remains portable.

sources.lock.json records a SHA-256 for every authoritative generated or external input. Compilation fails validation if the bytes differ. Updating a source is therefore an explicit project change that must update its lock.

network/overrides.toml records stable station ids and one of:

- generated: the generator may replace it;
- preferred: regeneration should penalize movement but may propose it;
- locked: regeneration must preserve the accepted location;
- manual: created by a designer rather than the generator;
- retired: retained in history but excluded from the candidate.

The compiler supports generated, preferred, locked, and retired states for source stations, plus manual and retired states for designer-created stations. Moving a station deterministically warps its affected corridor inside the project regeneration radius, holds accepted locked stations as zero-displacement anchors, recalculates the affected route length and simulator inter-station distances, and preserves unaffected line geometry. The map also supports stable, click-to-create alignment control points. A designer can drag a point, choose its regeneration influence radius, and mark it preferred or locked; the same deterministic corridor and simulator regeneration then applies. Manual station insertion or retirement rebuilds the effective simulator station catalogue and ordered per-line topology as well as the GIS network. A two-endpoint manual-line workflow creates a stable line id, deterministically sampled initial corridor, two terminal platforms, a service plan for every day type, and simulator line/fleet/dispatch records. Local alignment controls can then shape the corridor. Manual lines can use either an explicit direct chord or a deterministic least-cost route over SHA-256-locked demand/buildability planning surfaces; the revision records the method, source IDs, and demand weight.

services/service-plan.toml contains a seven-day calendar mapped to named day types and a plan for every line/day-type pair. Each plan has a service span and contiguous headway windows. The compiler calculates cycle time, indicative peak fleet, capacity per hour per direction, daily service kilometres, and weekly service kilometres.

demand/od-matrix.toml contains source-controlled planning periods and optional origin–destination flows in passengers/hour. Periods refer to service day types and time intervals; flows refer only to active stable station IDs. A content-derived ID preserves flow identity while the passenger rate is edited. The compiler screens each record against the lower scheduled passengers/hour/direction capacity across all service windows overlapping the period and records direct/cross-line status and indicative utilization. This early screen is deliberately not a passenger assignment, ridership forecast, platform-flow model, or interchange/egress analysis.

coordination/issues.toml stores review decisions for deterministic civil BCF topics. Status, assignee, resolution, and reviewer are project intent rather than edits to a generated job artifact. Resolving or closing an issue requires a substantive resolution and reviewer. The compiler validates the issue set, includes it in the project hash and immutable revision snapshot, and reports semantic issue-state changes in revision comparison. A new civil BIM job then emits a new BCF reflecting that revision; earlier BCF files remain immutable evidence.

Designers may seed a new issue from a selected IFC asset. City Studio validates the title, description, and one-to-fifty stable OSR asset IDs and derives a deterministic `custom-<content-hash>` identifier. The civil adapter rejects unknown assets, then derives stable BCF topic and viewpoint UUIDs from that identifier. Re-entering identical content is rejected as a duplicate rather than silently creating parallel issues.

# 5. Revision lifecycle

```
working draft
    | save intent/service files
    ▼
Git-visible working tree
    | compile and validate
    ▼
candidate snapshot in build/
    | materialize revision
    ▼
cities/workspaces/<slug>/revisions/osr-<hash>.json
    | branch + commit + pull request
    ▼
cities/workspaces/<slug>/approvals/reviews.toml
    | append reviewer decision + review reference
    ▼
reviewed merge
    | protected/signed tag
    ▼
approved design baseline
```

Autosaves do not create commits. Materialize revision writes an immutable, content-addressed JSON record only when validation has no errors. It includes:

- project identity and schema version;
- source locks and their observed hashes;
- effective lines and stations;
- complete weekly service plans and fleet/capacity metrics;
- planning periods, OD flows, and conservative scheduled-capacity metrics;
- civil coordination issue status, assignment, resolution, and reviewer;
- semantic station movements;
- validation findings;
- exact project-input SHA-256, compiler version, and embedded compiler/UI source SHA-256;
- content SHA-256;
- parent Git commit.

The content hash excludes wall-clock time and Git branch state. Recompiling the same project bytes produces the same content hash and revision id. The revision record separately pins the Git commit from which the candidate was created.

The Studio suggests a branch and tag; users or CI perform remote GitHub operations. This avoids embedding personal tokens or silently rewriting repository history.

Approval decisions are append-only records referring to an existing immutable revision. Each records approved or changes-requested status, reviewer and role, decision date, rationale, and a pull-request or evidence reference. A stable content-derived `approval-…` id makes identical submissions idempotent. Approval metadata is intentionally excluded from the design content hash: otherwise approving a revision would create a different revision requiring a new approval. The TOML approval history remains Git-reviewed alongside the revision and can survive migration away from GitHub.

## 6. Determinism contract

OSR uses three determinism classes:

1. Byte deterministic: project files, JSON/TOML/GeoJSON/CSV outputs, revision manifests, and schedules.
2. Geometry deterministic: CAD/GIS exports may contain tool metadata or archive timestamps but must be geometrically equivalent within a declared tolerance.
3. Analysis deterministic: numerical solvers must reproduce accepted results within a declared tolerance using pinned inputs and tool versions.

Remote OSM, population, building, terrain, imagery, and survey inputs must be captured or checksum-locked. Running against an unpinned live endpoint is an exploration, not a releasable design revision.

## 7. Architecture

The initial implementation is crates/osr-city-studio:

- a Rust project compiler and validator;
- deterministic source hashing and revision ids;
- semantic station movement detection;
- manual station authoring and simulator-topology regeneration;
- manual line authoring with terminal, service, GIS, and simulator synthesis;
- semantic comparison between materialized revisions and the working candidate;
- weekly service metrics;
- deterministic OD demand intent, validation, scheduled-capacity screening, and semantic flow comparison;
- a local HTTP API;
- an embedded browser UI with an editable, layered local SVG/GIS view whose source catalogue, feature counts and SHA-256 digests are served with the project;
- artifact visibility for current design, GIS, simulation, engineering, operations, and release outputs.

The server binds to localhost by default. It reloads committed project files for each request so external Git changes are visible. Writes are serialized and published atomically.

The longer-term tool adapter boundary is:

```
declared inputs + parameters + tool version
                  |
                  v
            allowlisted adapter
                  |
                  v
artifact + logs + findings + content hashes
```

The first implemented adapters compile the candidate GIS package, run a fixed one-hour `osr-sim` day-type scenario, and export a selected line through `osr-alignment-export` to LandXML, railML, review JSON, and stakeout CSV. They serialize through one job slot, persist records and full logs, expose progress and bounded log tails, and hash every output. Adapter names, binaries, and arguments are selected by Rust code; the browser cannot supply an executable or unrestricted shell text. Future adapters may wrap osr-design, osr-scenario, GDAL/QGIS, FreeCAD/IFC, SUMO, pandapower/pvlib, finance, and operations generation under the same boundary.

Successful jobs copy their review evidence into the job-specific directory so later candidate compilations cannot overwrite the recorded files. The browser artifact endpoint canonicalizes the selected record path beneath the City Studio build root, limits preview size, accepts only known JSON/XML/CSV/text formats, and verifies the recorded SHA-256 before returning content. The GUI plots GeoJSON, local alignment points, LandXML geometry, and stakeout data and summarizes railML and simulator evidence. For civil review it joins the verified object index and 4D sequence to provide deterministic envelope rotation, native IFC presentation-layer visibility, construction-stage playback, task/QA context, and stable BCF object picking. These previews are not an authoritative CAD or safety-assurance tool; native IFC detail remains in Bonsai.

# 8. GitHub review policy

An approved city revision should use:

- protected default branches;
- pull requests rather than direct pushes;
- required City Studio validation;
- engineering and operator review appropriate to the changed objects;
- immutable release tags;
- signed tags where the deployment governance supports them;
- an in-repository approval record for decisions that must survive migration away from GitHub.

Text, compact geometry, summaries, manifests, and approval records belong in Git. Large FreeCAD/Blender/IFC packages, imagery, rasters, videos, and raw solver output belong in Git LFS, GitHub Releases, or deployment-controlled artifact storage. Their hashes and generating inputs remain in the revision.

Geo and service files use stable ids, sorted records, and canonical serialization. The Studio will add object-aware merge conflict reporting before concurrent multi-user editing is promoted.

# 9. Safety boundary

City Studio produces planning candidates and approved configuration packages. It cannot issue a movement authority, route grant, maintenance override, or degraded-mode command.

The OCC may consume an approved, signed baseline. Live actions remain governed by RFC 0013, RFC 0017, RFC 0018, deployment roles, and the deployment safety case. Sharing a map renderer or object id does not merge those authorities.

# 10. Implemented acceptance fixture

The Samawah project is the first committed acceptance fixture. It:

- pins the current design, corridor, and simulator scenario;
- locks all three platforms in the accepted CBD interchange;
- defines weekday, Friday, and weekend service for all three lines;
- produces nine line/day-type service metric records;
- exposes 21 station platforms in the Studio map;

- regenerates affected GIS corridor geometry and simulator distances after a station movement while preserving locked station anchors;
- supports direct line edits through stable alignment control points with editable influence radii;
- creates, moves, renames, classifies, and retires manual stations while regenerating GIS and simulator topology;
- creates and retires complete manual lines, including terminal platforms, weekly services, fleet sizing, dispatch points, and candidate geometry;
- creates manual lines through either source-locked demand/buildability least-cost search or an explicitly identified direct planning chord;
- records routing method, demand weight, and every raster/provenance source id on the line and in candidate GIS output;
- compares old revision records with the working candidate using engineering tolerances for serialized floating-point values;
- persists civil coordination decisions as Git-reviewable intent, rejects unsupported or unevidenced closures, and carries accepted state into a newly generated BCF without mutating prior job evidence;
- creates deterministic custom BCF topics from selected IFC assets and rejects duplicate content, invalid asset IDs, and dangling selections;
- loads the hash-verified civil 4D sequence with discipline filters, rotation, task-stage playback, and stable object selection;
- appends deterministic approval decisions only for existing immutable revisions and proves that approval does not alter the design hash;
- emits separate weekday, Friday, and weekend simulator scenarios plus a SHA-256 artifact manifest;
- runs allowlisted field-evidence, GIS, simulator, and LandXML/railML alignment jobs with persistent status, captured logs, and SHA-256 output records;
- retains immutable per-job artifact copies and rejects altered evidence before browser preview;
- compiles without validation errors;
- produces an identical content hash across repeated compilations.

The next acceptance increment is native IFC geometry streaming plus demand/OD and interchange-capacity inputs.

# RFC 0032 — Train-centred control prototype (superseded)

Repository source: `docs/rfcs/0032-train-centred-control.md`

Status: superseded by RFC 0033.

The original prototype introduced a separate `osr-tacs` movement-authority and protection implementation. It is retired in favour of resource contracts in `osr-core`, committed lifecycle handling in `osr-interlocking`, and thin `osr-runtime` process hosts around the existing consensus/MA/ATP/ATO/brake path. The previous synchronous twin results are replaced by actual process-reference execution. Bounded resource-model evidence remains explicitly limited to its physical-proving assumptions. No hardware or operating release is claimed.

# RFC 0033 — TACS runtime and committed resource control

Repository source: `docs/rfcs/0033-tacs-runtime-and-resource-control.md`

Status: proposed development target; software evidence generated/unreviewed. Supersedes: RFC 0032's separate authority/protection implementation. Deployment: synthetic reference only; sectional-authority pilot retained.

## Responsibility and interface map

| Function | Decision owner | Physical or deployment boundary |
|---|---|---|
| Shared railway identities/configuration | `osr-core::deployment` | Exact model-byte hash; frozen startup parameters; designed revision distinct from installed and approved records |
| Authoritative resource lifecycle | `osr-interlocking::resources`, `resource_log`, `DerivedState` | Only verified committed `ResourceControl` entries mutate ownership |
| Ordered authoritative decisions | Existing `osr-consensus::step` | Three static voters; independent power/network placement must be designed and assessed |
| Physical proving | Identified point/station I/O hosts | Asset-scoped occupancy, integrity, points, restrictions and qualified no-reentry proof; synthetic ports in the reference |
| Onboard movement authority | Existing `compute_self_ma_from_state` | Validated committed view, exact frozen model, bounded full train footprint and evidence age |
| Speed and emergency protection | Existing `osr-atp::atp_evaluate` | Grade-adjusted illustrative braking profile; measured braking/adhesion/latency remains open |
| Mission and station requests | Existing `osr-ato::ato_evaluate`, `station_step` | Doors, charger isolation, connector clearance and energy independently gate departure |
| Final brake request | Existing `osr-brake::brake_evaluate` | Application request to separately qualified safety-output channel; software host is not qualified output hardware |
| Authentication and message contracts | `osr-proto`, `osr-crypto`, `osr-secbus`, consensus proposal verifier | Registered issuer, asset permissions, configuration/session/sequence/time checks before state effects |
| Process execution and persistence | Thin `osr-runtime` hosts | Framed local ports, event scheduling, disk writes before outbound effects, conservative cold start |
| OCC | Service intentions and observations | No authority, ownership release or latch-clear bypass |
| ERPNext/FUXA | Existing observation/maintenance integrations | Observation only; no new railway command interface |

There is one MA implementation and one ATP implementation, executed in each logical protection channel. Resource contracts from the earlier prototype move into existing crates; `osr-tacs` and its parallel MA/protection algorithms are retired. `osr-runtime` contains orchestration and adapters. Route selection remains intent, per `osr-onboard-routing`; agreement cannot supersede missing permission or physical proving. Logical peer observations may traverse common infrastructure; no direct radio or `osr-t2t` crate is added.

## Configuration and communications

`railway-model.json` schema `osr-tacs-railway/2` supplies resource IDs, existing section IDs, conflicts, extents, asset identities, train/session/formation parameters, station locations, static voters and role-scoped public keys. `deployment.json` is an exact-byte-hash-bound generated startup export. `FrozenRailway` rejects unsupported versions, invalid topology/identities, changed startup parameters and operational activation. This source is a designed synthetic configuration; `installed_state=not-installed` and `approved_operating_profile=prototype-unapproved` are separate explicit facts. Changes require a new bundle and restart, never live digital-twin mutation.

The reference transport uses signed `osr-runtime/1` packets, postcard encoding, existing signed consensus proposals and explicit internal interlocking entries. Legacy protobuf/postcard `osr-proto::Entry` remains a separate versioned format; it must not be deserialised directly into internal entries. Float-based legacy position inputs require checked unit conversion at an explicitly selected adapter. The runtime path publishes integer measured speed and bounded, non-zero uncertainty. Unsupported/malformed packets fail closed.

The envelope binds configuration hash, registered session, monotonic sequence, original observation time and message kind. Limits: 512 KiB application payload, 768 KiB signed payload, 4 MiB framed command, 16 publications per batch, 12,000 log entries and a 256-message reference queue. One-second input freshness and 100 ms maximum configured clock error are prototype assumptions; PTP and hardware timing must establish their operational applicability. Future-dated packets are rejected. Send/receive counters persist across restart. Asset permissions are separate from signature validity. All load-bearing events, including positions, use `Safety`. The legacy simulator consensus publisher also classifies occupancy-changing position reports as `Safety` and retains its last committed view when quorum confirmation is unavailable. No advisory route/position can unlock track.

The published deterministic reference keys are test fixtures. Operational provisioning, protected key storage, rotation, revocation distribution, offline replacement and recommissioning require a controlled maintenance pack. Changing keys or sessions changes the configuration hash; interoperability stops until the complete bundle is reconciled. Revoked participants

are rejected. Crash-fault Raft is assumed: a signed member's committed-prefix assertion is not a Byzantine quorum certificate. Authenticated erroneous sensors and common software, configuration, power and clock causes remain FMEA concerns.

## Ownership and evidence freshness

Unknown qualified clear available reserve/prove/lock occupy explicit withdrawal qualified no-reentry/clearance available. Identified occupied startup admission can bind the proved train/session when no conflicting owner exists; it cannot transfer another owner's lock. Leases time out to `ReleasePending`, retaining their owner. Restart increments the committed controller epoch, retains owners as unknown and quarantines empty clearance for the maximum prior permission plus clock error. Identified retained owners can be reconciled without transferring protection. Blocked possessions cannot be cleared by these recovery APIs.

An empty detector does not prove cancellation safe. Qualified release requires bounded full rear clearance with integrity, or committed withdrawal and a proved stop/protected approach that prevents old-permission re-entry. These are physical interface assumptions to validate. Platform resources remain owned at arrival. Depot/work resource is explicitly protected; rescue, coupled formations, turnbacks, arbitrary topology and large fleets remain separate packages.

MA expiry is the minimum of the new MA window and the original position, local proof and held permission deadlines. Recalculation cannot refresh evidence. Every traversed section must have the correct active owner/configuration/epoch, current point proof and integrity. Local full-footprint uncertainty checking adds a restrictive gate before ATP. Recovery requires stopped, valid local facts and a privileged local procedure, never a dashboard acknowledgement. Civil conditions enter through asset-scoped signed restrictions/closures; urgent protection must have an engineered path independent of alarm viewing. Removal requires qualified inspection/handback, not an ERP status change.

## Persistence and process reference

`osr-consensus::disk::DiskJournal` has one OS-locked writer. Frames carry node, configuration, term, vote, complete log deltas, commit index, application state and replay fences, with length and CRC bounds. Every host persists and fsyncs file and directory before exposing messages or actuator requests. Torn/corrupt journals inhibit startup; repair never silently discards an accepted lock. Storage compaction atomically replaces a full-log checkpoint after fsync. Logical Raft snapshotting/log truncation is not implemented. Capacity exhaustion inhibits further publication; offline servicing requires retained-protection and configuration reconciliation. A power interruption during rename/fsync requires storage/hardware qualification; SIGKILL tests are software evidence.

The default Raft batch remains one entry. The reference host uses bounded contiguous batches of twelve; Rust handles each entry under the same checked prefix semantics. This is outside the one-entry formal refinement and needs independent refinement review. Quorum confirmation records fresh per-peer responses in the current term, including empty-log heartbeats; stale historical replication indices cannot refresh a quorum. Durable reboot restores no leader role, quorum confirmation or volatile acknowledgements.

Run `python3 tools/automation/tacs_reference.py --output /tmp/reference.json`. The coordinator spawns four `osr-train-agent` processes (A/B for each train) and six `osr-wayside-agent` processes: three voters, point I/O and west/east station I/O. Charger requests and local proving pass through the station process ports; their asset-scoped interlocks can inhibit power and cannot grant movement. The depot/work resource is committed blocked and remains blocked across expiry and controller restart. Two further `osr-safety-output` processes each host the paired `osr-brake::dual::DualGuard` comparator. Both channels must agree to permit; either emergency, missing/stale/replayed request, disagreement or unhealthy feedback latches an emergency output with zero torque. The reference feeds at 50 ms, before the 100 ms output deadline. A late feed cannot replace an overdue request to hide a missed interval; only stopped, privileged, fresh recovery can clear the latch. The deterministic twin explicitly selects `--clock virtual`. The default output host now has an independent monotonic-clock sampling thread, bounded input parsing and timestamped output snapshots. Idle/partial input and blocked consumption cannot suspend that sampler. Source issue timestamps and process-clock epochs remain distinct from receipt time. Native process and expiry tests are software evidence; independent physical timers, scheduling bounds, source authentication and de-energised hardware outputs remain unqualified. See the runtime contract. Processes exchange signatures through asynchronous bounded queues; publication does not wait for commitment. Simulation truth enters only own-train sensors and local infrastructure proving ports, never the MA state. Real journals and process kill/restart are used. The same frozen bundle feeds every process. The physics fixture checks its supported extents, conflict identities, formation/braking and berth/energy parameters before startup; unsupported bundles require a new calibrated fixture. `osr-sim`'s legacy synchronous cluster publisher remains isolated from this reference; it is not claimed as the deployed asynchronous path. Full integration of its scenarios/physics, shared clocks, radio/T2G/TCN failover and direct-peer performance is future work.

Station sequence is stop/secure exchange/charge isolate physical departure proof ready. The reference measures synthetic energy and closed-loop speed; per-car BMS/thermal/door/PSD/traction integrations remain pending HIL. Failed

charging can hold service without erasing track ownership. Emergency departure cannot bypass a connected charger or unlocked door. Missing application output must trip a separately qualified deadline/output channel; the isolated reference output ports model deadlines and latches but do not qualify that hardware function.

## Default redundant protection and platform review follow-up

The executable policy sets two logical channels, two-out-of-two permission and either-channel trip as the development default for train protection, point proving/locking, crossings, doors/platforms, charging isolation and obstacle protection. Loss of either channel stops the affected function. Automatic single-channel operation or takeover is excluded. Availability after a channel failure requires a separately assessed architecture. Three Raft voters replicate authoritative state; they are not protection outputs. The conservative deployable pilot profile and its release gates remain in force.

Each train A/B host uses a separate OS process, journal and restored committed view. The binary requires `--safety-channel A|B`; a persisted journal cannot change channel on restart. A publishes the train's network proposals; B evaluates the same committed domain inputs without publishing duplicate proposals. Loss of A does not authorise B takeover. Pair comparison uses exact synthetic cycle sequence/time, brake and torque agreement. It has no end-to-end source-issued output identity yet. Shared software, sensor fixture, host, test keys, coordinator clock and comparator are explicit common causes. Physical power/output separation, channel-local clocks and independent feedback must be engineered and qualified. Only train protection's logical pair is executed; the policy explicitly keeps all five other local pairs open. Two processes are not installed board quantities.

The 2 October 2026 review of `17b31f055c9e16b5439c18b4a4d83f004890bcad` identified a stale FMEA applicability check and a concealed deadline gap. This change rejects stale failure subjects as well as stale configuration baselines, retains the late-feed regression and adds missing-A, missing-B, disagreement, replay and feedback-failure process cases. Each new case must first permit motion, actually inject its fault, trip within one 50 ms reference step, stop with retained protection and remain latched. These are virtual-time software criteria, not measured hardware response times. The existing TLC abstraction covers resource ownership only; it does not prove the new paired output function.

Next work closes named integration gaps in this order. Owners and reviewers are roles to appoint; acceptance is still open.

| Work | Owner / independent reviewer | Required exit evidence |
|---|---|---|
| Autonomous watchdog and output paths | Embedded/electronics / safety-I/O reviewer | Coordinator/application/comparator freeze and kill, delayed scheduling, clock rollback/skew, power loss and stuck feedback; measured traction inhibition and effective braking without a new application command |
| Sensors and emergency union | Train integration / protection reviewer | Typed adapters to existing localisation, fire, derailment, obstacle and BMS/thermal evaluators; wheel slip/bias and simultaneous resource faults independently reach the final output; shared bad sensors do not establish independence |
| Repeated station missions | ATO/station integration / operations reviewer | Explicit mission/stop identity and arrival/departure transitions; at least three stops, short charge, delayed doors, turnback/resume, per-car charging and no moving door release |
| Remaining local protection pairs | Wayside/station / safety-I/O reviewer | Point/crossing proving, door/PSD, charger isolation and obstacle channels; independent release and inspected handback |
| Calibrated plant and city conversion | Simulation/configuration / braking and site reviewers | Sealed city revision converted to supported resources and shared `osr-sim` plant with mass/load, adhesion, gradients, build-up/delay, thermal/energy limits; full LM3 stopping envelope under uncertainty sweeps |
| Duty, recovery and storage | Simulation/runtime / operations and storage reviewers | Representative city's station capacity, overnight storage, morning dispatch, charging outage/recovery; separate rescue/tow/split/reverse/handover missions and sustained duty without capacity exhaustion or unbounded restart; safe snapshots/replay fences retain locks |
| Formal and scenario evidence | Assurance / independent formal reviewer | Property-to-code/test mapping, overlapping multi-resource routes, sequences/epochs/crash points, counterexample replay and specific hazard activation/deadline/excursion/queue/CPU/storage/recovery metrics |
| Integration and lifecycle quantities | Platform/hardware / configuration and cost reviewers | Observation-only A/B health/discrepancy/feedback/age/degraded/revision data through supervision gateway to FUXA/ERP; no acknowledgement resets; actual serial/power/firmware/calibration/replacement records and matched-service redundancy/spares/training/assessment costs |
| Physical release | Hardware/operations / independent assessor | HIL, measured braking/integrity/radio, power interruption, closed-track recovery and maintenance drills before profile approval |

`station_step(Ready, fresh berthed/secured arrival)` currently remains Ready; the host targets the final stop. Nominal arrival therefore does not demonstrate another passenger exchange or a multi-station mission. The bounded two-train fixture retains geometry checks; expanding it cannot substitute for calibrated city conversion. Civil closures must bind precise operational resources and inspected handback separately from ERP repair completion. No duplicated ERP/GUI or

comfort software is implied by protection redundancy. Commodity hosts, the existing small Rust evaluators, reusable local controllers and open replacement/ calibration procedures remain the implementation approach. Hardware quantities and hot-standby/two-MCU mappings must be reconciled at the hardware freeze.

## Evidence and staged delivery

The shared connected-engineering compiler carries part subassembly controller function train/infrastructure hazard control evidence operating response. Source changes stale execution hashes and propagate through configuration-bound claims and blocked release decisions. TLC checks a bounded resource abstraction with qualified physical proving assumptions; it is neither a Rust refinement proof nor an unbounded liveness result. G0–G4 decisions remain blocked pending review and measurements.

Owners/reviewers below are accountable roles to appoint, not fabricated named approvals. No package is accepted merely because a generated checkbox is true.

| Package | Technical owner | Independent reviewer | Exit evidence / dependency |
|---|---|---|---|
| 1 Architecture | Control architect | Independent railway safety engineer | Reviewed responsibility map; current baseline |
| 2 Shared configuration | Configuration/lifecycle engineer | Independent configuration auditor | Identity/schema/mixed-version tests; 1 |
| 3 Resource/durability | Interlocking/consensus engineer | Independent formal/storage reviewer | Lifecycle, crash and restart evidence; 2 |
| 4 Authority/protection | ATP/localisation engineer | Independent braking engineer | Freshness/uncertainty/integrity properties; 2–3 |
| 5 Communications | Communications/security engineer | Independent security/timing reviewer | Replay/loss/restart/vendor-neutral transport tests; 2 |
| 6 Runtime | Embedded runtime engineer | Independent safety-I/O reviewer | Multi-process reference and physical power-loss tests; 3–5 |
| 7 Station | Station/energy integration engineer | Independent doors/charging reviewer | Complete station-cycle and per-car tests; 4–6 |
| 8 Twin/campaign | Simulation engineer | Independent test engineer | Reproducible raw results; starts after 2 |
| 9 FMEA/GSN | Assurance engineer | Independent hazard reviewer | Connected change impact and applicability; continuous from 1 |
| 10 HIL/hardware | Electronics integration engineer | Independent hardware assessor | Measured output/timing/fault records; 6–9 |
| 11 Closed track | Test/operations engineer | Independent field safety reviewer | Braking, integrity, recovery drills; 10 |
| 12 Profile release | Railway release authority | Independent assessor | Named gates, rollback and approved installed bundle; 9–11 |

Hardware preparation proceeds with software and assurance using existing `t-ecu-s`, `t-ecu-a`, `t-obs`, `w-sbc`, `s-sbc` families. Each pack needs exact module/SKU/substitutes, wiring/connectors/enclosure, power/thermal/environmental budgets, fail-safe outputs/watchdogs, calibration, controlled firmware, fixtures, bench records, and complete-unit replacement/recommissioning instructions. Existing COTS and custom-board release tracks both remain valid; safety-channel selection follows `control-electronics/safety-controller-selection.md`. This change supplies no invented SKUs, installed serials or physical test records.

Cost comparison uses equivalent service and availability, separately counting train controllers, static voters, non-voting sites, radios/antennas/power, retained detection, installation, spares/calibration/maintenance, integration, assessment, recovery/disruption and local/import content. No equipment removal or city-model savings is authorised without replacement function and evidence. The reference's ten processes are software roles, not a bill of materials. Cost quantities/prices remain deployment-specific inputs; an unknown input must keep the comparison incomplete. Track duplicate safety implementations, configuration variants, core dependencies and physical interfaces alongside money.

# RFC 0034 — Connected station, production and battery model

Repository source: `docs/rfcs/0034-connected-station-production-and-battery-model.md`

Status: proposed planning design; 2026-10-06. The draft mentioned against `5f5d9fd` was not present in this checkout; this RFC reconciles the requested position with the current source rather than assuming that an unpublished text is authoritative. No vendor quotation, structural release, railway approval, construction contract or funding commitment is created.

The shared model joins station topology, civil quantities, supplier and logistics contracts, shift scheduling, scope reconciliation, battery profiles and construction fleet/crew contracts. Baghdad is a generated application of these shared contracts, not a separate set of design rules.

Related decisions: RFC 0010 stations, 0011 civil, 0021 battery traction, 0024 thermal, 0026 charging, 0028 construction QA, 0029 maintenance, 0030 manufacturing, and 0002 energy sizing.

## Shared decisions

| Subject | Proposed position | Release boundary |
|---|---|---|
| Ordinary elevated station | One central island, two boarding faces and two tracks | Site exceptions require a recorded reason; accessibility, fire, passenger-flow and structure qualification |
| Running spans | Existing single-track OSR-Pi20/Pi25 family | Prestressing and all permanent/construction stages require structural release |
| Erection | Whole-beam launcher on constrained continuous fronts; mobile cranes where access is advantageous | Separate equipment, lifting and closures approval |
| Segmental | Separate geometry/transport option | Match-casting, temporary suspension, joints, stressing and tendon protection; separate gantry and productivity |
| Baghdad | 18 launchers, two separate crews/shifts per day | User-selected sensitivity; independent access and ready supports required |
| Precast supply | Existing qualified Iraqi factories plus necessary tooling/bed upgrades | Current contracted capacity, delivery and acceptance evidence; candidate capability grants no capacity |
| Batteries | LFP reference plus separate stationary/onboard sodium-ion study profiles | Cell/pack, electrical, thermal, life, software calibration and charging qualification |
| Equipment reuse | Individually identified transferable construction fleet | Compatibility, availability, shipping and recommissioning checks in each city |

Every new input carries units, source, date, confidence and qualification. User-selected scenarios, calculated quantities, documented historical capability and supplier quotations are different evidence kinds. Stable input-content revisions and file hashes identify generated packages, including modified working-tree inputs, without depending on their containing commit. Unknown installed prices, reaction designs or spare capacities remain unknown; zero is reserved for a measured/declared absence.

## Station and civil contract

Elevation is independent of archetype. `major` is a physical island, not two side platforms. Each platform, face, track direction, boarding datum and door/PSD side comes from one layout. Stacked interchanges have individual platform levels and explicit concourse transfer connections. CAD, IFC, assembly datums and the EBOM consume this contract. A physical platform count never substitutes for boarding faces or train berths.

The initial elevated island study has two lifts, two escalators, two lift shafts and two separated stair routes. It is not an approved universal minimum. Equipment has stable identities, served levels, envelopes, entrances and concourse connections. The layout rejects overlapping equipment and insufficient clear widths. Bidirectional flow, one-lift-unavailable operation, independent evacuation, assisted rescue, road barriers and additional street equipment remain separate assessments. Additional equipment/entrances can be supplied by site configuration.

Access CAPEX uses installed item quantities and associated works; energy, annual maintenance and replacement have separate outputs. Net island savings deduct wider deck, changed supports and spreading approaches. Unknown structural costs prevent a net saving claim.

Station decks, widened pier caps and foundations never inherit running-viaduct width. Approach offsets use a quintic transition and a curvature screen, followed by alignment/cant/gradient qualification. Construction requires wider launcher support and clearance checks, delivery access, released supports and an erection sequence. Changed entrances have geographic coordinates and trigger a coverage review; existing centroid coverage cannot be certified for newly proposed entrances.

# Manufacturing, suppliers and erection

Pi-beam specifications record concrete, steel, prestressing and inserts; manufactured study mass and centre of gravity; lifting/storage/transport positions; strength gates; bearing/restraint interfaces; tolerances; and acceptance records. The 60/75-tonne figures are bare sections. Study suspended load includes local diaphragms, reinforcement, prestressing, embedded items and lifting gear. Equipment approval fails until the arrangement and strength/tolerance records are released. Launcher support reactions, asymmetric placement torsion and delivery-vehicle deck loads have separate construction-stage screening outputs.

The capacity register records products, prestressing capability, beds, moulds, handling dimensions/mass, demonstrated cycles, total versus contracted output, commitments, storage/dispatch, prices, terms, qualification and upgrades. Iraq already has many precast facilities and production expertise; this is the user-provided sourcing basis. No named facility or unverified spare capacity is adopted. Each factory must enter the shared register with product-specific evidence and contracted capacity before it can supply the programme. Slabs, walkways, ducts and suitable pier parts can be allocated separately; aggregate allocations cannot exceed a product's contracted capacity.

The shared chronological supply chain now feeds contracted completions, acceptance holds, manufacturing rejects, dispatch and transport directly into erection. Factory buffers count both awaiting-acceptance and accepted stock. Full buffers pause casting without banking unused whole production capacity; rejected or damaged beams create replacement demand while installed quantities remain fixed. Shared transport fleets cannot be multiplied across routes. In-transit loads reserve front storage and receive credit only after arrival; an available qualified alternative route can serve a blocked primary route.

Delivery routes constrain journey/window/loading/unloading times, trailers, payload/bridge limits, long-load/turning access, accepted/rejected components, order and buffer space, plus alternative routes/suppliers. Unknown/rejected route approval supplies zero output. Front start/end chainage, direction, launcher, delivery access, support readiness, interruptions, start/finish/relocation dates and work intervals are explicit. “Two per line” initializes the scenario; assignments may change with lengths/readiness. Shared obstructed routes and sequential erection paths cannot receive simultaneous output credit.

The simulator counts integer beams and complete paired-track bays. Daily production is productive shift time divided by a complete bay cycle, with handovers, maintenance, weather, windows, ramp-up, station interruptions and relocations. Extra launchers on one sequential front are spares, not extra independent paths. Casting, acceptance, transport and released supports cap progress. Each front reports the model days limited by each resource, and the package separately records production, acceptance, shipment, arrival and rejection totals. The conditional pool describes a capacity requirement and requires explicit study opt-in; it is not inserted into the real supplier register. The shared `precast-logistics.json` register contains actual route evidence when supplied. Fractional 1.5/1.8/2.0 bays/launcher/day are averages, implying 54/64.8/72 beams/day across 18 machines. Two shifts do not automatically double output. A conditional forecast assumes the necessary supply; the evidence-backed forecast remains unreleased when no suppliers/contracts/supports are qualified.

# Costs, equipment and people

Make/buy separates delivered purchases, project tooling, upgrades/beds, storage/dispatch and new factories. Supplier amortisation and project tooling cannot both be charged. Rolling-stock assembly and electronics factory allowances remain until their scope is reconciled; replacing civil supply is not permission to delete them.

The civil calibration is edited and the cost file regenerated. Supplied products, erection equipment, transport, temporary works, labour/supervision, night shifts, inspection, maintenance/relocation, traffic management and supports have explicit study allocations. Station exceptions and special structures stay separate. The $9m central purchase allowance for 18 whole-beam launchers remains unquoted, with transporter, lifting gear, freight/duties, assembly, commissioning, supports, spares, crews, relocation and station-modification exclusions. It is not a segmental-gantry quote. The installed civil rate's embedded erection allowance remains unverified: purchase expenditure creates no additional claimed saving until an explicit scope-matched removal is justified.

ERP drafts identify each launcher, transporter and lifting frame as an Asset, with purchase/commissioning records, operating configurations, inspection/maintenance, spares, competence, location, availability, allocation and dismantle/ship/recommission tasks. Cash purchase, project cost allocation and residual value stay separate; initial Baghdad cash is not eliminated by reuse. Transfers cannot overlap allocations and require subsequent-city compatibility.

Department unit crew qualified worker task is a validated chain. Each front and shift requires supervision/lifting, operators, riggers/signalling, survey/QA, mechanical/electrical maintenance, delivery coordination and factory acceptance. Workers cannot fill both shifts concurrently. Handovers, relief/leave coverage, competence expiry, supervised commissioning and equipment-specific assessment are explicit; unfilled drafts do not grant permission to work.

# Battery and chronological energy contract

Profiles specify supplier/cell identity and evidence revision, gross/usable kWh, complete mass/volume, electrical configuration/range, temperature/SOC/age-dependent charge and discharge limits, efficiency/cooling, life, installed/replacement price and qualification. Catalogue sodium values are illustrative pack sensitivities, not asserted vendor performance. Vehicle tare changes by the difference from the included LFP pack; that mass propagates to traction energy and costs. Cases hold usable capacity and service constant: LFP throughout, sodium stationary/LFP onboard, sodium both. The small onboard pack remains a separate duty-cycle option.

The network duty uses declared fleets, dispatch termini, headways, station distances, dwell and installed site capacities, with an explicit average-speed timing assumption and stock-readiness checks. Minute chronology allocates concurrent arrivals across shared cabinet power, subtracts setup time, applies charge taper/temperature/SoH, accounts for regen acceptance, seasonal solar/cleaning, hot-weather auxiliaries, missed visits, outages, reserves, degradation and replacement. Report minimum SOC, unserved duties and missed charges, not annual totals alone. The study needs a calibrated timetable and full seasonal chronological validation before service acceptance.

`osr-bms` requires an explicit commissioned profile with matching pack, chemistry, evidence revision, qualification and valid calibration. A chemistry-string change cannot select or derive sodium protection from LFP defaults. Existing trip, latch, cooldown, off-gas/fire isolation and derating behaviour are preserved and shared by the validated evaluator. Planning profiles are not BMS commissioning profiles.

# Regeneration and acceptance

The outstanding review is traced in `remaining-work.json`, covering all 20 software, engineering, commercial, workforce, deployment and governance areas. Source-hashed records may be entered through `connected-delivery-evidence.json`; a receipt is not authority authentication or acceptance. No supplier, appointment or qualification is invented. The user-provided Iraqi precast capability basis remains qualitative, without selecting a named facility.

`beam-stage-assurance.json` adds gross-section properties, uniform-selfweight moments, lift/store/transport support reactions, sling forces and launcher-position envelopes. Geometry comes from the canonical Pi family. These are statics screens with explicit mass/support/dynamic assumptions. Prestress, reinforcement, connections, material/release strength, fatigue/vibration, anchors, bearings, stability and manufacturer load charts remain required for an independently checked design.

`station-capacity.json` calculates the union of shared-layout equipment envelopes on each platform and its remaining area and contiguous lane. Lift-out capacity and circulation/density comparisons use source-entered criteria; an empty register yields unknown throughput. Multilevel demand allocation, street barriers, surveyed entrance walking routes, evacuation/rescue and station/launcher structures require site assessment.

`procurement-evidence.json` separates dated preliminary, firm and contracted quotations from factory capacity and purchase commitment. Its catalogue beam requirements reference identified span components; special spans remain outside ordinary orders. Tooling already amortised in a unit price cannot be added as project tooling. The USD 9m allowance remains purchase cash only. `cashflow-sensitivities.json` links those identified payments to each conditional schedule at assumed 4/8/12% simple ACT/365 interest with full borrowing of the identified cash. Unknown costs, scope-removal credit, complete financing and accepted revenue remain null, so these sensitivities cannot be published as complete capital or net savings.

The generic front splitter can reassign the available radial donors in another city without requiring six donors or fabricating 18 active fronts. Configured spare launchers add no independent output. Other-city runs remain independent, unqualified planning scenarios; transfer from Baghdad is not authorised before its critical path and compatibility/recommissioning are accepted.

ERP execution records now bind lifecycle release to the actual project/front. Required transfers need transfer, compatibility and recommissioning evidence. Actual work start/close timestamps are controlled; active work cannot be reopened to hide an allocation, and cancellation requires reviewed handback. Completed/cancelled work history continues to participate in worker-rest checks. These business controls grant no railway engineering acceptance.

The identified span register partitions running intervals at millimetre precision into proposed 20 m/25 m catalogue spans and explicitly unresolved special spans. Ordinary beam requirements have stable component and span IDs; special spans receive no ordinary-beam order or invented design. Proposed supports require survey and structural acceptance. Disconnected sections incur a stated relocation allowance instead of receiving continuous launcher progress. Fixed allocation and a conditional six-machine transfer to additional ring fronts use the same 18 launchers, contracted-throughput requirement and 72-transporter fleet. Added ring access and support readiness are assumptions, not feasibility evidence.

Ring stock serves both headings at the declared dispatch stations, including controlled wrap distances in reverse. The energy study continues through three service days without resetting train or storage state. A declared study strategy permits grid replenishment within each site's remaining import capacity. Native section timing comes from `osr-sim`'s scenario loader and rest-to-rest movement model. The fixed-assignment diagnostic and coupled dispatch controller are separate: the controller keeps an energy-held train at its actual station, continues charging and removes it from subsequent dispatch availability until recovery. It reports distinct held journeys, hold minutes and missed opportunities separately. Minute discretisation, berth/depot access, transient traction, conflict authorities and field calibration remain open; no service or chemistry acceptance follows from these screens.

Explicit working calendars now gate erection, casting, acceptance, deliveries and foundation release on closed days. Holidays, dated maintenance, available windows and permission for the erection night shift are configurable. A six-day sensitivity retains the same fleet and installed quantities. Daily supplier-specific shifts, permitted night work and named relief rosters need actual evidence; no statutory holiday list or permission is invented.

Native simulator commissioning uses `[[battery_commissioning]]` records, each naming train, profile ID, pack identity, chemistry, evidence revision, nominal pack voltage, model capacity and a complete `CommissioningProfile`. Every train must be covered if any binding is supplied; duplicate packs, mismatched chemistry/capacity and unqualified profiles fail. The onboard evaluator uses the selected immutable calibration, cell count and voltage and exposes identity in its report. Legacy absent bindings remain labelled by zero commissioned trains and are synthetic planning shadows. Catalogue chemistry profiles contain no accepted commissioning records.

ERP native Task/ToDo transitions now require a submitted `OSR Construction Release`, reviewed by a user with HR and project authority roles. Evidence is private, task-bound and hashed. Controlled Employee authorisations and Asset lifecycle records require appropriate HR/project roles to change and are re-read under resource locks. Work checks active company/department identity, unrevoked competence, asset configuration/commissioning, inspection/maintenance coverage, unresolved repairs, native shifts, approved leave and holiday lists, reviewed night permission, relief/handover, overlap and rest across completed shifts. Completing work additionally requires a reviewed completion record. Revoked reviews and changed attachments cannot grant work. Installation and local tests establish code paths, not a deployed workforce, actual competence or physical railway release.

Station-specific assignment accepts sourced OD cohorts with declared station legs, headings, transfers and a peak window. It counts each paid journey once, additional transfer boardings separately, section loads and station waiting accumulation against that window's declared service. Empty inputs produce unknown demand. The common 3,000 pax/h input is a separately labelled stress case; measured lift-out throughput, circulation, rescue and entrance-based catchments remain evidence gates.

The Iraq national brief and funding document use one current country basis. The USD 8.312bn `local_positive` comparator is distinct from the unpriced accelerated case and the historical USD 7.581bn funding calculation. No debt-clearance month, national budget or realised saving is claimed for the current case. Existing Iraqi precast facilities and expertise are acknowledged without selecting a named facility or assuming spare contracted capacity.

Run `.venv/bin/python tools/automation/connected-build-study.py --city baghdad --refresh-cad` and `--check`. Regenerate station kits, native FreeCAD station libraries and IFCs with their established generators, and generate `civil-cost-model.toml` from calibration. The connected package contains quantities, fronts, resource and procurement/payment sensitivities, conditional opening dates, battery/operating/replacement costs, financing gaps, proposed entrance geography, ERP asset/crew drafts and a hashed source/output manifest. Prior adopted cost/finance/coverage packages remain identified comparators while unresolved supplier, structural and access inputs prevent promotion to an accepted budget or programme.

Regression gates: one island/two faces; access equipment matches geometry; shifts change resources not physical quantities; no erection beyond accepted/delivered beams or supports; contracted supplier limits; mutually exclusive access and asset transfers; battery mass/energy/cost propagation; and source/assumption provenance. The implementation sequence is station/civil topology, suppliers/logistics/shifts, costs/reuse, batteries and city regeneration.

# RFC Index

Repository source: `docs/rfcs/README.md`

RFCs are the design-decision record for OpenSourceRail. They describe what the project chose, what it deliberately excluded, and which implementation milestones prove the choice in code, CAD, or documents.

## By Theme

| Theme | RFCs |
|---|---|
| Core architecture and software | 0001, 0004, 0005, 0006, 0017, 0018, 0031, 0032 (superseded), 0033 |
| Energy and train systems | 0002, 0008, 0020, 0021, 0022, 0023, 0024, 0026 |
| Civil, track, stations, depots | 0009, 0010, 0011, 0012, 0014, 0025 |
| Operations and safety | 0013, 0015, 0016, 0027, 0028, 0029, 0030 |
| Control electronics and DIY deployment | 0007, 0019 |

The historical v0.3 release-candidate summary is in `../../CHANGELOG.md`, and remaining validation work is tracked in `../ROADMAP.md`.

The current published software baseline is v0.4.0; subsequent work is recorded in the changelog.

- RFC 0033 — TACS runtime and resource control — proposed development target; existing control components and multi-process reference.
- RFC 0034 — Connected station, production and battery model — proposed shared topology, contracted supply, shift scheduling, scope costs and battery alternatives.

# Rolling Stock

Repository source: `docs/rolling-stock/README.md`

This folder contains the handoff documentation for train designs. The current mid-size-city vehicle is the `light-metro-3car`: a cabless, driverless, battery-electric trainset with roof solar, identical multi-part fiberglass end cowls with single panoramic glass faces, LED headlamps, repeated self-contained cars, one powered bogie and one trailer bogie per car, high-floor bogie zones, low-floor centre door/PRM zones, and externally accessed, saloon-isolated side battery enclosures beneath the seat zone for the 300 k to 1 M population networks. Samawah is one generated instance of this shared family, not the reason the family exists.

## Packages

| Package | Scope |
|---|---|
| `design-system.md` | Top-down / bottom-up design hierarchy and automatic candidate-iteration loop |
| `light-metro-3car/` | General arrangement, fiberglass end cowl, body, bogie, traction, interfaces, BOM, fabrication plan, compliance, and drawing register |

## Related Artifacts

Use the generated buildable package as the practical handoff from this documentation to drawing, RFQ, shop routing, QA, and first-article planning: manifest first, definitions for drawing/RFQ, travelers for operation routing, material/process control, and signoff templates.

| Artifact | Location |
|---|---|
| Generated CAD screenshots | `../screenshots/` |
| Generated design iteration scorecards | `../../design/component-catalogue/catalog/design-system/` |
| Generated buildable trainset manifest and review | `../../design/component-catalogue/catalog/buildable-trainset/` |
| Product-tree definitions for drawing/RFQ/material/process specs | `../../design/component-catalogue/catalog/buildable-trainset/definitions/index.md` |
| Unsigned shop traveler templates with process controls | `../../design/component-catalogue/catalog/buildable-trainset/travelers/index.md` |
| Canonical parametric source | `../../design/component-catalogue/src/osr_mech/rolling_stock/` |

| Concept image | `../assets/solar-metro-trainset.png` |
| Control-electronics integration matrix | `../../control-electronics/rolling-stock-integration.md` |
| Interior COTS catalogue | `../../control-electronics/trainset-interiors.md` |

# Rolling-stock top-down / bottom-up design system

Repository source: `docs/rolling-stock/design-system.md`

This is the design authority layer above the parametric CAD. It gives the project a systemic way to move from whole-train intent down to bought-in parts, fabricated parts, subassemblies, final assemblies, and then back up through scoring and evidence.

The rule of thumb is simple:

1. Start top-down with requirements: platform fit, axle load, range, traction margin, thermal margin, cost, mass, manufacturability, and safety evidence.
2. Decompose into the owned design hierarchy: external components, fabricated parts, subassemblies, final assemblies.
3. Iterate candidate definitions automatically inside an explicit design space.
4. Promote only feasible candidates into FreeCAD/FEM regeneration.
5. Freeze only when the requirements scorecard, supplier evidence, CAD, FEM, BOM, and manufacturing plan agree.

## Hierarchy

| Layer | Meaning | Examples | Source of truth |
|---|---|---|---|
| Top-level requirements | What the train must achieve | platform margin, range, axle load, cost, mass, traction/HVAC margin | `osr_mech.design_definition.REQUIREMENTS` |
| External components | Bought-in or BID/SOURCE modules | traction motors, HVAC, batteries, doors, glazing, sensors, couplers | `ExternalComponent` records plus supplier evidence |
| Fabricated parts | Parts OSR owns and regional workshops make | shell, bogie frame, motor cradle, cowl rings, articulation adapters | `FabricatedPart` records plus CAD templates |
| Subassemblies | Integration units that can be inspected | car module, powered bogie, trailer bogie, cowl, articulation, roof services | `Subassembly` records plus FreeCAD review groups |
| Final assemblies | Released trainset configurations | promoted light-metro 3-car trainset | `FinalAssembly` records plus generated CAD/FEM/BOM |

## Automated iteration

The first implementation is deterministic and dependency-free:

```
tools/automation/design-iterate.sh
```

It exhausts the declared discrete design space for the default `light-metro-3car` family, evaluates every candidate, and writes:

- `design/component-catalogue/catalog/design-system/design-iteration.json`
- `design/component-catalogue/catalog/design-system/design-iteration-summary.md`

To turn the winning candidate into a buildable product tree and review the current CAD/BOM baseline against it:

```
tools/automation/buildable-trainset.sh
```

That writes the buildable manifest and buildability review under `design/component-catalogue/catalog/buildable-trainset/`.

To run a bounded exploratory pass:

```
tools/automation/design-iterate.sh --family metro-4car --max-iterations 250
```

The current scorecard is intentionally planning-grade. It is good enough to rank candidate architecture choices before spending FreeCAD/FEM time, but it is not a certification result. As the project matures, replace or augment the simple metrics with:

- FreeCAD-derived mass properties and package clearances;
- CalculiX margins from `tools/automation/freecad-generate.sh --fem`;
- supplier quotations and evidence status;
- lifecycle energy and maintenance models;
- risk penalties from the hazard log and compliance matrix.

## Promotion loop

Use the generated best candidate as a design review input, then run:

```
tools/automation/freecad-generate.sh --models --assemblies --fem
tools/automation/freecad-generate.sh --screenshots --station-scenes
```

If CAD/FEM/supplier evidence rejects the candidate, update the component catalogue or constraints in `osr_mech.design_definition`, rerun `tools/automation/design-iterate.sh`, and promote the next best feasible candidate. That is the closed loop: requirements drive definitions, definitions drive CAD/FEM, evidence updates definitions.

# Executed trainset industrialisation expansion

Repository source: `docs/rolling-stock/industrialisation-execution.md`

Implementation plan · generated review · execution evidence · industry source register · machine-readable programme · OSR-MFG-001 · native battery datum fixture · native fixture receipt.

The six repository work packages in the plan are implemented. They expand the existing shared train model and factory definitions with callable screening, planning, trace-validation and offline commissioning tools. The current six-car reference yields 117 material passports, 117 process routes and 756 assembly operations, linked to 16 existing factory packages, 10 manufacturing controls and 416 first-article characteristics. Physical qualification remains open.

## Delivered implementation

| Package | Implemented behaviour | Verification and physical boundary |
|---|---|---|
| IM-01 design | Eight source-backed improvements bind automation, redundancy, monitoring, traction, HVAC, doors, acoustics and modular materials to existing part IDs | Missing sensor/latency/common-cause evidence remains visible; CCTV is not reclassified as an obstacle safety sensor |
| IM-02 materials | Per-product passports preserve existing material/process candidates; coupon mass/stiffness, layered conduction and duty-energy tools compare explicit inputs | No grade/strength/fire/fatigue/EPD release is inferred from a lighter material or supplier envelope |
| IM-03 assembly | Six-restraint fixture, signed tolerance stacks, parent/child preparation and handback dependencies | Native locator positions/volumes and two drawing projections checked; clamp capacity, deflection, calibration and physical repeatability remain required |
| IM-04 production | Open travelers, CSV exports, offline work instructions and capacity/wait-aware scheduling | Actual operation times and qualified process windows remain null; synthetic scheduling demonstrations are not factory forecasts |
| IM-05 quality | Exact identity/revision/lot checks, calibrated range/expiry, environment, uncertainty decisions, torque/angle traces, process-window sampling and NCR blocking | Outputs only prepare independent review; they never approve physical work or change ERP status |
| IM-06 commissioning | Offline lifecycle and critical-fault contract, bounded auxiliary reset and movement inhibition | Computational fault cases pass; real TCMS/ATP/ATO, redundancy timing, sensor coverage and GoA4 evidence remain open |

The reference fixture now places all six locators on pads, supported brackets, outriggers and base members. Its kinematic rank is six. These solids are an inspectable datum study rather than released load-bearing shop drawings.

Materials examples are explicitly synthetic. For the same coupon geometry, lower-density materials reduce mass while lower modulus increases deflection. Changing thickness updates both mass and bending stiffness; an assumed strength or carbon factor is not silently supplied. The duty comparison conserves energy and exposes effects of declared mass, traction/regeneration efficiencies, resistance and auxiliaries. It does not verify CRRC's energy-saving claim.

## Run and inspect

Use a fresh output folder for each controlled generation:

```
tools/automation/osr-python tools/automation/factory-modernisation.py generate \
  --output build/engineering/my-factory-programme

tools/automation/osr-python tools/automation/factory-modernisation.py verify \
  --output build/engineering/my-factory-programme

tools/automation/osr-python tools/automation/factory-fixture-freecad.py \
  --fixture build/engineering/my-factory-programme/assembly_package.json \
  --output build/engineering/my-battery-fixture.FCStd
```

Supply `--model` and `--battery` together to bind another compiled train variant. The package retains those inputs, source hashes, JSON requirements/passports/ operations/protocols, the blank traveler, synthetic method demonstrations, `assembly-operations.csv`, `material-passports.csv`, `work-instructions.md` and an immutable receipt. Verification checks outputs and recompiles generated data.

For an actual work order, retain the generated blank template and create a separate controlled execution package/record. Bind it to the identified as-built configuration, issued family-specific drawings, complete part allocations, released acceptance criteria and qualified process windows. Fill actual physical serials/lots, operators, independent inspectors, timestamps, calibrated evidence and NCR dispositions. Reconcile its revision/hash whenever the approved package changes. Reference aggregate rows cannot substitute for resolved physical parts.

```
tools/automation/osr-python tools/automation/factory-modernisation.py assess \
  --output build/engineering/my-factory-programme --record path/to/actual-record.json
```

The default reference package remains blocked: it is as-designed, has no physical asset identity and lacks complete production allocations, released criteria and special-process data. Assessment of that template cannot become an approval.

## Design and factory handoff still required

The detailed LM3 manufacturing packages must undergo family-transfer review for six-car geometry, loads, datums and supplier interfaces. The reference LTO battery is also an alternative to the catalogue's LFP candidate, requiring an approved substitution/design release. No selected adhesive, cure recipe, weld authority, torque setting or fire-rated material is issued by this expansion.

Execute physical pilots in the plan's order: battery mounting, representative bogie, carbody/door/HVAC bay, then full-train commissioning. Collect first-pass yield, scrap, rework causes, actual cycles, repeatability and repair/removal time before claiming factory improvements. The existing full-train contact-domain rejection at 9.13 s remains a service gate. Supplier, process, physical and independent railway/safety evidence cannot be closed by software demonstrations.

## Retained verification

42 focused tests pass, including 30 new tests for this expansion and the existing fabrication-twin and production-schedule checks. They cover identity, stale/tampered evidence, expired tools/materials, uncertainty margins, process sampling, NCR/predecessor holds, fixture rank, resource limits, energy balance, critical fault lockout and withdrawn movement qualification.

The generated package was verified by source/output hashes and recompilation. Native FreeCAD 1.1.4 checked all 15 fixture solids and their positions/volumes, and generated two nonempty projections with 49 plan and 36 elevation edges. The independent six-restraint check passes. All 13 offline commissioning cases pass their software contracts; physical commissioning and fixture qualification remain unperformed.

# OpenSourceRail trainset improvement and industrialisation plan

Repository source: `docs/rolling-stock/industrialisation-expansion-plan.md`

Revision 1 · 2026-10-11 · implementation and verification programme.

The programme expands design, materials, assembly, production and quality using the existing product tree, shared train definition and factory release packages. It will deliver executable planning, inspection and commissioning tools with retained evidence. Physical process qualification, supplier release and railway approval remain separate deliverables requiring actual facilities and measurements.

## Evidence and interpretation

The requested Railway-News article was published on 12 May 2026. CRRC's primary account describes a Line 12 train completed on 17 April 2026. It identifies automated lifecycle functions, redundant critical subsystems, obstacle/running-gear monitoring, permanent-magnet traction and passenger comfort improvements. Its reported energy-saving objective is a manufacturer/project claim; OSR will require a defined duty cycle and measured baseline rather than adopt that number. The AH specification and vendor implementation are not an open design recipe.

| Source | Practice to adapt | OSR interpretation |
|---|---|---|
| Alstom smart manufacturing | Skilled process teams, repeatable special processes, monitored equipment and lean flow | Qualified manual/semi-automatic work first; add robots only after repeatability, access and throughput justify them |
| Alstom digital maintenance | Digital instructions and connected torque records | Tool-neutral per-joint records and offline instructions, with revisions, calibrated tools and independent review |
| Siemens railcar coating schedule | Coordinate coating resources, drying and QA timing | Resource-constrained assembly planning; material-specific wait times must be explicit |
| Siemens measurement quality | Associate dimensional inspection with measurement-room conditions | Retain temperature, calibration and uncertainty with measurements |
| Alstom environmental design | Consider energy, recyclability and lifecycle effects | Compare mass, stiffness, repair, fire/corrosion evidence and lifecycle data together |
| NIST capability methods | Capability requires suitable data and process assumptions | Calculate diagnostic statistics; withhold capability approval without stability, measurement-system and distribution evidence |
| BIPM JCGM 106 | Measurement uncertainty affects conformity decisions | Use an explicit project-approved decision rule; offer a conservative interval guard as an internal method |
| ISO 22163, ISO 3834-2 | Railway quality and welding quality requirements | Retain applicability, controlled editions, competence and qualification evidence; no certification inferred from generated records |

## OpenSourceRail constraints

Preserve the repository's path-based licensing: Apache-2.0 software, CERN-OHL-S hardware and CC-BY-SA documentation. Manufacturer sources remain references under their own terms. Do not redistribute proprietary CAD, process recipes or AH train specifications as OSR designs.

Keep interfaces, part identity, inspection definitions and exports open in JSON, CSV, Markdown and native CAD. Each supplier substitute must pass the same functional interface and evidence requirements. Support local fixtures, common fasteners, repairable modules, documented removal paths and offline work instructions. Do not require a manufacturer's cloud or proprietary torque tool.

The detailed factory packages describe the LM3 reference. Transferring their methods to another family requires its own length/datums, loading, drawing and supplier compatibility checks; the six-car planning generator is not that release. The existing 9.13 s contact-domain rejection remains an explicit operating gate.

## Execution packages

| ID | Work package | Repository implementation | Completion evidence |
|---|---|---|---|
| IM-01 | Source-backed design expansion | Feature/requirement register binds automation, redundancy, running-gear health, traction, HVAC, doors and acoustic interfaces to catalogue IDs | Every feature has source, limits, part/interface ownership, verification and unresolved evidence |
| IM-02 | Material and energy trade-offs | Material qualification passports; geometric mass/stiffness/thermal screening and energy balance tools | Independent formula tests; no qualified selection without fire, fatigue, corrosion, repair and supplier evidence |
| IM-03 | Assembly quality by design | Datum fixture constraint checks, tolerance stacks, per-instance assembly operations and hold points | Six independent fixture restraints; worst-case fit checks; cycles/unknown predecessors rejected |
| IM-04 | Production execution | Open travelers and resource scheduling with explicit cure/dry waits, competencies and process requirements | Capacity/predecessor tests; immutable work-order/configuration/evidence bindings |
| IM-05 | Quality at source | Calibration/uncertainty-aware measurement decisions, material genealogy, torque/process traces, NCR blocking and diagnostic capability statistics | Negative tests for stale revisions, expired tools, missing evidence, reused identities and unresolved defects |
| IM-06 | Automated commissioning contracts | Offline lifecycle/interlock/fault-injection model and commissioning protocols | Door/obstacle/brake/depot/washing/reset invariants tested; no live control or GoA4 qualification claimed |

The implementation will reuse the existing factory packages, manufacturing controls, first-article inspection plan, product material/process specifications and shared engineering instance IDs. Generated plans and blank travelers cannot serve as execution evidence. Factory acceptance requires actual controlled documents, physical records, independent quality review and the designated authority.

## Pilot sequence and physical work

1. Battery installation and equipment mounts: kit by joint/lot, verify mating datums, validate tolerance/thermal clearances, record fastener stacks and tool traces, inspect routing/isolation and perform approved load/leak/electrical tests.
2. Representative bogie: material receipt, qualified weld/fixture sequence, distortion and NDT, axlebox fit and bearing trace, suspension settings, brake and sensor installation, then an independently witnessed rolling/loaded test.
3. Carbody/door/HVAC bay: survey portals/curbs, qualify composite/bond/seal processes, verify doors and drains, assess heat/noise/fire evidence, and demonstrate sequential removal and interchangeable replacement.
4. Full train: close genealogy and configuration, execute integration/fault protocols, then complete supported wheel–rail/service, braking, thermal, comfort and safety qualification with physical holdouts.

Record first-pass yield, rework by defect cause, scrap/yield, calibration failures, trace completeness, measured cycle time, WIP and replacement time. Establish baselines before claiming savings. Automation investment follows repeatability and measured production demand; avoid transferring another factory's robot count, cycle times or quality claims to OSR.

## Acceptance and execution reporting

The repository implementation is complete when IM-01 through IM-06 are callable, their generated products reconcile with existing identities, their tests and demonstrations are retained, and the review states the remaining physical work. Executable protocol/software completion is distinct from train or factory qualification. Report each package as implemented, verified in software, awaiting supplier/process data, or awaiting physical validation.

# light-metro-3car trainset package

Repository source: `docs/rolling-stock/light-metro-3car/README.md`

This directory holds the dimensioned specification for the light-metro-3car trainset — the default family for populations 300 k – 1 M per RFC 0008 §5. Samawah is one generated city instance that selects this family; the trainset package itself is shared.

This package started as the v1 RFC 0008 bid specification and now also links the current envelope-level FreeCAD/PNG outputs and generated buildable trainset handoff. A domestic rolling-stock fabricator can read the dimensions, masses, interfaces, sub-assembly tree, fabrication sequence, procurement BOM skeleton, and design-review CAD. The design deliberately favours a modern low-capex factory: COTS rail subsystems wherever possible, simple cut/bend/weld fabrication for the primary frame, and composite non-structural panels for sides, roof fairings, multi-part fiberglass cabless cowls, and interior liners. The side and roof skin now uses a common 1 m mould/clip pitch, allowing the three-car exterior body to be installed in one eight-hour shift after the frames pass paint and dimensional release.

## Contents

| File | Scope |
|---|---|
| `general-arrangement.md` | Overall envelope, gauge clearance, consist diagram, floor heights, door positions |
| `fabrication-plan.md` | Cut-bend-weld primary structure, composite cladding, COTS module installation sequence |
| `bogie.md` | 2-axle standard bogie spec, wheel profile, suspension, brake mount |
| `body.md` | Welded steel underframe/spaceframe, composite side panels, end bulkheads, articulation interface frames |
| `dedicated-parts-and-moulds.md` | Discrete chassis/body, fascia/glass/lamp and interior fitout parts with dedicated moulds, trim nests, gauges and release evidence |
| `modular-fiberglass-body.md` | 1 m clip-on fiberglass side/roof modules, keyed retainers, dry seals, one-shift trainset body route, and cost basis |
| `roof-fitout.md` | Roof skin/fairing mould family, HVAC curb and skirts, PV/gland/antenna closeouts, walkways, keep-outs and assembly tests |
| `exterior-finish-process.md` | Simplified white base plus pre-cut livery film and trial-only calcium-carbonate radiative roof coating qualification route |
| `end-cowl.md` | Identical A/B-end fiberglass cowl kit, cast split, laminate/tooling rules, glazing/sensor interfaces |
| `cabin-fiberglass.md` | Cabin FRP/phenolic ceiling liners, sidewall/window reveals, battery strake covers, vestibule/PRM trims, tooling, lay-up, trim, inspection, and repair instructions |
| `articulation.md` | Inter-car and train-to-train articulation/gangway modules: lower spherical pivot, upper links, bellows, turntable, trainline routing, and configurable open-end option |
| `cots-integration.md` | COTS/fabricated interface diagrams, part delineation, and assembly sequence |
| `traction.md` | 800 V-class LFP packs, six PMSM/controller sets, direct-DC auxiliaries, station charging, and verification gates |
| `localization-plan.md` | Staged make/buy policy for bogies, doors, articulation, windows, seats, battery, traction, and body |
| `interfaces.md` | Coupler, station charging, articulation, platform gap, TCN-E connector, aux power |
| `bom-skeleton.md` | Procurement BOM lines and marketplace listed-price consist totals |
| `marketplace-price-anchors.md` | Alibaba/AliExpress line-by-line price anchors and qualification caveats |
| `compliance.md` | Standards matrix: EN 15227, EN 45545, EN 14363, EN 50155, ISO 3095, EN 12299 |
| `drawing-register.md` | v2 drawing IDs, supplier documents, inspection evidence, release gates |
| `v2-release-checklist.md` | Fabrication-release gates: supplier envelopes, FEA, weld maps, drawings, NC data, harness routing, first-article evidence |

The governing visual/layout reference is `solar-metro-trainset.png`: white/silver body, green waist band, dark skirts, single dark panoramic-glass ends, mixed bonded/rail-mounted roof PV, two low-floor door pairs per side per car, repeated self-contained cars with one powered bogie and one trailer bogie each, and batteries under longitudinal seats. The end glazing is an open driverless passenger view through heated RF-transparent laminated glass with LED headlamp and marker-light clusters below it. Because the cars use standard bogies, each car has ~3 m high-floor end decks over the bogies and a 350 mm, ~10 m low-floor centre door/PRM zone. The front and rear passenger ends are not walled off by cab bulkheads; the end saloon looks through the single panoramic glass pane at both ends of the driverless train. The front/back exterior module is the same multi-part fiberglass cast kit at both ends; its controlled design is in `end-cowl.md`.

The companion production graphic is `solar-metro-production-assembly.png`. It shows the intended manufacturing story: a welded 16.5 m datum frame, bolt/bond COTS side, roof, door, glazing, battery-seat, and HVAC modules, then lower the car onto standard bogies and repeat the module to make the consist.

COTS passenger-facing modules are controlled by the supplier-neutral envelope catalogue at `control-electronics/trainset-interiors.md`. Locally moulded or CNC-trimmed cabin fiberglass/phenolic liners, battery strake covers, and vestibule trims are controlled in `cabin-fiberglass.md`. The current vendor-fit shortlist is captured in `bom-skeleton.md` and names rail product families for doors, windows, HVAC, flooring, seats, lighting, PIS/audio, batteries, traction motors, brakes, couplers, and front/back sensing while keeping the CAD envelope swap-friendly.

# Canonical Parametric Source

The parametric Python source files are the design basis for envelopes, interfaces, and generated review views. The styled fiberglass end-cowl A-surfaces are controlled by the surface-modelled LM3-BDY-155 release CAD described in `end-cowl.md`; those surfaces are exported back into the drawing pack as neutral CAD.

| Source | Controls |
|---|---|
| `trainset.py` | Family length, car count, repeated car motorisation, cowl/body/bogie assembly |
| `car_body.py` | 16.5 m body module as layered CAD subassemblies: primary structure, exterior/glazing/doors, interior, HVAC ducts, LV/data routing, HV/PV/thermal/fire paths |
| `modular_fiberglass_body.py` | Sixteen 1 m cladding bays per car, side/roof module geometry, clips, anti-lift retainers, dry gaskets, and the eight-hour body schedule |
| `sensor_cowl.py` | Identical A/B-end multi-part fiberglass cowl kit envelope with one dark panoramic glass pane, LED headlamps, marker lights, and T-OBS visual interface |
| `systems.py` | Couplers, detailed articulations/gangways, batteries, rooftop solar/MPPT package, DC charge/protection racks, doors, electronics, charging, T-OBS packs |
| `bogie/` | Powered and trailer bogie assemblies |
| `cad_templates/rolling_stock.py` | Sheet-metal/chassis manufacturing templates |
| `buildable_trainset.py` | Product-tree manifest, definitions, assembly integration design, and unsigned shop travelers |
| `exterior_finish.py` | Machine-readable finish zones, prohibited coverage, livery-film process, CaCO3 qualification gates and review geometry |

# Buildable handoff package

The generated buildable package lives under `design/component-catalogue/catalog/buildable-trainset/`. Use it as the bridge from concept CAD to build planning:

This is specifically the `light-metro-3car` detailed reference. The integrated city twin uses these parts, moulds and travellers only when that family is selected. Other-family cities retain their generated family cost and programme but show an explicit family-definition hold until equivalent detailed packages are engineered and released.

| Artifact | Use it for |
|---|---|
| `buildable-trainset-manifest.md` | Parts subassemblies assemblies trainset tree, quantities, parentage, acceptance gates |
| `train-end-interface.md` | Single configurable train-end interface that can select either the panoramic glass front/end or the optional mid open train-to-train connection |
| `critical-path.md` | Rough first-train critical path, parallel fabrication plan, labour estimate, and minimum space model |
| `factory-plan.md` | Pilot factory sizing: chassis fabrication, bogie integration, moulding shop, final assembly, enclosed area, yard, machinery, and rough equipment prices |
| `factory-drawings/index.md` | Twenty-nine individual drafting/checking briefs binding the sixteen packages to products, reference envelopes, sources, tooling, views, controls and verification without claiming manufacturing issue |
| `factory-release-readiness.md` | Open issue/approval state across all 16 drawing, product-configuration, tooling and verification packages |
| `trainset-build-cost.md` | Recalculated 3-car trainset budget, including the explicit seats/floors/lighting/HVAC/windows/doors scope already inside the direct-module bucket |
| `mass-budget.md` | Reconciled 75.308 t modeled subtotal, 3.442 t engineering reserve, and 78.75 t controlled planning tare |
| `mass-closure-ledger.md` | All 120 product rows mapped to the nine mass categories, evidence routes for 117 active rows, the 73.376 t lightest existing design-space study, and recovery-reaction linkage |
| `joint-control-schedule.md` | Machine-readable joining classes, torque authority, and release state for all 108 integration joints |
| `manufacturing-and-assembly-controls.md` | Ten default work instructions covering datum control, steel, bolting, bonding/glazing, GFRP/fascia moulding, roof, interiors, lifting/recovery, finish and NCR handback |
| `first-article-inspection-plan.md` | 416 package-specific hold, witness and record-review characteristics with every execution result left unperformed |
| `definitions/index.md` | Drawing/RFQ definitions for every fabricated part, external component, subassembly, assembly, and trainset node, including structured material and process specs |
| `travelers/index.md` | Unsigned shop travelers with material/process controls, operation routers, labor estimates, tooling IDs, QA gates, revision approvals, signoff blocks, and NCR/deviation logs |
| `supplier-anchors.md` | Real manufacturer-family anchor, procurement state, known fit gaps and controlled local-equivalent route for every bought-in product row |
| `manufacturing-methods.md` | All 120 product links, timed mould/film/coating/seal/floor/fixture/motor methods, joining parts, hold points and external design references |
| `FreeCAD part/assembly library` | 120 individual native part documents plus 26 subassembly/car/final-assembly documents, hashes and reachability checks |
| `IFC4.3 part/assembly library` | Matching split geometric IFC files with retained product classes and hierarchy |
| `lm3-manufacturing-tooling.FCStd` | Selectable FreeCAD review objects for 30 mould, trim-nest, glass/lamp gauge, finish, stand and test-tool families |

| Artifact | Use it for |
|---|---|
| lm3-manufacturing-reference.ifc | IFC4.3 product hierarchy, typed doors/windows/floor/furniture/motor, 59 tasks, method assignments and multi-part tooling geometry |
| current-design-buildability-review.md | Current green/yellow/red closure status before first steel cut |

Typical first-article workflow:

1. Start at the buildability review and resolve release blockers.
2. Use the manifest to choose the next build cell or RFQ package.
3. Open that node's definition to create controlled drawings, supplier envelopes, material specs, process specs, or fixture requirements.
4. Open the matching traveler to plan operation sequence, labor, tooling, QA gates, and signoff responsibility.
5. During a real build, fill approval/signature fields and attach actual inspection evidence; generated traveler templates are intentionally unsigned.

## Current CAD / PNG Design Outputs

The whole-train part map and COTS interface diagrams are in cots-integration.md.

The present train design now has envelope-level definitions for the major train assemblies, sub-assemblies, repeated components, and body service layers. The car_body() assembly is deliberately nested as components -> subassemblies -> final car body, so CAD review can hide/show the primary steel shell, exterior solar-train skin, passenger interior, HVAC ducting, LV/data harnesses, high-voltage traction/PV routing, thermal-management pipes, and battery fire vent paths. The models are supplier-neutral CAD geometry in design/component-catalogue/src/osr_mech/rolling_stock and render to these design-review and manufacturing-method PNGs:

| Output | Scope |
|---|---|
| trainset-light-metro-3car.png | Final 3-car trainset assembly with car bodies, bogies, single panoramic-glass cowls, couplers, inter-car articulation, and train systems |
| end-glass-cowl.png | Cabless trainset end close-up with multi-part fiberglass cowl casts, one heated laminated panoramic glass pane, bonded edge frame, demist busbars, and washer/service hardware |
| trainset-car-detail.png | 16.5 m layered car body: structure, door/window openings, glazing, livery, roof PV/HVAC, interior, ducts, LV/data and HV/thermal routes |
| trainset-car-body-structure.png | Primary fabricated structure: shell, 10 m low-floor pan, side sills, crossmembers, roof cantrails, door portals, window posts, end rings, and bogie clearance envelopes |
| trainset-car-body-bogie-subassembly.png | Single-car structure with standard motor/trailer bogies under the ~3 m raised high-floor end zones |
| trainset-car-body-exterior.png | Solar-train exterior layer: glazing, door leaves, livery band, mixed bonded/rail-mounted roof PV/HVAC, and service skirts |
| trainset-roof-solar-system.png | Per-car rooftop solar package with bonded flexible laminates, raised rigid panels, rails, clamps, junction boxes, fire isolators, MPPT combiner, and downlink gland |
| trainset-car-body-interior.png | Passenger interior layer: under-seat battery strakes, benches, PRM bays, grab poles, handrails, and PIS |
| trainset-car-body-services.png | Service layers: HVAC ducts, LV/data trays, lighting, CCTV/intercoms, HV/PV routing, coolant, and battery fire vents |
| trainset-interior-fit-out.png | COTS passenger fit-out envelopes inside the car body |
| trainset-body-sheet-metal-kit.png | Sheet-metal/chassis manufacturing kit: underframe, bolsters, coupler pockets, side posts, rails, roof bows, end rings |
| trainset-factory-layout.png | Pilot factory layout with one 55 m final bay, chassis/body-frame fixtures, GFRP moulding/trim, bogie assembly, interior/HVAC kits, corrosion/base-finish cells, stores, QA, yard staging, and short test access |
| trainset-assembly-method-flow.png | Parallel first-article method plan tying critical-path tasks to chassis/body frame, GFRP modules, bogies, interior kits, doors/windows/roof, HV/electrical work, articulation/static testing, and dynamic release |
| trainset-gfrp-moulding-method.png | One-metre glass-fibre module method: mould/cure, demould/trim, insert/seal, master-frame dry fit, and clip-on installation to the painted carbody |
| trainset-bogie-marriage-method.png | Bogie-to-carbody marriage method with mobile lifting columns, accepted motor/trailer bogies, centre-pivot/air-spring datum checks, and static release hold points |
| trainset-car-systems.png | One self-contained car systems package: four door cassettes, platform interlocks, batteries, rooftop PV package, traction/charge power rack, charging connector, and accessibility/safety reservations |
| trainset-battery-pack.png | Eight LFP module envelopes plus HV contactor, fuse, BMS cabinet, outward vent, off-gas detection, and localized mist interfaces per car |
| trainset-door-system.png | Door cassette pair with sill gap fillers, locks, and external emergency releases |
| trainset-electronics-cabinet.png | Per-end T-ECU/S, T-ECU/A, and crashworthy event recorder, two sets per trainset |
| trainset-end-coupler.png | Scharfenberg Type 10 coupler, electric-head carrier, and EN 15227 crash absorber envelope |
| trainset-inter-car-articulation.png | Detailed inter-car articulation: lower spherical joint, anti-lift keeper, upper links, double-wall bellows, turntable floor, trainline routing, and kinematic envelopes; the same architecture now has a generated train-to-train open-end option in the buildable handoff |

| Output | Scope |
| --- | --- |
| `trainset-tobs-sensor-pack.png` | T-OBS LIDAR, mmWave radar, stereo camera, and ultrasonic sensor envelopes |
| `bogie-motor.png` | Powered bogie assembly with frame, wheelsets, motors, gearboxes, suspension, and brakes |
| `bogie-trailer.png` | Trailer bogie assembly using the common frame and suspension envelope |

# FreeCAD Assembly And FEA Screenshot Review

These screenshots are generated from the FreeCAD `.FCStd` review documents and the FreeCAD/CalculiX screening-output document. The assembled and exploded states are view groups in the FreeCAD files, not separate hand-positioned drawings.

**Trainset FreeCAD review**

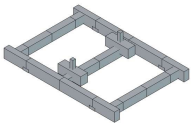
**FEA screening models**

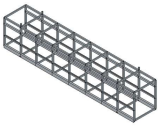
FEA screening models

**Chassis FEA**

**Bogie FEA**



**Body FEA**



| FEA screening models | Chassis FEA | Bogie FEA | Body FEA |
|---|---|---|---|
| | Chassis FEA | Bogie FEA | Body FEA |

The actual solver-result PNGs below are generated from CalculiX `.dat` fields: deformed beam shape, support/load markers, and von Mises stress colour scale.

| Chassis service gravity | Chassis AW3 proof | Chassis track twist |
|---|---|---|
|  |  |  |
| Chassis service FEA result | Chassis AW3 proof FEA result | Chassis track twist FEA result |

| Bogie vertical | Bogie brake/traction | Full body vertical | Full body lateral sway |
|---|---|---|---|
|  |  |  |  |
| Bogie vertical FEA result | Bogie brake traction FEA result | Full body vertical FEA result | Full body lateral sway FEA result |

| Train-to-train joint vertical | Train-to-train joint lateral sway |
|---|---|
|  |  |
| Train-to-train joint vertical FEA result | Train-to-train joint lateral sway FEA result |

The latest screening summary is `design/component-catalogue/catalog/fea/screening-summary.md`. The current FEA catalog includes solver-backed train-to-train local joint cases: vertical passenger/gangway loading and lateral/racking. The source FreeCAD review documents are catalogued in `design/component-catalogue/models/cad/README.md`, and raw CalculiX output folders are catalogued in `design/component-catalogue/catalog/fea/README.md`.

The same `.FCStd` documents can also be exported to local STL render meshes and rendered with Blender/Cycles for README-grade engineering-clay views:

| Trainset clay render | Full-body clay render | Chassis/bogie clay render |
|---|---|---|
|  |  | |
| Blender Cycles trainset render | Blender Cycles full body render | Blender Cycles chassis bogie render |

After the low-floor chassis rework, the chassis screen is inside the 25 mm deflection target: 9.8 mm maximum displacement under the 360 kN service-load screen. The broadened lateral body sway screen is now inside the 20 mm screening target at 18.1 mm maximum displacement, with stress still low at 40.2 MPa. The local train-to-train joint screens are also inside target after the deeper end-ring, portal, threshold, drawbar, and upper-link section update: 4.4 mm vertical displacement against a 12

mm target and 2.3 mm lateral displacement against a 16 mm target.

Complete mechanical interface package

The tracked generated CAD review artifacts are: `trainset-light-metro-3car.FCStd`, `chassis-bogie-assembly-states.FCStd`, `full-body-assembly-states.FCStd`, and `fea-screening-models.FCStd`. The matching electronics host-class quantities are mirrored in `control-electronics/rolling-stock-integration.md`.

The cross-domain depot bogie-change interface now ties the installed LM3 jack pads to the main-heavy depot lift heads through one tested datum contract. It remains a design-reference coordination assembly until vehicle reactions, underframe calculations, foundation design, selected lifting equipment, proof tests, and local safety approval are released.

The portable field-rerailing concept now screens the controlled 78.75 t tare and lighter sensitivity cases against a rail-rated 200 kN hydraulic cylinder envelope. It also pairs the J1--J4 vehicle interface with an optional wayside access interface for hardstanding, equipment offload, transverse bridge bearing and controlled access. Automotive scissor jacks and unilateral lifts are explicitly outside the design basis.

The generated product-level mass ledger keeps the lighter body/bogie option honest: its modeled subtotal is 73.376 t, or 76.818 t with the current reserve retained, but it remains an unpromoted study until all active row masses, individual-car weights, axle loads, centres of gravity and affected structural/dynamic evidence are accepted.

The remaining gaps are not missing assemblies in the train envelope; they are controlled detail-design and release tasks: frozen supplier exact envelopes, one-car-first manufacturing drawings, weld maps, NDT acceptance sheets, FEA-ready brackets, harness clamp locations, manufacturing tolerances, weight-and-balance evidence, and release drawings listed in `drawing-register.md` and `v2-release-checklist.md`.

For supplier work, the generated `default-product-specifications.md` now gives all 58 `BID/SOURCE` rows a costable reference configuration, published manufacturer facts, the current CAD fit envelope, localisation basis, and explicit override triggers. These values start comparable RFQs; they are not nominated suppliers or released order codes.

# Reference envelope (from RFC 0008 §1)

| Parameter | Value |
|---|---|
| Cars | 3 (articulated) |
| Overall length (over couplers) | 49.5 m |
| Tare mass target | 78.75 t controlled planning tare: 75.308 t modeled subtotal + 3.442 t engineering reserve; drawing-package mass closure still required |
| Axle load (AW3 crush) | ≤ 14 t |
| Max speed | 25 m/s (90 km/h) |
| Seats | 60 longitudinal seats |
| Passenger capacity (AW2) | 360 (seated + standing) |
| Passenger capacity (AW3 crush) | 480 short-duration crush load |
| Onboard battery | 540 kWh usable / 675 kWh gross LFP (180 / 225 kWh per car), in externally accessed, saloon-isolated side enclosures beneath the seat zone with outward venting |
| Peak onboard motor output | 1.8 MW operational cap (2.1 MW installed short-duration capability) |
| Floor height (above ToR) | 350 mm, ~10 m low-floor centre door/PRM zone; 760 mm, ~3 m high-floor end decks over standard bogies |
| Gauge | 1 435 mm standard gauge |

# What v1 does NOT include

- Production-detail MCAD files, selected supplier internals, tolerance stacks, manufacturing drawings, and custom-board KiCad files only where a deployment chooses custom electronics (v2).
- Detailed finite-element analysis (v3 — homologation phase).
- Operator-specific livery artwork and approved colour masters; the shared base-protection, pre-cut film and trial-only cool-roof process is defined.

## How to execute this package

1. A fabricator reads `general-arrangement.md`
   - `interfaces.md` to size their production line tooling.
2. `fabrication-plan.md` defines the shop route: tube/plate cutting, press-brake bends, welding fixtures, composite bonding, and COTS module installation.
3. Use the generated buildable manifest to see the current product-tree quantities and parent/child assembly structure.
4. `assembly-plan.md` defines how those parts and subassemblies join: weld, bolt, bond, gasket, harness, coolant, articulation, bogie marriage, end-cowl, and final trainset sequence.
5. Use the generated definition pack to start controlled drawings, RFQs, material specs, process specs, and fixture requirements.
6. Use the generated shop traveler pack to plan operation routers, labor, tooling IDs, QA gates, signoff responsibilities, and NCR/deviation records.
7. `bom-skeleton.md` gives the procurement team the source-identified parts (off-the-shelf commodity) and the TBD parts (where the fabricator bids on make-or-buy).
8. `drawing-register.md` turns the current CAD package and v2 detail work into controlled drawing IDs, supplier document requirements, and release gates.
9. `compliance.md` lists the test campaigns the type-approval needs; each is a separately-tendered scope with an accredited test house.
10. The current FreeCAD/PNG package supports design review. The v2 production CAD pack adds cut-lists, NC code, flat patterns, tolerance-controlled drawings, and welding-robot path artifacts for the shop floor.

## Licensing

v1 specification: CC-BY-SA 4.0. v2 CAD + drawings: CERN-OHL-S v2, matching the hardware licensing from ARCHITECTURE.md §9.

# Inter-car articulation - light-metro-3car

Repository source: `docs/rolling-stock/light-metro-3car/articulation.md`

The `light-metro-3car` uses two semi-permanent articulated gangway modules, one between Car A/B and one between Car B/C. This is not a Jacobs-bogie train: every 16.5 m car still has two standard two-axle bogies. The articulation module carries inter-car structural loads, keeps the passenger passage sealed, and routes trainlines while allowing the bodies to yaw, pitch, and roll independently on curves and vertical profiles.

## Reference architecture

The detailed CAD envelope is generated by `inter_car_articulation()`.

| Subsystem | Design intent |
|---|---|
| Lower central joint | Maintenance-light radial spherical bearing at 720 mm above top-of-rail, with anti-lift keeper and vertical anti-climb shear keys |
| Semi-permanent drawbar | Forged or welded drawbar between underframe anchor castings; carries traction/brake buff and draft loads within the consist |
| Upper articulation | Twin upper roll-yaw-pitch links at the gangway roof line to stabilise body relative motion without carrying floor load |
| Passenger gangway | Double-wall corrugated bellows, bolted clamp frames, flexible side walls and ceiling, segmented anti-slip turntable floor |
| Service routing | Separated HV jumper, redundant TCN-E Ethernet jumpers, CAN-FD/safety-loop jumper, coolant hose loops, HVAC air sleeve, drain channels |
| Maintenance access | Removable turntable service hatch, quick-access bellows clamp bolts, drain traps, replaceable wear plates and bearing inspection covers |

Reference product families used for sizing are HÜBNER-class tram/metro articulation and gangway systems and Schaeffler-class compact central articulated pivots. HÜBNER's public material describes modular lower and upper articulation systems, bellows, turntables, energy guidance, and air-duct integration for urban rail vehicles; Schaeffler's central pivot reference describes a lower central joint using a radial spherical plain bearing with anti-lift function for turn, tilt, and pitch movement under operating loads.

## Geometry envelope

| Parameter | Value | Notes |
|---|---|---|
| Modules per 3-car consist | 2 | Car A/B and Car B/C |
| Module length envelope | 1 120 mm | Straddles the carbody interface; does not add to the 49.5 m consist length |
| Passenger passage width | 1 650 mm | Clear gangway walk-through target before trim tolerances |
| Gangway floor height | 760 mm above ToR | Matches the raised bogie-end deck height at each car end |
| Lower joint height | 720 mm above ToR | Aligned with the existing coupler/drawgear datum |
| Bellows outside width | 2 300-2 400 mm | Inside the 2 850 mm body envelope with clamp-frame allowance |
| Bellows outside height | 2 620-2 690 mm | Clear above 2 100 mm passenger headroom |
| Floor turntable panels | 5 segments | Removable centre service hatch over lower joint |

## Kinematic envelope

The CAD carries explicit framed clearance envelopes so reviewers can see the motion allowance in PNG/FreeCAD views without hiding the joint.

| Motion | Design clearance | Basis |
|---|---|---|
| Yaw | +/- 12 deg | Covers the RFC 0009 `standard-urban` 90 m minimum curve with margin |
| Pitch | +/- 6 deg | Covers vertical curves, lifting, and bogie height variation |
| Roll | +/- 5 deg | Covers cant, suspension roll, uneven loading, and maintenance lift cases |

The clearance envelope is owned by OSR. The supplier may use a different internal link or bearing arrangement if it keeps the same carbody interfaces, passage envelope, and motion envelope.

## Train-to-train open end option

The same end-of-car structural datum is now treated as a configurable train-end interface. Each end position must be built as exactly one of two options:

| End option | Use | Installed modules |
|---|---|---|
| Panoramic glass front/end | Normal outer A and C ends of the reference three-car trainset | `LM3-EIF-SA650` common interface, `LM3-END-SA700` closed end cowl/coupler/crash/sensor assembly |
| Mid open train-to-train connection | Optional end treatment when two train modules are semi-permanently married into one longer walk-through consist | `LM3-EIF-SA650` common interface, `LM3-TTART-SA850` open-end articulation/gangway cassette |

The open connection is not a second carbody design. It replaces only the selected end dress-out: no panoramic glass, fiberglass nose cowl, or nose-mounted T-OBS sensor pack is fitted at the joined end. The common carrier ring, end bolt grid, underframe load datums, drain lands, seal datums, and protected service routes remain the same. The supplier gangway cassette then provides the lower joint/drawbar, upper links, bellows, turntable floor, and trainline/service jumpers across the two train modules.

The generated design record is `train-end-interface.md`. The CAD envelope is generated by `train_to_train_articulation()`.

# Load path

| Load case | Primary path | Detail requirement |
|---|---|---|
| Traction and braking draft | Underframe anchor casting -> drawbar -> lower spherical bearing -> opposite anchor | Proof to consist draft/brake load from traction and emergency braking |
| Buff/compression | Anti-climb shear keys and drawbar washer stack | No override into passenger gangway trim |
| Vertical relative movement | Lower spherical joint + upper links | Anti-lift keeper must retain bodies during jacking/lifting cases |
| Yaw/curve movement | Lower spherical joint with upper roll-yaw-pitch links | No binding at +/- 12 deg yaw |
| Gangway passenger load | Segmented turntable floor into both adapter frames | 5 kN/m2 service load target before supplier-specific proof |
| Crash isolation | End crash energy remains at outer couplers; articulation protects inter-car passage and trainline integrity | No articulation-mounted crush can in v1 unless supplier requires it |

The primary steel at each car end must include an articulation adapter frame, underframe anchor casting, upper clevis brackets, bellows clamp frame nutplates, drain lands, and service hatch aperture. These are fabricator-owned steel details; the gangway module remains a tendered COTS/BID package.

# Trainline routing

The articulation separates high-energy, data, safety, coolant, and HVAC paths so a single abrasion or water-ingress failure cannot remove all services.

| Route | Location | Notes |
|---|---|---|
| HV traction jumper | Right-hand protected conduit | Shielded, orange, bonded at both carbody frames; HVIL loop routed adjacent |
| TCN-E redundant Ethernet | Upper right protected conduit | Two physically separated TSN Ethernet ports continue the consist ring |
| CAN-FD + emergency-brake safety loop | Mid-height right conduit | Hardwired emergency-brake loop remains electrically independent |
| Coolant flexible hose loops | Low left service bay | Drip tray below, quick-disconnect only in depot |
| HVAC air sleeve | Upper left duct | Flexible sleeve, condensate drainage, no external add-on duct |
| Drain channels | Both floor edges | Water traps accessible through gangway floor hatch |

# Maintenance and replacement

| Task | Interval target | Access |
|---|---|---|
| Visual bellows and clamp-frame inspection | Daily walkaround / depot entry | Exterior and interior gangway faces |
| Drain trap clean-out | Monthly or local dust/rain interval | Floor service hatch |
| Bearing/keeper inspection | 6-month A-check | Centre hatch and underframe access |
| Upper-link spherical eye inspection | 6-month A-check | Ceiling hatch / roofline service cover |
| Bellows replacement | 10-15 year overhaul planning interval | Clamp frames unbolt; module removed as a cassette |
| Full articulation module replacement | Heavy overhaul | Cars supported on jacks; drawbar unloaded; service jumpers disconnected |

# Procurement closure

The v1 BOM treats the complete gangway/articulation module as a BID line and the trainline energy-guidance kit as a SOURCE/MAKE line. At v2 release, the supplier package must provide:

- carbody adapter frame drilling pattern and shim pack limits,

- lower central joint bearing rating, anti-lift proof, and inspection method,
- upper link rating, spherical eye replacement process, and rubber/metal fire-smoke evidence,
- bellows, turntable, and interior panel EN 45545 evidence,
- energy guidance bending-radius limits and harness retention method,
- water ingress, drain, and cleaning instructions,
- articulation motion test report at the OSR yaw/pitch/roll envelope.

# Assembly and joining plan — light-metro-3car

Repository source: `docs/rolling-stock/light-metro-3car/assembly-plan.md`

This plan answers the shop-floor question: do the parts and subassemblies actually connect, and how are they joined?

The current product tree is connected by parent/child IDs in the generated buildable manifest: `design/component-catalogue/catalog/buildable-trainset/buildable-trainset-manifest.md`. This document adds the missing single-page join doctrine: datum stack, joining method, sequence, and acceptance hold point for each subassembly and final-assembly interface.

The machine-readable parent/child join classes, torque authority, and release state are generated in `joint-control-schedule.md`.

It is still a planning document, not a released shop drawing. Every structural weld, bolted joint, adhesive bond, HV connection, and coolant joint still needs a released interface-control drawing, the numeric torque or supplier procedure required by the joint schedule, a weld map, surface-preparation procedure, and signed traveler before first article build.

## Join-class rules

Use the least exotic joint that preserves structure, inspection, and serviceability:

| Join class | Used for | Default method | Release evidence |
|---|---|---|---|
| Structural weld | Primary steel underframe, side frames, bolsters, coupler pockets, end rings, bogie frames | Fixture tack, WPS-controlled MIG/MAG weld, controlled cool/stress relief where required, post-weld machining of critical datums | Material heat trace, WPS/WPQR, welder ID, weld map, VT plus MT/UT where classed, post-weld datum survey |
| Bolted structural datum | Bogie marriage, coupler/crash absorber, articulation bearings, door cassette frames, HVAC curbs, battery trays | Classed fasteners into machined pads/weld nuts/captive inserts; shim only at released shim packs; torque stripe after final torque | Bolt grade certificate, torque record, locking method, shim map, witness marks, re-torque rule |
| Qualified adhesive/bonded interface | Glazing lands, selected non-service cowl seams, PV bonded pads, and supplier-required local seams; not LM3-BDY-160 side/roof modules | Abrade/clean/prime, controlled adhesive batch and pot life, clamped cure, witness coupon where required | Surface-prep record, adhesive batch/shelf-life, cure time/temperature, coupon/pull evidence, water/leak test |
| Gasketed removable panel | One-metre GFRP side/roof modules, cowl hatches, skirts, service covers, battery access lids, and roof fairings | Keyed hooks, captive clips, retained fasteners, or quarter-turn retainers with continuous gasket and drain path | Insert pull-out, fastener retention, gasket compression witness, clip/anti-lift witness marks, water test, service-removal check |
| Electrical / data | HV battery, inverter, charge rack, roof PV, TCN-E, CAN-FD, safety loop, door and HVAC looms | Keyed connectors, HVIL where HV, segregated clipped routing, bonding jumpers, strain relief and service loops | Continuity, insulation resistance, HVIL, bond continuity, network enumeration, bend-radius and clamp-pitch inspection |
| Fluid / thermal | Battery/inverter coolant, HVAC drains, washer tubes, fire suppression interfaces | Quick-disconnects or compression fittings on supported pipe/hose; no unsupported hose spans across moving joints | Pressure/leak test, drain-flow test, rub/chafe inspection, service isolation procedure |

## Assembly datum stack

Build from hard datums outward:

1. Track/fixture centreline.
2. Underframe centre spine and bogie-centre datums.
3. Side-frame door/window aperture datums.
4. Roof rail and HVAC/PV datum plane.
5. End-ring, coupler face, and cowl glass/sensor datums.
6. Systems routing datums: HV, LV/data, coolant, drains.
7. Passenger-facing trim and service covers.

No supplier module may force rework of an upstream structural datum. If a supplier envelope does not fit the frozen datum, the accepted actions are: released shim pack, adapter bracket revision, or supplier alternate. Grinding/drilling a released primary datum in final assembly is a nonconformance.

# Subassembly connection plan

| Node | Connects to parent by | Critical parent datum | Acceptance hold point |
|---|---|---|---|
| `LM3-BDY-SA110` underframe datum weldment | WPS-controlled welds between side sills, centre spine, cross bearers, bolsters, coupler pockets, and tray rails; post-weld machined bogie/coupler datums | Fixture centreline, bogie centres, coupler pocket centre plane | Material release, fixture tack survey, weld/NDT release, post-weld datum survey |
| `LM3-BDY-SA120` carbody spaceframe | Welded/bolted side frames and roof bows onto underframe datum pads; door/window portal reinforcement tack-welded before closure | Door aperture planes, window carrier rings, roof-rail pitch | Door/window aperture survey, roof rail survey, carbody dimensional report |
| `LM3-SHELL-A200` painted frame and body skin | Corrosion-protected steel frame plus moulded 1 m clip-on GFRP side/roof modules, glazing lands, and removable skirt/cowl interfaces | Painted steel clip rails, window apertures, end-ring cowl datum | Corrosion report, mould/cure/coupon records, sealed-edge record, clip/anti-lift witness map, eight-hour route record, water-ingress pre-test; cure record only for glazing/cowl seams |
| `LM3-WIN-SA320` side glazing cassette | Bonded or gasketed laminated-glass cassette into `LM3-BDY-P110` carrier ring; mechanical anti-drop retention where supplier requires | Window carrier ring and primer/bond land | Aperture gauge, bond/gasket procedure, water-ingress test |
| `LM3-DOOR-SA310` door cassette | Bolted COTS door cassette into `LM3-BDY-P100` portal frame with shim pack, threshold beam, drains, closed/locked loop, and emergency release | Door portal plane, sill height, lock-loop bracket | Door gauge fit, obstruction test, closed-and-locked test |
| `LM3-INT-SA330` interior fit-out | FRP/phenolic liners and battery strake covers on potted inserts, clip grids, retained fasteners, and limited non-service adhesive/sealant; lighting/PIS/CCTV plugs into LV looms | Saloon floor datum, ceiling rail, window reveal datum, PRM aisle gauge | Egress check, fire-material pack, liner/trim fit survey, lighting/PIS/CCTV static test |
| `LM3-ROOF-SA410` roof systems | HVAC bolted to gasketed roof curb; PV modules either bonded to prepared pads or clamped to raised rails; antennas/lights through sealed glands; bonding jumpers to roof earth studs | Roof rail pitch, HVAC curb plane, PV keep-out zones, cable-gland locations | Roof leak test, HVAC drain test, PV isolation/bonding check |
| `LM3-HV-SA510` traction/HV/cooling | Battery packs bolted into under-seat trays with isolation mounts; inverter/charge rack bolted to underframe rails; HV cables in covered trays; coolant quick-disconnects and supported pipes | Battery tray rail, HV segregated route, side-pin charger datum, coolant manifold support | HVIL test, insulation resistance, coolant pressure test, first-energisation release |
| `LM3-BOG-SA610` powered bogie | Welded H-frame plus bolted wheelsets, bearings, primary suspension, brake hardware, traction motors, gearbox, torque links, and earth straps | Bogie frame pivot, axle centres, motor-cradle datums | Frame NDT, wheelset/bearing certificate, motor/gearbox alignment, static brake test |
| `LM3-BOG-SA620` trailer bogie | Welded H-frame plus bolted wheelsets, bearings, suspension, brake package, wear plates, and height-setting shims | Bogie frame pivot, axle centres, air-spring pad plane | Frame NDT, wheelset/bearing certificate, ride-height setup, static brake test |
| `LM3-CWL-SA710` fiberglass cowl cast kit | FRP cowl shell dry-built on cowl fixture; potted/captive inserts; bolted removable hatches; adhesive/sealant only at non-service sealing surfaces | Backing-ring flange, glass carrier land, lamp/sensor hatch datum | Laminate coupon release, insert pull-out, trim/drill survey, A/B-end dry-build water test |
| `LM3-END-SA700` train-end assembly | Coupler/crash absorber bolted into steel pocket; end ring/anti-climber bolted/welded to carbody datum; cowl kit bolted/gasketed to backing ring; sensors/lights bolted to datum brackets | Coupler face, anti-climber datum, cowl backing ring, sensor optical/radar datum | A/B end interchange, coupler datum survey, sensor calibration, recovery interface check |
| `LM3-ART-SA800` articulation/gangway | Lower spherical bearing and drawbar pinned/bolted to underframe anchor castings; upper links bolted to end frames; bellows clamp frames bolted/gasketed; service bundles through drag-chain | Inter-car joint centre, yaw/pitch/roll envelope, trainline bend-radius route | Motion-envelope proof, trainline continuity, water-ingress/drain test |
| `LM3-SYS-SA900` train control/electronics | T-ECU/A and cabinets bolted to DIN/cabinet rails; TCN-E/CAN/safety-loop connectors plugged and labelled; firmware/configuration loaded after harness continuity | LV cabinet rail, trainline backbone, event-recorder access | Network enumeration, firmware record, self-test, event-recorder write/read test |
| `LM3-CAR-A900` complete car | Shell receives doors, windows, roof, interior, HV, powered bogie, and trailer bogie; bogies married through centre pivot/air springs/yaw dampers; all earth bonds closed before energisation | Carbody bogie centres, ride-height datum, door/platform datum, HV isolation boundary | Car weigh, door/HVAC/static systems test, bogie marriage report, low-speed yard movement |
| `LM3-TRAINSET-A000` trainset | Three complete cars joined with two semi-permanent articulations; A/B end assemblies installed at outer ends; train-control network configured across the consist | Train centreline, articulation centres, coupler faces, trainline continuity | Trainset weigh, static brake/door/HVAC/HV tests, FEM screening accepted, dynamic-test release |

# Final assembly route

## 1. Release child subassemblies

- Confirm every child assembly has a signed traveler, accepted material pack, and matching revision in the manifest.

- Quarantine any COTS module whose supplier envelope, mass, connector, or evidence pack does not match the interface-control drawing.
- Stage A-car, B-car, C-car kits separately. The cars are repeated, but the outer-end fit-out is only installed on the two trainset ends.

## 2. Build and release each car module

1. Put `LM3-SHELL-A200` on leveled stands using the underframe datum.
2. Install `LM3-DOOR-SA310` and `LM3-WIN-SA320`; complete water and door-loop tests before interior trim blocks access.
3. Install `LM3-ROOF-SA410`; close roof leak, drain, PV isolation, and roof-bonding checks.
4. Install `LM3-HV-SA510`; leave HV locked out until bond continuity, coolant pressure, and insulation tests pass.
5. Install `LM3-INT-SA330`; prove PRM aisle, hatch access, fire-label, rattle, and egress checks.
6. Marry `LM3-BOG-SA610` and `LM3-BOG-SA620` to the carbody. Set ride height and record shim packs.
7. Weigh the car and complete low-speed yard movement before it enters trainset assembly.

Each one-metre side/roof body module is already moulded, cured, demoulded, CNC-trimmed, edge-sealed, fitted with inserts/clips/gaskets, labelled, and dry-fitted to a master frame before the car reaches final assembly. Installation then follows the LM3-BDY-160 dry cycle: clean and inspect the datum rail, fit the EPDM seal, engage the asymmetric hook, close captive clips, engage the independent anti-lift retainer, and record the visible witness marks. Six two-person crews install the 144 modules across three released frames in one eight-hour shift. Glazing and end-cowl non-service seams retain their separate qualified adhesive cycles. No clip or fastener may pull an out-of-tolerance frame or panel into position.

## 3. Join the three-car consist

1. Place Car A, Car B, and Car C on level track with coupler/articulation centres on the train centreline.
2. Confirm the end-interface configuration record for each end position: the reference three-car trainset selects panoramic glass at the two outer ends and open mid connections only at internal or train-to-train joints.
3. Install `LM3-ART-SA800` between A-B and B-C:
   - pin/bolt lower drawbar and spherical bearing;
   - install anti-lift keeper;
   - install upper roll/yaw/pitch links;
   - fit bellows clamp frames and turntable floor;
   - route HV, LV/data, coolant, HVAC sleeve, and drains through the released drag-chain path.
4. Perform articulation yaw/pitch/roll sweep before connecting final trim covers.
5. Complete trainline continuity, safety-loop, Ethernet ring, coolant pressure, and water/drain tests across both joints.

## 4. Select and install end assemblies

1. Survey `LM3-EIF-SA650`, the common configurable end-interface set, before fitting any end dress-out.
2. For a panoramic outer end, install `LM3-END-SA700`.
3. Bolt coupler/crash absorber into the steel pocket and torque stripe.
4. Fit fiberglass cowl kit to the backing ring with gasketed retained fasteners; seal only at released non-serviceable seams.
5. Install panoramic glass, lamps, T-OBS sensors, washer/heater lines, rescue cabinet, and electrical jumper.
6. Survey coupler face and sensor datum. Do not use cowl shimming to compensate for coupler-pocket error.
7. For a train-to-train open mid connection, do not install the panoramic cowl/glass/sensor stack. Install `LM3-TTART-SA850` only after the two train modules are aligned on the final assembly track, then fit the open portal clamp frame, bellows, threshold bridge, turntable, service-jumper cassette, drain trays, and blanking/transition covers.
8. Complete the train-to-train motion sweep, threshold level check, trainline continuity, service segregation, and water/drain test before closing passenger trim.

## 5. Configure train control and perform static tests

- Install `LM3-SYS-SA900` cabinets and train-control equipment.
- Enumerate TCN-E devices car by car, then end to end.
- Load firmware/configuration and record hashes.
- Run static brake, door, HVAC, charger, roof-PV isolation, HVIL, event-recorder, passenger information, CCTV/intercom, and emergency release tests.

## 6. FEM/static proof gates before running

Before dynamic running, release the FEM/static screens for:

- underframe supported at bogie interfaces;
- coupler pocket and crash-load path;
- bogie frame and motor cradle;
- battery tray/service-lid rails;
- door portal and threshold;
- roof equipment rails/PV mounts;
- articulation anchor brackets;
- train-to-train open joint vertical and lateral/racking loads if `LM3-TTART-SA850` is selected.

Any screen above the service-stress threshold or with local joint stress concentration requires a detailed local model and drawing revision before the trainset leaves the commissioning cell.

## 7. Dynamic running release

Run in this order:

1. Low-speed yard movement: 0-10 km/h propulsion, brake apply/release, door inhibit, and emergency-stop checks.
2. Articulation sweep on curves and vertical transitions.
3. Brake bedding and static-to-dynamic brake correlation.
4. Charger docking at the standard side-pin interface, including two-train shared-cabinet arbitration and emergency isolation.
5. Roof PV charge acceptance and isolation under motion/dwell states.
6. Passenger-systems shake/rattle check.
7. Fault-injection run: door interlock fault, HVIL open, TCN device missing, charger abort, battery off-gas, failed mist pump/flow, and obstacle- detection degraded state.

Release to trial running only after the signed trainset traveler, FEM/static proof pack, NCR closure list, and as-built interface-control drawings agree.

# Open release gaps

- Join class, torque authority, and release state are emitted for every product-tree integration joint; numerical torques still require the named supplier instruction or released joint calculation.
- Weld symbols/classes exist as process intent, but not as released dimensioned drawings.
- Adhesive bead dimensions, open time, clamp plan, and cure fixtures need supplier-specific procedures.
- Electrical harness clamp coordinates and coolant support coordinates need a released routing drawing.

# Body structure — light-metro-3car

Repository source: `docs/rolling-stock/light-metro-3car/body.md`

The retained geometry below uses GFRP cladding. The new material-neutral panel benchmark uses stiffened aluminium as the reference hypothesis for simple replaceable panels and compares aluminium/GFRP sandwich alternatives on common proposed interfaces. Its analytical results do not adopt a replacement material or change the train BOM; primary structure and railway acceptance remain open.

The body architecture is deliberately simple to manufacture in a regional workshop: a welded carbon-steel primary structure with clipped one-metre fiberglass cladding and COTS passenger-facing modules. The design avoids large aluminium extrusion dies, stainless body pressings, and bespoke door/window/HVAC development.

## Architecture

Each 16.5 m car is split into four production zones:

| Zone | Construction | Function |
|---|---|---|
| Stepped underframe ladder | Cut/bend/weld S355 steel box and folded plate | Carries buff/compression, bogie pivots, battery boxes, coupler loads; drops through the centre door/PRM zone and rises over standard bogies |
| Side/roof spaceframe | S355 rectangular hollow section | Door posts, window rails, roof equipment rails, composite panel support |
| Composite exterior | 1 m-wide fire-rated fiberglass sandwich modules | Clipped, replaceable weather skin, insulation, aerodynamics, livery surface |
| Interior cassette | COTS panels, seats, lights, grab rails, PIS, HVAC ducting | Passenger finish and replaceable equipment |

Steel is the certified load path. Composite panels are non-structural: they may stiffen local skins, but crashworthiness, jacking, lifting, coupler loads, and bogie loads are closed through the welded frame.

The CAD implementation follows the same hierarchy in `car_body.py`:

| CAD subassembly | Included layers |
|---|---|
| `car_body_structure()` | Welded shell, 350 mm and ~10 m low-floor centre pan, 760 mm and ~3 m high-floor bogie-end decks, transition ramps/steps, side sills, raised bogie plinths, bogie sweep/drop envelopes, crossmembers, window posts, waist rails, end rings, anti-climber beams, roof cantrails, door portal posts and headers |
| `car_body_exterior()` | Sixteen 1 m fiberglass side/roof bays with clips and dry seals, plus glazing, door leaves, livery, skirts, roof PV, and HVAC |
| `car_body_interior()` | Under-seat battery strakes, longitudinal seats, PRM bays, grab poles, handrails, passenger information displays |
| `car_body_services()` | HVAC supply/return/drop ducts, LV/TCN cable trays, LED lighting, CCTV, intercoms, door harness loops, HV traction/PV routing, coolant pipes, battery fire vent paths |

`car_body()` returns the complete nested assembly. FreeCAD and PNG review artifacts are generated from that source; they are not the design authority.

## Primary steel structure

### Underframe

The underframe is a jig-welded ladder:

| Member | Section | Material | Notes |
|---|---|---|---|
| Side sill | 200 × 100 × 8 mm RHS | S355J2 or local equivalent | Continuous between end modules |
| Centre spine | 250 × 100 × 8 mm RHS | S355J2 | Battery-box and equipment support |
| Cross bearer | 160 × 80 × 6 mm RHS | S355J2 | 750 mm nominal pitch |
| Bogie bolster | Folded/welded 12 mm plate box | S355J2 | Machined centre-pivot insert after weld |
| Coupler pocket | 16 mm folded plate + crush can interface | S355J2 | EN 15227 energy absorber bolts on |
| Battery tray rail | 80 × 60 × 5 mm RHS | S355J2 | Under-seat module cassette support |
| Articulation adapter frame | 12 mm folded plate + machined inserts | S355J2 | Lower spherical joint, bellows clamp, and upper-link clevis datums |

The floor is not flat. The two centre doors per side and wheelchair bay sit in a ~10 m low-floor zone at 350 mm above top-of-rail for platform boarding. The end saloon zones rise to 760 mm over the standard ~3 m bogies, with short interior steps and ramp panels between the zones. The body sides therefore use a lowered side sill through the centre door bay and raised plinth rails over the bogie zones.

All primary welds are made in a rotating fixture so flat/horizontal weld positions dominate. The v2 drawing pack assigns EN 15085 weld classes per joint; the v1 assumption is CL1 for bolsters, coupler pockets, and crash boxes, CL2 for side sills/cross

bearers, CL3/CL4 for panel tabs and interior brackets.

### Articulation interface frames

Each inner car end carries an articulation adapter frame rather than a simple drawbar bracket. The frame includes:

- underframe anchor casting for the semi-permanent articulated drawbar,
- machined land for the lower spherical bearing and anti-lift keeper,
- vertical anti-climb shear-key pockets beside the lower joint,
- upper clevis brackets for the twin roll-yaw-pitch stabilising links,
- bellows bolted clamp frame and replaceable nutplates,
- drain channel lands and a floor service-hatch aperture,
- separated HV/data/coolant/HVAC bracket datums for the energy-guidance routes through the gangway.

The articulation supplier owns the internal bearing, bellows, turntable, and link details. The fabricator owns the steel adapter frame, weld map, machined datum survey, corrosion protection, and shim pack. See `articulation.md` for the motion envelope and `interfaces.md` for the trainline interface.

### Side frame

The side frame is a light spaceframe welded to the underframe:

- Door posts: 120 × 80 × 6 mm RHS.
- Window posts: 80 × 50 × 4 mm RHS.
- Waist rail: 100 × 50 × 5 mm RHS.
- Cant rail: 100 × 50 × 5 mm RHS.
- Roof bows: 80 × 40 × 4 mm RHS at 1 000 mm pitch.
- Equipment rails: bolted stainless inserts for HVAC, antennas, marker lights, CCTV, and cable trays.

Door openings are not cut from a finished shell. They are built as open bays around the COTS door cassette so the door supplier's frame, threshold, drainage tray, and emergency-release hardware install as a single bolted module.

## Composite exterior panels

Exterior body modules hang from keyed rails and are mechanically retained to the steel frame. The common design is controlled in `modular-fiberglass-body.md`:

| Panel | Construction | Attachment |
|---|---|---|
| Side skin | 28 mm nominal fire-rated GFRP sandwich; 1,000 mm pitch / 994 mm finished width | Keyed hook, captive over-centre clips, independent anti-lift retainer, dry EPDM joint |
| Roof fairing | 28 mm nominal GFRP sandwich; 1,000 mm pitch / 994 mm finished width | Same clip grid; removable above HVAC/equipment |
| Nose/sensor cowl | Multi-part fiberglass (GFRP) cast kit over steel crash frame | Identical at both train ends; bolted, sacrificial, and replaceable; single heated RF-transparent panoramic end glass pane with LED headlamp/marker clusters |
| Skirts | Composite or aluminium removable panels | Quarter-turn service fasteners |
| Interior liners | EN 45545 HL2 FRP or phenolic panels | Clip/bolt to secondary rails |

The composite supplier owns laminate coupons, resin selection, fire test evidence, and repair manuals. The OSR body drawing owns only panel envelopes, edge radii, insert locations, grounding/bonding points, and removal clearances.

The front and rear exterior ends use the same A/B-end fiberglass kit: upper brow, left/right cheek casts, lower apron, lamp/service hatches, and backing-ring flanges around the single glass carrier over the steel crash frame. See `end-cowl.md` for the cast split, laminate schedule, mould/tooling rules, and glass/sensor service interfaces.

Cabin fiberglass/phenolic parts are controlled separately because they are passenger-facing and have different fire, edge-radius, rattle, and service-removal rules from the exterior cowls. See `cabin-fiberglass.md` for the ceiling liner, sidewall/window reveal, battery strake cover, vestibule kick-panel, PRM transition, tooling, lay-up/trim, inspection, and repair instructions.

## COTS windows

Windows are bought as certified rail/bus glazing modules rather than fabricated locally:

- Laminated safety glass to EN 15152 or equivalent.
- Typical opening: 900 × 1 200 mm.
- Bonded-in or gasketed cassette depending on supplier.
- Emergency ventilation only where required by the authority having jurisdiction; default HVAC assumes fixed glazing.
- Drainage path and adhesive bead are per supplier installation drawing, not re-engineered by OSR.

## COTS doors

Door modules are commercial off-the-shelf electric sliding-plug or plug-outward rail doors:

- Clear opening: 1 250 mm × 2 000 mm.
- Electric actuation; no trainwide pneumatic door supply.
- Supplier-provided threshold, guide rail, controller, obstacle detection, emergency release, seals, and manual isolation.
- OSR provides 24 V DC / 110 V DC power, Ethernet/CAN-FD command, hardwired closed-and-locked loop, drainage, and mounting datum.

The preferred procurement pattern is to qualify two door suppliers against the same envelope. The carbody must not depend on a unique proprietary door pocket.

## COTS roof and passenger systems

The body reserves bolted envelopes for:

- Roof HVAC: one 24 kW nominal packaged unit per car, hot-climate variant for +50 °C ambient.
- LED lighting: 24 V DC rail-rated strip or troffer modules.
- PIS displays and speakers: off-the-shelf rail/bus units.
- CCTV: PoE cameras in serviceable composite housings.
- Intercom: COTS EN 50155 rail intercom stations.
- Seats: longitudinal rail/bus bench modules bolted to under-seat battery cover rails.
- Grab rails: stainless tube systems with off-the-shelf clamps.

HVAC, lighting, PIS, CCTV, intercom, seats, and grab rails are procurement modules. OSR fixes the envelope, fastener grid, power budget, data interface, fire rating, and maintainability clearance. Supplier-neutral envelopes and evidence requirements live in `control-electronics/trainset-interiors.md`.

The full interface map, including how the COTS modules join to the fabricated steel/composite body, is in `cots-integration.md`.

## Keyed composite cassette interface

The steel underframe and spaceframe are the permanent datum skeleton. Side and roof weather modules use the dry LM3-BDY-160 interface; door, window, skirt, nose, and interior cassettes retain their component-specific interfaces:

- a 3-2-1 locating scheme, with two primary locating pins and an asymmetric third locator that prevents reversed installation;
- captive clips and a standard 1,000 mm longitudinal pitch;
- a replaceable EPDM compression seal, drained secondary rail, and visible latch witness mark for side/roof modules;
- independent mechanical anti-lift retention;
- dedicated bonding/grounding studs; and
- keyed quick connectors located outside wet drainage paths.

Fastener holes clamp the cassette; they do not establish body geometry. Location is owned by the datum features. Production adhesive is not used at the removable side/roof body-to-frame joint. Glazing and released non-service end-cowl seams retain

their qualified adhesive processes. The fiberglass nose remains a sacrificial shell over the steel crash structure.

## Molded service infrastructure

Composite parts may incorporate empty HVAC supply/return geometry, condensate drains, cable raceways, conduit paths, clip lands, lighting recesses, and equipment bosses. Consumable services remain removable:

- no cable, coolant pipe, sensor, lamp, fan, filter, evaporator, damper, or connector is encapsulated in laminate;
- passenger-side service covers provide removal access without cutting the panel;
- wiring is installed as keyed, labelled, pre-terminated looms; and
- main roof air-duct geometry may be molded into the sandwich, but every active HVAC component remains a separate service module.

The cassette release test includes datum repeatability, insert pull-out, bond durability, water ingress, bond continuity, fire/smoke/toxicity, and a timed service-removal demonstration.

## Floor

- 5-6 mm steel or aluminium deck panels over cross bearers.
- Removable hatches above battery and HV equipment zones.
- Phenolic or aluminium honeycomb floor boards in the saloon.
- Slip-resistant vinyl or rubber floor covering, EN 45545-2 R5.
- ~10 m low-floor centre door zone; ~3 m raised end decks over bogies.

## Corrosion protection

Steel primary structure receives:

- Shot blast to Sa 2.5.
- Zinc-rich epoxy primer.
- Seam sealer at composite/steel interfaces.
- Cavity wax in closed sections after weld inspection.
- Polyurethane topcoat where visible or exposed below floor.
- Drain holes in every closed bay that can collect condensation.

Composite/steel joints use isolation tape or coated inserts to avoid galvanic corrosion where aluminium brackets or stainless fasteners are present.

## Fire compliance

Every passenger-facing material must meet EN 45545-2 HL2 or the deployment authority's accepted equivalent.

| Item | Requirement |
|---|---|
| Steel primary frame | Non-combustible; coating fire data required |
| Composite exterior panels | R1 HL2 or better |
| Interior panels | R1 HL2 or better |
| Floor covering | R5 HL2 or better |
| Seats | R7 HL2 or better |
| Cable insulation | R15/R24 HL2 or better |
| Door/window seals | R23 HL2 or better |

## v2 deliverables

- Welded frame FreeCAD assembly and 2D drawings.
- Flat pattern DXF for folded plates.
- Tube cut list with mitre angles and fixture datum references.
- Weld map with EN 15085 classes, WPS references, and inspection hold points.

- Composite panel envelope drawings and insert maps.
- 3-2-1 locator, asymmetric key, fastener-grid, sealant-groove, bonding, and quick-connector interface drawings.
- Door/window/HVAC supplier interface drawings.
- Static proof-load and fatigue FEA report.
- EN 15227 crashworthiness simulation report.

# Bogies — light-metro-3car

Repository source: `docs/rolling-stock/light-metro-3car/bogie.md`

Six bogies per consist: three powered bogies and three trailer bogies, arranged as one powered bogie plus one trailer bogie under each repeated 16.5 m car module. All bogies use the RFC 0022 suspension, wheelset, brake, and pivot geometry; the trailer variant omits motors and gearbox.

## Bogie envelope (all six, common)

| Parameter | Value |
|---|---|
| Wheelbase (axle-to-axle) | 2 100 mm |
| Wheel diameter, new / worn | 760 / 680 mm |
| Wheelset type | Monobloc, machined per RFC 0022 |
| Wheel profile | S1002 on standard-gauge rail |
| Axle load (AW3, both axles) | ≤ 14 t each |
| Gauge | 1 435 mm standard gauge |
| Track-brake coil (magnetic track brake) | not fitted — per RFC 0008 §3.2 electric-only brake |

## Powered bogie (three per consist)

### Frame

- Welded H-frame, steel S355JR per EN 10025, EN 15085 CL1 welds.
- Length (axle-to-axle) 2 100 mm; width 2 400 mm; depth 300 mm.
- 4 suspension pedestals — 1 per axle end.

### Primary suspension

Chevron rubber springs (one per axle end):

- Vertical stiffness: 1 500 kN/m nominal per spring.
- Lateral stiffness: 5 000 kN/m.
- No shock absorbers at primary level (the chevron's internal damping is sufficient).
- Service interval: replace every 10 years or on inspection finding; visual inspection every 7 days per RFC 0013 M5.

### Secondary suspension

Twin-bellows air spring + lateral damper (one pair per bogie):

- Air spring: Continental / ContiTech CF-series class, 55 °C continuous bellows rating.
- Levelling valves hold the centre door-zone floor within ± 5 mm from empty to AW3.
- Damper: KONI 32-series linear, 6 kNs/m at nominal velocity.
- Auxiliary rubber emergency bearer supports the car after air loss.

### Motor mount

Two PMSM axle-hung motors per powered bogie, one per axle. Motor details in `traction.md`.

### Brake

- Service + emergency: axle-mounted brake disc on each axle. Caliper electromagnetic actuation — two calipers per disc.
- Parking: spring-applied, electromagnetic-release on the same caliper; cut-out spring force ≥ 12 kN per caliper.
- WSP: wheel-slide protection via the per-axle tacho input + `osr-brake` modulation (proptest-verified B4 conservative).

## Trailer bogie (three per consist)

The trailer bogie is a fresh OSR bogie frame built to the same datum scheme as the powered bogie. Differences from the powered bogie:

- No motor. All axles idle.
- Brake: same 600 mm disc on each axle for service / emergency / park.
- Mass: lower than the powered bogie by the omitted motors, gearboxes, and inverter cabling.

## Brownfield recovered-component policy

Recovered freight bogie frames are not spliced into the OSR consist. Where a deployment has usable donor stock, only component-level recovery is allowed after quarantine, cleaning, dimensional survey, and NDT:

- Axles may be re-machined/reprofiled only if UT/MT inspection and metrology pass the supplier acceptance sheet.
- Axleboxes and bearing housings may be reused only after crack inspection, bore measurement, and traceable bearing replacement or bearing supplier re-certification.
- Chevron primary springs, air springs, dampers, brake calipers, yaw links, and motor/gearbox mounts are new qualified parts.

This keeps the mechanical release on one fresh bogie-frame drawing while still allowing brownfield cost recovery where the evidence is credible.

## Interfaces

- Bogie-to-body pivot: centre pin ring bearing, 400 mm diameter, PTFE slider.
- Yaw restraint: two longitudinal links per bogie with elastomeric bushes. No hydraulic yaw dampers (tangent speeds ≤ 25 m/s don't demand them on the RFC 0009 preset radii).
- Power electrical: 650–700 V nominal traction DC plus isolated 110 V and 24 V DC services through a cableguide at the centre pin; not through the pivot itself.
- Air: local secondary-suspension levelling only, fed by one compact compressor/dryer/reservoir/isolation manifold per car module. No trainwide pneumatic brake or door supply per RFC 0008 §3.2.

## Interchangeability

Every powered bogie in every OSR deployment of this family is identical. The trailer bogie shares:

- Frame geometry (drilling pattern).
- Suspension parts.
- Brake disc + caliper.
- Wheel monobloc.

So most bogie spares are shared across powered and trailer variants.

## Weld classes (EN 15085)

| Assembly | Class |
|---|---|
| Frame primary welds | CL1 |
| Motor mount welds | CL1 |
| Brake caliper mount | CL1 |
| Cable-guide mount | CL3 |
| Non-structural covers | CL4 |

Per EN 15085, every CL1 weld is radiographically inspected at the certified shop.

## v2 deliverables (not in v1)

- Dimensioned assembly drawings per EN 15016 / ISO 128.
- FEA: frame stress under AW3 + dynamic accelerations.
- FRA: fatigue-endurance curves over 1M simulated load cycles.
- Weld-quality records template (EN 15085 compliance file).

# Procurement BOM skeleton — light-metro-3car

Repository source: `docs/rolling-stock/light-metro-3car/bom-skeleton.md`

This is the source-identified parts list a fabricator uses to price the consist. Parts split three ways:

- SOURCE — commodity off-the-shelf. Distributor, catalogue, or marketplace quote line available; no engineering work required.
- MAKE — fabricator produces in-house. Single-supplier tender.
- BID — multi-supplier tender. The deployment's procurement office runs the bid.

Costs are BASE USD volume-100. Country cost factor from `lib/templates/country-costs.toml` scales them per deployment.

Scope note: this is a consist-level procurement BOM, not a final manufacturer MBOM. It now covers every train-level subassembly needed to build, commission, and maintain the v1 trainset concept; supplier drawings still break many lines into child parts during v2.

City CAPEX uses this BOM as an audit lower bound, not as the final rolling-stock price. The deployable trainset cost is carried in `lib/templates/capex-costs.toml` as a local-owner production planning unit, and the shared national railway production-plant setup allowance is 60 k USD per supported vehicle/car module base, with 120 k USD per vehicle/car module retained as a high sensitivity check.

Generated CSV outputs:

- `build/bom/rolling_stock_bom.csv` adds low/base/high cost bands to every BOM line.
- `build/bom/rolling_stock_cots_fitout_bom.csv` is generated directly from the source-shaped COTS fit-out catalogue in `design/component-catalogue`.

Cost confidence:

- SOURCE lines use public catalogue/distributor or commodity quote bands until procurement replaces them with current supplier quotes.
- MAKE lines use local fabrication estimate bands until a shop route, fixture plan, and labour-rate pack are issued.
- BID lines are tender-only rail components. Public product pages inform shape, interface, and supplier class; exact price requires RFQ.

## Concept alignment

This BOM is keyed to the visual and layout concept in `docs/assets/solar-metro-trainset.png`:

- 3 cars, each 16.5 m, 49.5 m over couplers.
- Each car repeats the same self-contained architecture: one powered bogie, one trailer bogie, one 180 kWh usable under-seat battery pack, two independent motor controllers, isolated LV DC/DC, and protected station/PV DC interfaces.
- 3 powered bogies and 3 trailer bogies total.
- 6 traction motors total; the planning profile caps consist traction peak at 1.8 MW.
- Roof solar arrays on each car, with compact end HVAC modules.
- Wide passenger windows, identical multi-part fiberglass driverless end cowls with one large dark panoramic glass pane and LED headlamp/marker clusters, white/silver body shell, green waist band, dark skirts, and yellow door thresholds.
- Standard bogies under every car, requiring ~3 m high-floor end decks over the bogies and a ~10 m low-floor centre zone with two door openings per side.
- Batteries remain under longitudinal seats, not on the roof or deep underframe.

## Supplier fit-in references

The generated COTS/RFQ candidate register is the only current selection input. It maps every bought-in LM3 product row to an official manufacturer source, selection maturity, published facts, fit work and a local-equivalent route. The broader supplier-anchor register defines supplier-neutral boundaries. Neither register is an order, a quotation or approval; exact configurations close only through the first-article execution pack.

# Historical price floor

The compact marketplace-price ledger preserves the older low-cost sensitivity calculation only. It is not a component-selection source and cannot close a supplier, engineering or safety gate. Regenerated city twins use the controlled manufacturer candidate IDs while retaining the existing cost as a planning allowance until an RFQ response replaces it.

## Safety, accessibility, and maintainability

| Line | Desc | Qty | Source | Base USD | Notes |
|---|---|---|---|---|---|
| A1 | Wheelchair bay fixtures + passenger call buttons | 6 bays | SOURCE | 1 000 | Alibaba accessibility fixture/call-button anchor; two PRM spaces per car |
| A2 | Tactile / visual safety signage and labels | set | SOURCE | 500 | Alibaba safety-label/signage anchor; doors, emergency, high-voltage, lift points |
| A3 | Emergency lighting + exit marker kit | 3 cars | SOURCE | 1 000 | Alibaba/AliExpress emergency LED anchor; battery-backed, EN 45545 materials |
| A4 | Fire extinguisher, first-aid, and incident-seal kit | set | SOURCE | 500 | Marketplace consumables anchor; operator restocks consumables |
| Safety/accessibility/maintainability subtotal | | | | 3 000 | |

## Consist total

| Bucket | Subtotal (USD) |
|---|---|
| Body + interior | 233 200 |
| Bogies (6 per consist) | 125 600 |
| Traction + power | 266 450 |
| Electronics + safety | 34 340 |
| Safety, accessibility, and maintainability | 3 000 |
| Total direct-material consist | 662 590 |

Generated cost band from the same line items:

| Case | Direct material | +28% labour / assembly | Planning total |
|---|---|---|---|
| Low | 516 027 | 144 488 | 660 515 |
| Base | 662 590 | 185 525 | 848 115 |
| High | 1 031 521 | 288 826 | 1 320 347 |

Marketplace listed-price per-consist floor (volume 100): 0.70-1.40 M USD with assembly allowance, base approximately 0.90 M USD.

This table is an audit lower bound for raw procurement. City CAPEX uses the local-owner rolling-stock planning unit in `lib/templates/capex-costs.toml`: 1.0 M USD per `light-metro-3car` trainset. That unit includes local assembly/labour, nominal per-train QA/acceptance evidence, and modest local handover logistics. Fixtures/tooling live in the railway production plant line; warranty, spares, and routine commissioning support are OPEX.

For comparison, legacy-vendor light-metro trainsets in the target regions typically land 4-6 M USD each. The marketplace floor shows how cheap the commodity hardware can be, but it is not a certified rail quote; supplier qualification, local production overhead, plant setup, QA, and acceptance testing will lift any production purchase above this floor.

## Per-deployment customisation

The operator's own procurement office fills in:

- Livery paint scheme (B20).
- Seat fabric colour (B14).
- TRG-1 5G carrier SIM spec (per-country mobile network).
- Public-safety radio band (E-: not in base BOM).
- Station contact adapter geometry only where a legacy pilot cannot use the standard side contact; voltage and cabinet architecture are not customized.

## v2 deliverables (not in v1)

- Supplier shortlist per BID line with qualification criteria.
- Lead-time analysis per SOURCE / MAKE / BID.
- Risk log: single-source parts + mitigation.

- Weight budget with per-line tare contribution + final target vs actual.

# Cabin fiberglass and phenolic interior parts

Repository source: `docs/rolling-stock/light-metro-3car/cabin-fiberglass.md`

This page controls the non-structural fiberglass, phenolic, and glass/basalt-fibre composite parts inside the `light-metro-3car` passenger cabin. The steel body remains the certified load path. These parts are sacrificial, replaceable, fire-rated passenger liners and fairings.

The design intent is simple: the same regional composite cell that can make or repair the end cowls can also make the cabin liners, battery strake covers, and vestibule trim without expensive rail-OEM tooling.

## Controlled cabin fiberglass items

| Product-tree ID | Item | Qty basis | Function | Parent |
|---|---|---|---|---|
| `LM3-INT-P020` | FRP/phenolic ceiling liner, light trough, and HVAC plenum cover set | 1 car kit/car | Covers roof bows, carries lighting trough openings, and provides removable HVAC/service access | `LM3-INT-SA330` |
| `LM3-INT-P030` | FRP/phenolic sidewall liner, window reveal, and cable-cover panel set | 2 side kits/car | Hides secondary structure and cable trays while preserving window replacement access | `LM3-INT-SA330` |
| `LM3-INT-P040` | FRP battery strake covers, seat-base fairings, and service-hatch shells | 1 car kit/car | Covers under-seat battery strakes, protects passengers from HV bay covers, and keeps battery access removable | `LM3-INT-SA330` |
| `LM3-INT-P050` | FRP vestibule kick panels, PRM ramp/step covers, and door-pocket trims | 4 door-zone kits/car | Protects high-wear door/PRM transition zones and trims the low-floor/high-floor step faces | `LM3-INT-SA330` |

All items are non-structural. They may carry local light fittings, labels, small service covers, or trim clips, but they do not carry seat loads, grab-rail loads, jacking loads, crash loads, battery loads, or door loads.

The buildable product tree further separates light troughs (`LM3-INT-P021`), HVAC/service ceiling pieces (`P022`), window reveals (`P031`), cable covers (`P032`), seat fairings (`P041`), PRM/step pieces (`P051`), and door-pocket trims (`P052`). The complete part/mould schedule is in `dedicated-parts-and-moulds.md`.

## Material system

Use one of these material routes per part family, frozen by the v2A drawing and supplier evidence pack:

| Route | Use | Nominal construction | Notes |
|---|---|---|---|
| Hand lay-up or vacuum-infused FRP | Curved ceiling, sidewall, battery strake, and door-pocket shapes | Fire-retardant E-glass or basalt cloth with vinyl-ester or phenolic-compatible resin | Good for modest tooling and local repair |
| Flat phenolic composite board | Flat liners, cable covers, access doors, and kick panels | EN 45545 HL2 candidate phenolic/glass board, CNC trimmed | Lowest risk where single curvature is not required |
| Lightweight sandwich FRP | Broad ceiling or sidewall panels where oil-canning is visible | Thin FRP skins over fire-rated foam/honeycomb core | Keep solid laminate at all inserts and edges |

Passenger-facing materials need EN 45545-2 HL2 or the deployment authority's accepted equivalent. Do not install uncertified decorative films, foams, sealants, adhesives, or edge trims in the cabin.

## Design rules

- Minimum visible edge radius: 3 mm; 6 mm preferred in standing areas.
- No exposed glass fibres: all cut edges are sealed after trimming.
- Use removable panels wherever the panel covers lights, HVAC drops, cable trays, battery access, fire detection, or emergency equipment.
- Use potted stainless, brass, or GFRP inserts only in solid laminate pads. Do not put inserts directly into foam/honeycomb core.
- Keep panel gaps at 3-5 mm nominal with dark shadow seals; avoid tight cosmetic gaps that become rattles after thermal cycling.
- Use captive or retained fasteners in service panels so hardware does not fall into the saloon.
- Use anti-slip surfacing and yellow/contrast nosing on PRM ramp, threshold, and step-cover pieces.
- Keep HV warning labels and service-lock labels on the removable battery strake cover, not on separate loose trim.
- Do not bond cabin trim permanently across any battery, HV, fire, HVAC, door, or window service path.

# Tooling package

| Tooling ID | Tool | Applies to | Acceptance |
|---|---|---|---|
| LM3-TL-INT-10 | Ceiling liner buck and trim fixture | LM3-INT-P020 | Light trough and HVAC openings within ±1.0 mm |
| LM3-TL-INT-11 | Sidewall/window reveal buck and drill fixture | LM3-INT-P030 | Window reveal gap 3-5 mm; fastener pitch within ±0.75 mm |
| LM3-TL-INT-12 | Battery strake cover mould and service-hatch gauge | LM3-INT-P040 | Hatch opens without seat removal; HV label visible |
| LM3-TL-INT-13 | Door/PRM transition trim fixture | LM3-INT-P050 | PRM transition and anti-slip witness accepted |

The first article may use low-cost MDF/epoxy tooling or machined foam patterns sealed with epoxy tooling coat. Production tooling should be female moulds for curved visible parts and CNC trim nests for flat phenolic panels.

# Making instructions

## 1. Release package

1. Freeze the panel envelope, insert map, visible gap, service-removal direction, and fire-rating route.
2. Check material certificates for resin, reinforcement, board stock, adhesive, sealant, decorative coating, and edge trim.
3. Issue the traveler and verify the parent carbody/interior datum.
4. Cut a witness coupon for every laminate batch and cure cycle.

Hold point: fire-material certificates and laminate/panel batch records accepted before lay-up or CNC trimming.

## 2. Mould or board preparation

1. Clean the mould/fixture and inspect for scratches, release buildup, or previous repair.
2. Apply release wax/PVA/semi-permanent release per supplier procedure.
3. For phenolic boards, stage the CNC spoilboard and vacuum hold-down without contaminating passenger-facing surfaces.
4. Mark every blank with product ID, car number, side, and batch.

Hold point: mould/fixture release record complete.

## 3. Lay-up or trim

1. Cut dry reinforcement plies with fibre directions marked.
2. Lay visible gelcoat or interior finish coat where the process uses in-mould finish.
3. Lay outer plies, core where allowed, local solid-laminate pads, and inner plies.
4. Wet out by hand lay-up or vacuum infusion; avoid resin-rich pools around inserts and tight returns.
5. Cure under controlled temperature/time. Record ambient temperature, resin batch, pot life, vacuum level if used, and cure time.
6. Demould only after the resin supplier's minimum cure condition.
7. Trim, drill, and edge-radius the panel in its trim fixture.

Hold point: coupon, cure, visual void/dry-fibre inspection, and trim-line gauge accepted.

## 4. Inserts, edges, and finish

1. Pot threaded inserts into solid laminate pads or bonded doubler pads.
2. Seal all drilled and trimmed edges.
3. Apply decorative paint/film only after fire-material compatibility is accepted.
4. Add anti-slip witness panels, yellow/contrast nosing, labels, and QR/part ID labels.
5. Fit gaskets, clips, retained fasteners, and access-panel tethers.

Hold point: insert pull-out sample, edge-seal inspection, and label placement accepted.

## 5. Trial fit and release

1. Dry-fit each panel in the carbody/interior fixture before installing seats, grab rails, and lighting.
2. Check window replacement access, battery hatch removal, lighting service removal, HVAC access, cable-tray access, and emergency equipment visibility.
3. Shake/rattle check by hand before the first static electrical test.
4. Record shim packs, clip counts, fastener torque where applicable, and any approved deviations.

Hold point: egress gauge, sharp-edge inspection, service-removal trial, rattle check, and fire-material pack complete.

## Repair instructions

- Cosmetic scratches: sand, clean, fill with compatible fire-rated repair resin/filler, refinish, and record repair location.
- Cracked non-service panel: remove and replace if crack crosses an insert, edge return, access door, or passenger touch zone.
- Battery strake or PRM panel damage: replace the panel, then repeat HV-label, service-hatch, anti-slip, and sharp-edge checks.
- Fire, smoke, or heat exposure: quarantine the panel and replace unless the material supplier provides a signed repair disposition.

## v2A drawing outputs

The v2A drawing pack shall release:

- panel envelope and visible-gap drawings,
- laminate/board schedule,
- insert and clip map,
- CNC trim DXF or mould trim curves,
- service-removal direction and access envelope,
- edge radius and edge-seal procedure,
- anti-slip/nosing/label map,
- first-article inspection form,
- repair and replacement limits.

# Compliance matrix — light-metro-3car

Repository source: `docs/rolling-stock/light-metro-3car/compliance.md`

Standards the consist is designed against. Every row is a type- approval campaign the operator runs pre-revenue. Upstream provides the design envelope; each deployment owns its own test-house relationship.

## Structural + mechanical

| Standard | Scope | Evidence for v1  v2 |
|---|---|---|
| EN 15227 Cat C-II | Crashworthiness at 25 km/h metro scenario | FEA simulation report (v2) |
| EN 12663 Cat P-III | Static + fatigue body loading | FEA report (v2) |
| EN 14363 | Dynamic behaviour + safety against derailment | On-track test campaign (v3) |
| EN 13749 | Bogie frame fatigue + structural | FEA + test-rig (v2/v3) |
| EN 15085 CL1–CL4 | Weld quality per assembly | Per-welder EN ISO 9606 certificates (v2) |
| UIC 510-2 | Wheel profile + wear limits | Monobloc certificate from supplier (v1 source) |
| UIC 505-1 | Structure gauge | General-arrangement compliance shown (v1 ) |

## Fire + materials

| Standard | Scope | Evidence |
|---|---|---|
| EN 45545-2 HL2 | Fire behaviour of materials | Per-material test reports from an accredited lab (v2 campaign) |
| Applied to: body, seats, flooring, cabling, insulation, door rubbers | | |

## Electrical + electronic

| Standard | Scope | Evidence |
|---|---|---|
| EN 50155 OT4 | On-board electronic equipment ambient class | Per-PCB compliance (RFC 0007 v1 bring-up) |
| EN 50121-3-2 | Rolling-stock EMC | Pre-compliance sweep on test car (v3) |
| EN 50126 | RAMS lifecycle | SIL-4 safety case — links into `docs/safety-case/` |
| EN 50716:2023 | Railway software development — SIL-4 target | Coding standard per RFC 0005 §7; evidence per crate; EN 50128/50657 retained only where a national transition mapping requires them |
| EN 50129 | Safety-related electronic systems — SIL-4 | Composite fail-safe argument for T-ECU/S (RFC 0007 §4.1) |

## Passenger experience + accessibility

| Standard | Scope | Evidence |
|---|---|---|
| EN 12299 | Ride-comfort indices | Dynamic-ride test (v3) |
| ISO 3095 | External + internal noise | Acoustic measurement (v3) |
| UIC 741 | Platform-to-train gap | General arrangement + gap-filler flap spec (v1 ) |
| EN 14752 | Door systems | IFE type-4 door or equiv. (v1 source-identified) |
| EN 16586 | Accessibility PRM | Wheelchair-space layout and COTS fit-out envelopes (v1 — see COTS catalogue) |
| EN 15152 | Windows | Laminated safety glass (v1 source-identified) |

## Onboard safety systems

| Standard | Scope | Evidence |
|---|---|---|
| IEC 62278-1 / EN 50716 / EN 50129 as above for the SIL-4 target | Every onboard safety evaluator has proptest + Kani evidence | Per-crate solution nodes in the GSN safety case; physical, process and assessor evidence remain open |
| EN 14033 | Rail infrastructure works — applies to self-propelled work consists (n/a for revenue service) | n/a |

## Target-region overlays (per-deployment)

Each country's NRSA (or equivalent) has its own approval process. Common overlays:

- Iraq (RFC 0003 Samawah): Iraqi Railways directorate approval.
- GCC region: GCC rail-authorities common spec.
- Sub-Saharan Africa: per-country; AU railways coordination underway.

v1 does NOT enumerate overlays — that is the operator's NRSA-liaison scope. Upstream provides the EN-standard base.

## Test-campaign ordering

A typical sequence from design freeze to revenue:

1. v2 CAD release: FEA reports (EN 15227, EN 12663, EN 13749).
2. v2A drawing register release: controlled drawings, supplier installation documents, and evidence gates issued per `drawing-register.md`.
3. First-article prototype: EN 45545 material test campaigns.
4. Static test on bogie rig: EN 13749 frame fatigue.
5. Dynamic test (pilot deployment): EN 14363 derailment safety; EN 12299 ride comfort; ISO 3095 noise; EN 50121-3-2 EMC.
6. Safety-case sign-off: EN 50126 lifecycle file complete.
7. NRSA approval.
8. Revenue service.

Steps 1–5 are fabricator + accredited-test-house scope. Steps 6–7 are operator + project-safety-team scope.

## What v1 commits to

- Source-identified parts where such parts exist (Scharfenberg coupler, IFE door, PZ pantograph, EN 45545 materials).
- BID scope clearly delimited (motor, inverter, battery pack).
- MAKE scope matched to local fabricator capability (cut/bend/weld body frame, bogie frames, brackets, wiring harness).
- No proprietary/closed interfaces anywhere in the consist.

## What v1 does NOT commit to

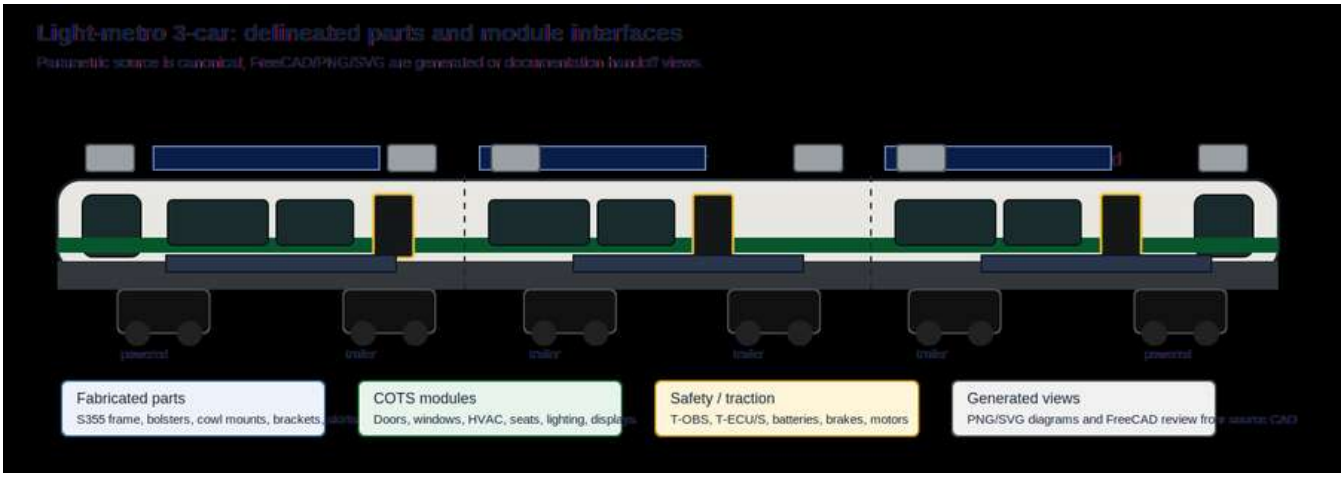
- Specific test-house accreditation (per-country choice).
- Specific national-regulatory overlay fitments (flag signage, emergency PA language, fare-gate integration — all per-deployment).
- Second-source data for BID parts (v2).

# COTS Integration And Part Delineation

Repository source: `docs/rolling-stock/light-metro-3car/cots-integration.md`

This page shows how off-the-shelf rail/bus components join to the fabricated `light-metro-3car` body, bogies, cowls, and electrical systems. The parametric source remains the design basis; these diagrams are the readable integration map.

## Whole-Train Part Map

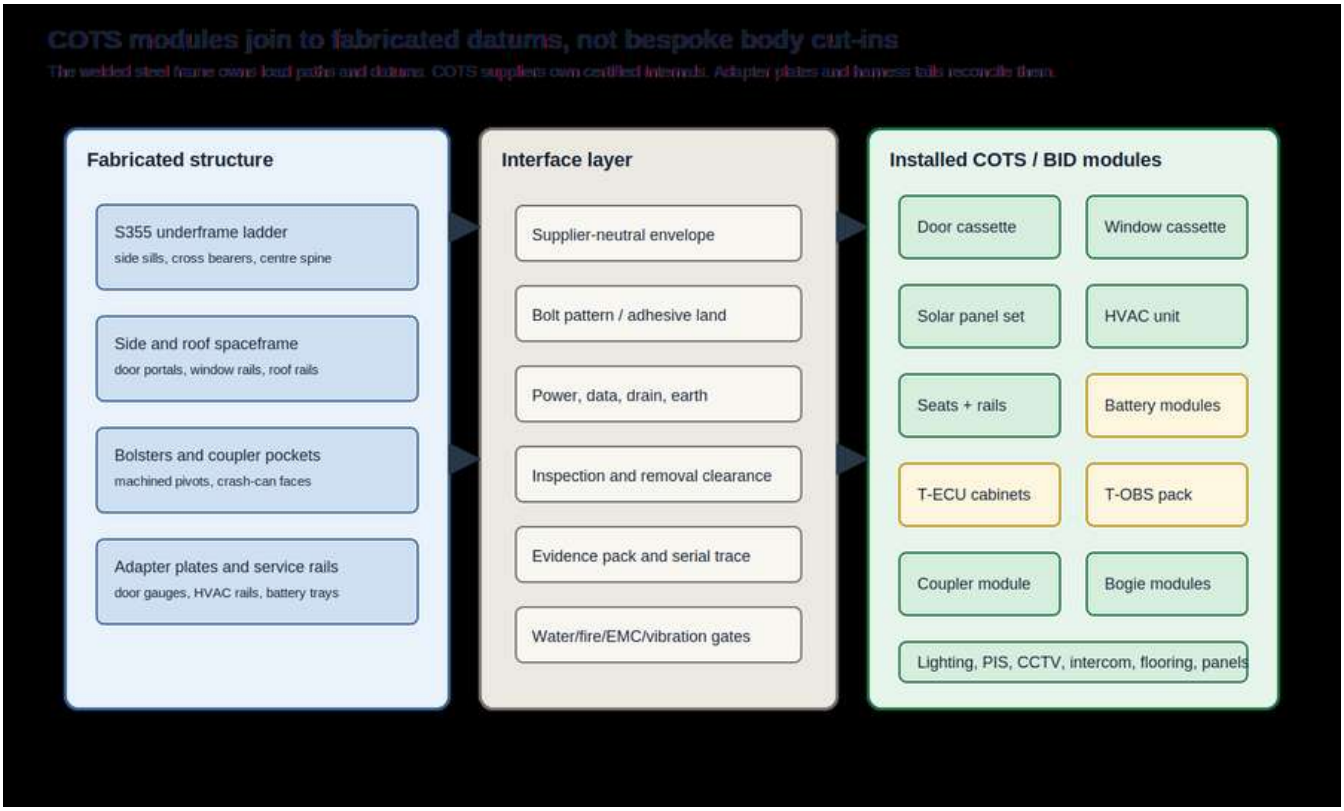


Annotated trainset part map

The train is built from three repeated 16.5 m car modules:

| Zone | Fabricated parts | COTS / BID modules | Parametric source |
|---|---|---|---|
| End cowls | Steel crash frame, multi-part fiberglass A/B-end cowl casts, cowl backing ring, single panoramic glass carrier, LED lamp brackets | Dark RF-transparent laminated end glass pane, T-OBS LIDAR/radar/camera/ultrasonic pack, LED headlamps, marker/DRL bars, washer/heater | `end-cowl.md`, `sensor_cowl.py`, `systems.py` |
| Body side | S355 side frame, two door portals per side, window rail, waist rail, composite skin | Window cassettes, door cassettes, green livery band, yellow thresholds | `car_body.py` |
| Stepped floor | Dropped ~10 m low-floor centre pan, ~3 m raised bogie-end deck supports, side plinth rails, transition steps | Phenolic/aluminium floor boards, rubber covering, step nosings, PRM floor finish | `car_body.py`, `cad_templates/rolling_stock.py` |
| Roof | Roof bows, PV/HVAC rails, bonded-pad lands, cable tray brackets, composite fairings | Bonded flexible PV laminates, raised rigid panels on clamped rails, MPPT combiner, compact HVAC units, antennas | `car_body.py`, `systems.py` |
| Under-seat bay | Battery tray rails, service covers, outward vent path, mist-pipe/nozzle datums, seat support rail | 225 kWh-per-car LFP modules, BMS, fuses, contactors, mist pump/sensors, longitudinal seat modules | `car_body.py`, `systems.py` |
| Underframe | Side sills, centre spine, cross bearers, bolsters, jacking pads | Six motor controllers, isolated LV DC/DC, protected station/PV DC interfaces, HV cabling, cooling loops, brake/WSP harnesses | `cad_templates/rolling_stock.py`, `systems.py` |
| Running gear | Bogie adapter, motor cradle, torque-link brackets | Three powered bogies, three trailer bogies, wheelsets, brakes, bearings, air springs | `bogie/` |
| Train ends and inter-car | Coupler pocket, shear plate, articulation adapter frames, underframe anchor castings, upper clevis brackets, trainline brackets | Scharfenberg Type 10 couplers, crash absorbers, lower spherical articulation joint, upper links, bellows, turntable floor, energy-guidance chains | `systems.py`, `articulation.md` |

# Interface Stack

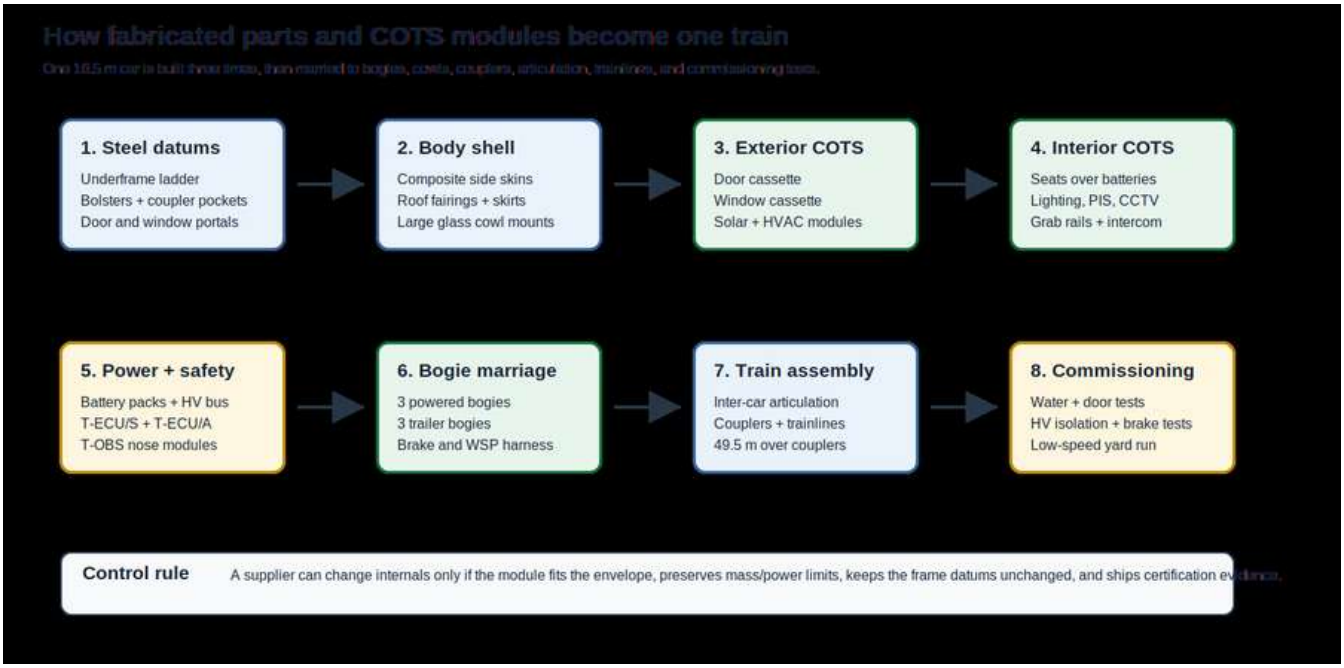


COTS modules joining fabricated structure

Every COTS module is installed through a supplier-neutral interface. OpenSourceRail owns the envelope, datum, power/data/drain/earth interfaces, maintainability clearance, and evidence requirements. The supplier owns detailed internals, service procedure, lifecycle tests, and certification data.

| COTS module | Fabricated datum | Interface closure | Evidence required |
|---|---|---|---|
| Window cassette | Window rail and bonded aperture | Adhesive bead or gasket, drain path, bonded earth if heated | EN 15152 or accepted equivalent, fire/smoke data for seals |
| Door cassette | Door portal, threshold tray, lock-loop bracket | Bolted frame, 24/110 V DC, Ethernet/CAN, hardwired closed/locked loop, drain | EN 14752 or equivalent, obstruction detection, lifecycle test |
| Platform/PSD interface | Door centre datum and sill edge | ATO stopping target, platform screen-door alignment, closed/locked interlock, intrusion sensor sightline | Station integration test, door-open permissive proof, degraded-mode procedure |
| Rooftop PV, mounts, and air cleaner | Bonded-pad lands, roof PV rails, edge-clamp datums, cable gland, blower/nozzle hardpoints | Six bonded flexible laminates and six raised rigid modules per car, isolated combiner, MPPT feed, fire disconnect, filtered low-pressure air-knife cleaner | IEC PV module data, adhesive/bond coupon test, rail vibration mount evidence, blower IP/noise data, filter access proof, soiling-recovery test |
| Station/PV DC interfaces | Underframe charge-rack rails and cooling ports | Per-car roof MPPT, protected station DC input, contactors, precharge, CAN/Ethernet | Rail power-electronics datasheet, insulation/earthing analysis, EMC/vibration evidence, charge-state validation |
| HVAC unit | Roof equipment rails and condensate drain | Bolted rail pattern, molded/removable duct adapter, direct 650–700 V DC, CAN/Ethernet diagnostics | 50 °C hot-climate curve, vibration, EMC, refrigerant record |
| Seat module | Battery-cover seat rail | M10 cantilever bracket, service-lid clearance below cushion | EN 45545 R7, static strength, vandal-resistance data |
| Battery module | Under-seat tray and vent plenum | HV connector, coolant quick-disconnect, BMS harness, side vent | Cell/pack test report, isolation, fire containment, lifting procedure |
| T-ECU cabinet | End electronics cabinet rail | DIN rail, 24/110 V DC, TCN-E, CAN-FD, EB loop, earth braid | Board spec, commissioning self-test, serial and firmware record |
| T-OBS pack | Nose cowl optical/radar datum | Heated window, service fasteners, power/data, safety verdict to T-ECU/S | Sensor calibration, 2oo2 verdict test, washer/heater test |
| Coupler | Coupler pocket and shear plate | M24 bolt pattern, drawgear carrier, brake/electric head clearance | EN 15227 absorber data, rescue procedure, inspection interval |
| Articulation/gangway | Adapter frame, lower anchor casting, upper clevis brackets | Lower spherical pivot, anti-lift keeper, upper links, bellows clamp frame, turntable floor, separated HV/data/coolant/HVAC routes | Motion-envelope test, bearing proof, EN 45545 bellows/turntable data, water ingress and drain test |
| Bogie | Bolster pivot and air-spring pads | Centre pin, PTFE slider, yaw links, brake/WSP/traction harness | Wheelset certs, brake test, frame weld records, suspension data |

# Assembly Sequence



Assembly sequence from fabricated parts to complete train

The sequence is intentionally ordinary for a regional manufacturer: fabricate datum structure first, preserve supplier-neutral interfaces, install COTS modules late, then close the train with test evidence.

# Delineated Part Register

| Part family | Visible in design | Procurement line(s) | Source of truth |
|---|---|---|---|
| Windows | Dark side glazing rectangles in side walls | B10 | `car_body.py`, `cots_equipment.py` |
| Fiberglass end-cowl casts | Identical A/B-end upper brow, cheek casts, lower apron, backing-ring flanges, and lamp/service hatches | B8 | `end-cowl.md`, `sensor_cowl.py` |
| Doors | Two double-leaf black doors with yellow thresholds per car side | B11, B25 | `car_body.py`, `systems.py` |
| Solar panels, air cleaner, and MPPT | Mixed bonded/raised roof PV modules, filtered air pump/manifold, roof combiner, MPPT in every car systems rack | T21, T22, T23 | `car_body.py`, `systems.py` |
| HVAC systems | Compact grey roof modules at car ends | T14 | `car_body.py`, `cots_equipment.py` |
| Batteries | Under-seat blue module rows, eight per car in CAD | T5-T8, T16-T20 | `car_body.py`, `systems.py` |
| Seats | Longitudinal COTS benches over battery covers | B14, A1 | `cots_equipment.py` |
| Grab rails | Stainless saloon stanchions and rails | B15 | `cots_equipment.py` |
| PIS / CCTV / intercom | Saloon and doorway information/safety modules | B18, B19, E14, E15, E20 | `cots_equipment.py`, `systems.py` |
| Electronics cabinets | End-cabinet T-ECU/S, T-ECU/A, recorder modules | E1, E2, E22, E23 | `systems.py` |
| T-OBS sensor packs | Nose LIDAR/radar/camera/ultrasonic module | E18, E19 | `sensor_cowl.py`, `systems.py` |
| Couplers and crash absorbers | End coupler head, shear plate, absorber cartridge | B22, B23 | `systems.py` |
| Articulation | Lower spherical joint, drawbar, anti-lift keeper, upper links, bellows, turntable, drag-chain and service loops | B9, B24, B29 | `systems.py`, `articulation.md` |
| Powered bogies | Three powered bogies, one under each repeated car module | G1, G18, G19, T1-T3 | `bogie/`, `trainset.py` |
| Trailer bogies | Three trailer bogies, one under each repeated car module | G2-G17, G20 | `bogie/`, `trainset.py` |

# Generated Design Views

The same part families are visible in the generated screenshots:

| View | What to inspect |
|---|---|
| `trainset-light-metro-3car.png` | Whole-train layout, repeated self-contained cars, single panoramic-glass cowls, roof PV, bogies |

| View | What to inspect |
| --- | --- |
| trainset-car-detail.png | Complete layered car body with windows, doors, solar array, HVAC, interior, electrical, and thermal routes |
| trainset-car-body-structure.png | Primary fabricated shell, ~10 m floor, side sills, crossmembers, roof rails, window posts, end rings, bogie envelopes, and door portals |
| trainset-car-body-bogie-subassembly.png | Single-car body structure mounted over standard motor/trailer bogies, showing raised ~3 m end decks and the low-floor centre zone |
| trainset-car-body-exterior.png | Exterior glazing, door leaves, livery band, skirts, mixed bonded/rail-mounted solar array, and compact HVAC roof units |
| trainset-roof-solar-system.png | Rooftop PV package: bonded flexible laminates, raised rigid panels, mounting rails, edge clamps, junction boxes, isolators, MPPT combiner, and downlink gland |
| trainset-car-body-interior.png | Under-seat battery strakes, seats, wheelchair bays, grab poles, handrails, and PIS |
| trainset-car-body-services.png | HVAC ducting, LV/data trays, lighting, CCTV/intercoms, HV/PV routing, coolant, and fire vent paths |
| trainset-interior-fit-out.png | COTS passenger fit-out envelopes inside the body reservation |
| trainset-car-systems.png | Batteries, four door cassettes, platform safety interfaces, roof PV/MPPT package, DC charge/protection rack, charging connector, wheelchair bays, systems layout |
| trainset-door-system.png | Door leaves, operator rail, lock/release, gap filler |
| trainset-battery-pack.png | Battery module set, HV contactor, fuse, BMS cabinet |
| trainset-electronics-cabinet.png | T-ECU/S, T-ECU/A, event recorder, power distribution |
| trainset-inter-car-articulation.png | Inter-car lower spherical joint, upper links, bellows, turntable floor, energy guidance, and kinematic clearance envelopes |
| trainset-tobs-sensor-pack.png | LIDAR, radar, stereo camera, ultrasonic sensors |
| bogie-motor.png | Powered bogie with motors, gearbox, suspension, brakes |
| bogie-trailer.png | Trailer bogie envelope |

# Dedicated body, chassis, fascia and interior parts

Repository source: `docs/rolling-stock/light-metro-3car/dedicated-parts-and-moulds.md`

This page is the design-reference split of the LM3 body and fitout into parts that a local factory can identify, fixture, inspect, replace and cost. It is not a released drawing pack: material grades, laminate schedules, weld classes, fastener values, structural calculations and supplier interfaces still pass through their stated release gates.

## Chassis and body steel

| Product ID | Dedicated part family | Manufacturing boundary | Principal fixture/evidence |
|---|---|---|---|
| `LM3-BDY-P010` | left/right side sills | Longitudinal primary members | `LM3-TOOL-STEEL-FIXTURE`; heat and straightness trace |
| `LM3-BDY-P020` | centre spine and longitudinal load-path kit | Kept separate from transverse members until fixture load | Spine straightness and bogie-centre datum survey |
| `LM3-BDY-P021` | cross-bearers, door outriggers and equipment brackets | Nested and station-marked repeated transverse parts | Cross-bearer profile gauge, station map and tack survey |
| `LM3-BDY-P030` | bolster boxes, spring pads and pivot inserts | Machined datum set after qualified weld | Line-bore/NDT and spring-datum survey |
| `LM3-BDY-P060` | low-floor centre pan and service-floor supports | Low saloon floor and removable equipment access | PRM-height, aisle and pan-weld inspection |
| `LM3-BDY-P061` | raised bogie-end decks, transition ramps and hatch frames | Two removable end-zone sets per car | Deck/transition gauge and hatch-removal trial |
| `LM3-BDY-P070` | side posts, door portals, waist and cant rails | Two side frames per car | Door/window gauges and side-frame survey |
| `LM3-BDY-P080` | roof bows and equipment/cable rails | Structural roof datum below removable skins | HVAC/PV pitch and bracket proof evidence |

The steel frame remains the certified crash, buff, passenger, bogie, battery, jacking and recovery load path. GFRP, liners, film and fairings never substitute for these members.

## One-metre exterior part family

The 144-module trainset count is retained, but the engineering tree no longer hides all four variants in one line.

| Product ID | Variant | Reference quantity/trainset | Controlled distinction |
|---|---|---|---|
| `LM3-BDY-P130` | solid side | 48 | Unpierced side/weather panel; final mix follows the bay map |
| `LM3-BDY-P131` | window edge | 24 | Sealed reveal edge, window drain and cassette-removal clearance |
| `LM3-BDY-P132` | door edge | 24 | Door-pocket closeout, threshold drain and door-service sweep |
| `LM3-BDY-P133` | roof skin/fairing | 48 | HVAC, PV, antenna, access and drain trim variants |

All variants retain the 1,000 mm mould pitch, 994 mm finished width, clip datum, independent anti-lift retainer, 6 mm dry EPDM joint and master-frame dry fit. Production quantities are configuration-controlled by the final door/window bay map; the four reference quantities sum to 144.

## Interior fitout split

| Product ID | Serviceable part family | Must remain accessible |
|---|---|---|
| `LM3-INT-P020` | main ceiling liners | Light, diffuser, detector and service apertures |
| `LM3-INT-P021` | light-trough bezels and diffuser carriers | Plug-in main and independent emergency lights |
| `LM3-INT-P022` | HVAC transitions, detector bezels and ceiling hatches | Air balance, detectors, cables and drain inspection |
| `LM3-INT-P030` | main sidewall liners | Side structure and window interface |
| `LM3-INT-P031` | four-piece window reveals | Glass edge, setting blocks and complete cassette removal |
| `LM3-INT-P032` | waist cable covers and LV/data access lids | Segregated harnesses and retained service loops |
| `LM3-INT-P040` | battery-strake covers | HV barrier labels and exterior-only pressure relief |
| `LM3-INT-P041` | seat-base fairings and equipment hatches | Structural seat saddles, isolation and cleaning access |
| `LM3-INT-P050` | vestibule kick and threshold closeouts | Door drains and threshold hardware |
| `LM3-INT-P051` | PRM transition/step covers, nosing and anti-slip pieces | Structural floor datum and trip-edge inspection |
| `LM3-INT-P052` | door-pocket liners and jamb covers | Certified door sweep, sensitive edge and emergency access |

Every interior moulding is non-structural. Seats and handrails connect through calculated saddles and `OSR-RAIL-42`, never through the finish panel. All cabin materials, films, adhesives and edge treatments require the project fire/smoke evidence route.

# Fascia, panoramic glass and lamps

The six cowl casts remain LM3-CWL-P011 through P016. Three dedicated fitout kits now define what sits behind them:

| Product ID | Fitout | Design rule | Release check |
|---|---|---|---|
| LM3-FAS-P010 | panoramic glass carrier, setting-block pockets and secondary retention | Transfers pane loads to the steel-backed ring; cowl skin is not structural | Carrier survey, edge-clearance gauge, retention proof and pane-removal trial |
| LM3-FAS-P020 | reversible lamp cassette tray and aiming adjusters | Same physical end kit leads or trails; service hatch removal must not lose datum | Lamp gauge, aim/retention, harness clearance and removal trial |
| LM3-FAS-P030 | EPDM seals, drain rail, washer sleeves and edge closeouts | Replaceable weather boundary with visible earths/connectors | Seal batch, compression map, drain flow and water test |

The panoramic glass supplier still owns glass construction, heater/busbar and its adhesive or cassette process. The lamp supplier owns photometry, EMC/IP and thermal evidence. The OSR parts own the repeatable mechanical datums and the ability to remove either system without destroying the cowl.

# Dedicated mould and fixture set

| Tool ID | Purpose |
|---|---|
| LM3-TOOL-SIDE-MOULD | common 1 m side-module female surface |
| LM3-TOOL-SIDE-VARIANT-NEST | solid/window/door CNC trim and drill variants |
| LM3-TOOL-ROOF-MOULD | common 1 m roof skin surface |
| LM3-TOOL-ROOF-FAIRING-MOULD | HVAC curb, PV gland, antenna and hatch inserts |
| LM3-TOOL-COWL-MOULD | split brow, cheek, apron, hatch and backing-flange mould family |
| LM3-TOOL-GLASS-CARRIER-NEST | glass carrier, seal compression, sill drain and setting-block gauge |
| LM3-TOOL-LAMP-AIM | reversible cassette datum and photometric target carrier |
| LM3-TOOL-INT-CEILING-MOULD | ceiling, light and HVAC aperture family |
| LM3-TOOL-INT-SIDE-MOULD | sidewall, window reveal and waist-cover family |
| LM3-TOOL-INT-STRAKE-MOULD | battery strake, seat fairing and hatch family |
| LM3-TOOL-INT-DOOR-PRM-MOULD | vestibule, PRM/step and door-pocket family |

First-article MDF/epoxy or sealed machined-foam patterns are acceptable only when the released resin/process permits them. Production visible surfaces use female tools, removable inserts and CNC trim nests. A mould drawing must fix draft, split lines, trim curves, flange returns, insert locations, vacuum/resin ports, cure support and a dimensional inspection method.

# Remaining locally made systems and their drawing homes

The factory package now assigns every local MAKE row to at least one drawing brief. This prevents brackets, carriers and harnesses that sit between major assemblies from being left as unwritten shop-floor decisions.

| Local scope | Product IDs | Drawing seeds | Controlled result |
|---|---|---|---|
| Coupler, battery, door and window primary interfaces | LM3-BDY-P040, P050, P090, P100, P110 | LM3-BDY-130, LM3-BDY-140 | Calculated load paths, machined datums, weld/NDT map, supplier keep-outs and replacement clearances |
| Replaceable door/window carriers | LM3-DOOR-P010, LM3-WIN-P010 | LM3-DOOR-200, LM3-WIN-210 | Adjustable carriers, setting blocks, keyed dry seals, drains, gauges and timed cassette replacement |
| Configurable end and articulation adapter | LM3-END-P060–P062, LM3-END-P030, LM3-ART-P010 | LM3-END-650, LM3-SYS-170 | One common end datum, one selected option per position, anti-lift retention, service access and full-motion proof |
| Powered bogie local structure/services | LM3-BOG-P010, P030, P050, P060 | LM3-BOG-400 | New H-frame, motor cradle/torque link, guards, sensor brackets and protected harness route |
| Trailer bogie local structure/services | LM3-BOG-P020, P031, P061 | LM3-BOG-410 | New H-frame, guards, brake/WSP brackets and protected harness route |
| Battery, HV and coolant local hardware | LM3-HV-P010–P030 | LM3-HV-310, LM3-HV-320 | Sliding trays/restraints, exterior vent/drain, segregated covered HV route, bonds, clamps, bleed/drain and test points |
| LV trainline and distribution | LM3-CTRL-P040 | LM3-ELC-300 | Harness-board definition, wire/terminal schedule, branch and clamp coordinates, service loops, labels and 100% continuity test |

These are drafting and verification homes, not released dimensions. Supplier interfaces, structural calculations, cable/pipe selections, tolerances and signed first-article records remain mandatory inputs to the corresponding factory package.

# Assembly handoff

1. Release and survey the underframe, floor, side and roof structural datums.

2 Dry-build the four exterior variants on the master frame; prove clips, anti-lift devices, seals, drains and window/door service sweeps.

3 Build the six cowl casts, glass carrier and lamp tray on the end fixture; prove A/B interchange before fitting glass or lamps.

4 Pre-fit all interior panels on the bare service rails; demonstrate every window, light, HVAC, cable, seat-base and door service path.

5 Apply the controlled finish system, install bought-in equipment, complete water/rattle/functional tests, and attach signed evidence to the serialized car configuration.

# Drawing and evidence register — light-metro-3car

Repository source: `docs/rolling-stock/light-metro-3car/drawing-register.md`

This register is the bridge between the v1 Markdown specification and the v2 CAD/shop-drawing release. It lists the controlled drawings, supplier documents, and test evidence a fabricator must produce before the first article can be released for static and dynamic testing.

Document IDs use `LM3` for the `light-metro-3car` family. Revision `A` is the first v2 release candidate.

The generated `factory-drawings` seed index now provides an individual drafting/checking brief for each of the 29 drawing IDs controlled by the 16 factory packages. Those seeds cover every locally manufactured product row and organize scope; they remain non-dimensioned and unissued until this register's release gates close.

# Controlled drawing set

| ID | Title | Owner | v1 source | v2 release content |
|---|---|---|---|---|
| LM3-GA-000 | Trainset general arrangement | OSR/mechanical | `general-arrangement.md` | 2D GA, clearance envelope, platform interface, mass table |
| LM3-MASS-010 | Controlled trainset mass budget and product closure ledger | OSR/mechanical + suppliers | generated `mass-budget.md`, generated `mass-closure-ledger.md` | Modeled category subtotal, explicit engineering reserve, all 120 product responsibility assignments, supplier/production-CAD/weigh evidence state, lightweighting comparison, individual-car/axle/CG closure |
| LM3-JNT-020 | Joint and fastener control schedule | OSR/mechanical + integrator | generated `joint-control-schedule.md` | Parent/child joint IDs, joining classes, torque authority, locking/re-torque release requirement, numeric values, inspection record |
| LM3-BDY-100 | Carbody primary steel assembly | Fabricator | `body.md` | FreeCAD/neutral CAD package, 2D assembly, weld map, datum scheme |
| LM3-BDY-110 | Underframe ladder assembly | Fabricator | `body.md` | Tube cut list, plate flat patterns, fixture drawing |
| LM3-BDY-120 | Side/roof spaceframe assembly | Fabricator | `body.md` | RHS cut list, door/window aperture datums |
| LM3-BDY-130 | Coupler pocket and crash-can interface | Fabricator + coupler supplier | `body.md`, `interfaces.md` | Machined inserts, bolted energy absorber interface |
| LM3-BDY-140 | Battery tray and under-seat enclosure | Fabricator + battery supplier | `body.md`, `traction.md` | Service hatches, vent path, HV isolation clearances |
| LM3-BDY-150 | Exterior glass-fibre material, mould, and trim-envelope control | Composite supplier + fabricator | `body.md`, `modular-fiberglass-body.md` | Laminate schedule, reusable mould drawings, core/insert maps, CNC trim envelopes, edge radii, fire evidence, repair zones |
| LM3-BDY-155 | Identical A/B-end fiberglass cowl cast kit | Composite supplier + OSR/mechanical | `end-cowl.md`, `sensor_cowl.py` | Surface-modelled exterior A-surface and derived B-surface/flange/trim/mould neutral CAD, CWL-FRP-01 through CWL-FRP-06 mould/trim drawings, laminate schedule, insert map, steel backing-ring datum, glass/lamp/sensor hatch service access |
| LM3-BDY-160 | One-metre clip-on glass-fibre body module system | Composite supplier + fabricator | `modular-fiberglass-body.md`, `modular_fiberglass_body.py` | Common 1,000 mm side/roof moulds, mould release and cure records, solid/window/door/roof trim variants, clip rail and insert map, anti-lift retainer, EPDM joint/drain, module numbering, master-frame dry fit, timed one-shift installation route |
| LM3-BDY-165 | Exterior module variant trim and configuration map | Composite supplier + fabricator | generated `factory-release-work-packages.md` | Solid/window/door/roof CNC trim and drill definitions, serialized bay map, clip/seal datums, replacement and repair zones |
| LM3-FAS-180 | Panoramic glass carrier, seal and drainage interface | OSR/mechanical + glazing supplier | `end-cowl.md`, generated `factory-release-work-packages.md` | Steel-backed carrier segments, setting blocks, secondary retention, pane-edge clearances, compression map, drain/washer/heater routes and removal path |

| LM3-HV-325 | Rooftop PV and charge-input assembly | Solar + traction suppliers | `traction.md`, `interfaces.md`, BOM | Bonded flexible laminates, raised rigid panels, roof rails, edge clamps, MPPT combiner, fire isolators, downlink gland, air-cleaner pump/nozzle manifold, bonding/earthing details |
| LM3-OBS-330 | T-OBS nose sensor-pack installation | T-OBS supplier + integrator | RFC 0015, BOM | LIDAR, radar, stereo camera, ultrasonic transducers, heated sensor windows, cleaning access |
| LM3-BOG-400 | Powered bogie assembly | Bogie fabricator | `bogie.md` | Frame drawing, motor/gearbox/brake interfaces |
| LM3-BOG-410 | Trailer bogie assembly | Bogie fabricator | `bogie.md` | Frame drawing, brake/suspension interfaces |
| LM3-TRC-500 | Traction package installation | Traction supplier | `traction.md` | Motor, gearbox, inverter, cooling, EMC bonding |
| LM3-COM-600 | Train communication and antenna install | Integrator | `interfaces.md` | TCN-E, radios, GNSS, CCTV, PIS, intercom |

# Manufacturing evidence

| ID | Evidence | Required before | Notes |
|---|---|---|---|
| LM3-EV-CFG-000 | Configuration baseline sheet | v2A design freeze | Confirms 3 repeated 16.5 m cars, 3 powered bogies, 3 trailer bogies, 540 kWh usable battery, 78.75 t controlled planning tare (75.308 t modeled subtotal + 3.442 t engineering reserve), and no city-specific train variant |
| LM3-EV-MAT-001 | Steel mill certificates and heat traceability | G0 material release | Covers RHS, plate, machined inserts |
| LM3-EV-REC-005 | Recovered axle/axlebox acceptance pack | G0B recovered-component release | Quarantine, cleaning, dimensional survey, UT/MT/NDT, bearing replacement or supplier re-certification |
| LM3-EV-WLD-010 | WPS/PQR register and welder qualifications | First production weld | EN 15085 / EN ISO 9606 basis |
| LM3-EV-WLD-020 | Weld inspection and NDT report | G1 frame complete | VT + MT/UT per weld class |
| LM3-EV-DIM-030 | Frame dimensional survey | G1 frame complete | Bogie centres, door/window apertures, coupler height |
| LM3-EV-COR-040 | Blast, primer, topcoat, cavity-wax report | G2 corrosion complete | Includes DFT readings |
| LM3-EV-CMP-050 | Composite material and mould-process certificate pack | G3 shell complete | EN 45545 evidence, resin/fibre/core/gelco at batch trace, mould release record, cure record, coupon trace, and repair method |
| LM3-EV-CMP-055 | Fiberglass cowl cast first-article report | G3 shell complete | Laminate coupons, insert pull-out, split-line fit, glass-carrier land survey, and A/B-end interchange check |
| LM3-EV-CMP-057 | One-metre body module first-article report | G3 shell complete | Mould inspection, cure and demould record, laminate coupons, CNC trim report, edge-seal record, master-frame dry fit, clip/anti-lift proof, insert pull-out, water/vibration test, and timed removal/refit |
| LM3-EV-DIM-058 | Dedicated factory drawing/interface package review | v2A design freeze | Use the generated factory-release readiness record to show all 16 packages have approved drawings, frozen inputs, product revisions, released tooling, characteristic lists and named verification owners; generation alone does not constitute approval |
| LM3-EV-BND-060 | Adhesive batch, surface-prep, cure records | G3 shell complete | Includes witness coupons |
| LM3-EV-GLZ-065 | Front glass carrier, seal and service trial | G4 COTS systems fitted | Retention proof, edge/compression survey, drainage/water result, heater isolation and timed pane replacement |
| LM3-EV-LMP-067 | Reversible front-lamp fit and aim report | G4 COTS systems fitted | A/B interchange, optical-axis/aim range, lock/vibration retention, harness access and supplier photometric evidence |
| LM3-EV-WTR-070 | Water ingress test | G4 COTS systems fitted | Doors, windows, roof equipment |
| LM3-EV-FIN-075 | Livery film first-car application and repair report | G4 COTS systems fitted | Actual-substrate coupon, batch/application record, edge/seam map, wash compatibility, patch and one-metre module removal trial |
| LM3-EV-RCF-077 | Radiative roof-coating qualification disposition | Optional coating production release | Fire/material acceptance, new/aged optical results, durability/cleaning evidence, one-car trial and accepted baseline-finish fallback |
| LM3-EV-ELC-080 | Bonding/earthing and insulation resistance | G5 electrical safe | Includes HV and LV separation checks |
| LM3-EV-HV-090 | HVIL and battery isolation report | G5 electrical safe | Battery supplier + integrator sign-off |
| LM3-EV-DOOR-100 | Door obstruction, release, lock-loop test | G6 static complete | Per door cassette serial number |
| LM3-EV-HVAC-110 | HVAC cooling and drain test | G6 static complete | +50 C performance evidence may be supplier lab data |
| LM3-EV-INT-115 | Interior moulding, fitout and service-access report | G6 static complete | Fire trace, dry-fit/gap/rattle/sharp-edge results, floor/PRM evidence and sequential service-removal demonstrations |
| LM3-EV-BRK-120 | Static brake and park-brake test | G6 static complete | Links to bogie/brake supplier records |
| LM3-EV-MASS-130 | Weighing and axle-load report | G7 dynamic ready | Empty and simulated AW2/AW3 cases |
| LM3-EV-RIDE-140 | Bogie alignment and ride-height report | G7 dynamic ready | Before dynamic testing |
| LM3-EV-REC-150 | Jacking, lifting and field-rerailing interface report | Recovery release | Individual-car mass/CG cases, structural proof, equipment freeze, four-point gauge, asymmetric/loss-of-pressure trials and trained-crew demonstration |
| LM3-EV-FEM-175 | Train-to-train joint FEM screening pack | Optional open-end release | Train-to-train joint vertical and train-to-train joint lateral/racking beam-model screens |

# Supplier document index

| Package | Supplier document required | Acceptance rule |
|---|---|---|
| Doors | Installation manual, maintenance manual, lifecycle test, EN 14752 evidence | Fits LM3-DOOR-200 without primary steel change |
| Windows | Glazing certificate, adhesive/gasket procedure, replacement manual | Fits LM3-WIN-210 and passes water test |
| HVAC | Datasheet, +50 C derating curve, wiring manual, refrigerant record | Fits LM3-HVAC-220 and aux-power budget |
| One-metre GFRP body modules | Mould split/datum drawings, laminate schedule, fire test, cure record, CNC trim report, repair manual, insert pull-out data, seal/gasket procedure | Modules remain non-structural, clipped and gasketed to LM3-BDY-160 without side/roof production adhesive |
| Fiberglass end cowls | Mould split/trim drawings, laminate coupons, fire test, insert pull-out data, gasket/seal procedure, repair manual | Same cast kit fits both A-end and B-end without steel-frame change |
| Rail livery film | Rail-use statement, film/ink/overlaminate/edge-system data, substrate/application/cleaning limits and fire evidence | Fits LM3-FIN-240 seams and keep-outs, adheres to the actual cured base finish, and passes repair/removal trial |
| Radiative roof coating | Controlled formulation, fire/chemical/material compatibility, application limits, new/aged optical and durability evidence | May be used only within LM3-FIN-245 trial zones after accepted one-car disposition; qualified light base finish is the fallback |
| Configurable train-end interface | End carrier ring drawing, option bolt-grid gauge, panoramic/open-mid configuration procedure, seal/drain test, selected-option record | Each end position selects exactly one of the panoramic glass end or the mid open train-to-train connection |
| Seats/rails | Fire certificate, pull-load certificate, cleaning/repair manual | Fits LM3-INT-230 insert grid |
| Lighting/PIS/CCTV/intercom | EMC/vibration evidence, firmware version, wiring manual | Enumerates on car network and passes static test |
| Battery | Cell/module certificate, BMS manual, vent/fire containment data | Fits LM3-BDY-140 and LM3-HV-310 |
| Traction and charging | Motor/controller/gearbox datasheets, station DC-charge interface data, onboard HV protection/IMD data, PV MPPT data, cooling and EMC instructions | Fits LM3-TRC-500, LM3-HV-320, and LM3-HV-325 |
| Rooftop solar and air cleaner | PV module datasheets, adhesive/bond process, rail/clamp vibration evidence, fire-isolation switch data, blower/nozzle IP and vibration evidence, filter-service access, soiling-recovery test | Fits LM3-HV-325 without roof-spaceframe redesign |
| Bogie parts | Wheelset, bearing, spring, damper, brake supplier certificates | Fits LM3-BOG-400/410 |
| Articulation/gangway | Bearing rating, motion-envelope proof, bellows/turntable fire evidence, maintenance manual | Fits LM3-SYS-170 and optional LM3-SYS-175 without carbody adapter redesign |

# Release gates

| Gate | Minimum drawing/evidence state |
|---|---|
| v2A design freeze | LM3-EV-CFG-000 and LM3-EV-DIM-058 complete; all controlled drawings issued at rev A; supplier envelopes frozen |
| First steel cut | LM3-BDY-100/110/120, LM3-EV-MAT-001, LM3-EV-WLD-010 complete |
| First carbody shell complete | LM3-EV-WLD-020, LM3-EV-DIM-030, LM3-EV-COR-040 complete |
| First COTS fit-out complete | Door/window/HVAC/interior/film supplier docs accepted; LM3-EV-GLZ-065, LM3-EV-LMP-067, LM3-EV-WTR-070, LM3-EV-FIN-075 and LM3-EV-INT-115 complete |
| First energisation | LM3-EV-ELC-080 and LM3-EV-HV-090 complete |
| Static test release | LM3-EV-DOOR-100, LM3-EV-HVAC-110, LM3-EV-BRK-120 complete |
| Dynamic test release | LM3-EV-MASS-130 and LM3-EV-RIDE-140 complete |

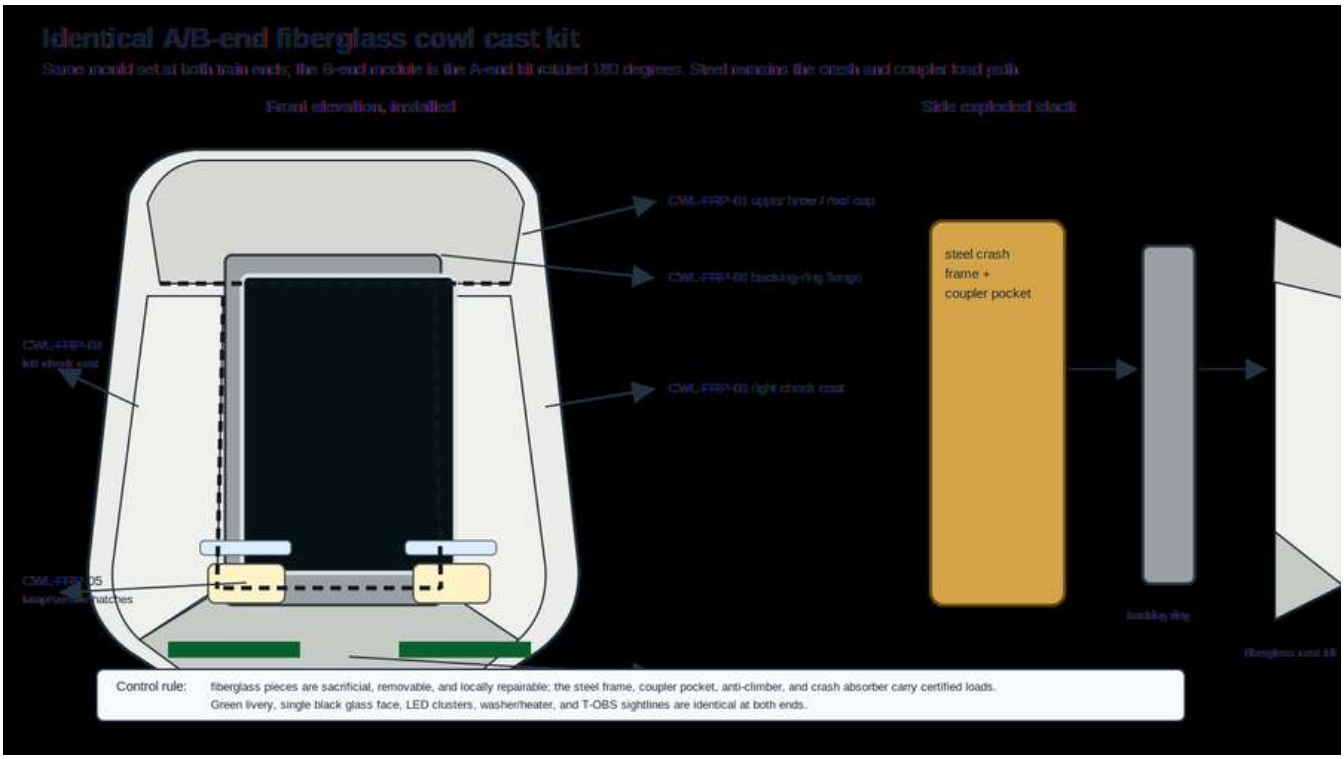
# Change control

- Any supplier swap that fits the reserved envelope is a document revision, not a structural redesign.
- Any change to side sills, bolsters, coupler pockets, door posts, or crash-can interfaces reopens FEA and static proof evidence.
- Any mass increase above a module row limit requires a new axle-load report before dynamic testing.
- Any power increase above a module row budget requires an aux-power and cooling-capacity review.

# Identical fiberglass end-cowl design

Repository source: `docs/rolling-stock/light-metro-3car/end-cowl.md`

This page controls the `light-metro-3car` front/back end module. The train is driverless and reversible, so the "front" and "back" are the same part kit: one A/B-end fiberglass cowl assembly installed at each outer end, with the B-end kit rotated 180 degrees about the vertical axis. There are no handed cab moulds and no rear-only cosmetic parts.



Multipart fiberglass end-cowl cast kit

The form language follows the README reference image: white/silver rounded ends, one uninterrupted dark panoramic glass face, green waist band carried onto the cowl flanks, low dark skirt, and LED head/marker lights below the glass. The cowl is a sacrificial weather/aero/sensor fairing over a steel crash frame; it is not the buff, collision, coupler, or anti-climber load path.

The production shape should be authored in a surface-modelling package suited to styled fiberglass work. The parametric `sensor_cowl.py` geometry is an envelope and interface proxy; it is not intended to be the final class-A exterior surface. The released cowl CAD should come from surface/NURBS or SubD modelling, then be exported as neutral STEP or IGES surfaces with separate mould, trim, flange, and inspection geometry.

## Envelope

| Parameter | Value | Notes |
|---|---|---|
| Module role | identical A-end/B-end kit | Same mould set and drawing set for both train ends |
| Along-track length | 1 800 mm | Overlay inside the 17 m end-car envelope |
| Car interface width | 2 850 mm | Matches `CarDimensions.body_width_mm` |
| Car interface height | 3 450 mm | Matches `CarDimensions.body_height_mm` |
| Leading-face width | 1 800 mm | Rounded/tapered visual face |
| Leading-face height | 2 800 mm | Allows roof cap transition into body |
| Panoramic glass opening | 1 500 mm x 1 780 mm | One heated laminated pane |
| Exterior corner target radius | >= 200 mm | Keep edges easy to laminate and repair |
| Nominal panel mass target | <= 180 kg per end kit | Excludes glass, T-OBS, coupler, and crash absorber |

## Fiberglass cast split

The end cowl is built as a multi-part fiberglass (GFRP) kit so it can be made in modest female moulds, repaired locally, and removed after minor collision damage without cutting the steel body.

| ID | Cast part | Qty per end | Function | Main interfaces |
|---|---|---|---|---|
| CWL-FRP-01 | Upper brow and roof cap cast | 1 | Blends roof into the black glass surround and sheds rain above the pane | Roof bow tabs, upper backing ring, washer nozzle covers |

| ID | Cast part | Qty per end | Function | Main interfaces |
|---|---|---|---|---|
| CWL-FRP-02 | Left cheek side-return cast | 1 | Tapered side surface, green livery continuation, side split-line closure | Left side frame tabs, backing ring, lower apron |
| CWL-FRP-03 | Right cheek side-return cast | 1 | Mirror of CWL-FRP-02 | Right side frame tabs, backing ring, lower apron |
| CWL-FRP-04 | Lower apron and anti-climber cover cast | 1 | Lower rounded nose, lamp recess support, removable access to coupler recovery space | Lower crash-frame tabs, lamp pods, skirt edge |
| CWL-FRP-05 | Lamp/washer service hatch casts | 2 | Replaceable local covers around LED clusters, washer manifold, and service fasteners | M6 captive fasteners, gasketed edge, lamp bracket |
| CWL-FRP-06 | Sectional backing-ring flange casts | 4 | Bond/bolt land behind glass carrier and cast split lines; carries seals, not crash loads | Steel crash ring, glass carrier, EPDM seals |

The cheek casts may use mirrored moulds, but they keep the same datum scheme and hole pattern. The full end kit is duplicated at the other end of the train without changing sensors, lamps, glazing, wiring exits, or maintenance access.

## Laminate and materials

| Region | Nominal construction | Notes |
|---|---|---|
| Broad brow/cheek/apron skins | Fire-rated E-glass or basalt-fibre/vinyl-ester sandwich, 16-24 mm total | Foam or honeycomb core only in broad low-load panels |
| Split-line flanges and bolt lands | Solid GFRP, 6-10 mm | No core at fasteners, seals, jacking-prone edges, or repair trim lines |
| Insert pads | Local solid laminate build-up plus potted stainless or GFRP hard points | M6/M8 service fasteners; M10 only where the steel bracket owns load |
| Exterior finish | White/silver gelcoat or paint over primer | Must accept green livery film/paint band |
| Inner finish | Light-colour fire-rated coating | Allows crack and water-ingress inspection |
| Seals | EPDM or silicone rail-rated gasket/sealant | Continuous drain path below glass and hatch seams |

All passenger-facing or exposed composite materials need EN 45545-2 HL2 or locally accepted equivalent evidence. The composite supplier owns resin selection, laminate coupons, fire/smoke/toxicity evidence, insert pull-out data, repair instructions, and batch traceability.

## Tooling rules

- Build the visible A-surface first in the surface modeller, using the README image and package envelope as references.
- Derive B-surfaces, nominal laminate thickness, return flanges, split flanges, hatch offsets, and trim curves from that controlled A-surface.
- Export neutral surface CAD for design review and mould manufacture; keep the parametric FreeCAD/Python model as the envelope, integration, and documentation proxy.
- Use female moulds with removable split flanges; no one-piece bathtub mould that traps the part.
- Minimum mould draft: 3 degrees on return flanges and hatch pockets.
- Minimum exterior radius: 75 mm on cosmetic edges, 125 mm preferred at roof and cheek transitions, 200 mm at the large outer corners.
- Keep split lines on visual shadow lines: roof-to-glass brow, cheek-to-front face, apron-to-skirt, and lamp hatch surrounds.
- Add 35-50 mm internal lap flanges at cast-to-cast seams.
- Provide witness holes or bond-line tell-tales where adhesive closure is hidden after assembly.
- First article may be hand lay-up or vacuum infusion; production should prefer vacuum infusion where the supplier can control resin fraction and repeatability.

## Structural interfaces

The steel end frame remains the certified load path. The fiberglass kit attaches to secondary tabs and a bolted backing ring:

- M8 stainless/captive fastener grid at 180-250 mm pitch around the steel cowl ring.
- Slotted holes only in fiberglass flanges, never in the steel crash datum.
- Nylon/GFRP isolation washers where stainless fasteners meet coated steel or mixed-metal inserts.
- Structural adhesive or elastic sealant between fiberglass and secondary rails for weather sealing and vibration control.

- Separate earth straps for heated glass, lamps, washer heater, and T-OBS hardware; do not rely on composite continuity.
- Drain holes at the lower apron and glass carrier, routed away from coupler electronics and the T-OBS backplate.

## Glazing, lamps, and sensors

The cowl fitout is now separated into `LM3-FAS-P010` panoramic glass carrier, `LM3-FAS-P020` reversible lamp cassette/aiming tray, and `LM3-FAS-P030` seal/drain/washer closeout kit. Their checking nest and lamp aiming jig are defined in `dedicated-parts-and-moulds.md`.

The cowl carries one large heated RF-transparent laminated glass pane in a dark bonded carrier. The carrier bolts to the steel-backed ring through the fiberglass flange, so a damaged cast can be removed without discarding the glass if the pane is intact. Any necessary structural support, heater traces, sensor brackets, or busbars must sit behind the black edge band or read visually as part of the dark glass, not as visible vertical dividers.

The LED headlamp/marker-light cassette is symmetrical: either train end can lead or trail. Software decides head/tail aspect; the physical lamp and harness are identical. The T-OBS LIDAR, radar, stereo camera, and ultrasonic pack sits behind the same glass/sensor aperture at both ends, with washer nozzles and heater busbars accessible through CWL-FRP-05 and the upper brow service covers.

## Assembly sequence

1. Survey the steel end ring and secondary cowl tabs after body corrosion coating.
2. Trial-fit CWL-FRP-06 backing-ring flange sections and shim to the steel datum.
3. Fit CWL-FRP-01, CWL-FRP-02, CWL-FRP-03, and CWL-FRP-04 dry with temporary fasteners; check split gaps and door/platform clearance.
4. Surface-prepare steel and fiberglass bond/seal lands.
5. Install backing-ring flanges, cheek casts, upper brow, lower apron, and hatch casts with adhesive/sealant and retained fasteners.
6. Install the glass carrier, laminated panes, heater/washer harness, LED lamp cassettes, and T-OBS module.
7. Complete water-ingress, heater, washer, lamp aspect, T-OBS calibration, and removable-hatch access tests.

## Making instructions

### 1. Surface and mould release

1. Freeze the LM3-BDY-155 A-surface, B-surface, split lines, trim curves, flange returns, glass-carrier land, hatch openings, and insert map.
2. Manufacture female moulds for CWL-FRP-01 through CWL-FRP-06. Use removable mould flanges at cheek/apron/brow split lines.
3. Polish, seal, and release each mould per the tooling-resin supplier procedure. Record mould ID, release system, operator, date, and number of pulls since last reconditioning.

Hold point: mould surface and release record accepted before lay-up.

### 2. Lay-up / infusion

1. Cut dry glass/basalt reinforcement plies and core sheets from the released ply book; mark fibre direction and part ID.
2. Lay gelcoat or primer-compatible surface coat where the process uses in-mould finish.
3. Lay outer plies, core only in broad low-load skins, solid-laminate flange/insert zones, and inner plies.
4. Fit potted inserts and doubler pads only into solid laminate build-up zones; do not place inserts into core.
5. Hand lay-up or vacuum infuse. Record resin batch, catalyst/hardener batch, pot life, ambient temperature, vacuum level if used, and cure time.
6. Cure and post-cure per resin supplier procedure. Keep one laminate coupon with every resin batch and cure cycle.

Hold point: coupon, cure, resin batch, and visual void/dry-fibre checks accepted before demould.

### 3. Demould, trim, and drill

1. Demould without prying on visible A-surfaces or glass-carrier lands.
2. Trim parts in the cowl trim fixture; never freehand trim a split line or glass land.
3. Drill fastener, insert, drain, washer, lamp, and service-hatch holes from controlled drill bushes.
4. Seal all cut edges and drilled holes.
5. Dry-build CWL-FRP-01 through CWL-FRP-06 on LM3-TL-COWL-09 and measure split gaps, flange alignment, lamp pocket position, and glass-carrier land.

Hold point: trim-line survey, insert pull-out sample, edge-seal inspection, A/B interchange check, and dry-build water path accepted.

### 4. Finish and repair sample

1. Release the qualified white/silver gelcoat or base coating. Apply the green waist-band continuation as pre-cut rail-use film where its substrate, fire, edge, cleaning and removal evidence is accepted; otherwise use the released paint route.
2. Fit gaskets, retained fasteners, drain sleeves, washer-nozzle covers, and hatch tethers.
3. Make a sacrificial cheek/apron repair coupon from the same laminate and demonstrate sand/fill/recoat before accepting the first article.

Hold point: finish DFT/visual record, gasket compression, repair coupon, and removable-hatch trial accepted.

## Inspection and release evidence

| Evidence | Acceptance intent |
|---|---|
| Laminate coupon pack | Fire rating, resin/fibre fraction, cure record, material batch trace |
| Insert pull-out test | Confirms service fasteners and flange hard points survive repeated removal |
| End-ring dimensional survey | Confirms the cowl kit fits the steel datum without forcing the glass carrier |
| Split-line and water test | No water path into T-OBS, glass heater busbar, coupler head, or saloon floor |
| Lamp and sensor calibration | Both A-end and B-end kits meet identical sightline and aspect checks |
| Repair demonstration | Sand/fill/recoat of a damaged cheek/apron sample without replacing steel |

## v2 drawing outputs

The v2 drawing pack shall issue these as controlled drawings under LM3-BDY-155:

- mould split and trim drawings for CWL-FRP-01 through CWL-FRP-06,
- controlled exterior A-surface, B-surface, flange, trim, and mould surface exports from the surface modeller,
- laminate schedule and ply drop/overlap maps,
- insert and fastener map,
- steel backing-ring and shim interface drawing,
- glass carrier and seal land drawing,
- lamp/sensor hatch service drawing,
- repair-zone and allowable damage map,
- first-article dimensional inspection form.

# Simplified exterior finish: base protection, livery film and cool roof

Repository source: `docs/rolling-stock/light-metro-3car/exterior-finish-process.md`

The simplified process removes most masked multi-colour painting, not the protective systems beneath it. The production sequence is:

1. qualified corrosion protection on steel;
2. white/light-neutral in-mould gelcoat or compatible base coating on GFRP;
3. pre-cut, replaceable graphic film for the green waist band, logos and local colour blocks;
4. a separately qualified high-reflectance roof coating on exposed roof fairings only.

## What film can and cannot replace

Film can replace decorative colour-band masking and repainting on smooth, fully cured, accepted substrates. It cannot replace steel primer/topcoat, cavity wax, edge sealing, composite gelcoat/base protection, fire barriers, anti-slip surfaces, structural adhesive, weather seals, safety markings or electrical insulation/bonding.

The reference procurement row is `LM3-FIN-P010`: a bay-numbered, pre-cut film kit with controlled overlaps, edge treatment, datum marks and repair patches. Use a current film system whose manufacturer explicitly supports rail-vehicle graphics. 3M's current rail bulletin requires pre-installation inspection, clean substrate preparation, application controls, quality inspection, maintenance and removal procedures; its rail catalogue includes IJ180-class film. That makes it a useful procurement anchor, not an automatic LM3 approval.

Primary references:

- 3M Application: Rail instruction bulletin
- 3M Controltac Graphic Film 180mC product page

The selected film, ink, overlaminate and edge system still require project fire, adhesion, temperature, UV/weather, cleaning-chemical and removal evidence on the actual cured GFRP/steel base finish.

## Film manufacturing and application route

| Seq. | Operation | Evidence |
|---|---|---|
| 10 | Freeze colour artwork, module/bay seams, door/window/cowl breaks, logos and prohibited zones | Approved livery map and cut files |
| 20 | Complete and sign substrate inspection; verify full paint/gelcoat cure, repair defects and clean by selected supplier process | Per-car pre-installation record |
| 30 | Plot/cut and label left/right/bay/cowl pieces on `LM3-TOOL-FILM-TEMPLATE`; make an adhesion/removal coupon | Cut-kit map and accepted coupon |
| 40 | Dry-apply from controlled datum; squeegee air to open edges; keep knives off the vehicle finish | Installer and environment record |
| 50 | Finish seams/edges and post-heat only where the selected system requires it | Edge/overlap inspection map |
| 60 | Water/wash inspect and demonstrate local patch plus complete 1 m module removal | Appearance, ingress and repair record |

Film terminates before EPDM joints, drains, captive fasteners, glass edges, lamp apertures, bonding points, safety labels and access lands. Prefer each graphic piece to stay on one replaceable 1 m module so collision repair does not require stripping an adjacent good panel.

## Calcium-carbonate radiative roof candidate

Purdue's 2020 open paper demonstrated a single-layer CaCO3-acrylic research paint with 95.5% solar reflectance and 0.94 normal emissivity in the atmospheric window. Those values are useful initial screening targets, not guaranteed vehicle values. The paper does not establish rail fire compliance, adhesion to the LM3 laminate, flexibility under vibration, erosion, depot-wash durability, soiling behaviour, repairability or aged optical performance.

Primary research:

- Li et al., Full Daytime Sub-Ambient Radiative Cooling in Commercial-like Paints
- Purdue-hosted open paper PDF

`LM3-FIN-P020` is therefore `concept`/trial-only. It cannot be promoted to a trainset production finish until this gate is passed:

| Gate | Minimum evidence |
|---|---|
| Formulation | Controlled binder, CaCO3 particle-size distribution/concentration, additives, shelf life, mixing and application window |
| Rail material | Fire/smoke/toxicity and chemical compatibility accepted for the deployment case |
| Substrate | Adhesion, flexibility/thermal cycling, edge compatibility and repair on the actual GFRP base system |
| Exposure | UV, humidity, heat, rain, dust/sand, abrasion and depot-wash ageing |
| Optical | Measured solar reflectance and thermal/sky-window emittance when new and after ageing/soiling/cleaning |
| Operations | Glare/visibility, runoff, cleaning, damage inspection and local repair procedure |
| Vehicle trial | One-car A/B roof-zone temperature, HVAC energy, soiling and maintenance comparison through representative hot service |

The trial mask excludes PV surfaces/clamps, HVAC air and heat-exchanger paths, antennas/sensors, walkways, lifting covers, earth bonds, glands, drains, seals, labels and service lands. No HVAC-energy or passenger-temperature saving is claimed until the one-car trial measures it.

## Factory simplification result

The body cell retains one small controlled coating capability for steel repair, GFRP edge repair and the roof candidate. It no longer needs to mask and spray the full green/silver livery scheme. White GFRP parts can leave the mould with their qualified base surface, while numbered film kits move decorative work to a clean, low-dust application bay and make one-metre collision repairs local.

# Fabrication plan — light-metro-3car

Repository source: `docs/rolling-stock/light-metro-3car/fabrication-plan.md`

This plan turns the v1 rolling-stock package into a buildable factory route for the first `light-metro-3car` trainset. It favours ordinary regional manufacturing capability: saw/laser/plasma cutting, press-brake bending, MIG/MAG welding, dry clip-on fiberglass body modules, limited qualified adhesive bonding, bolted module installation, and COTS rail/bus subsystems.

It is not a homologated shop drawing pack. The v2 pack must add dimensioned drawings, weld symbols, tolerances, FEA, supplier installation manuals, and authority-approved inspection records.

Solar metro production assembly concept

The production concept is deliberately modular: make the steel datum structure locally, install certified supplier modules late, and repeat the same 16.5 m car body to form the trainset.

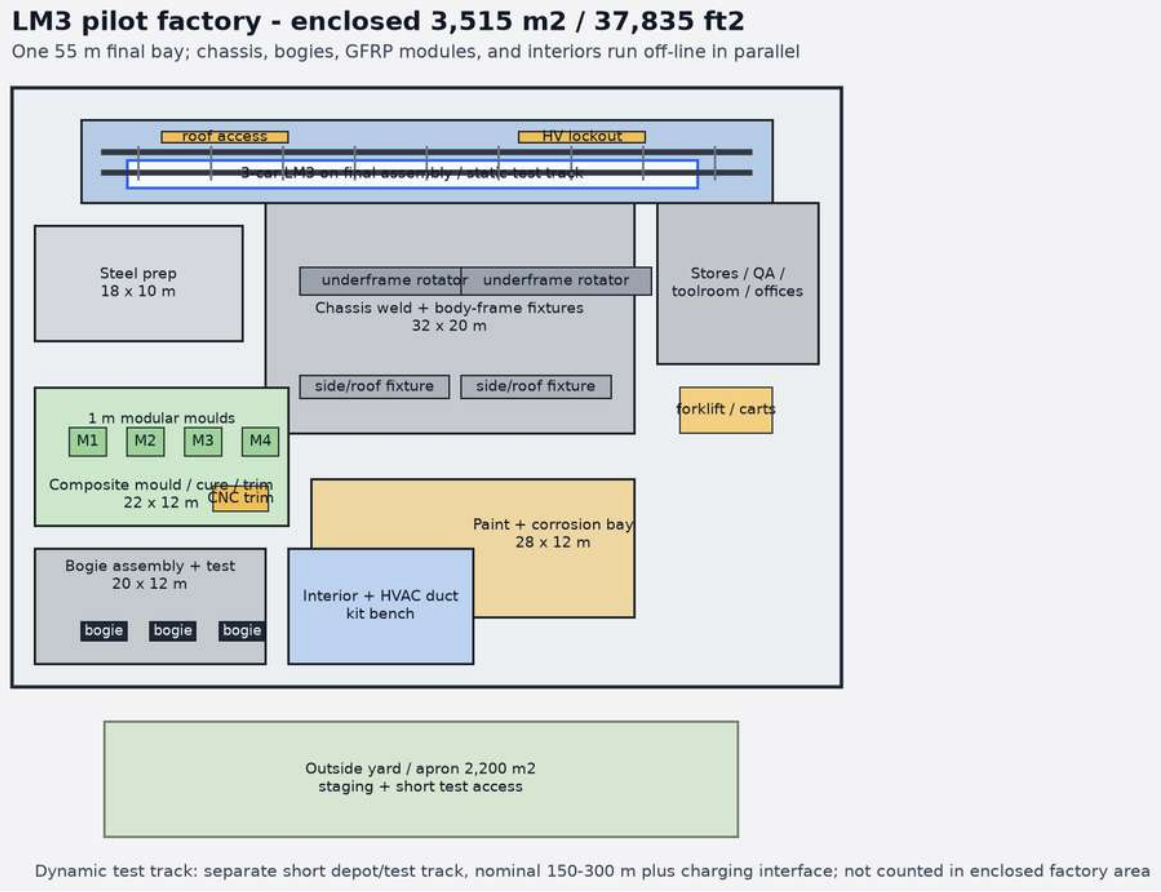
## Manufacturing doctrine

| Scope | Default decision | Reason |
|---|---|---|
| Primary structure | MAKE: cut/bend/weld S355 steel | Available in rail, truck, ship, oilfield, and bridge workshops |
| Side/roof body modules | MAKE/BID: 1 m-wide clipped fiberglass modules from reusable short moulds | No full-car mould or production adhesive cure; corrosion resistant and locally replaceable |
| Nose panels | BID/SOURCE: multi-part fiberglass end-cowl casts | Styled sacrificial shell retains its separate gasket/adhesive process over the steel crash frame |
| Doors | BID: COTS electric rail door cassette | Certified obstacle detection, locking, seals, emergency release |
| Windows | SOURCE/BID: COTS bonded/gasketed glazing | Avoids bespoke glass certification |
| HVAC | SOURCE/BID: packaged roof unit | Mature hot-climate bus/rail supply chain |
| Lighting | SOURCE: rail/bus LED modules | Commodity, low-voltage, easy replacement |
| Passenger interior | SOURCE/BID: bus/rail seats, rails, PIS, CCTV | Keeps OSR focused on interfaces and safety evidence |
| Cabin fiberglass liners/trims | MAKE/BID: fire-rated FRP or phenolic ceiling, sidewall, battery-strake, and vestibule panels | Same low-cost composite cell as the cowls; replaceable passenger-facing trim |
| Bogie frame | MAKE fresh OSR powered/trailer frames under controlled weld procedure | Structural rail part; can be local but must be qualified; recovered freight frames are not used |
| Wheelsets, bearings, brakes | BID/SOURCE | Safety-critical rotating/brake parts stay supplier-certified |
| Traction, batteries, BMS | BID/SOURCE | Supplier qualification and test evidence required |

# Factory cells

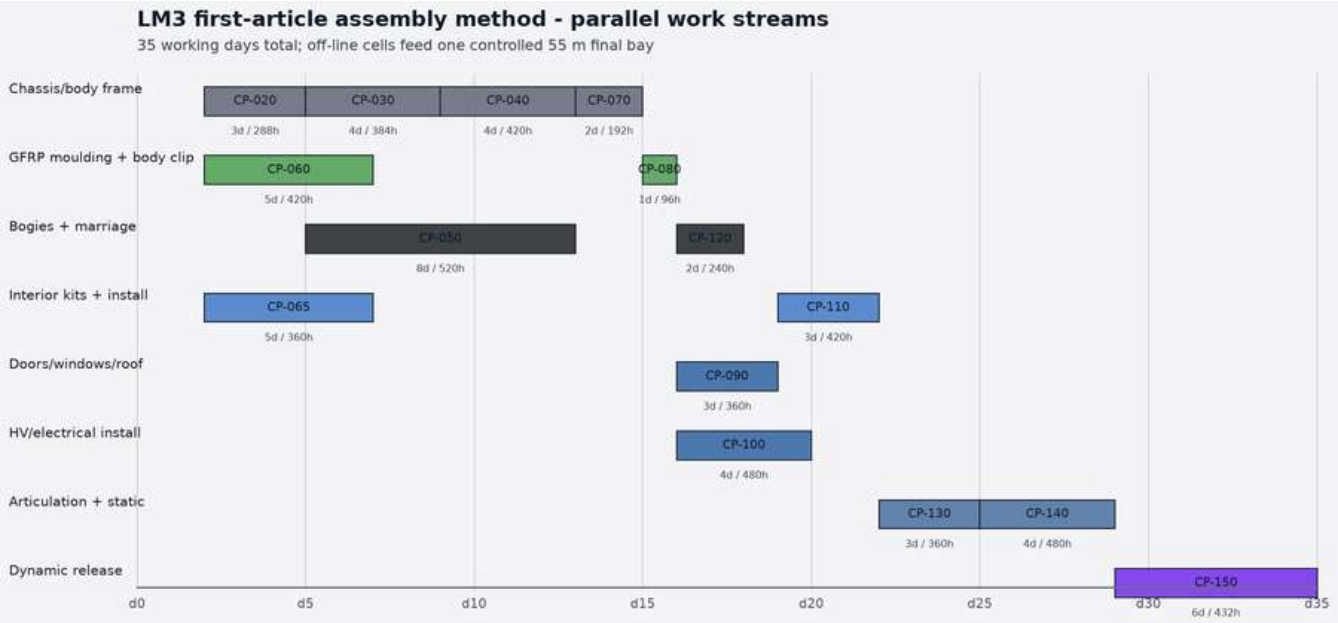
The first factory needs five cells, not a full legacy rolling-stock plant:

The generated numeric sizing is controlled in `factory-plan.md`: 3,515 m2 enclosed pilot factory, 2,200 m2 outside yard/test apron, 13 working days for chassis/painted frame fabrication, 13 working days for bogie build and bogie-to-carbody integration, 14 working days for GFRP moulding plus clip-on body installation, and 13 working days for final assembly plus static commissioning inside the first-article 35-working-day network. It also lists the rough machinery package at about $1.02M including setup contingency, excluding building/land and homologation laboratory equipment.



LM3 pilot factory layout

The generated layout keeps the long final track for accepted kits only: steel cutting, chassis/body-frame fixtures, moulding, bogie assembly, interior/HVAC kit work, corrosion protection/base finish, stores, QA, and yard staging run beside it instead of blocking it.



The first-article method plan splits the 35-working-day build into parallel streams so the constrained final bay receives released chassis, GFRP, bogie, interior, door/window, roof, HV, articulation, and static test work at the latest practical point.

1 Steel prep cell

- CNC saw or tube laser for RHS.
- Plasma/laser/waterjet table for plate.
- Press brake for folded bolsters, coupler pockets, trays, and brackets.
- Drill/mill for datum holes and bolted inserts.

2 Weld and fixture cell

- Underframe rotating fixture.
- Side-frame fixture.
- Bogie-frame fixture.
- Certified MIG/MAG equipment.
- Weld fume extraction and preheat capability where WPS requires.

3 Paint and corrosion cell

- Shot blast or outsourced blast booth.
- Zinc-rich epoxy primer.
- Seam sealing and cavity wax station.
- Topcoat booth for exposed steel and brackets.

4 Composite and glazing cell

- Reusable one-metre side-module and roof-module moulds with released A-surfaces, local-core maps, solid clip lands, and insert boss features.
- One-metre module trim/drill gauge and master-frame trial-fit stand.
- Resin, fibre, core, gelcoat/paint-primer, release-system, cure-record, and witness-coupon control for each moulded batch.
- End-cowl cast trim/drill jigs or incoming-inspection fixtures for supplier-made fiberglass casts.
- Clip/anti-lift proof fixture and dry-seal inspection tools.
- Small controlled cure area for glazing and end-cowl non-service seams only.
- Window bonding/gasket installation.

5 Final assembly and commissioning cell

- Level track or assembly stands.
- Bogie drop/lift equipment.
- Roof access for HVAC and antennas.
- HV isolation tools and test equipment.
- Door calibration, lighting/PIS/CCTV checks, brake tests.

## Sheet-metal tooling package

The v2 drawing pack shall release the following tooling before first steel cut. The tooling is intentionally ordinary: press-brake tooling, laser-cut fixture plates, bolted datum towers, and removable clamps rather than legacy carbody megajigs.

| Tooling ID | Tool | Purpose | Required accuracy |
|---|---|---|---|
| LM3-TL-UNDERFRAME-01 | Underframe rotating weld fixture | Holds side sills, cross-bearers, bolsters, coupler pockets, and battery trays | ±1.5 mm on bogie centres; ±2.0 mm on door datum plane |
| LM3-TL-BOLSTER-02 | Bolster box subfixture | Pre-welds folded bolster boxes, air-spring pads, and pivot boss backing plates | ±0.5 mm before line-bore |
| LM3-TL-COUPLER-03 | Coupler pocket fixture | Keeps crash-can plate, shear plate, and pocket inserts square to train centreline | ±0.75 mm on coupler face datum |

| Tooling ID | Tool | Purpose | Required accuracy |
|---|---|---|---|
| LM3-TL-SIDE-04 | Side-wall post/rail fixture | Locates door portals, window posts, waist rail, and cant rail | ±1.0 mm at door cassette opening |
| LM3-TL-ROOF-05 | Roof bow fixture | Holds roll-formed roof bows and HVAC rail inserts | ±1.5 mm on HVAC rail pitch |
| LM3-TL-PANEL-06 | One-metre side/roof module mould and trim/drill fixture | Moulds GFRP side/roof modules, locates solid clip lands and potted inserts, then CNC trims solid/window/door/roof variants from the common datum | ±0.5 mm on clip grid; ±1.0 mm on trim edge |
| LM3-TL-DOOR-07 | Door cassette fit-up gauge | Confirms COTS door cassette envelope, threshold, and lock-loop bracket clearances | Supplier installation tolerance |
| LM3-TL-HV-08 | Battery tray/service-lid gauge | Checks tray drainage, lid gasket land, HV cable gland reach, and seat-base clearance | ±1.0 mm on service-lid gasket land |
| LM3-TL-COWL-09 | Fiberglass end-cowl cast fit-up fixture | Holds CWL-FRP-01 through CWL-FRP-06 to the steel backing-ring datum and checks split-line gaps, insert pitch, glass carrier land, and lamp/sensor hatch access | ±1.0 mm on glass-carrier land; ±2.0 mm on cast split gaps |
| LM3-TL-INT-10 | Cabin ceiling liner buck and trim fixture | Moulds/trims ceiling liners, light troughs, HVAC plenum covers, and service lids | ±1.0 mm on light/HVAC apertures |
| LM3-TL-INT-11 | Cabin sidewall/window reveal drill fixture | Locates sidewall liners, window reveals, cable covers, clips, and retained fasteners | ±0.75 mm on clip/fastener pitch |
| LM3-TL-INT-12 | Battery strake cover and hatch gauge | Checks under-seat FRP covers, service hatch removal, HV labels, and seat-base fairing clearances | Hatch removable without seat removal |
| LM3-TL-INT-13 | Door/PRM transition trim fixture | Checks vestibule kick panels, step covers, threshold trims, anti-slip strips, and contrast nosing | PRM transition accepted by gauge |

The current CAD manufacturing templates generated from `design/component-catalogue` are tracked as parametric source and FreeCAD review artifacts:

| Template/source | Use |
|---|---|
| `main_frame()` | Underframe ladder, formed sills, cross-bearers, bolsters, battery trays, coupler pockets |
| `body_sheet_metal_kit()` | Whole body/chassis sheet-metal kit: underframe, side posts, door portals, waist/cant rails, roof bows, end rings |
| `fiberglass_cladding_system()` / `modular_fiberglass_body.py` | One-metre GFRP side/roof module grid, clip hardware, EPDM joints, module numbering, and one-shift installation route |
| `sandwich_panel()` | Legacy sandwich-panel aperture and retainer template retained only as a detail reference for non-structural local panels |
| Surface-modelled LM3-BDY-155 cowl CAD | Final fiberglass cowl A-surface, B-surface, flanges, trim curves, and mould surfaces |
| `sensor_cowl()` | Identical A/B-end fiberglass cowl envelope, single panoramic glass, lamp/service hatches, and T-OBS visual interface |
| `door_leaf()` | COTS-style door leaf shell, bonded glazing, EPDM seals, hanger rollers |
| `chassis_interface_assembly()` | Bolster, bogie adapter, motor cradle, guide blocks, fasteners, service strut, connector interfaces |

For a visual map of which COTS modules bolt, bond, plug, or slide into these fabricated datums, see `cots-integration.md`.

# Build sequence per car

## 1. Kitting

- Issue tube cut list, plate flat patterns, brackets, inserts, and supplier interface drawings.
- Export NC data directly from the v2 flat-pattern drawings; each part receives a QR/etched part ID before forming.
- Mark every primary steel member with heat/batch traceability.
- Stage COTS modules by car number: doors, windows, HVAC, lighting, seats, intercom, CCTV, PIS, battery pack, inverter, auxiliaries.
- If a brownfield deployment proposes donor axles or axlebox hardware, quarantine them in a separate incoming-inspection lot until cleaning, dimensional survey, UT/MT inspection, and supplier acceptance are complete.

Hold point: material certificates and supplier certificates accepted before cutting.

## 2. Underframe

- Cut side sills, centre spine, cross bearers, battery rails, and folded plate boxes.
- Press-brake side sills, bolster webs, coupler-pocket plates, battery-tray lips, and service-lid gutters using matched V-dies.
- Tack in underframe fixture from centre datum outward.

- Weld side sills, cross bearers, bolster boxes, coupler pocket, and battery/equipment supports.
- Fit temporary anti-pull bars across door openings and side sills before long weld runs.
- Stress-relieve or controlled-cool where required by WPS.
- Machine or line-bore centre-pivot and critical mounting inserts after welding.

Hold point: dimensional survey, visual weld inspection, MT/UT on CL1/CL2 joints, bogie-centre datum report.

## 3. Side frame and roof frame

- Weld door posts, window posts, waist rail, cant rail, and roof bows on the side-frame fixture.
- Trial-fit a COTS door cassette gauge before welding the portal reinforcement closed.
- Lift side frames onto underframe datum pads.
- Weld/bolt side frames to underframe as specified by v2 drawings.
- Install roof equipment rails and cable tray brackets.

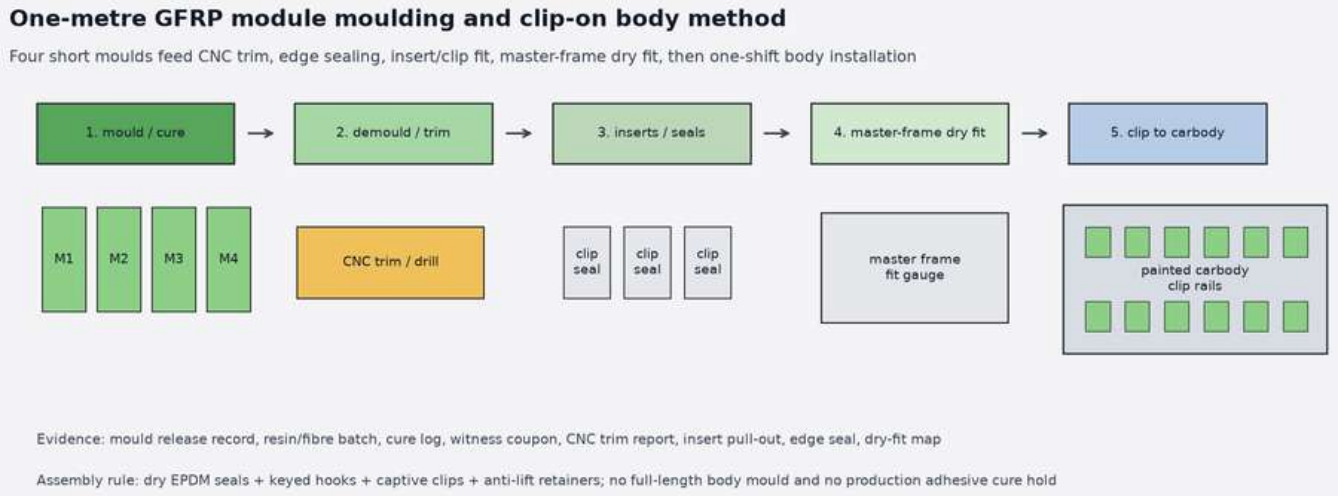
Hold point: door aperture survey against chosen COTS door cassette; window aperture survey against chosen glazing cassette.

## 4. Corrosion protection

- Blast exposed steel to Sa 2.5.
- Apply zinc-rich primer and topcoat system.
- Seal lap joints and composite bond interfaces.
- Apply cavity wax after all hot work and inspection is complete.

Hold point: dry-film thickness report and sealed-drain checklist.

## 5. One-metre composite exterior



GFRP module moulding and clip-on body method

- Before final assembly, fabricate each 1 m side and roof module in the released mould: clean and inspect the mould, apply release system and UV-stable gelcoat/paint-primer, cut glass-fibre plies and local core, lay up solid clip lands and insert bosses, infuse or wet-lay the laminate, cure, demould, retain witness coupons, CNC trim/drill the selected solid/window/door/roof variant, and seal all cut edges.
- Fit potted/captive inserts, keyed hooks, anti-lift features, drain details, and EPDM seals to each module, then dry-fit against the master frame before kitting by car side, roof bay, and serial number.
- Stage 96 numbered side modules and 48 roof modules for the three-car trainset. Verify all CNC-trim variants against the common 1,000 mm gauge.
- Put all three painted, dimensionally released frames in the body cell and assign two two-person crews per car.
- Fit dry EPDM seals, hang each module from its asymmetric keyed hook, close captive over-centre clips, and engage the independent anti-lift retainer.

- Record visible witness marks against the digital module map; do not use a clip to pull an out-of-tolerance frame or panel into position.
- Complete the three-car side/roof installation, water test, rattle check, and snag release inside one eight-hour shift per LM3-BDY-160.
- Separately trial-fit skirts and the identical A/B-end fiberglass cowl kit.
- Dry-build CWL-FRP-01 upper brow, CWL-FRP-02/03 cheek casts, CWL-FRP-04 lower apron, CWL-FRP-05 lamp/service hatches, and CWL-FRP-06 backing-ring flanges on the end-cowl fit-up fixture.
- Use the module drill jig to install captive clip receptacles and anti-lift hardware. Side/roof body-to-frame joints receive no production adhesive.
- Fit removable skirt panels with quarter-turn or captive fasteners. Fit cowl hatches with retained fasteners and continuous gasketed drain paths.

Hold point: signed module/clip map, laminate coupons, insert and clip proof, edge-seal record, mould release and cure records, eight-hour route record, water/rattle test, split-line cowl water test, applicable cowl/glazing adhesive cure records, and removable-panel access check.

## 6. COTS doors and windows

- Install door cassette into prepared structural bay.
- Install threshold, drainage, seals, and emergency release hardware.
- Install fixed or vented glazing cassettes.
- Connect door power, hardwired closed-and-locked loop, Ethernet/CAN, and local service connector.

Hold point: water ingress test, door obstruction test, emergency release test, closed-and-locked circuit test.

## 7. Roof systems

- Install packaged HVAC units onto roof rails.
- Install antennas, marker lights, CCTV housings, and regen resistor.
- Connect ducting to interior cassette.
- Fit removable composite roof fairings around service envelopes.

Hold point: roof leak test, HVAC condensate drain test, lifting and fall-arrest access check.

Roof and side modules locate on precision keyed datums. The asymmetric hook prevents reversal; captive clips provide clamping and the separate anti-lift feature provides fail-safe retention. Record the locator survey, latch witness map, earth-bond resistance, water test, and timed module removal. Active services are installed in moulded empty routes and are never laminated into the composite.

## 8. Interior cassette

- Install floor boards and removable hatches.
- Install fire-rated FRP/phenolic ceiling liners, light troughs, sidewall/window reveals, cable covers, under-seat battery strake covers, vestibule kick panels, PRM ramp/step covers, and door-pocket trims from `cabin-fiberglass.md`.
- Install under-seat battery enclosure covers and service locks.
- Install seats, grab rails, lighting, PIS, speakers, CCTV, intercom, emergency signage, and fire extinguishers if locally required.
- Install cable harnesses as pre-terminated looms, not loose field wiring.

Hold point: egress width check, sharp-edge check, service-panel removal trial, rattle check, lighting lux test, fire-material certificate pack complete.

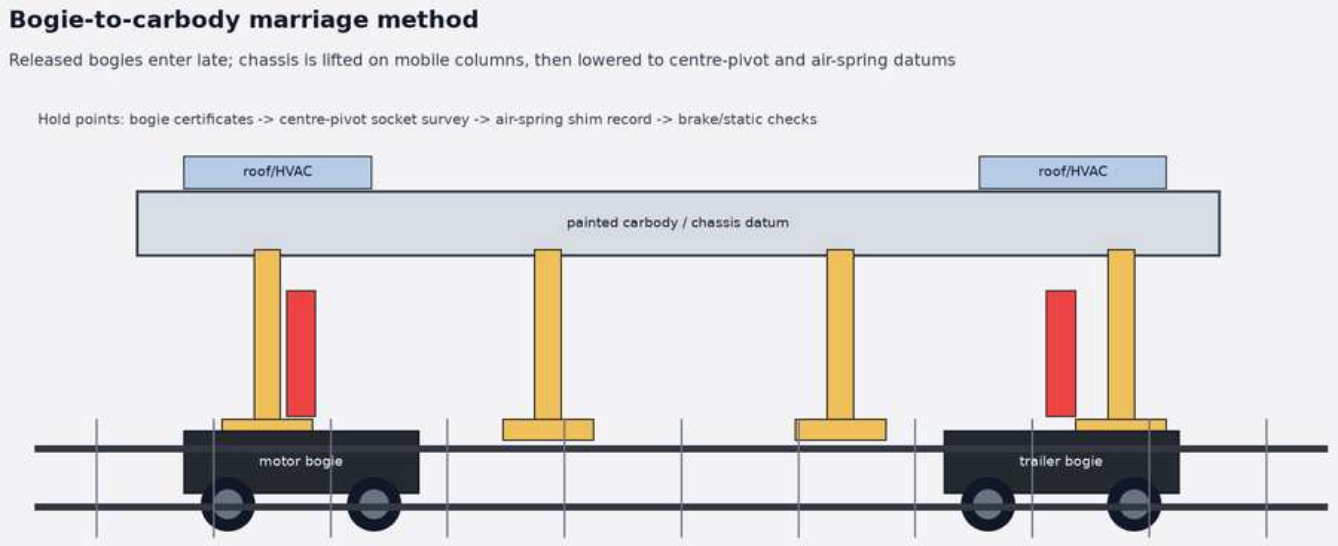
## 9. Power and traction equipment

- Install battery packs in under-seat cassettes.
- Install six motor controllers, isolated LV DC/DC converters, HV contactors, cooling loops, temperature/off-gas detection, outward module vents, and the per-car battery water-mist reservoir/pump/pipe/nozzles.

- Pressure-test coolant loops before energisation.
- Perform insulation resistance and HV interlock loop tests.

Hold point: HV safety sign-off before first energisation.

## 10. Bogie marriage and commissioning



Bogie-to-carbody marriage method

- Assemble powered and trailer bogies separately.
- Build one powered bogie and one trailer bogie through full weld, dimensional, NDT, wheelset, brake, suspension, and harness inspection before committing the remaining four bogies.
- Reject recovered freight bogie frames. Only accepted donor axles or axlebox hardware may enter the OSR bogie build, and only with the inspection records linked to the vehicle serial file.
- Drop carbody onto bogies using surveyed bolster datums.
- Connect traction, brake, WSP, tachometer, bearing-temperature, and suspension interfaces.
- Run static brake test, door test, HVAC test, lighting/PIS/CCTV test, battery charge/discharge test, and low-speed yard movement test.

Hold point: first-article inspection release before dynamic testing.

# COTS interface rules

The carbody must reserve supplier-neutral interfaces:

| Module | OSR fixes | Supplier owns |
|---|---|---|
| Door cassette | Opening envelope, structural datum, power, data, hardwired lock loop, drainage path | Door mechanics, controller, seals, obstacle detection, emergency release |
| Window cassette | Opening envelope, bond/gasket land, drainage, replacement access | Glass laminate, frame, adhesive/gasket, certification |
| HVAC | Roof rail pattern, power budget, duct opening, condensate route, service clearance | Refrigerant circuit, controls, compressor, fans, fire certificate |
| Battery mist | Reservoir/pump bracket, stainless-pipe route, nozzle datums, drain and service access | Qualified pump/nozzle hardware, flow/pressure sensors, component certificates |
| Lighting | 24 V DC rail, mounting pitch, lux target, emergency mode input | Luminaire, diffuser, driver electronics |
| Seats/grab rails | Floor/sidewall insert grid, strength target, envelope | Seat shell, upholstery, rail clamps, fire certificates |
| PIS/CCTV/intercom | Power/data connector, field of view or visibility target | Device hardware, firmware, certificates |

No primary steel member should be redesigned when a COTS supplier is changed. Supplier changes should require only adapter plates, harness tails, software configuration, and certification paperwork updates. The detailed envelopes and incoming-inspection evidence are maintained in the `control-electronics/trainset-interiors.md` catalogue.

## Inspection gates

| Gate | Evidence |
|---|---|
| G0 material release | Mill certificates, supplier certificates, incoming inspection |
| G0B recovered-component release | Quarantine record, cleaning record, dimensional report, UT/MT/NDT evidence, supplier sign-off for any donor axle/axlebox item |
| G1 frame complete | Dimensional survey, weld map, NDT report, traceability register |
| G2 corrosion complete | Blast record, coating DFT report, cavity wax checklist |
| G3 shell complete | Composite cure records, water test, removable-panel access report |
| G4 COTS systems fitted | Door/window/HVAC/lighting supplier acceptance records |
| G5 electrical safe | Insulation resistance, bonding/earthing, HVIL, functional safety I/O |
| G6 static complete | Brake, door, HVAC, lighting, battery, communications, fire detection |
| G7 dynamic ready | Weighing, ride-height, bogie alignment, low-speed movement release |

## First-article constraints

- Build one carbody first, not a full three-car batch.
- Build one powered bogie and one trailer bogie first, not all six bogies as an uncontrolled batch.
- Do not commit to production tooling until G1 and G3 are passed on the first carbody.
- Freeze COTS supplier envelopes only after fit-up review with actual door, window, HVAC, and seat samples.
- Treat every locally made structural weld procedure as a certifiable manufacturing process, not a prototype craft operation.
- Keep composite panels sacrificial and replaceable. They should fail cheaply without damaging the steel load path.

# LM3 Portable Field-Rerailing Concept

Repository source: `docs/rolling-stock/light-metro-3car/field-rerailing-concept.md`

Status: design-reference coordination basis. This is not a certified recovery method, equipment selection, ground-bearing calculation, or authority to lift a damaged vehicle.

## Design Decision

LM3 shall be designed for recovery by a small, specifically trained response crew using portable rail-rated hydraulic equipment. Ordinary automotive scissor jacks are outside the concept. The normal kit uses synchronized telescopic cylinders, wide baseplates, keyed/tilting vehicle adapters, mechanical cribbing, and a transverse rerailing bridge.

The controlled source assemblies are:

- `portable-field-rerailing-kit` for the recovery equipment envelope;
- `underframe-jacking-recovery-interface` for the installed J1–J4 pads, lifting-eye bosses, tow/rerailing lugs, and labels; and
- `civil-wayside-rerailing-access-interface` for optional hardstanding and equipment access at selected road-accessible response nodes.

All three use the same jack centres: X = +/-5,600 mm and Y = +/-1,180 mm from the car centreline/top-of-rail coordinate system.

## Mass Sensitivity

The controlled planning tare remains 78,750 kg until supplier-frozen, detailed CAD, and weighed evidence closes the mass budget. The lower cases below are sensitivity studies, not released tare values.

| Case | Train tare | Mean car tare | Ideal four-point static reaction |
|---|---|---|---|
| Controlled planning tare | 78,750 kg | 26,250 kg | 64.36 kN per point |
| 10% lower sensitivity | 70,875 kg | 23,625 kg | 57.92 kN per point |
| 20% lower sensitivity | 63,000 kg | 21,000 kg | 51.48 kN per point |

The generated mass-closure ledger confirms that the current design-space search does not establish a large mass saving. Its light-body/light-bogie candidate is 73.376 t before reserve and 76.818 t with the reserve retained, only about 1.932 t below the selected case. A materially lighter train therefore requires a new structural/material design and full crash, fatigue, fire, running-dynamics, braking, and manufacturability closure.

## Preliminary Load Screen

For coordination only, each permitted load case applies a 1.35 unequal-load factor and a 1.50 action factor. The one-end case assigns 60% of the car tare to the raised end to screen longitudinal centre-of-gravity movement.

| Load case | Active points | Supported tare | Required capacity per point | 200 kN equipment-envelope margin |
|---|---|---|---|---|
| Complete car with running gear retained | 4 | 100% | 130.32 kN | 69.68 kN |
| One end with its bogie retained | 2 | 60% | 156.39 kN | 43.61 kN |

Passing this screen only shows that a portable 200 kN cylinder class is worth developing. It does not release the car structure, the jack, or the lift. The final reactions shall use individual-car masses and centre-of-gravity envelopes for every passenger/load condition, suspension state, bogie-retained condition, tilt, damaged-point availability, and supplier load path.

## Recovery Modes

| Condition | Preferred response |
|---|---|
| Healthy wheels, train immobilized | Isolate, release/pipe the brake as designed, fit the recovery coupling, and tow or propel under the operating rulebook. Do not lift merely because traction power is unavailable. |
| One locked or locally damaged wheelset | Use the released wheel dolly/skate and rescue coupling if gauging, braking, axlebox condition, and infrastructure permit. |
| Upright, minor derailment with intact lift points | Stabilize and crib; lift one end or the complete car on a synchronized transverse pair/four-point set; translate on the rerailing bridge; lower to rail; inspect before any movement. |
| Pad inaccessible, unstable/rolled vehicle, structural damage, poor ground, bridge/tunnel constraint, or hazardous battery condition | Escalate to the specialist heavy-recovery plan and crane or alternative engineered method. The portable method is prohibited. |

## Equipment Envelope

- Four rail-rated telescopic cylinders, at least 200 kN rated capacity each and no more than 30 kg per cylinder envelope for two-person/manual team handling.
- Four wide-area baseplates/ground spreaders and four keyed, angular-tolerant adapters that positively locate on J1--J4.
- Two modular transverse rerailing bridges with locking traverse sleds.
- Mechanical cribbing and secondary retention. Hydraulic pressure is never the sole means of supporting a vehicle while personnel enter a hazard zone.
- A separately metered four-circuit pump/control unit allowing synchronized or deliberate individual correction from outside the exclusion zone.
- Hoses, rupture protection, gauges/load monitoring, lighting, bonding and isolation equipment, chocks, wheel dollies/skates, rescue coupler, and the controlled recovery manual.

Commercial technology demonstrates that portable equipment in this class is feasible: LUKAS publishes a 24 kg internal rerailing jack with 204 kN lifting force and transverse bridge systems; Holmatro publishes compact rerailing cylinders with hose-rupture-controlled lowering. These are capability references, not selected suppliers.

## Vehicle Detail Requirements

1. Prove complete-car and one-end lifting with running gear mechanically retained, including articulation anti-lift and service-loop conditions.
2. Keep J1--J4 visible and accessible after suspension collapse; provide removable skirt panels without personnel entering beneath an unsupported vehicle.
3. Key every portable adapter so it cannot be mistaken for a depot column head or applied to non-structural cladding.
4. Provide externally readable mass, centre-of-gravity range, permitted support combinations, isolation, brake-release, bogie-retention, and lifting diagrams at both car sides and in the digital recovery manual.
5. Keep the rescue coupler, tow lugs, brake connection, dead-battery controls, and HV isolation accessible after loss of normal auxiliary power.
6. Treat a missing/damaged required pad, lateral single-side lift, or work under hydraulic support without mechanical retention as a stop condition.

## Release Hold Points

1. Replace planning mass with weighed individual-car values and signed centre-of-gravity/load-condition envelopes.
2. Release underframe, articulation, bogie-retention and coupler calculations; weld/NDT schedules; adapter drawings; and pad proof loads.
3. Freeze a cylinder, bridge, pump, hose, control, cribbing and dolly supplier set with inspection and maintenance requirements.
4. Complete geotechnical/ground-bearing checks for designated access nodes and define the field method for non-designated locations.
5. Conduct no-load, representative ballast, asymmetric, loss-of-pressure, emergency-lowering, full-car, one-end and translate/lower trials.
6. Train and assess the recovery crew using the production vehicle, timed deployment, communications, exclusion-zone, battery and evidence-preservation procedures.
7. Issue vehicle-specific jacking/lifting diagrams and instructions before entry into service.

## Reference Requirements And Capability Examples

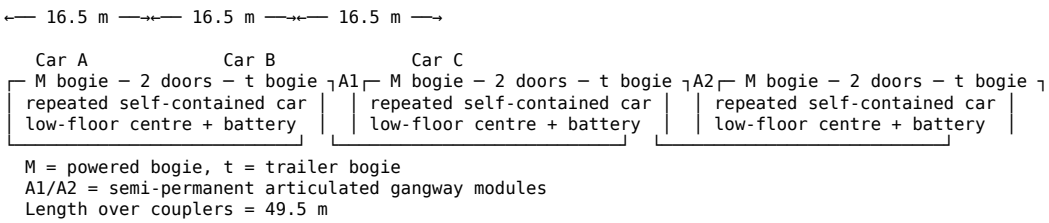
- UK LOC&PAS NTSN, Issue 2 (May 2025)
- RSSB RIS-2780-RST Issue 1.1 — Rail Vehicle Structures
- LUKAS HP 21 / 300 R rerailing jack
- LUKAS rerailing systems

- Holmatro rerailing cylinders

# General arrangement — light-metro-3car

Repository source: `docs/rolling-stock/light-metro-3car/general-arrangement.md`

## Consist diagram



- Three self-contained cars, joined by two semi-permanent articulated gangway modules.
- No driving cabs — GoA 4 identical A/B-end multi-part fiberglass sensor cowls at both ends per RFC 0015, with heated RF-transparent glass, T-OBS sensors, and LED headlamp / marker-light clusters.
- No cab bulkhead — the front and rear passenger ends are not walled off; the saloon remains open to the single panoramic glass end pane so passengers see through both driverless ends.
- Six bogies total — two standard 2-axle bogies per car.
- Two articulations total — lower spherical pivot/drawbar, upper roll-yaw-pitch links, double-wall bellows, segmented turntable floor, and separated trainline routing at each carbody interface.
- Powered wheelsets: one powered bogie per car, giving three powered bogies and six powered axles across the consist.
- Battery: 180 kWh usable / 225 kWh gross LFP per car under the longitudinal seats. The 10 m centre door zone stays low-floor and clear.
- Roof: PV strip per car, split around compact end HVAC modules.

## Key dimensions

| Parameter | Value | Source |
|---|---|---|
| Length over couplers | 49 500 mm | promoted v2A envelope: 3 × 16.5 m car modules |
| Car A length | 16 500 mm | modular car envelope |
| Car B length | 16 500 mm | modular car envelope |
| Car C length | 16 500 mm | modular car envelope |
| Body width (outer) | 2 850 mm | concept envelope, fits UIC 505-1 gauge |
| Height over rail (roof) | 3 450 mm | concept envelope, before roof equipment |
| Overall running height | 3 900 mm controlled envelope; current CAD reaches 3 868 mm | includes PV, HVAC, mounts, and production tolerance |
| Floor height (above top-of-rail) | 350 mm, 10 m low-floor centre door/PRM zone; 760 mm, ~3 m high-floor end decks over bogies | low-floor access with standard bogies |
| Bogie wheelbase | 2 100 mm | RFC 0022 single-SKU bogie |
| Wheel diameter (new / worn) | 760 / 680 mm | RFC 0022 |
| Inter-bogie distance (within a car) | 12 300 mm | 16.5 m module with 2.1 m bogie inset from each end |
| Articulation module length envelope | 1 120 mm | straddles each carbody interface; does not add to consist length |
| Articulation passage width | 1 650 mm | walk-through gangway target before trim tolerances |
| Articulation yaw/pitch/roll clearance | +/- 12 deg / +/- 6 deg / +/- 5 deg | detailed in `articulation.md` |
| Coupler face height (above ToR) | 720 mm | Scharfenberg Type 10 dim. |
| Headroom at doors | 2 000 mm | |
| Headroom at seats | 2 100 mm | |
| Passenger-compartment interior width | 2 700 mm | |

The 16.5 m promoted car module is intentional rather than a placeholder. With ~3 m bogie zones at each end it leaves about 10 m of low-floor centre span for two door pairs, wheelchair turning circles, and standing space, while keeping the 3-car train to 49.5 m for the derived 59.5 m OSR standard platform. Longer 19-20 m cars remain possible as a later capacity variant, but the v1 base favours workshop-friendly modules and curve overhang margin.

## Door positions

Two large 1 400 mm-wide double-leaf plug doors per car side in the 10 m low-floor centre zone (6 door pairs per side for the consist). The two openings fit between the ~3 m high-floor bogie decks at each end, leaving the middle span for PRM circulation and standing room. Positioned:

- Each car: door centres at 5.50 m and 11.00 m from the car end.

All doors are plug-outward doors per RFC 0008 §3.3 with a 1 400 mm nominal structural opening and at least 1 250 mm clear passage after seals/thresholds at 2 000 mm height.

## Gauge compliance

UIC 505-1 static envelope:

- Width at floor level: 2 850 mm ≤ 3 150 mm limit
- Overall height over ToR: 3 900 mm ≤ 4 320 mm limit
- Dynamic outline (controlled lateral sway and +30 mm vertical excursion): 2 970 × 3 930 mm — still inside the 3 150 × 4 320 mm boundary

No interference with UIC 505-1 at any of the RFC 0009 track presets (`standard-urban` / `standard-metro` / `mainline-mixed`).

## Platform clearance

- Low-floor centre door and PRM zone at 350 mm ToR platform height. Each car has about 10 m of low-floor length between the standard bogie zones. The ~3 m raised end decks sit directly over the bogies; those raised zones are inside the saloon, away from the boarding thresholds.
- Horizontal gap at door sill: ≤ 75 mm per UIC 741. Achieved by a 40 mm sliding skirt at each door that extends on dwell (retracted in motion).
- On curved platforms at RFC 0009 `standard-urban` minimum radius (90 m): the door-to-platform horizontal gap grows to ~110 mm — requires an 80 mm gap-filler flap at the door sill.

## Mass distribution (AW2, nominal loaded)

| Location | Mass (t) |
|---|---|
| Car A incl. powered + trailer bogie | 33.45 |
| Car B incl. powered + trailer bogie | 33.45 |
| Car C incl. powered + trailer bogie | 33.45 |
| Total consist (tare + AW2 passengers) | 100.35 |

Controlled planning tare = 78.75 t: 75.308 t optimizer subtotal plus a 3.442 t engineering reserve pending drawing-package mass closure. AW2 load = 21.6 t (360 passengers × 60 kg average).

Distribution per axle under AW3 (crush load, 480 passengers × 60 kg = 28.8 t):

- Powered and trailer bogies: ~10–12 t per axle depending on seated battery-side loading.

All ≤ 14 t per RFC 0008 §3.1 axle-load constraint .

## Structural loading cases (for v2 FEA)

The design envelope the v2 CAD model is checked against:

- EN 15227 Cat C-II collision: 25 km/h train-to-obstacle. Cab crush zone absorbs. Anti-climbing features at both ends.
- EN 12663 Cat P-III car-body static: compressive end load 640 kN; diagonal 600 kN. Welded S355 underframe/spaceframe carries the load path; composite side and roof panels are non-structural weather/aero skins.
- Vertical accel: ± 0.5 g normal service; ± 2 g emergency brake / collision.
- Lateral accel: ± 0.3 g through max-cant curve.

The current screening FEA is linked from the package README. The full-body lateral-sway screen is still a v2 closure item: the next body release must add diaphragm/knee-brace detail at the side-frame and waist-rail load path, then rerun the shell/beam model before first steel cut.

## Cross-refs

- Bogie detail `bogie.md`
- Body structure `body.md`
- Identical fiberglass end cowl `end-cowl.md`
- Traction `traction.md`
- Interfaces `interfaces.md`

# Interfaces — light-metro-3car

Repository source: `docs/rolling-stock/light-metro-3car/interfaces.md`

The interfaces this trainset exposes to the outside world. Every interface is pinned to a commodity standard; no bespoke connectors.

## Coupler

| Parameter | Value |
|---|---|
| Type | Scharfenberg Type 10 automatic |
| Vertical coupling compatibility | Any Scharfenberg-family consist at 720 mm coupler face height |
| Mechanical strength | 1 000 kN static tensile |
| Electric coupler | 128 pins: 24 V DC aux, CAN-FD (2 pairs), Ethernet (TSN 1 Gbps), emergency-brake loop, video (MIPI over fibre) |
| Pneumatic coupler | None. No pneumatic brake / air-horn compressed-air coupling. |
| Activation | Electrical lock/unlock from recovery cabinet or OCC command |
| Cut-out / rescue mode | Mechanical unlock handle accessible at ground level |

Every OpenSourceRail consist in every deployment carries the same coupler — any trainset can rescue any other.

## Inter-car articulation and gangway

The 3-car reference consist has two semi-permanent articulated gangway modules. They are not end couplers and they are not Jacobs bogies; they are fixed intra-consist structural/passenger/service interfaces between self-contained standard-bogie cars.

| Parameter | Value |
|---|---|
| Modules per 3-car consist | 2 |
| Lower joint | Spherical central articulation bearing with anti-lift keeper |
| Draft/buff path | Underframe anchor casting -> articulated drawbar -> lower joint -> opposite anchor |
| Upper control | Two roll-yaw-pitch links with spherical bearing eyes |
| Passenger passage | 1 650 mm target clear width, segmented anti-slip turntable floor |
| Bellows | Double-wall corrugated gangway with bolted clamp frames |
| Kinematic envelope | +/- 12 deg yaw, +/- 6 deg pitch, +/- 5 deg roll |
| Trainline routing | Separated HV, TCN-E, CAN-FD/safety-loop, coolant, HVAC air sleeve, and drains |
| Replacement | Module cassette at heavy overhaul; bellows and floor hatch serviceable in depot |

Detailed structure, service routing, supplier evidence, and maintenance intervals are in `articulation.md`.

## Station charging connector

| Parameter | Value |
|---|---|
| Primary type | Side-pin conductive connector per RFC 0026 |
| Alternate type | Pantograph-down dock where platform geometry requires it |
| Operating voltage | Train pack voltage, approximately 650–700 V nominal and 740 V normal maximum |
| Contact / insulation rating | At least 1 000 V DC |
| Contact current (charging) | 500–1 000 A station class |
| Actuation | Electro-mechanical (no pneumatic) |
| Location | One train-side connector per car, platform side |
| ATO interface | Extend/retract via the `osr-ato` + `osr-aux-power` pairing on the T-ECU/A |
| Onboard power electronics | Per-car HV contactor/protection/IMD charge rack; the station-side DC/DC regulates dock current and the roof PV uses its own MPPT stage |

The station battery buffer supplies the charge pulse. Inter-car coordination and per-car current limits are handled by `osr-aux-power`; pack current and temperature limits come from `osr-bms`.

## Platform gap

Per RFC 0010 §4.4:

| Parameter | Value |
|---|---|
| Horizontal gap (straight platform, door-to-sill) | ≤ 75 mm (target 40 mm with retractable skirt) |
| Horizontal gap (curved platform at 90 m radius) | ≤ 110 mm with 80 mm gap-filler flap |
| Vertical gap (floor-to-platform) | ≤ 50 mm |
| Door sill retractable skirt | 40 mm, electrically actuated at dwell-open |

| Parameter | Value |
|---|---|
| Door sill gap-filler flap | 80 mm, drops on PSD-open signal at curved platforms (identified per-deployment) |

Gap-filler flap is a simple solenoid-driven plate — no pneumatic, no gear train. Failure mode: flap stuck up `osr-door-control` blocks door-open; failure flap stuck down  visual inspection at depot next cycle.

## Platform automation and PSD interface

The train has two door openings per side per car. On the 3-car reference consist that is six door centres per platform side, all in the 350 mm low-floor zones. Station platform screen doors or platform edge doors align to the train-side door centres.

| Parameter | Value |
|---|---|
| Door centres per car | 5.67 m and 11.33 m from the car end |
| Door centres per 3-car platform side | 6 |
| ATO stopping target | ± 300 mm normal, ± 500 mm degraded before door-open inhibit |
| Door-open permissive | Train stopped + correct side selected + PSD/edge-door ready + closed/locked loop healthy |
| Intrusion sensing | Door-sill camera/obstruction harness plus station edge sensor input |
| Short-platform operation | Selective door opening by car and side via `osr-door-control` |

## TCN-E connector (intra-consist, via articulation)

Standard Ethernet + power bundle through each articulation joint:

| Signal | Cable | Notes |
|---|---|---|
| TCN-E port A | Cat 6 RJ45, TSN-capable | Per RFC 0006 §4; single-ring backbone |
| TCN-E port B | Cat 6 RJ45, TSN-capable | Redundant ring |
| CAN-FD (doors + HVAC) | Twisted pair per ISO 11898 | |
| LIN (local panels) | Twisted pair per ISO 17987 | |
| 24 V DC aux + control | 2.5 mm² × 2 wires | Aux + return |
| 110 V DC backup | 4 mm² × 2 wires | Emergency battery backup |
| Safety loop (emergency brake) | Hardwired pair; normally-closed | Electrically independent of TCN-E |

Connection through the articulation bellows via drag-chain; no disconnects — this is an intra-consist fixed bus.

## Station charging dock

The charging interface to the station:

| Parameter | Value |
|---|---|
| Connector | Side-pin primary; pantograph-down alternate |
| Voltage | Follows the train pack: approximately 650–700 V nominal, 740 V normal maximum; hardware rated at least 1 000 V DC |
| Max current | 825 A equipment limit; approximately 714–769 A at the 500 kW operating point |
| Ramp rate | Controlled by the station DC/DC under train BMS limits relayed by `osr-aux-power` |
| Connector extend / retract signals | From `osr-aux-power` via TCN-E |
| Isolation | Dock-side mechanical isolator; electrical monitoring via `osr-energy-site` |
| Onboard sink | Traction battery through per-car HV contactor, fuse, IMD/HVIL, and BMS-controlled charge rack; no onboard AC conversion |

Full RFC 0002 energy-sizing compatibility.

## Roof PV charge input

The roof solar input is an onboard source, not a wayside interface, but it shares the same charge rack and isolation logic as the station dock.

| Parameter | Value |
|---|---|
| Modules per car | 12 |
| Mount styles | 6 bonded flexible laminates; 6 raised rigid panels on rails and edge clamps |
| String hardware | Module junction boxes, two string raceways, MPPT combiner, fire-isolation switches |
| Battery interface | PV downlink cable gland into the per-car MPPT/DC charge rack |
| Control | `osr-aux-power` selects PV harvest, station charge, regen absorb, or shed-load mode against `osr-bms` limits |

## Emergency door release (external)

- Each exterior door has an external unlock per EN 14752.
- Mechanical; no electronics on the external side.
- Engages only when trainset speed ≤ 5 km/h OR on emergency- brake trip (latched state).

## Ground-radio (external antennas)

| Antenna | Location | Band | Notes |
|---|---|---|---|
| TRG-1 5G main | Car A roof | n77 / n78 / CBRS | |
| TRG-1 5G diversity | Car C roof | Same band | MIMO pair |
| TRG-2 LoRa | Car B roof centre | 868 MHz (EU) / 915 MHz (US/MEA) | |
| GNSS | Car A roof + Car C roof | L1/L2 | |
| Public-safety (optional) | Car A roof | 700 MHz | Per-deployment |

All antennas use a single-type N-male to RP-SMA termination, no bespoke sockets.

## Mass & structure compatibility matrix

Rolling-stock × track-geometry × station-archetype compatibility per RFCs 0008 §4 / 0009 §10 / 0010 §12:

| Compatible with | Reason |
|---|---|
| `standard-urban` geometry | Yes — 49.5 m consist, 90 m min curve OK, 50 ‰ max grade OK |
| `standard-metro` geometry | Yes — plenty of margin |
| `mainline-mixed` geometry | Yes — meets 25 ‰ max grade (lower than the consist's 5 % capability) |
| `halt` station | Yes — short-platform door select required |
| `standard` station | Yes — 59.5 m derived platform for the 49.5 m consist |
| `major` station | Yes |
| `interchange` station | Yes |
| `terminal` station | Yes — side-pin dock fits |
| `depot-terminal` station | Yes |

## v2 deliverables (not in v1)

- Coupler electrical connector pinout drawing.
- Station charging dock mechanical envelope (for station civil design).
- Gap-filler flap mechanism drawings.
- Antenna radiation-pattern simulations at the consist roof.

# Make/Buy and Localization Plan

Repository source: `docs/rolling-stock/light-metro-3car/localization-plan.md`

This plan implements RFC 0021's principle: own the interfaces and evidence, localize ordinary fabrication early, and localize safety-critical catalogue parts only after process capability and qualification are demonstrated.

| System | First production | Early local work | Later localization gate |
|---|---|---|---|
| Bogies | Buy complete qualified bogies for the prototype and approximately first 20–30 trainsets | Inspection, wheel reprofiling, brake service, harnesses, final vehicle marriage | Local frame welding/final assembly after stable demand, EN 15085-quality welding, dimensional capability, NDT, fatigue evidence, and supplier audit; continue buying qualified wheels, axles, bearings, suspension, brakes, motors and gearboxes |
| Doors | Buy drive, lock, sensing, emergency release and controller kits | Fabricate leaves, frames, rails, housings, thresholds, adapters and harness tails to the OSR cassette ICD | Localize drive parts only after lifecycle, obstruction, lock integrity, environmental and software-interface qualification |
| Articulation | Buy spherical bearing, yaw/pitch joint, anti-lift elements, elastomers and bellows | Fabricate steel adapter frames, drawbar support, floor bridge, covers, trays and service guides | Localize joints/bearings only after proof, fatigue, wear and fire evidence |
| Windows | Buy complete laminated solar-control rail/bus safety-glass cassettes | Local aperture frames, drains, adapter plates and installation | Local glazing only after optical, impact, fragmentation, thermal and adhesive-system qualification; acrylic/polycarbonate remains limited to noncritical covers/interiors |
| Seats | Buy or locally fabricate simple qualified longitudinal bench shells | Local steel/aluminium frames, mounts and replaceable trim | Release only with material fire/smoke/toxicity certificates and mount/static proof-load evidence |
| Battery | Buy qualified cells/modules, BMS sensing, contactors and fire-detection components | Local enclosure frames, vent ducts, cooling manifolds, mist pipework, harnesses and pack integration under supplier controls | Cell manufacture is out of scope until a separate industrial program exists; pack integration requires IEC 62928-based test evidence |
| Traction | Buy matched motor/controller sets | Local brackets, coolant manifolds, cables and connectorized harnesses | Motor/controller localization only after dynamometer, insulation, EMC, vibration and functional-safety qualification |
| Body | Local from first article where capability exists | Welded S355 datum skeleton, modular GFRP cassettes, sacrificial nose, interior panels and final assembly | Production release after weld procedure/NDT, composite fire/bond/insert, water ingress, tolerance and FEA gates |

The semi-permanent drawbar carries longitudinal train loads separately from the passenger gangway. Door, glazing, HVAC, traction, battery and articulation suppliers shall fit published supplier-neutral envelopes rather than drive changes into the primary steel structure.

All localization decisions are serial-number traceable. A lower purchase price never overrides missing material certificates, process qualification, inspection records, software/configuration control, spares support, or the deployment safety case.

# Marketplace Price Proxies (cost studies only)

Repository source: `docs/rolling-stock/light-metro-3car/marketplace-price-anchors.md`

> Do not use this page to select build parts. The controlled supplier-anchor register assigns a real manufacturer family, known fit gaps and local-equivalent route to every bought-in LM3 product. This older ledger remains only to reproduce the low-cost sensitivity in the BOM; marketplace listings are not engineering or procurement approval.

Checked 2026-06-04 against public Alibaba marketplace pages and AliExpress item history through PriceArchive where direct AliExpress search pages are unstable. These are listed-price anchors, not certified rail procurement quotes. They exclude freight, duty, supplier audits, rail fire/smoke/toxicity reports, EN/TSI evidence packs, warranty terms, and acceptance testing unless the BOM line says otherwise.

The updated BOM therefore represents a marketplace-only procurement floor for a three-car standard-gauge consist. BID lines still need supplier RFQs before a build can be treated as qualified rolling stock.

## RFC 0021 procurement baseline

The T-series rows below preserve the marketplace evidence ledger, but RFC RFC 0021 defines the procurement baseline. Current RFQs shall target:

- three 225 kWh gross liquid-cooled LFP car packs: $65k–80k per train;
- six heavy-vehicle-class PMSM/controller sets: $48k–72k per train;
- HV distribution/contactors/insulation monitoring: $8k–12k per train;
- isolated LV DC/DC equipment: $5k–10k per train; and
- roof MPPT/DC electronics: $2k–4k per train.

These are target bands, not observed quotations. Candidate reference evidence includes EVE's railway LFP application, Inovance HM47/LD32 product data, Longertek direct-DC rail HVAC, and the SINEXCEL PDS1-750K-H datasheet. None of those pages demonstrates compliance with the complete OSR railway duty; the RFQ must price qualification, software/interface support, spares, warranty, freight, and acceptance testing separately.

# Anchor Index

| Line(s) | Marketplace anchor | Listed price observed | BOM base used | Qualification note |
|---|---|---|---|---|
| B1 | Alibaba S235/S355 rectangular steel tube | 380-720 USD/t | 3,000 | Includes 3.2 t steel, waste, local handling, and cut premium. |
| B2 | Alibaba S355 steel plate and S355 price table | 435-790 USD/t | 2,000 | Includes 2.0 t plate plus material loss and freight allowance. |
| B3 | Alibaba steel fabrication services | quoted per piece/order | 6,000 | Fixture consumables and cut/drill setup allowance; real quote needs DXF pack. |
| B4 | Alibaba welding wire | 0.86-1.50 USD/kg | 2,000 | Consumables only; certified welding labour remains outside direct material. |
| B5 | Alibaba zinc-rich coating | 2.11-4.21 USD/kg | 4,000 | Primer, blast media, cavity wax, masking, and waste allowance. |
| B6, B7, B21 | Alibaba fire-rated composite panel | 2-50 USD/sq m | 9,000; 4,000; 5,000 | Commodity panels priced low; EN 45545 certificate must be supplied or tested. |
| B8 | Alibaba FRP/composite panel proxy | 5-40 USD/sq m | 4,000 | Multi-part fiberglass end-cowl cast kit only; glazing and sensor hardware are separate lines. |
| B9 | Alibaba train gangway suppliers | 3,500-15,999 USD/set | 30,000 | Covers two articulation/gangway sets at listed rail-part levels. |
| B10, B27 | Alibaba train tempered laminated glass | 5-90 USD/sq m; rail curved glass 38.50-41.50 USD/sq m | 6,000; 10,000 | Side window cassettes are commodity anchored; heated curved end panes need RFQ. |
| B11 | Alibaba automatic sliding door systems | 145-200 USD/operator; 890-2,988 USD/hermetic door proxy | 90,000 | Marketplace door hardware is a proxy; passenger door certification is still BID. |
| B12 | Alibaba floor sandwich / composite board proxy | 5-50 USD/sq m | 6,000 | Structural floor board, hatches, inserts, and fire rating require supplier pack. |
| B13, B28 | Alibaba bus vinyl flooring and vehicle decal/vinyl proxies | 5-45 USD/sq m | 1,500; 2,000 | Flooring and exterior livery film are commodity-priced. |
| B14 | Alibaba bus seats | 15-160 USD/seat | 6,000 | Seat shell/listed transit seating anchor; rail upholstery/fire evidence needed. |
| B15 | Alibaba bus handrail fittings | 1.15-10.40 USD/fitting | 2,500 | Stainless tube, joints, brackets, and installation hardware. |
| B16, A3 | Alibaba 12/24 V bus interior lamps | 3-15 USD/lamp | 1,500; 1,000 | Emergency lighting battery packs are included in A3 allowance. |
| B17 | Alibaba bus lighting and marker lamps | 1-150 USD/lamp | 1,200 | Exterior head/tail/marker kit with sealed lamp allowance. |
| B18, E14 | Alibaba bus LED sign/display and destination sign suppliers | 55-350 USD/display | 3,000; 3,000 | Includes interior/exterior display mix and controller allowance. |
| B19, E15 | Alibaba bus CCTV systems and AliExpress PoE camera history | 37-580 USD/kit; cameras from a few USD | 2,500; 600 | CCTV/intercom kit uses commodity camera anchor; safety outputs remain separate. |
| B20 | Alibaba automotive urethane coating proxy | 2-15 USD/kg | 3,000 | Paint material only; booth labour and rework outside direct material. |
| B22 | Alibaba railway coupler proxy | RFQ/listed parts around low thousands | 8,000 | Rescue-capable coupler still requires rail supplier RFQ before build. |
| B23 | Alibaba railway draft gear proxy | RFQ/listed parts around low thousands | 4,000 | EN 15227 crush-can qualification remains a tender item. |
| B24, T18, E17, E20 | Alibaba wiring harness services and HV cable proxies | quoted per loom/order | 4,000; 12,000; 9,000; 3,000 | Harness direct material anchor only; drawings and tests must be quoted. |
| B25, T19 | Alibaba linear actuator proxy | 20-300 USD/actuator | 6,000; 3,000 | Door and charging actuators need safety interlock validation. |
| B26, B29 | Alibaba machined steel fabrication proxy | quoted per part/order | 3,000; 6,000 | Jacking/lifting fittings and articulation adapter frames need final drawings. |
| G1, G2, G13, G17, G18, G20 | Alibaba train railway bogie parts | 900-15,000 USD/frame/part | 10,000; 12,000; 3,000; 3,000; 4,000; 3,000 | Fabricated bogie items are anchored to marketplace rail-part fabrication. |
| G3 | Alibaba railway wheel price and locomotive wheelset | 500-2,000 USD/wheelset | 18,000 | Twelve wheelsets at listed wheelset range with inspection allowance. |
| G4 | Alibaba railway bearing proxy | 40-150 USD/bearing; higher for certified units | 12,000 | Uses marketplace bearing housings plus certified bearing uplift. |
| G5, G10, G12 | Alibaba rail spring/bushing proxies | 20-125 USD/spring or link proxy | 4,800; 2,400; 1,800 | Elastomer and spring compounds require certificate traceability. |
| G6 | Alibaba railway air spring | 300-1,500 USD/unit | 6,000 | Twelve air springs at low listed rail range. |
| G7 | Alibaba railway hydraulic damper proxy | 50-300 USD/unit proxy | 3,000 | Damping curve and temperature envelope need supplier confirmation. |

| Line(s) | Marketplace anchor | Listed price observed | BOM base used | Qualification note |
|---|---|---|---|---|
| G8, G16 | Alibaba railway brake pads and rail brake-disc proxies | pads 13-100 USD; discs via RFQ/proxy | 12,000; 1,500 | Braking friction material must be qualified with the selected caliper. |
| G9 | Alibaba brake caliper proxy | industrial calipers 40-215 USD; rail RFQ higher | 12,000 | Rail electromagnetic caliper remains BID despite commodity proxy. |
| G11 | Alibaba heavy bearing / PTFE slider proxy | 50-500 USD/unit proxy | 3,000 | Centre-pin ring and slider stack need load rating. |
| G14, G15 | AliExpress/Alibaba encoder and temperature sensor proxies | single to tens of USD | 600; 500 | Rail harnessing and environmental protection covered elsewhere. |
| G19 | Alibaba flexible gear coupling proxy | 100-800 USD/set | 2,000 | Torque rating needs confirmation against final motor/gearbox. |
| T1 | Alibaba PMSM motor proxies | 3,200-11,150 USD/motor; supplier table 4,500-7,000 USD | 36,000 motor share | Six HM47-class 350 kW short-peak candidates; controller share is T3 and rail duty remains unqualified. |
| T2 | Alibaba industrial gearbox proxy | 500-4,000 USD/unit proxy | 10,000 | Rail duty cycle and noise target need gearbox RFQ. |
| T3 | Alibaba EV inverter / PCS proxy | 4,999-5,450 USD for PCS proxy | 24,000 | Six independent LD32-class controllers; generic PCS listings are lower-bound evidence only. |
| T4, T7, T20 | Alibaba EV cooling and pump proxies | tens to hundreds USD per pump/plate | 6,000; 2,000; 2,500 | Cooling loops need thermal validation. |
| T5 | Alibaba 200 kWh battery packs | marketplace BESS and EV-pack listings vary widely by certification scope | 75,000 | Three 225 kWh gross / 180 kWh usable LFP car packs; liquid cooling, segmentation, IEC 62928 test evidence and propagation controls require RFQ. |
| T6 | Alibaba BMS proxy | hundreds to low thousands USD/system | 4,500 | Pack-level BMS electronics only. |
| T8, T17 | Alibaba aluminium enclosure / duct fabrication proxies | quoted per part/order | 6,000; 3,000 | Under-seat enclosure and vent ducts need final sheet-metal drawings. |
| T9 | Alibaba aspirating smoke detector | 1,095-1,850 USD/unit proxy | 10,800 | Six detector channels at commodity detector pricing. |
| T10 | Alibaba water-mist component proxy | component listings vary by pump/nozzle scope | 9,000 | Three localized battery-only systems with reservoir, DC pump, stainless pipe, nozzles and feedback; propagation testing excluded. |
| T11, T16 | Alibaba 1000 V DC contactors and AliExpress contactor history | 7-100 USD/contactors; larger vacuum units 290-621 USD | 10,000; 2,400 | Main 800 V-class HV distribution requires interrupt, weld, IMD, vibration and supplier evidence. |
| T12, T23 | Alibaba 30 kW DC charge modules | 480-510 USD/module; PCS 4,999-5,450 USD | 4,500; 3,000 | Train has a protected station-DC interface and roof MPPT; the 500 kW conversion stage is wayside. |
| T13 | Alibaba auxiliary DC/DC proxy | 100-1,500 USD/unit proxy | 7,500 | Isolated 800 V to 110/48/24 V DC domains; no central AC inverter. |
| T14 | Alibaba bus rooftop air conditioning | 2,237-6,500 USD/bus roof unit | 12,000 | Three roof HVAC units at bus commodity pricing. |
| T15 | Alibaba braking resistor proxy | 50-1,000 USD/unit proxy | 1,000 | Regen dump resistor needs thermal enclosure design. |
| T21 | Alibaba 400 W solar panels and flexible 400 W panels | rigid 41-79 USD/panel; flexible 50-139 USD/panel | 6,000 | Full-roof panel material for 36 mixed rigid/flexible modules. |
| T22 | Alibaba solar mounting/combiner proxies | low dollars per clamp/rail; combiner/MPPT low hundreds | 6,000 | Bond pads, raised rails, clamps, junction boxes, MPPT, and isolation. |
| E1, E2 | Alibaba PCB assembly proxy | quoted per board/order | 1,200; 1,500 | Custom boards include assembly allowance; SIL evidence excluded. |
| E3 | AliExpress IMU proxy | tens to hundreds USD/module | 200 | ADIS-grade part can exceed commodity proxy; base uses low-cost alternate. |
| E4 | AliExpress GNSS module proxy | tens of USD/module | 100 | Uses commodity GNSS board anchor. |
| E5 | AliExpress NFC reader proxy | single to tens of USD/module | 20 | Reader board only. |
| E6 | AliExpress secure-element proxy | single USD/module | 20 | Chip/module allowance only. |
| E7 | AliExpress 5G M.2 modem proxy | tens to hundreds USD/module | 200 | Carrier approval and antenna certification excluded. |
| E8 | PriceArchive SX1276 LoRa modules | 5.62-19.04 USD/module; 55.66 USD/10-pack | 20 | One radio plus spares. |
| E9 | AliExpress NVMe proxy | tens of USD | 40 | Operational recorder storage only; crash memory is E23. |
| E10 | PriceArchive 10.1 inch touchscreens | 100-255 USD/display class | 300 | Two maintenance screens. |
| E11, E12, E13 | Alibaba industrial pendant / switch proxies | low to hundreds USD each | 500; 40; 100 | Depot-only manual controls, plungers, and guarded keyed switches. |
| E16 | Alibaba safety relay proxy | tens of USD/module | 200 | Relay stage material only; safety case excluded. |

| Line(s) | Marketplace anchor | Listed price observed | BOM base used | Qualification note |
|---|---|---|---|---|
| E18 | Alibaba industrial LIDAR proxy | 598-3,289 USD/sensor proxy | 8,000 | Two nose modules with LIDAR/cameras/radar allowance; rail T-OBS supplier RFQ needed. |
| E19 | Alibaba washer/heater actuator proxies | tens to hundreds USD/system | 1,000 | Keeps glass sensor windows serviceable. |
| E21 | Alibaba 5G/GNSS antenna proxy | tens to hundreds USD/antenna | 300 | Roof antenna set material only. |
| E22 | Alibaba DIN rail cabinet proxy | hundreds to low thousands USD/cabinet | 3,000 | Three electronics cabinets and distribution hardware. |
| E23 | Alibaba rugged SSD/event-recorder proxy | hundreds to low thousands USD | 2,000 | Crashworthy event recorder still requires qualification. |
| A1 | Alibaba bus call button/accessibility proxy | single to tens USD/device | 1,000 | Wheelchair bay fixtures, buttons, trims, and guards. |
| A2 | Alibaba safety label/signage proxy | cents to low dollars per label | 500 | Full train labels and tactile/visual signage. |
| A4 | Alibaba fire extinguisher / first aid proxy | tens of USD per kit | 500 | Operator consumables and seals. |

## Cost Interpretation

The BOM numbers were reduced where the marketplace anchor directly covered the quantity. Safety-critical, custom, and certified rail parts remain marked BID or MAKE where the listed price is only a proxy. The direct-material base is therefore useful for open-source design trade studies and commodity purchasing discussions, but it should not be used as a production-ready certified trainset quote.

# One-metre clip-on fiberglass body — LM3-BDY-160

Repository source: `docs/rolling-stock/light-metro-3car/modular-fiberglass-body.md`

The train exterior is a replaceable, non-structural weather skin made from simple fiberglass modules on a 1,000 mm longitudinal pitch. The welded S355 underframe, side posts, door portals, window carriers, roof bows, end rings, anti-climbers, and crash structure remain the designated primary load path; structural qualification and acceptance remain separate release gates.

Each 16.5 m car has sixteen full 1 m cladding bays between two 250 mm steel end-ring transitions. A three-car train therefore uses 144 main modules: 96 side modules and 48 roof modules. The product tree now identifies solid-side `LM3-BDY-P130`, window-edge `P131`, door-edge `P132`, and roof/fairing `P133` parts separately. They share the same mould width, clip datums, trim datum, seals, and repair method. CNC trimming creates the aperture variants after moulding.

## Controlled geometry

| Item | Design value |
|---|---|
| Longitudinal pitch | 1,000 mm |
| Finished module width | 994 mm |
| Dry joint | 6 mm replaceable EPDM compression seal |
| Nominal sandwich depth | 28 mm |
| Bays per 16.5 m car | 16 |
| Side modules per car | 32 |
| Roof modules per car | 16 |
| Solid/window/door/roof reference split | 48 / 24 / 24 / 48 per trainset |
| Main modules per trainset | 144 |
| End transition outside module grid | 250 mm at each car end |

The parametric source is `modular_fiberglass_body.py`. It generates side modules with the released door/window cuts, roof modules, clip hardware, anti-lift retention, and joint gaskets. The machine-readable module and assembly manifest is generated under `design/component-catalogue/catalog/modular-fiberglass-body`.

## Mould fabrication route

Each side, window-edge, door-edge, and roof variant is made from the same short glass-fibre body tooling philosophy: reusable 1,000 mm mould pitch, variant-specific CNC trim, and a master-frame dry-fit before kitting.

| Seq | Operation | Required evidence |
|---|---|---|
| 10 | Release mould, trim fixture, laminate schedule, core map, insert map, and module serial range | Traveler revision, material certificates, mould release |
| 20 | Clean mould, inspect A-surface, apply release system, and apply UV-stable gelcoat or paint-primer layer | Mould surface record, release-system lot |
| 30 | Cut glass reinforcement and local core; lay up solid clip lands, pot insert bosses, and bag or close mould | Ply/core/insert checklist |
| 40 | Infuse or wet-lay laminate, control cure, demould, post-cure where specified, and retain witness coupons | Cure time/temperature, coupon ID, demould inspection |
| 50 | CNC trim door/window/roof variant, drill clip grid from datum, seal all cut edges, and mark serial/revision | Trim gauge, hole-position gauge, edge-seal record |
| 60 | Fit captive inserts, keyed hooks, clips, anti-lift features, drain details, and EPDM seals; dry-fit to master frame | Insert pull-out lot, gasket compression witness, master-frame fit |

Supplier BOM rows fund qualified fibre, resin, core, gelcoat/paint-primer, release systems, seal stock, and coupon material. They do not introduce a bonded full-side or full-roof panel. The body module becomes a released part only after mould/cure records, CNC trim evidence, sealed-edge inspection, insert proof, and dry-fit evidence are closed.

Decorative colour is not part of the laminate load path. The preferred production route is a qualified white/light in-mould base finish followed by bay-numbered rail-use livery film. See `exterior-finish-process.md`; film does not replace corrosion, fire, cut-edge or composite surface protection.

## Retention and sealing

Every module hangs on an asymmetric keyed upper hook and closes onto captive over-centre clips. An independent anti-lift retainer prevents a panel leaving the vehicle if a clip is not fully latched. Clip witness marks are visible from the service side. The fasteners remain captive when open.

The weather joint is a dry, replaceable EPDM compression gasket over a drained secondary rail. Production adhesive is not used between the body module and frame, so there is no cure delay and a damaged 1 m section can be exchanged. Adhesive

remains permitted inside a supplier-controlled fiberglass sandwich, for glazing, and at released non-service seams in the separate end cowl.

The clip, insert, rail, and backing-plate loads still require calculation and first-article proof. The release pack must include fire/smoke/toxicity evidence, laminate coupons, insert pull-out tests, clip proof load, fatigue/vibration, water ingress, aerodynamic pressure, and timed removal/refit evidence.

## One-day exterior-body route

Six two-person crews work on three released frames in parallel, two crews per car. All parts are moulded, trimmed, painted, labelled, gasketed, and kitted before the frames enter the body station.

| Seq | Activity | Elapsed | Crews | Release evidence |
|---|---|---|---|---|
| 10 | Verify frame datums and kit revisions | 0.5 h | 3 | Frame/module map signed |
| 20 | Fit dry seals and inspect clip receptacles | 1.0 h | 6 | Seals continuous; drains open |
| 30 | Hang and latch both side skins | 3.0 h | 6 | All clip witness marks visible |
| 40 | Hang and latch roof modules | 1.5 h | 6 | Anti-lift retainers closed |
| 50 | Fit closures, skirts, labels, and earth bonds | 1.0 h | 6 | Continuity and access checks |
| 60 | Water/rattle test and close snags | 1.0 h | 3 | Signed eight-hour body release |
| Total elapsed | | 8.0 h | | |

This is an exterior-body installation claim, not a claim that an uncertified train can go from bare steel to passenger service in one day. Doors, glazing, roof equipment, interiors, traction equipment, batteries, bogies, static and dynamic commissioning, homologation, and first-article testing remain their own controlled operations.

## Cost and plant effect

The repeated short mould removes the full-car mould, large cure fixture, long bonding operation, and bonded-panel rework allowance from the baseline. The CAPEX source therefore uses a 28% local assembly allowance, a $900 k three-car trainset planning unit, and $60 k per supported car module for the shared national production-plant setup allowance. The high plant sensitivity is $120 k per car. These remain planning values until supplier quotes and timed first-article builds replace them.

## Sandwich-panel development

The competing material benchmark adds stiffened aluminium and aluminium sandwich alternatives to the GFRP research route, with the same proposed panel footprint, supports and loads. Aluminium is the reference hypothesis for simple panels; GFRP remains available for compound-curved parts and roof studies. The benchmark retains failed thermal screens, unknown quotes and all manufacturing/physical acceptance gates. It does not change this retained GFRP geometry or its historical module inventory.

The hybrid panel development package adds explicit fibre directions, skin/core/bond/finish layers, reinforced edges, potted inserts, curved roof CAD and an aperture-based 144-module mass takeoff. Its interactive comparison varies skin, core, module/support spacing, crown and ribs under stated pressure and ageing assumptions. The steel/aluminium comparisons require equivalent reinforcement and performance evidence before claiming savings. Material coupons, clipped-module/roof-bay tests and complete-cost quotations remain open. These development results do not reduce the frame, adopt a new train mass, qualify a fire stack or replace the B6/B7 planning allowance.

# Roof moulds, HVAC, solar and service fitout

Repository source: `docs/rolling-stock/light-metro-3car/roof-fitout.md`

The LM3 roof is a layered, serviceable assembly. Structural roof bows and equipment rails (`LM3-BDY-P080`) carry loads. Clip-on roof skins (`LM3-BDY-P133`) and local fairings (`LM3-ROOF-P030/P040`) provide weather, aerodynamic and maintenance closeout only.

## Part and zone definition

| Item | Function | Must not carry |
|---|---|---|
| `LM3-BDY-P133` | 1 m roof skin and trim variants | HVAC, PV, lifting or walkway structural loads |
| `LM3-ROOF-P010` | bolted/gasketed HVAC curb, duct collar, condensate tray and drains | Loads outside the released HVAC interface |
| `LM3-ROOF-P020` | PV rails/pads, clamps, bonds and isolation labels | Unverified adhesive-only module retention |
| `LM3-ROOF-P030` | removable HVAC intake/exhaust skirt, curb fairing and access hatches | Curb, lifting or fall-protection loads |
| `LM3-ROOF-P040` | PV/gland plinths, antenna closeouts and walkway edges | Antenna/PV proof loads or worker load |
| `LM3-EXT-P040` | supplier roof HVAC unit | Carbody loads beyond frozen feet/curb |
| `LM3-EXT-P050` | supplier PV module and clamp kit | Roof-skin load; rails resolve into structure |
| `LM3-EXT-P070` | antennas, walkway pads, lifting covers and labels | Unreleased roof penetrations |
| `LM3-FIN-P020` | trial radiative coating on exposed fairings | Any structural, sealing, bonding or anti-slip role |

## Mould family

The common roof mould fixes crown, 1,000 mm pitch, side returns, clip lands and dry-joint geometry. Replaceable inserts in `LM3-TOOL-ROOF-FAIRING-MOULD` produce:

- plain roof skin;
- HVAC curb/fairing and removable skirt;
- PV rail/pad and junction/gland plinth;
- antenna/radio closeout;
- retained inspection or lifting cover;
- walkway edge and drain closeout.

Openings are CNC trimmed after cure from the common datum. No roof penetration is hand-cut on the vehicle. Solid laminate surrounds fasteners and cut edges; all trimmed edges are sealed, and every removable part has retained hardware.

## Arrangement and keep-outs

The released roof coordination drawing must freeze HVAC feet, supply/return drops, condensate drains, PV rails/clamps, cable glands, resistor heat zone, antennas, lightning/bonding network, lifting covers, walkways and fall-safe access. It must also reserve hand/tool access and a removal path for each unit.

Radiative coating is allowed only on the remaining exposed roof/fairing area. It is prohibited on PV active surfaces and clamps; HVAC intake, exhaust and heat exchangers; antennas/sensors; walkways; lifting covers; earth bonds; glands; drains; seals; safety labels; and all service or adhesive lands.

## Controlled assembly route

1. Survey roof bows and rails before corrosion-coating closeout.
2. Install and leak-test the HVAC curb, duct collar, tray and drains.
3. Fit PV rails/pads, bonds and cable-gland plinths; perform pull, pitch and continuity checks before modules obscure them.
4. Dry-fit plain/fairing roof mouldings, hatches, skirts and closeouts; check airflow, thermal and service envelopes.
5. Apply qualified exposed-roof finish with the controlled mask map.
6. Install HVAC, PV, antennas, resistor shields, walkways and covers.
7. Complete roof water, condensate-flow, bonding, PV isolation, antenna, airflow and service-removal tests.

The HVAC and PV product selections remain supplier freezes. These moulds and interfaces let the local factory progress without pretending that a generic box is the final certified unit.

## Curved sandwich development and heat qualification

The development CAD and volume verification separates ply skins, adhesive, foam and solid edge lands on a parametric curved roof. Its 50 mm crown is an assumption pending the coordination drawing, and curved insert lands still require local mounting detail. The test and quotation register requires an equipment-adjacent heat-soak bay beneath PV, aged bonds/inserts, water ingress, pressure, fatigue, clip-loss retention and electrical bonding. Core thermal stability and resin glass-transition temperature do not establish an allowable temperature for the assembled panel. No equipment or personnel load is transferred to the weather skin by these development calculations.

# Traction and DC Power — 800 V-Class Reference

Repository source: `docs/rolling-stock/light-metro-3car/traction.md`

Controlling decision: RFC 0021

The three-car train is three electrically self-contained cars coupled into one coordinated consist. Each car carries one 225 kWh gross / 180 kWh routinely usable liquid-cooled LFP pack, two independent traction controllers, two PMSMs, isolated low-voltage DC/DC equipment, direct-HV DC HVAC, and one roof-PV MPPT.

The pack modules sit in fire-separated side enclosures beneath the longitudinal-seat zone. They have no service opening into the saloon: removal, drainage, pressure relief and thermal-runaway venting are all outward through the lower bodyside. Interior fairings are non-structural passenger barriers, not battery access hatches.

```
Car A: roof PV -> MPPT -----+
       station contact -----+-> 225 kWh LFP -> controller -> PMSM axle 1
       regenerative braking +             -> controller -> PMSM axle 2
                                             -> isolated LV DC/DC
                                             -> direct-HV DC HVAC

Cars B and C repeat the same package.
```

There is no traction transformer, continuous catenary, train-wide AC distribution, or central auxiliary inverter. Internal electronic motor drives inside qualified HVAC equipment remain permitted.

## Battery and DC link

| Parameter | Reference value |
|---|---|
| Chemistry | LFP |
| Consist gross / routinely usable | 675 / 540 kWh |
| Per-car gross / routinely usable | 225 / 180 kWh |
| Architecture class | 800 V-class |
| Nominal operating voltage | 650–700 V DC |
| Provisional normal upper voltage | 740 V DC |
| Side-enclosure modules beneath seat zone | 8 per car, 4 per side |
| Electrical segmentation | 2 contactor-isolated strings per car, subject to topology study |
| Cooling | Liquid cold plates, with independent pack limits at 50 °C ambient |
| Monitoring | Cell/module voltage and temperature plus compartment off-gas detection |

The 740 V provisional limit preserves operating margin below a 750 V-class candidate controller ceiling. Cell count and SOC window are not released until controller transient withstand, regeneration overvoltage, contactor interrupt duty, precharge, isolation monitoring, creepage/clearance, and charger compatibility are jointly verified.

An identified module hazard causes string- or pack-level isolation according to the proved topology. The design does not claim individual series-module bypass.

## Traction equipment

| Parameter | Reference envelope |
|---|---|
| Motor count | 6, two per powered bogie |
| Controller count | 6, one per motor |
| Type | Heavy-commercial-vehicle-class PMSM/controller set |
| Candidate motor | Inovance HM47-class or qualified equivalent |
| Candidate controller | Inovance LD32-class or qualified equivalent |
| Candidate motor short peak | 350 kW for supplier-qualified duration |
| Installed hardware peak | 2.1 MW |
| Initial train control cap | 1.8 MW |
| Cooling | Per-axle liquid loop branch with monitored flow and temperature |

Supplier names define RFQ and packaging references, not sole-source requirements. The interface control document shall state voltage/current, CAN message mapping, torque accuracy, safe-torque-off behavior, thermal limits, ingress protection, shock/vibration, EMC, fault reporting, mounting, coolant, and connector requirements.

## Gearbox and adhesion closure

The previous 6.5:1 gearbox ratio is withdrawn. The selected ratio must be derived from the qualified motor torque-speed map, 760/680 mm new/worn wheel diameters, 90 km/h service speed, overspeed margin, grade requirement, and thermal duty.

Analysis shall cover:

- AW0 through AW3 acceleration and jerk;
- dry and wet rail, including coefficient-of-adhesion sweeps at 0.05, 0.10, and 0.15;
- maximum wheel torque at new and worn diameter;
- field-weakening and motor/controller overspeed;
- one-controller and one-car-pack unavailable operation;
- regenerative-braking acceptance at high SOC;
- continuous grade and repeated 1 km stop duty at 50 °C ambient; and
- gearbox bearing, lubrication, sealing, and maintainability.

The 1.8 MW control cap remains the release value until these analyses show a larger command improves timetable performance without exceeding adhesion, battery, converter, or cooling limits.

## Station charging interface

- Primary mechanical interface: automated conductive side contact.
- Station cabinet: one 500 kW bidirectional DC/DC stage.
- Cabinet current ceiling: 825 A reference.
- Contacts: up to two platform contacts sharing one interlocked cabinet budget; they are never each allocated 500 kW simultaneously.
- Normal dwell: approximately 60 seconds, giving about 8 kWh after losses.
- Terminal: same 500 kW hardware with a longer balancing dwell.
- Train protection: HVIL, insulation monitoring, precharge, weld detection, touch-safe sequencing, emergency isolation, and BMS charge limit.

At 700 V the ideal current at 500 kW is about 714 A; at 650 V it is about 769 A. The simulation and controller enforce power, current, battery charge acceptance, conversion loss, and ambient derating at the same time.

## Rooftop PV

The existing approximately 15.12 kWp train roof array is retained as an auxiliary-energy offset and SOC-maintenance source, not the primary traction supply. Each car has its own MPPT, isolation switch, combiner, protected DC interface, and removable wiring route. Solar cables are not embedded in the roof laminate.

Both bonded flexible and rail-mounted rigid module packaging remain prototyping candidates until wind, vibration, fire, bonding, water-ingress, and replacement evidence selects one production arrangement.

## Auxiliary power

| Domain | Architecture |
|---|---|
| HVAC | Direct 650–700 V DC input rail unit with internal motor electronics |
| Safety controls | Redundant isolated 24/48 V DC/DC domains |
| Doors and lighting | Isolated LV DC distribution with local protection |
| PIS, CCTV and compute | Separate isolated service domain with load shedding |
| Pumps and cooling | Monitored DC supplies; fire-mist pump independent per car |

Loss of a nonessential service domain must not remove braking, door release, fire detection, emergency lighting, communications, or pack isolation.

## Fire protection interface

Each battery module is enclosed, monitored for temperature and off-gas, and vented outward. Each car carries a small water reservoir, DC pump, monitored stainless distribution line, and mist nozzles serving only battery compartments. The system cools adjacent modules and slows propagation; it does not claim to terminate cell-level thermal runaway.

Traction controllers, DC/DC equipment, and HVAC electronics use fire-resistant metal enclosures, detection, and electrical isolation. They do not have automatic gaseous or water-mist suppression. The saloon has no automatic sprinkler or CO2 flooding system.

## Release evidence

- Pack cell/string topology and voltage/transient analysis.
- Motor/controller/gearbox duty-cycle simulation and dynamometer evidence.
- AW3 adhesion, grade, acceleration, regen, and stopping analysis.
- 50 °C train and station converter thermal/derating tests.
- Charger shared-contact arbitration and failed-cabinet scenarios.
- Battery-module propagation, vent and mist flow/pressure tests.
- EMC, shock/vibration, ingress, insulation and high-potential tests.
- Supplier-neutral interface control drawings and acceptance procedures.

# Light-Metro 3-Car V2 Release Checklist

Repository source: `docs/rolling-stock/light-metro-3car/v2-release-checklist.md`

The v1 package is a complete concept envelope and procurement BOM. The v2 package is the fabrication release. This checklist defines the missing artifacts that must exist before the trainset can be treated as production-ready.

| Gate | Required artifacts | Closure criterion |
|---|---|---|
| Design baseline freeze | Signed LM3 configuration sheet covering 3 repeated 16.5 m cars, 3 powered bogies, 3 trailer bogies, 540 kWh usable onboard battery, 78.75 t controlled planning tare (75.308 t modeled subtotal + 3.442 t engineering reserve), two door pairs per side per car, and no city-specific train variant | Drawing register, mass budget, product mass-closure ledger, BOM, RFC 0008, RFC 0021, RFC 0022, and `trainset.py` all agree |
| Supplier envelope freeze | Door, window, HVAC, articulation, coupler, battery, inverter, motor, brake, bearing, sensor, and charging connector interface drawings | Every selected supplier part fits without changing primary steel datums |
| Structural analysis | EN 15227 crashworthiness, EN 12663 carbody static/fatigue, EN 13749 bogie frame FEA, plus closure of the current lateral-sway screen review | Reports reviewed and linked from `compliance.md`; revised body model is <= 20 mm lateral displacement or has an approved target change |
| Weld package | Weld maps, WPS/PQR register, weld classes, NDT plan, fixture-control plan | EN 15085 CL1/CL2 joints have inspection method and acceptance criteria |
| Bogie frame and recovered-component acceptance | Fresh powered/trailer bogie-frame drawings, supplier certificates for new safety-critical parts, and any donor axle/axlebox quarantine + NDT + metrology sheets | No recovered freight bogie frame enters the OSR consist; recovered components are accepted only line-by-line |
| Manufacturing drawings | 2D controlled drawings for body, bogie, brackets, panels, battery trays, door portals, coupler pockets, HVAC rails, and identical fiberglass end-cowl casts | Drawing register reaches rev A with owner, material, tolerance, and inspection method |
| Factory drawing/interface packages | Sixteen generated work packages covering every locally made row across chassis, structural interfaces, exterior modules, panoramic glass, lamps, configurable ends, bogies, battery/HV hardware, trainlines, roof equipment, interiors, fixture rails, livery film, trial roof coating and recovery | Every package has frozen inputs, approved controlled outputs, characteristic list, verification owner and evidence route; the generated package itself is not an approval |
| Flat-pattern and NC output | DXF/neutral CAD flat patterns, bend tables, nesting sheets, drilling/cutting programs | Shop can cut and bend one carbody kit without interpreting 3D envelopes |
| Harness and pipe routing | Clamp locations, bend radii, connector access, HV segregation, coolant bleed/drain points, EMC bonding plan | Routing pack passes maintainability and electrical safety review |
| Weight and balance | Close all 117 active rows in generated `mass-closure-ledger.md`; per-line mass rollup, individual-car and complete-train calibrated weighs, axle loads by AW0/AW2/AW3, roof equipment CG, battery mass distribution | Nine categories reconcile, the signed tare/CG report supports the controlled mass, and <= 14 t AW3 axle load is verified; the 73.376 t modeled lightweight candidate cannot change tare before its separate substantiation gates close |
| First-car build hold point | One 16.5 m carbody shell, one powered bogie, one trailer bogie, one battery enclosure set, one door bay, and one roof/HVAC/PV bay built and inspected before committing all three cars | Dimensional/NDT findings are closed or fed back into rev B tooling before repeat production |
| First-article inspection | Dimensional survey, water ingress, door fit, HVAC drain, battery isolation, brake/static tests | Results accepted into certification evidence register |

## COTS CAD Rule

Parametric CAD and FreeCAD review models may stay supplier-neutral until procurement freeze. After freeze, each selected supplier module gets a named envelope model with revision, datasheet source, keep-out zones, and service-removal path. Generic envelope models remain useful for early design review but do not close v2.

# Rust codebase review and OpenSourceRail integration plan

Repository source: `docs/rust-codebase-review-and-integration-plan.md`

Review date: 2026-09-27 Scope: the complete Cargo workspace, its Python/GIS and supervision boundaries, CI, formal-evidence hooks, and the ERP/SCADA/AI architecture.

## Executive assessment

The Rust workspace stands up well as a deterministic engineering, simulation and controller-evaluation codebase. It does not yet stand up as a commissioned or certified railway control product. Those statements are compatible: the repository has meaningful fail-restrictive logic, property tests, integration tests, differential tests and selected bounded proofs, while still lacking the physical I/O, persistent service deployment, calibration, independent safety assessment and operating evidence required for live authority.

At the start of this review the workspace contained 56 crates and about 72,000 lines of Rust under `src/` and `tests/`. The workspace test suite and Clippy with warnings denied passed. The review therefore concentrated on incorrect trust assumptions and integration seams rather than rewriting stable evaluator logic.

This review added a 57th crate, `osr-supervision-contract`, to make the Rust-to-operating-platform boundary explicit and observation-only. The follow-on lifecycle-control pass adds the 58th, `osr-lifecycle-identity`, so Rust and the ERP compiler enforce the same lookup-only physical-asset identity contract.

## What is credible now

| Area | Evidence in the repository | Current credible use |
|---|---|---|
| Pure control evaluators | Integer-oriented ATP, brake, BMS, points, door, fire, obstacle and related evaluators with unit and property tests | Simulation, design review, shadow execution and HIL preparation |
| Interlocking and consensus | Deterministic replay, partitions/healing tests, authenticated ingress, Python differential checks and selected Kani harnesses | Research and bounded pilot/shadow evidence; not certified movement authority |
| Integrated simulation | Cross-crate train, station, wayside, energy, fare, condition and OCC scenarios | Software-in-the-loop regression and city design validation |
| Design and topography | Source-locked routing rasters, open DEM elevation/slope, water masks, civil classification, station exclusions and City Studio layers | Reproducible planning screening; not survey or construction release |
| Security primitives | HMAC/Ed25519 primitives, authenticated envelopes, replay/freshness checks and unsafe-code prohibition | Building blocks and simulation evidence; not a deployed PKI or key ceremony |
| Assurance tooling | Structured safety cases, source/result hashes, Kani result capture and explicit evidence acceptance | Evidence management; not independent certification |
| Operator interfaces | OCC and simulation GUIs plus a local City Studio server | Demonstration and training, not a resilient production OCC |
| Business integration | A scoped gateway connects observations to history, FUXA and ERP maintenance; ERP cannot release the railway | Demonstration and bounded business workflow |

## Findings from scrutiny

### Strengths

1. The workspace centrally forbids unsafe Rust and pins a minimum toolchain.
2. Safety-oriented evaluators are generally pure and deterministic, which makes replay, property testing and formal analysis practical.
3. The simulation exercises real crate APIs rather than parallel mock control laws.
4. Failure behavior is frequently conservative: unknown positions, stale authority, sensor disagreement and lost quorum restrict operation.
5. The documentation usually distinguishes research, planning and simulation evidence from certification and field acceptance.
6. City inputs and generated engineering evidence have extensive content-lock and provenance mechanisms.

## Defects and trust gaps found in this review

| Priority | Finding | Consequence | Resolution in this plan |
|---|---|---|---|
| P0 | Routing bounds were inferred from a flattened index | An out-of-range column could alias into a later row | Explicit row and column checks plus regression/property tests |
| P0 | Penalty length was only a debug assertion | A malformed caller could panic in an optimized build | Runtime shape/value validation and typed errors |
| P0 | Release arithmetic used Rust's default unchecked-overflow profile | Optimized builds could wrap accidental integer overflow | Workspace release overflow checks enabled |
| P1 | The raster loader ignored the sidecar's declared file path | Metadata and consumed bytes were not one enforced contract | Safe declared-path loading with traversal rejection |
| P1 | Raster/grid/topography/anchor semantics were weakly validated | NaN, invalid coverage, malformed dimensions or bad anchors could leak into planning | Bounds, finiteness, domain, overflow and identity validation |
| P1 | City Studio GIS reads could call the bundle loader without enforcing project source locks | A layer could be called source-locked while loading tampered bytes | One verified routing-bundle method for routing, compilation and GIS |
| P1 | The Rust bridge exposed an ad hoc serialization of internal controller types | Python depended on implementation layout and authority was implicit | A strict normalized observation contract with exact units and source crates |
| P1 | CI did not test all features, doc tests or dependency advisories | Feature-specific drift and known vulnerable dependencies could escape the normal gate | All-feature Clippy/tests, doc tests and pinned RustSec audit |
| P1 | The first RustSec run found vulnerable GUI transitive dependencies and unmaintained `bincode`/font-parser dependencies | Known denial-of-service, argument-injection, unsoundness and maintenance risks were present in the lockfile | Rust 1.92 and egui 0.34 migration, patched transitive versions, and `postcard` wire serialization; the strict audit now passes without exceptions |
| P2 | The long-horizon simulator check was ignored in normal CI and there was no recurring coverage artifact | Slow regressions and unexercised areas were less visible | Tracked two-day/four-mode CI evidence, weekly seven-day soak and workspace LLVM coverage artifact |

# Target integration architecture

```
flowchart LR
  GIS[Locked OSM, water and open DEM evidence] --> Route[Rust routing and City Studio]
  Route --> Revision[Content-addressed design revision]
  Revision --> Sim[Rust system simulation]
  Sensors[Future commissioned physical adapters] -. reviewed contract .-> Eval[Rust evaluators]
  Sim --> Eval
  Eval --> Obs[osr-supervision-contract\nobservation-only]
  Obs --> Gate[Scoped integration gateway]
  Gate --> Hist[History and alarms]
  Gate --> FUXA[Read-only supervision views]
  Gate --> ERP[ERP maintenance and draft business records]
  Hist --> Council[Governed multi-model executive evidence]
  ERP --> Council
  Council --> Draft[Attested allowlisted ERP drafts]
  Draft --> ERP
  Human[Licensed operators, engineers and accountable officers] --> Control[Railway command and release]
  Eval --> Control
  Council -. no command path .-> Control
  ERP -. no release path .-> Control
```

The critical rule is structural, not promotional: the observation crate has no command, reset, movement-authority, protection, ERP-action or executive-decision type. AI models see an immutable gateway snapshot derived from observations. They cannot call a Rust controller. Even a quorum decision can only prepare an allowlisted, unsubmitted ERP draft. Human and independently assessed railway paths retain command, protection, engineering release and legal accountability.

# Executed implementation plan

## Phase 1 — establish the baseline and maturity boundary

Actions:

- inventory every workspace member and its tests;
- run all-target workspace tests before modification;
- run all-feature Clippy with warnings denied;
- inspect architecture, SBC allocation, City Studio, topography, simulation, supervision, ERP and executive-council documentation;
- distinguish defects from acknowledged physical/certification work.

Exit criterion: a review based on executable behavior and documented claims, not crate names. Completed.

## Phase 2 — harden topography and route synthesis

Actions:

- reject empty, overflowing or internally inconsistent grids;
- validate demand weights and penalty rasters before Dijkstra execution;
- check row and column bounds independently;
- consume the safe relative paths declared by raster sidecars;
- validate grid geography, raster byte counts, cost/demand/buildability, 0–100 water coverage, finite elevation, non-negative slope and anchors;
- use one source-lock-verifying City Studio bundle loader for routing and GIS;
- retain the planning boundary: open DEM and OSM water identify likely viaduct/bridge/station-exclusion areas but do not become surveyed alignment.

Exit criterion: malformed or tampered routing inputs fail with an error rather than aliasing, panicking, silently drifting or being shown as locked. Completed.

## Phase 3 — create a stable Rust-to-supervision contract

Actions:

- introduce `osr-supervision-contract` with strict Serde fields;
- require schema, simulation environment, observation-only authority, bounded identity/time and a bounded unique observation set;
- attach units and originating Rust crates to every measurement;
- normalize nine evaluator families into the contract in the native bridge;
- make the Python gateway require the exact identities, ranges, integer enums, units and source-crate mappings;
- remove Python's dependency on serialized internal Rust state layouts;
- retain a shared JSON fixture asserted by both Rust and Python tests.

Exit criterion: an extra command field, altered authority, missing or duplicate reading, wrong unit/source, non-finite value, fractional enum or physical frame fails closed. Completed.

## Phase 4 — integrate with ERP, SCADA and governed AI

Actions:

- feed only validated observations into the existing scoped gateway;
- keep FUXA as a read-only view of gateway state;
- keep condition-to-ERP delivery in the durable, idempotent maintenance path;
- let executive proposals reference the gateway's immutable context digest;
- prohibit council outcomes from entering the controller command queue;
- document that source-crate names are provenance, not proof of commissioning;
- preserve native ERP permissions and independent railway handback.

Exit criterion: Rust data improves operating and management evidence without granting ERP, FUXA or AI a safety or release capability. Completed in the software architecture; physical adapters remain a commissioning activity.

## Phase 5 — broaden verification and release gates

Actions:

- add routing property tests for path bounds/connectivity and water semantics;
- execute every population archetype plus greedy topology synthesis against a connected, bounded route contract;
- add malformed-grid, path-traversal, topography-domain and source-lock tests;

- reject mismatched raster dtype/shape/byte order/length, unpaired DEM layers, invalid geographic references and duplicate anchors in regression fixtures;
- add observation-contract unit tests and adversarial Python projection tests;
- bind the Rust output byte structure to the cross-language fixture;
- pin a representative `postcard` entry to exact bytes so a serializer or enum layout change cannot silently alter the replicated-log wire format;
- run Clippy and tests with all features and add doc tests;
- add a pinned `cargo-audit` RustSec gate;
- pin Rust 1.92 in the workspace, installer, CI and `rust-toolchain.toml`;
- upgrade the GUI dependency chain and replace unmaintained `bincode` with `postcard`, then require the advisory audit to pass without an allowlist;
- compile both operator GUI libraries for their no-default-feature WebAssembly target as a distinct CI gate;
- enable checked arithmetic in optimized releases;
- run a tracked two-day normal/peak/degraded/recovery resource-bound profile in CI and a seven-day release profile on the weekly schedule;
- generate a recurring LLVM source-coverage artifact.

Exit criterion: fast PR checks cover structure and contracts; expensive soak and coverage work runs recurringly and can be invoked manually. Completed.

### Phase 6 — documentation and reproducible handoff

Actions:

- update the Rust workspace map and embedded-integration contract;
- update architecture diagrams to show the observation boundary and AI non-authority path;
- record exact remaining deployment gates below;
- run repository-wide Rust and Python regression suites and hygiene checks.

Exit criterion: documentation describes the implementation that tests execute, and does not imply certification or a physical deployment. Completed, subject to final regression results recorded in the change handoff.

## Test strategy after this review

| Layer | Harness | Purpose |
|---|---|---|
| Function | Rust unit tests | Exact evaluator and validation behavior |
| Invariant | Proptest suites | Broad input-space determinism, bounds and fail-restrictive properties |
| Cross-crate | `osr-sim` integration tests | Real subsystem composition and fault propagation |
| Differential | Interlocking Rust/Python comparison | Independent reference agreement |
| Formal | Kani workflow | Bounded selected safety properties with preserved results |
| Cross-language | Rust bridge fixture plus Python rejection tests | Schema, unit, provenance and authority compatibility |
| Long horizon | Tracked two-day four-mode report plus scheduled release-mode seven-day simulation | Energy reserve, invariant health, degraded/recovery behavior and bounded retained state over time |
| Supply chain | RustSec audit of `Cargo.lock` | Known dependency advisories |
| Static | rustfmt and all-feature Clippy with warnings denied | Consistency and lint debt prevention |
| Coverage | Scheduled LLVM LCOV artifact | Identify unexercised Rust paths without inventing an arbitrary safety threshold |

Coverage percentage is not a safety claim. A high line-coverage number cannot replace requirements traceability, boundary-value analysis, fault injection, formal arguments, HIL or independent assessment.

## Verification snapshot after follow-through

The final local tree was exercised again after the review changes:

- `cargo clippy --workspace --all-features --all-targets -- -D warnings` passed;

- `cargo test --workspace --all-features --all-targets` passed; the explicitly deterministic two-day report is checked in CI and the seven-day profile is covered by the scheduled release workflow and was also run successfully during the main review;
- `cargo llvm-cov 0.9.1 --workspace --all-features --all-targets` passed and reported 28,075/37,209 instrumented lines, or 75.45%. This increased from the pre-follow-through 72.12% snapshot. The deliberately targeted changes moved routing topology from 1.78% to 76.05%, raster validation to 95.68%, and both `osr-proto` and `osr-supervision-contract` to 100%;
- the source-bound Kani 0.67.0 runner executed 39 tractable declared properties and all 39 passed, with a 600-second timeout and 4096 MiB per-process address-space cap. The manifests cover ATP, brake, points, obstacle detection, intrusion detection, secure bus, four bounded odometry properties and three bounded interlocking properties;
- the remaining nine of 48 declared properties are not closed: odometry determinism retains its recorded 1,800-second timeout and all eight interlocking non-overlap partitions retain their recorded memory exhaustion. These are open proof obligations, not observed counterexamples and not implicit passes.

The generated LCOV file and eight execution manifests are under `build/assurance/rust-review-final/`. They are ignored local working artifacts, identify the runner as `local-unattested`, set independent acceptance to false, and must not be presented as certified or independently accepted evidence.

## Remaining work that cannot be honestly completed by repository code alone

These are deployment and assurance gates, not deferred software TODOs to hide:

1. Commission physical MQTT/OPC UA/Modbus/device-bus adapters against named suppliers, exact firmware, units, scaling, freshness and local permissives.
2. Replace process-lifetime demonstration state with qualified persistent controller/service state where the deployment safety concept requires it.
3. Establish device identity, PKI, key injection/rotation/revocation, secure boot, measured update and incident-response ceremonies.
4. Run processor, bus, sensor, actuator, timing, EMC, environmental and degraded communications HIL campaigns on the selected hardware.
5. Complete requirements-to-test traceability and the deployment-specific hazard log with an independent safety assessor.
6. Prove or qualify the selected compiler, target, RTOS/OS, build pipeline and reproducible binary/signing process for the claimed safety integrity.
7. Receive licensed survey, geotechnical, hydrology, utilities, land, navigation and structural evidence before bridge/viaduct/station release.
8. Commission resilient production event storage, disaster recovery, observability, capacity and cyber monitoring for the OCC and historian.
9. Appoint human statutory directors, accountable railway managers, safety authorities and employment/finance/legal signatories. The AI council remains advisory and policy-bound; it is not a legal person or safety authority.

Until these gates close, the correct description remains: serious open engineering and simulation software with explicit pilot/shadow paths—not a certified autonomous railway or an autonomous corporate officer.

# Safety-case artifacts

Repository source: `docs/safety-case/README.md`

This directory collects the machine-checkable evidence that supports OpenSourceRail's safety claims. Per ARCHITECTURE.md §7 the safety case is structured in GSN (Goal Structuring Notation), serialised as TOML, and regenerated on every commit.

The TOML lives under `gsn/` and is compiled by the `osr-safety-case` crate (RFC 0005 §4.9). CI gate: `tests/starter_case_closes.rs` fails the build if any goal no longer traces to evidence — that is, adding a safety-relevant claim or deleting an evidence file breaks CI until traceability is restored. This checks graph links and source-path presence, not proof execution, current results or independent acceptance.

Compile the rendered case locally with:

```
cargo run -q --bin osr-safety-case -- docs/safety-case/gsn
```

## What's verified today

RFC 0004 §4 names five safety properties of the Movement Authority computer:

| Property | Harness in `crates/osr-interlocking/src/kani_proofs.rs` | Status |
|---|---|---|
| P1 — determinism | `kani_p1_determinism` | bounded local pass on `2bf8b7717`; see records |
| P2 — non-overlap | `kani_p2_non_overlap_two_trains` and seven paired companions | open; all eight partitions required |
| P3 — consist-fit | `kani_p3_consist_fit_single_train` | written |
| P4 — conservatism | `kani_p4_fail_restrictive_is_not_less_restrictive_than_known` | written (fail-restrictive path only) |
| P5 — time-bounded | `kani_p5_time_bounded`, `kani_p5_time_bounded_with_known_position` | written |

Also proptest-checked (sampling larger input domains with finite generated tests) in `tests/proptest_ma.rs` and `tests/proptest_determinism.rs`.

Continuously exercised in `osr-sim` on every scenario run: per RFC 0004 M5 the simulator emits `Entry` objects as trains move, and every section entry is gated by `osr_interlocking::section_available_to`. The generated Samawah reference run produces 2400 MAs / 2 h with zero invariant violations under both the in-memory backend and a 3-node Raft cluster.

Cross-checked against an independent Python reference interpreter (`tools/reference-ma/`) per RFC 0004 M4: `crates/osr-interlocking/tests/differential.rs` serialises random log prefixes, shells out to `python3 -m reference_ma`, and asserts byte-identical `MovementAuthority` JSON. Any divergence between the two twins is a bug in at least one of them.

Execution status: the declared harnesses run through a source-bound evidence runner. ATP determinism and interlocking determinism passed on candidate `2bf8b7717`; odometry determinism and the complete two-train non-overlap obligation remain open. See the retained execution records for commits, budgets, input hashes and failures. These are bounded fixture proofs; scaling toward RFC 0004's targets and independent safety acceptance remain open.

## What the other SIL-4 crates check today

| Crate | Properties | Verification |
|---|---|---|
| osr-atp | A1–A7 (determinism, expired MA trips, unknown position trips, train mismatch trips, head past MA end trips, overspeed trips, conservatism) | proptest for A1–A7; Kani harnesses for A1–A7 in `src/kani_proofs.rs` |
| osr-brake | B1–B5 (determinism, emergency union, emergency completeness, WSP conservative, park safe) | proptest + Kani for B1–B5 in `src/kani_proofs.rs` |
| osr-odometry | O1–O5 (determinism, forward non-regression, uncertainty monotone, balise reset, GNSS conservative) | proptest + Kani for O1–O5 in `src/kani_proofs.rs` |
| osr-wayside-points | W1–W6 | proptest + Kani for W1–W6 in `src/kani_proofs.rs` |
| osr-consensus | TLA+ invariants (ElectionSafety, LogMatching, LeaderCompleteness, StateMachineSafety, FailRestrictive) | proptest over cluster harness; TLA+ TLC on the spec, not yet a refinement proof |

## Running Kani

### Install

```
cargo install --locked kani-verifier --version 0.67.0
cargo kani setup
```

`cargo kani setup` downloads ~200 MB of CBMC tooling on first run.

### Run a single harness

```
cargo kani -p osr-interlocking --harness kani_p5_time_bounded_arithmetic
```

### Run all harnesses in a crate

```
cargo kani -p osr-interlocking
```

### Run all harnesses across the workspace

```
cargo kani --workspace
```

The arithmetic harness completes in seconds. Whole-function and topology-backed harnesses can exceed ordinary CI limits because standard-library map operations expand the bounded state space. Treat their bounds and reports as controlled formal evidence; never disable unwinding checks merely to obtain a green result.

## CI

The Kani workflow runs on pushes to `main`, pull requests and manual dispatch. It checks ATP rejection of an expired movement authority and interlocking validity-window arithmetic, then gates the 39 declared harnesses that currently complete within the controlled budget across eight packages with Kani 0.67.0. Manual dispatch additionally re-runs the nine open resource-bound obligations as explicitly non-gating diagnostics and preserves their failures, timeouts or any future closure. The default budget is 600 seconds and 4096 MiB of virtual address space per process. Manual dispatch can select 1800 seconds and/or 8192 MiB. All eight paired non-overlap harnesses remain required for proof closure; each retains both trains and symbolic head positions for its wayside condition. See the partition rationale.

Actual successes, failures and timeouts are archived with source hashes. Timeouts and memory failures do not establish a property. The runner terminates the entire verifier process group and limits memory to preserve subsequent results. A runner shutdown can still prevent artifact upload; an incomplete run cannot qualify a release.

The results register separates historical results from the latest candidate. A green push/PR workflow is a merge-regression signal, not full formal closure. Release packaging still requires successful exact-commit artifacts for all 48 declarations and rejects missing, failed or duplicated results; therefore the nine open obligations still prevent formal release qualification. General CI, integrated-stack and example-city acceptance are also required. Merging development work does not grant release or safety acceptance, and an earlier pass does not automatically qualify a later commit.

## What's planned

From RFC 0004 §M3 and the cross-crate safety plan:

1. Scale the P2 / P4 bounds toward the RFC's 8 trains × 50 entries × 100 sections target. Requires either smarter abstractions (reducing state-space explosion) or a fleet of dedicated CI workers.
2. Kani harnesses for the other SIL-4 crates — done. The four onboard/actuator evaluators (ATP, brake, odometry, wayside-points) now ship Kani harnesses alongside their proptest suites. The remaining work here is verification throughput — scaling bounds toward larger state spaces on dedicated CI.
3. A refinement proof from the TLA+ `SMRaft` spec to the Rust `osr-consensus` implementation. TLC already checks the spec's safety properties; refinement would formally connect the spec to the code. TLAPS or a separate tool is a candidate.
4. GSN safety case compiler — done. The `osr-safety-case` crate compiles the TOML claim files in `gsn/` and the `starter_case_closes` test gates traceability in CI on every commit. Counts are generated below; evidence pointers alone do not establish that a claim has been verified.

Generated case inventory: 32 goals, 6 strategies, 78 solutions. These counts describe traceability, not successful or accepted proofs.

## Directory contents

- `gsn/` — GSN TOML claim files. Each file is a coherent slice of the case (top-level goals, non-overlap decomposition, fail-safety decomposition, consistency decomposition). Compiled by `osr-safety-case`.
- `evidence/` — machine-readable Kani and proptest results (controlled runner imports remain deployment work; see result validation).
- `hazard-log/` — identified hazards and mitigations (planned).

# Safety evidence: traceability, results and acceptance

Repository source: `docs/safety-case/result-validation.md`

The default `osr-safety-case` command checks the GSN graph and evidence paths. It reports traceability complete, not safety-case acceptance. A source file containing a proof harness is not a proof result.

Two additional, conservative gates assess every declared solution:

```
cargo run -q --bin osr-safety-case -- docs/safety-case/gsn \
  --results build/assurance/results.toml --require-verified
cargo run -q --bin osr-safety-case -- docs/safety-case/gsn \
  --results build/assurance/results.toml --require-accepted
```

Missing results fail these gates. The repository does not manufacture passing records from its existing source pointers. Each supplied record must identify its solution, kind, source and exact anchor; for Kani the named function must exist in that source. It must also contain a successful execution status and zero exit code, tool/version, reviewed bounds, runner identity, source/input hashes and a separate report whose bytes match the recorded SHA-256. Changed source inputs or report bytes invalidate the result. Bounds must describe the actual run, including unwind limits, assumptions and tool configuration.

A trusted runner exports the following TOML contract (values below are explanatory placeholders and intentionally do not constitute usable evidence):

```
schema = "osr-evidence-results/1"

[[result]]
solution = "E1.1a"
kind = "kani"
path = "crates/osr-interlocking/src/kani_proofs.rs"
anchor = "kani_p2_non_overlap_two_trains"
tool = "kani"
tool_version = "record the actual version"
bounds = "record exact unwind, assumptions and command"
executed_by = "controlled-runner-identity"
status = "passed"
exit_code = 0
report = "build/assurance/p2-report.txt"
report_sha256 = "sha256 of actual report bytes"
[result.inputs]
"crates/osr-interlocking/src/kani_proofs.rs" = "sha256 of actual source"
# Include implementation, manifests, lockfiles and all reviewed dependencies.

[result.acceptance]
status = "accepted"
reviewer = "independent-reviewer-identity"
reference = "controlled acceptance record"
result_sha256 = "ResultRecord::fingerprint() from the reviewed result"
```

Acceptance binds the entire result record through a deterministic fingerprint, including input hashes, tool version and bounds; it cannot survive a changed execution record. The reviewer must differ from the executing identity. A passing result without this acceptance is reported separately.

This validates recorded evidence, not proof mathematics or reviewer identity. It does not parse arbitrary vendor reports, invoke proof tools, establish that an input list is complete, authenticate a runner, or grant railway release. Controlled runner exports, dependency-scope review and authenticated independent acceptance remain required. Citation solutions also need a reviewed result and local input/report artifacts. The strict gate requires all solutions rather than allowing one passing alternative to conceal missing declared evidence.

Inventory counts are generated from GSN TOML by `python3 tools/automation/safety-case-summary.py`; CI runs it with `--check`. The release-gap register remains the place to track physical and deployment acceptance work.

## Controlled execution and signed acceptance

`tools/automation/assurance-evidence.py run` discovers the 41 declared Kani solutions from GSN, invokes each exact harness with Kani 0.67.0, and exports `results.toml`, per-harness logs and `execution.json`. A nonzero exit, timeout or missing successful verification summary remains failed. Inputs include workspace Rust (including untracked local source), manifests, lockfiles, GSN, runner and CI workflow. Changed inputs during execution invalidate the run. CI runs all eight packages and uploads diagnostics even on failure.

```
PATH="$HOME/.cargo/bin:$PATH" tools/automation/osr-python \
  tools/automation/assurance-evidence.py run \
  --output build/assurance/review --timeout 300
```

Local runs identify themselves as `local-unattested`. A GitHub run reference is recorded as a declared executor, not authenticated by environment variables. `runner_authenticated` remains false: verifying the actual CI run, toolchain, dependency provenance and operating separation remains an independent task.

The separate `verify-acceptance` command authenticates an authorized reviewer's Ed25519 signature over exact JSON envelope bytes, checks the result/report/input hashes and current conservative dependency scope, rejects failed results, duplicate solutions and mismatched declared harnesses, and rejects an executor/reviewer identity match. It does not create a signature or decide that a review occurred.

A separately controlled policy supplies `reviewers`, keyed by reviewer identity, with `enabled`, `public_key` (relative to the policy file) and `public_key_sha256`. Keep that trust policy outside the contributor-controlled checkout. The signed envelope contains:

```
{
  "schema": "osr-independent-acceptance/1",
  "status": "accepted",
  "reviewer": "authorized-independent-reviewer",
  "reference": "controlled-review-record",
  "results_sha256": "hash-of-exact-reviewed-results.toml",
  "solutions": ["exact-reviewed-solution-identifiers"],
  "dependency_scope_reviewed": true
}
```

These are explanatory placeholders, not an acceptance record. The reviewer must review actual runner provenance and independence; different text labels alone do not establish different people. After an authorized reviewer supplies the envelope and detached signature:

```
tools/automation/osr-python tools/automation/assurance-evidence.py verify-acceptance \
  --results build/assurance/review/results.toml \
  --envelope /controlled/review/acceptance.json \
  --signature /controlled/review/acceptance.sig \
  --policy /controlled/trust/reviewers.json
```

Successful signature verification covers only the listed execution records. It does not satisfy the complete GSN case, authenticate physical evidence, or grant railway release. Other evidence kinds and the existing complete-case validator retain their own requirements. No independent acceptance was produced by the demonstration.

# Simulation software coverage

Repository source: `docs/simulation-software-coverage.md`

`osr-sim` executes connected software layers against the same run state:

- `onboard`: odometry, ATP/ATO, BMS, traction, brake, obstacle, fire, derailment, passenger assistance, and regenerative-current arbitration. The arbiter's refusal output is converted into friction effort;
- `vehicle_systems`: doors, auxiliary power, HVAC, lighting, and onboard PIS;
- `embedded`: TCMS, event recording, hot-axle monitoring, CBM sampling, and bounded T2G failover/store-and-forward. A TCMS trip inhibits dispatch or section progress on the next deterministic control cycle;
- `infrastructure_systems`: PSD, station PIS and SCADA per station, plus intrusion detection per wayside section and consensus verdict transitions;
- `habd_systems`: real trackside hot-axle evaluation at explicit bidirectional route-book locations, with next-station warning speed limits, latched stops, and inspected authority resets;
- `balise_systems`: a stable topology-derived passive-balise registry, real sighting audit, and accepted absolute fixes delivered to onboard odometry;
- `fare_systems`: signed single-ride issuance through the real TVM, gate validation, and back-office ledger/fraud reconciliation at every station;
- `occ_systems`: real TCMS-report ingestion into the OCC fleet roster; a critical train alarm opens a line incident and holds new dispatches until the line has recovered, without stopping a train already in a section;
- `proto_systems`: each live position report crosses the deterministic track-state codec; the decoded section, timestamp, speed and SoC feed OCC, and acceptance rejects decode loss or semantic drift;
- `energy_sites`: the standalone site controller governs every integer-watt PV/storage/grid/pad split; per-call conservation is checked in result data;
- `wayside_asset_systems`: every declared point machine executes against dual normal-position sensors and gates departures at its station; each declared level crossing runs the warning/barrier state machine and blocks its sections until closed. Zero crossings is an explicit not-applicable result for grade-separated networks;
- `backend_systems`: radio-delivered CBM ingestion, work-order generation, bounded history, and analytics over retained metrics;
- `time_sync`: the IEEE 1588 slave state machine acquires and retains the shared deterministic clock used by timestamped controller traffic.
- `selftest_systems`: all five deployment roles run their real software known-answer suites before service; a failure holds every dispatch.

Each layer emits deterministic result evidence. Auxiliary loads remain in the calibrated energy intensity and are not charged twice.

Coverage is deliberately narrower than “start every binary.” The simulator runs `osr-selftest` software checks, but physical wiring, sensor, relay and trust-anchor commissioning remains external evidence. The machine-readable contract at `lib/simulation-component-coverage.toml` classifies every entry in `deployment/components.toml` exactly once and fails if the inventory drifts. `scenario_model` entries would identify aggregate substitutes (none remain in the current inventory); `external_boundary` entries would remain explicit gaps (none remain in the current inventory).

Nominal OCC acceptance requires positive controller, telemetry and roster evidence with no incident or dispatch hold left active. A degraded integration test drives a TCMS emergency through the same core and verifies hold/release.

The HABD scenario contract follows the ERA infrastructure-register model: detector existence, location, and direction are explicit route assets. A trip remains latched until an identified inspection reset because the RSSB operating rule requires the train to stop and be examined before further movement. See the ERA RINF application guide and RSSB Rule Book module TW5.

Balise identifiers and positions are regenerated from directed section IDs. Nominal acceptance requires every crossing opportunity to produce a registry-validated odometry fix; missed or mismatched reports remain visible fault-injection outcomes and are never accepted as fixes.

The fare workload uses one representative transaction per station-minute to exercise software deterministically. Sales, grants, and ledger entries must reconcile, but the workload is not used as passenger-demand or revenue forecast evidence. `fare_token_tamper` exercises cryptographic denial and repeated-probe fraud signalling.

Run the inventory check with:

```
python3 tools/automation/validate-simulation-components.py
```

To verify tick evidence as well:

```
cargo run -p osr-sim --bin osr-sim -- \
  --config cities/catalogue/west-asia/Iraq/Samawah/samawah.toml \
  --duration 3600 --status-every 0 --json-out /tmp/osr-result.json
python3 tools/automation/validate-simulation-components.py --result /tmp/osr-result.json
```

City acceptance additionally hashes the rolling-stock template, buildable trainset manifest, and small-component standard. A stale or inconsistent `[consist.systems]` block therefore fails regeneration evidence.

# Software Architecture Diagrams

Repository source: `docs/software-architecture-diagrams.md`

> Operating architecture update: ERPNext + Frappe HR replace custom business administration. The diagrams below describe railway and existing assurance components; ERP cannot issue railway release authority.

These diagrams expand the system map in `ARCHITECTURE.md` and the crate allocations in `RFC 0005`. They are intended as editable architecture drawings for implementers, operators, and reviewers.

## 1. Deployed Demonstration Platform

Solid arrows below describe the localhost demonstration. The Rust evaluators run against simulation fixtures; this is not a commissioned railway deployment. Native ERPNext and FUXA accounts retain their own permissions inside Workbench.

```
flowchart LR
  UI["Workbench: city and asset context"]
  Design["City Studio / FreeCAD / Bonsai IFC / QGIS"]
  Twin["Versioned engineering and city packages"]
  ERP["ERPNext + Frappe HR: native business transactions"]
  Gateway["OSR integration gateway: scoped API, SQLite history and durable outbox"]
  Contract["Rust supervisory contract: observation-only"]
  FUXA["FUXA: generated supervision views"]
  Native["Rust station / vehicle / wayside evaluators"]
  Council["Governed AI executive council: multi-model recommendations"]

  Legacy["Historic Ops Core business records: read-only"]
  UI --> Design
  Design --> Twin
  Twin --> Gateway
  UI --> ERP
  UI --> FUXA
  UI --> Railway
  UI --> Gateway
  Fixture --> Native
  Native --> Contract
  Contract --> Gateway
  Fixture --> Gateway
  Gateway -->|deduplicated Issue / reviewed Asset Repair| ERP
  ERP -->|permission-filtered execution feedback| UI
  Gateway -->|REST tags / source quality| FUXA
  Gateway -->|immutable evidence context| Council
  ERP -->|permission-filtered business state| Council
  Council -->|attested allowlisted unsubmitted drafts only| ERP
  Legacy --> UI
```

ERP completion and alarm clearance cannot grant railway release or movement authority. LM3 factory views apply only to the matching city family; cross-family module reuse needs a separate reviewed mapping before it can be represented.

  ERP -.->|records for review; no release authority| Assurance
```

Dashed interfaces are proposed or require physical commissioning. NATS is not the transport of the deployed ERPNext/FUXA demonstration. Shared identity, TLS, backup operations, supplier bindings and HIL evidence remain deployment work. The remaining diagrams describe intended railway allocations and interfaces; they are not evidence that the depicted hardware paths have been commissioned.

# OSR-BP-001: Source-backed component and system practice

Repository source: `docs/standards/OSR-BP-001.md`

Version 1.0.0 · adopted 2026-10-11 · internal OpenSourceRail research and engineering-process standard.

This standard defines how OSR turns public industry examples and standards discovery into original, open guidance. It supplements OSR-ENG-001, OSR-ENG-002 and OSR-MFG-001. It governs research completeness and provenance; it does not supply universal product acceptance values.

The practice register and source register are the authoring inputs. The existing Digital Standards Thread remains the authority for deployment applicability, adopted editions/clauses, evidence and G0–G4 decisions. Each practice links to its existing STD-CTRL objectives; those links do not close a gate.

| Rule | Mandatory internal requirement | Automated check |
|---|---|---|
| OSR-BP-01 | Every scoped product, assembly, reusable civil type, station variant, Rust workspace package and engineering template shall have explicit specialist guidance. | Exact inventory/mapping equality; no keyword fallback |
| OSR-BP-02 | Every shared template shall be classified as in scope or excluded with a reason. | New/deleted/ambiguous template detection |
| OSR-BP-03 | Guidance shall cover design, materials/dependencies, assembly/build, inspection, maintenance, verification and unresolved decisions, with a responsible role. | Required nonempty card fields |
| OSR-BP-04 | Technical research shall record a primary publisher, public URL, reviewed date, source kind, finding and limitation. | Source identity/type/date and reference validation |
| OSR-BP-05 | Standard scopes, regulatory scopes, manufacturer examples and method references shall retain distinct interpretations. | Source-kind checks and generated limitations |
| OSR-BP-06 | Public metadata shall not be represented as complete clause review, product qualification or achieved safety integrity. | Unsupported acceptance/physical/clause states rejected |
| OSR-BP-07 | Cross-system interfaces shall have guidance and verification tasks in addition to local part checks. | Vehicle/track, energy, boarding and safety-control practice allocations |
| OSR-BP-08 | Guidance shall use existing assurance control identities; project adoption shall resolve jurisdiction, edition, clauses, limits and authority. | Complete practice-to-STD-CTRL crosswalk with known IDs |
| OSR-BP-09 | Unperformed verification plans shall retain open acceptance criteria, procedures, results and evidence. | Generated task states remain open and unperformed |
| OSR-BP-10 | Kit contents, optional configurations, station variants and future scopes shall remain visible. | Preserved applicability records and explicit expansion backlog |
| OSR-BP-11 | Published guidance shall be reproducible from exact source bytes and an explicit assessment date. | SHA-256 inputs and regenerated JSON/CSV/Markdown comparison |
| OSR-BP-12 | Research shall be refreshed after source expiry or an applicability-changing revision. | Date-based refresh findings; stale outputs fail checking |

OSR research refresh intervals are 90 days for regulatory sources, 180 days for manufacturer examples, 365 days for public standard scopes and 730 days for method references. These are internal review policies, not ISO or IEC requirements. A safety-relevant change triggers earlier review. Refreshing a date requires reviewing the source and recording any changed finding or limit; editing a date to make a check pass does not satisfy this rule.

Use ISO references where their scope applies, then applicable railway-specific IEC/EN methods and local authority requirements. For example, ISO 19659-4:2026 provides an HVAC-unit design-input and test scope, while IEC 62928:2017 addresses onboard traction batteries. Complete adopted clauses and installed-system evidence are required before project acceptance. Supplier web pages support discovery and method selection; they do not freeze a purchase specification.

Practice wording is original OSR synthesis and follows the repository's path-based licensing. References retain their publishers' terms. Proprietary drawings, normative text and control algorithms are not redistributed by this register. Portable data and supplier-neutral interfaces support local manufacture, repair and independent assessment.

# OpenSourceRail engineering standard OSR-ENG-001

Repository source: `docs/standards/OSR-ENG-001.md`

Version 1.0.0, effective 2026-10-10. This is an active OpenSourceRail internal process standard for shared engineering definitions, numerical verification, manufacturing evidence and physical correlation. The machine-readable policy owns its version, reference editions and numerical thresholds.

This standard applies to OpenSourceRail research and engineering workflows. It does not declare ISO certification, railway approval or production release. Applicable law and authority requirements take precedence, followed by the accepted project design basis, applicable adopted ISO methods, and these internal rules. An approved project may impose stricter limits.

## Applicable ISO references

The references below were checked against ISO's official catalogue on the effective date. Select the applicable material, process, product and test scope. Before claiming conformity, retain the controlled edition/amendments, applicable clauses, test procedure and completed conformity review. Catalogue descriptions identify scope; they do not substitute for normative method requirements.

| Domain | Reference and intended use |
|---|---|
| Railway quality | ISO 22163:2023: railway quality management; bind customer, statutory and regulatory requirements to evidence. |
| Measurements | ISO/IEC 17025:2017: competent testing/calibration and retained measurement evidence. |
| Structural design basis | ISO 2394:2015: reliability and risk principles; project limit states and resistance factors remain required. |
| Ride evaluation | ISO 2631-4:2001: fixed-guideway relative comfort guidance; select the applicable ISO 2631-1 weighting and evaluation method. |
| Datums and tolerances | ISO 1101:2017: geometrical specification; ISO 286-1:2010: applicable fits and size-tolerance system. |
| Fasteners | ISO 898-1:2013: applicable steel fastener mechanical properties; ISO 16047:2005: applicable torque/clamp-force tests. |
| Welds | ISO 5817:2023: applicable fusion-weld workmanship; ISO 15614-1:2017: applicable welding-procedure qualification. |
| NDT personnel | ISO 9712:2021: relevant industrial NDT qualification/certification. |
| Concrete coupons | ISO 1920-4:2020: hardened-concrete strength test procedures. |
| Composite coupons | ISO 14125:1998: composite flexural properties; additional tests must establish the actual layup and interface laws. |
| Metallic fatigue | ISO 12107:2012: fatigue experiment planning/statistical analysis. |
| Pile tests | ISO 22477-1:2018: maintained axial static compression tests; lateral and cyclic behaviour require separate procedures. |

ISO 2631-4 addresses relative comfort rather than supplying a universal absolute comfort threshold. Raw peak carbody acceleration from a short startup simulation shall not be labelled an ISO ride result. A workmanship quality level, fastener property class or coupon result shall not substitute for assembled strength, fatigue resistance, actual preload or joint capacity.

## Mandatory OpenSourceRail rules

1. Configuration: retain existing product/joint identities, exact revisions, datums, material batches, serials, geometry sources, selected property sources and file hashes. Freeze as-designed, as-built and as-maintained configurations. Changed inputs shall invalidate dependent calculations and inspection evidence.
2. Model scope: declare idealisations, unresolved properties, validity ranges, initial conditions and intended load cases. Missing data shall remain open. Envelope volume shall not establish material mass. Synthetic data shall never establish supplier release, measured properties or physical validation.
3. Numerical verification: use independent analytical/native benchmarks, force/moment/work checks and separate temporal/spatial refinement. Retain unsuccessful cases. A converged nonlinear solve alone shall not establish discretisation accuracy or physical validity.
4. Material and connection resistance: identify all material regions, reinforcement, tendons, interfaces, fasteners, welds, bearings and soil laws in the load path. Evaluate applicable ultimate, service, fatigue, long-term, temperature and construction conditions. Unknown resistance or an uncovered failure mode shall block an engineering acceptance claim.
5. Normal service: normal wheel contact shall remain strictly positive for the accepted service envelope. Use geometry/friction-specific railway force limits, actual ride evaluation methods and approved project deformation limits. Distress/defect tests shall retain contact loss and stop conditions separately.

6 Coverage: include complete passages, operating/resonance speeds, empty, nominal, crush and uneven loading, braking, rescue/maintenance, degraded conditions, both tracks and arrival offsets. Short startup comparisons shall remain screening evidence.

7 Calibration: retain timestamps, SI units, instrument calibration, specimen and configuration identity, positive measurement uncertainty and bounded parameters. Holdout specimens shall be separate from calibration specimens. Report sensitivity rank, parameter covariance, residual bias/RMSE, uncertainty, correlation and extrapolation limits. Physical acceptance requires actual tests and independent review.

8 Manufacturing: drawings shall specify functional datums, tolerances, fits, processes, connection definitions and inspection characteristics before issue. Bind work orders, calibrations, batches, serials and nonconformances to the exact revision. Successful CAD generation shall not issue a drawing or clear a defect.

9 Search and cost: compare equal service/route scope and trial budgets; retain failures and identical uncertainty cases across methods. Confirm selected designs with finer coupled/local models. Include foundations, track, transport, temporary works, inspection, maintenance and replacement; missing prices shall remain null.

10 Release: numerical verification, ISO method conformity, physical validation, drawing issue and authority acceptance shall remain separate decisions. Only the existing controlled release process may authorise production or operation.

## Internal numerical and calibration thresholds

These are OpenSourceRail rules, chosen as reproducible screening criteria. They are not ISO-prescribed tolerances or manufacturing specifications.

| Check | Internal criterion | Reason and scope |
|---|---|---|
| Independent refinement | Each declared observable changes by at most 5% between final levels | Makes resolution effects visible before comparing candidates; refine time and mesh separately. |
| Native load equilibrium | Relative force and moment error at most 0.1% | Detects allocation/postprocessing errors; moment uses a force-times-length scale for near-zero applied moments. |
| Contact work mapping | Absolute residual at most $10^{-6}$ W in the retained benchmark | Checks the opposing work maps in this benchmark; choose documented scaling for materially different solver units/scales. |
| Analytical/native benchmark | Relative error at most $10^{-6}$ | Checks implementations against independent equations, without claiming physical accuracy. |
| Section equilibrium | Relative error at most $10^{-5}$ | Checks fiber resultants; it does not establish uncovered limit states. |
| Native datum solve | Position residual at most $10^{-5}$ mm; orientation residual at most $10^{-8}$ rad | Numerical assembly closure only; these values are not production tolerances. |
| Holdout residual | Uncertainty-normalised RMSE at most 2; absolute normalised bias at most 1 | Candidate calibration screen; actual model discrepancy, correlated samples and operational prediction intervals require independent assessment. |

Acceptance limits for wheel force ratios, weighted ride, fatigue, clearance, deflection, settlement, bearing pressure, material resistance and proof loads shall be linked to their applicable method, geometry and project requirement. This internal process standard does not invent universal values for those limits.

## Execute and review

```
tools/automation/osr-python tools/automation/check-shared-engineering-standard.py \
  --review engineering/civil_exploration/examples/shared-spatial-engineering-review.json \
  --protocols build/engineering/spatial-campaign-converged/protocols.json \
  --output build/engineering/osr-standard-assessment
```

The assessment binds the standard version, review, protocol and implementation hashes. It produces governed protocols and separate numerical pass/fail and open physical/ISO gates. The published synthetic review remains unqualified even when its numerical rules pass. Revisions to this standard shall identify changed rules and their affected evidence; a new standard version shall not silently reaccept old inspections or physical tests.

# OSR-ENG-002: Automated reference part generation

Repository source: `docs/standards/OSR-ENG-002.md`

Version 1.0.0 · internal process standard · adopted 2026-10-10.

This OpenSourceRail standard governs automated reference design studies. It supplements OSR-ENG-001. It grants no supplier release, ISO conformity, production authority or railway operating approval. Project and legal requirements retain the precedence established by OSR-ENG-001.

The industry register records primary sources, review date, numerical data actually adopted and separate OSR assumptions. Public summaries guide method selection; full ISO clause review and project applicability remain open. In particular, ISO 12405-4:2018 covers road-vehicle battery performance tests. Any railway use requires explicit applicability review. ISO 1101, 898-1, 16047 and 17025 method/traceability references follow OSR-ENG-001; their public catalogue descriptions do not supply manufacturing tolerances, bolt preload or acceptance limits.

| Requirement | Internal mandatory rule | Executable verification |
|---|---|---|
| OSR-AP-001 | A generated family shall retain the authoritative count, length, bogie and axle datums. | Full-family count/position tests for all five families; complete-passage planner |
| OSR-AP-002 | Each physical mass shall belong to one nonoverlapping instance scope; expanded kit mass shall be removed from its aggregate. | Shared scope validator, independent total weight/reaction balance and passenger loading test |
| OSR-AP-003 | Battery architecture changes shall regenerate geometry, quantities, mass/inertia, energy, current, resistance and thermal inputs together. | Parallel-string change propagation and cutlist conservation tests |
| OSR-AP-004 | Generated reference geometry shall be valid within its declared primitive and packaging domain. | Positive/finite dimensions, balanced nonoverlapping holes and battery-bay rejection tests; native FreeCAD solids |
| OSR-AP-005 | Every physical joint shall bind known instance datums and a typed mechanical interface with units and signs. | Interface/model identity, endpoint, joint coverage, unit and limit tests; native assembly datum reconciliation |
| OSR-AP-006 | Every required catalogue allocation shall have a coverage record stating representation, evidence and unresolved limitations. | Unique complete coverage and unresolved-slot tests |
| OSR-AP-007 | Electrical and thermal calculations shall retain separate energy balances and current/SOC/temperature constraint states. | Independent $P=VI$, $I^2R$, exact cooling and charge/discharge energy checks |
| OSR-AP-008 | Generated quantities and QA characteristics shall retain instance identity; absent acceptance limits shall remain open. | Cutlist sums and QA open-limit tests |
| OSR-AP-009 | Source and generated-output hashes shall bind each package; verification shall reproduce its compiled results. | CLI generate/verify and altered-output rejection tests |
| OSR-AP-010 | Reference, numerical, engineering and physical acceptance states shall remain distinct. | Coverage/review false-release and null engineering-approval tests |

Energy checks use a 1e-7 J absolute residual tolerance in the controlled unit tests. Train mass accounting uses 1e-12 relative reconciliation tolerance. These are internal numerical implementation checks, not ISO or railway acceptance limits. Native assembly residuals and refinement thresholds remain governed by OSR-ENG-001.

Generated inspection nominal values are design targets. Acceptance intervals, measurement calibration/uncertainty, joint capacity, fatigue, fire protection, electromagnetic compatibility and operating cases require their own controlled evidence. None can be closed by a CAD placement constraint or a numerical mass sum.

For OSR-AP-004/010, a positive-load Hertz footprint shall fit inside the supplied wheel and rail profile tables. An unsupported converged contact shall be rejected before state/history commitment and reported as outside the model domain. The contact-domain investigation records this applicability clarification; it adds no ISO or railway acceptance limit.

# OSR-INT-001 — configuration-bound integration evidence

Repository source: `docs/standards/OSR-INT-001.md`

Revision 1, 11 October 2026. OpenSourceRail internal engineering policy. This is an original open project standard. It is not an ISO standard, a supplier qualification or a railway conformity certificate.

1. A design change shall compile into physical component identities, occupied geometry, material assumptions, mass, CG, inertia, installed datums and typed interfaces. Equivalent envelopes and residual allocations shall be identified. The same mass shall appear once in the assembled system.
2. Retained input, configuration, implementation and output checksums shall be exact. Recomputed floating-point results may use only a named reproduction tolerance, with units and magnitude stated. Reproduction tolerance shall not alter an engineering limit, source identity or acceptance decision.
3. A passage claim shall show every represented wheel on both sides crossing the infrastructure. A stopped braking case shall retain its different scope. Time and spatial refinement shall be separate comparisons. An unstable or unsupported profile, joint, material or operating case shall remain failed.
4. An optimisation candidate shall use the shared design compiler. Battery module counts, packaging, mass, inertia and energy shall remain linked. Research shortlists shall be separate from designs that satisfy all adopted limits. Unknown capacities, costs or operating limits shall remain unknown.
5. Mounting loads shall preserve simultaneous force and moment vectors and their time, part identity and load-history provenance. Compliance, clearance, preload, contact, member stiffness and fatigue shall state their represented domains. A coupon or elastic shank model shall not qualify an installation.
6. Flexible models shall contain material sections, openings, joints and mounting load paths appropriate to their stated fidelity. Rigid modes, mass, numerical convergence and work-conjugate attachment transfer shall be verified. Reduced beam verification and physical shell modal correlation shall remain separately identified.
7. Electrical and thermal coupling shall account for each physical load once. Current sign and units shall be explicit at controller boundaries. SOC, temperature and ageing maps shall have retained provenance and bounded interpolation domains. Missing calibration shall prevent a calibrated claim.
8. Installed condition shall bind a serial, manufactured revision, configuration, quantity, units, uncertainty, measurement record and instrument calibration valid at measurement time and across the measured range. Condition revisions shall be independent of manufactured revisions. Updating condition shall invalidate dependent analyses before any release decision.
9. Installed civil studies shall address each relevant component and limit state, including construction stages. Lifecycle comparisons shall share duration, route, traffic, access and service scope. Unpriced manufacture, transport, erection, temporary works, access, inspection, maintenance, replacement, disruption or decommissioning shall prevent complete-cost ranking.
10. Station verification shall combine boarding, route capacity, accessibility, equipment and power outages, fire scenarios and responder interactions. Queue conservation alone shall not establish evacuation/fire tenability.
11. Native manufacturing and ERP evidence shall use project-scoped work orders, inspections, materials, tools, timestamps, independent review and NCRs. Simulation records shall be labelled. Payroll examples shall not invent statutory policy; depreciation schedules shall not imply capitalisation journals were posted.
12. Controller qualification shall bind an actual target, wiring, I/O electrical characteristics, timing, watchdog, power-cut and storage evidence. Software execution shall remain distinct from hardware-in-loop and physical release. Formal proofs shall retain complete checks, source bounds and resource limits; timeouts, tool errors and memory exhaustion shall not become passes.
13. Recovery acceptance shall bind a separately hosted destination, identity migration, writer cutover, resumed controllers/jobs and measured RPO/RTO. A same-host fresh-volume rehearsal shall state its narrower scope.
14. Supplier selection and deployment closure shall require actual quotes, rights, support and authority records. Numerical, administrative and physical acceptance shall be reported separately. No generated template shall count as an executed test or approval.
15. Each displayed civil instance shall identify its analysed domain, geometry, mass, material and datum equivalence or an explicit unresolved association. Structural analysis domains absent from the display shall be reported. Homogenised springs shall not qualify discrete fasteners or anchorages.

16 Search methods and seeds shall receive equal declared evaluation and time allocations, with separate finalist-confirmation time. Shared cache use, incomplete trials and budget exhaustion shall be visible. Refined results shall satisfy all adopted limits before a numerical feasibility claim; physical and authority qualification remain separate.

ISO 10007 configuration-management, ISO 23247 manufacturing digital-twin and ISO/IEC 17025 laboratory practices inform the existing project standards thread. Applicability, purchased clauses, local law and independent acceptance remain in that thread. The reviewed method sources include NASA verification/validation, GENSYS wheel-profile verification, DfT station accessibility, and native ERP asset accounting boundaries. These references inform method selection, rather than asserting project conformity.

# OSR-MFG-001: Open factory execution and quality evidence

Repository source: `docs/standards/OSR-MFG-001.md`

Version 1.0.0 · adopted 2026-10-11 · internal OpenSourceRail process standard.

This standard supplements OSR-ENG-001 and OSR-ENG-002. It governs generated manufacturing routes, travelers, material traceability, measurement decisions and commissioning protocols. It does not certify an ISO quality system, approve a manufacturing process, release a product or authorise railway operation.

ISO 22163:2023 and ISO 3834-2:2021 identify railway and fusion-welding quality scopes. OSR-ENG-001 supplies the applicable measurement, fastener, datum, welding-procedure, NDT and material test references. Full controlled clause review, amendments, material/process applicability and national requirements remain project responsibilities.

| Rule | Mandatory internal requirement | Executable control |
|---|---|---|
| OSR-MFG-01 | Work shall identify configuration, part revision, physical serial/lot, work order, operator and independent inspector. | Traveler and measurement identity checks |
| OSR-MFG-02 | Material grade, certificate, shelf life, substitution and repair compatibility shall be controlled. | Material passport and lot/expiry checks; unknown released grade stays open |
| OSR-MFG-03 | Functional datums shall be common to fixture, part and inspection; workholding capacity is assessed separately. | Six-restraint rank and native locator checks; rank does not qualify clamps/load capacity |
| OSR-MFG-04 | Tolerance chains shall include signed dimensions, bounded tolerances and declared thermal offsets. | Worst-case interval; RSS only for supplied independent standard uncertainties |
| OSR-MFG-05 | Special processes shall use qualified procedures, competent personnel, released windows and complete traces. | Process-window duration/sampling checks; blank windows cannot pass |
| OSR-MFG-06 | Critical fasteners shall have per-joint/tool/revision traces; rework requires authority. | Torque/angle sample ordering, calibrated-range and rework checks; no preload inference from torque alone |
| OSR-MFG-07 | Measurements shall use valid calibration, recorded environment, uncertainty and an explicit decision rule. | Conservative expanded-uncertainty interval containment for declared limits |
| OSR-MFG-08 | Open NCRs, unperformed holds, reused unscoped measurements and stale revisions shall block review readiness. | Traveler predecessor, evidence and NCR checks |
| OSR-MFG-09 | Production forecasts shall distinguish planning times from released cure/dry windows and observed capacity. | Resource scheduling with wait times; missing actual durations remain unplanned |
| OSR-MFG-10 | Capability statistics shall not replace stability, distribution, measurement-system or individual inspection evidence. | Diagnostic Pp/Ppk; conditional Cp/Cpk requires explicit study records; no automatic threshold |
| OSR-MFG-11 | Automated lifecycle recovery shall preserve critical lockout and movement interlocks. | Offline fault campaign; actual safety control and GoA4 qualification remain separate |
| OSR-MFG-12 | Interfaces and work instructions shall remain portable, supplier-neutral and revision/hash bound. | JSON/CSV/Markdown/native CAD exports and reproducible package verification |

The measurement decision rule is an OSR internal conservative interval rule, informed by JCGM 106. It does not define a universal ISO consumer/producer risk. Selected projects must approve its uncertainty coverage and suitability. Overlap with a limit requires review; an unknown acceptance limit is never a pass.

NIST capability methods inform the diagnostic implementation. Fifty independent suitable samples is a screening policy, not an ISO qualification rule. Confidence, stability and distribution evidence and acceptance thresholds remain project-defined.

Generated operations, source claims, fixture studies and offline fault tests are design/protocol evidence. Only actual controlled records and the designated authority can disposition physical work. These tools perform no ERP submission, product release or live train-control action.

# Stations

Repository source: `docs/stations/README.md`

This folder is the station front door. The controlled source now generates positive-volume FreeCAD and IFC4.3 assemblies for all seven station archetypes; site coordinates, surveys, calculations and authority approval remain external release gates. The default architecture is a prefab steel portal frame with a solar canopy, platform edge systems, flat ground-level passenger slabs, and minimal station-building scope. Overbridges, lifts, and stairs are reserved for elevated/stacked sites or local road barriers.

## Packages

| Package | Scope |
|---|---|
| `standard-archetype/` | Shared `standard` station archetype envelope, canopy, accessibility, services, compliance, and drawing register |
| `../../design/component-catalogue/catalog/buildable-stations/` | Generated EBOM/MBOM and matched assembly travelers for every station catalogue entry |
| `../../design/component-catalogue/models/cad/stations/` | Native FreeCAD assemblies for halt, standard, major, two interchange forms, terminal and depot-terminal |
| `../../engineering/models/bim/reference/stations/` | Matching geometric IFC4.3 assemblies plus deterministic validation summary |
| `../../design/component-catalogue/catalog/buildable-stations/station-product-reconciliation.md` | Bidirectional ID check across BOM, traveler, variant drawing register, installed/exploded FreeCAD states and IFC4.3 |
| `../../design/component-catalogue/catalog/buildable-stations/factory-release-work-packages.md` | Nine bounded drawing, tooling, supplier and deployment handoff packages covering all 45 station product families |
| `../../design/component-catalogue/catalog/buildable-stations/factory-release-readiness.md` | Intentionally open readiness view for the 18 drawing/interface IDs and 22 tool/gauge families |
| `../../design/component-catalogue/catalog/buildable-stations/default-product-specifications.md` | Affordable supplier-neutral concept/RFQ defaults and override triggers for all 29 open product families |
| `../../design/component-catalogue/catalog/buildable-stations/factory-drawings/index.md` | Eighteen non-issued drafting/checking briefs spanning reusable fabrication, supplier interfaces and deployment drawings |
| `../../engineering/analysis/stations/screening-summary.md` | Solver-backed structural, passenger, drainage and baseline/proposed depot thermal/fire comparisons |
| `../../engineering/analysis/stations/mitigation-work-packages.md` | Owned evidence gates for the depot cooling, separation, protection, commissioning and approval response |
| `../../engineering/models/model-coverage.md` | Product-by-product geometry fidelity and release-evidence boundary |

## FreeCAD Station Scene Renders

These planning-review renders show the station access assumptions in context with ballastless track and driverless rolling stock.

| At-grade side-platform station | Elevated side-platform station | Elevated interchange station |
|---|---|---|
|  |  |  |
| At-grade side-platform station with ballastless track and driverless train | Elevated side-platform station with ballastless track and driverless train | Elevated interchange station with stacked tracks and driverless trains |

The standard product assembly also has two genuine selectable geometry states; the exploded view moves complete civil, canopy, MEP, passenger, access and charging work packages while retaining the installed coordinates in the same file.

| Installed coordination state | Exploded work-package state |
| --- | --- |
|  |  |
| Standard station installed FreeCAD assembly | Standard station exploded FreeCAD assembly |

# Standard Station Archetype Worked Example

Repository source: `docs/stations/standard-archetype/README.md`

Scope: architectural envelope + canopy first-pass structural calc for the shared `standard` station archetype. The worked dimensions use a 75 m safeguarded platform and hot-climate assumptions; each deployment overrides climate, orientation, and parcel interfaces through the generated city model and local survey package.

Reference consist: `light-metro-3car` per RFC 0008. Platform clearance: 10 m per RFC 0010 §4.1. Generic platform length: 49.5 + 10 = 59.5 m. Instance build allowance: 75 m safeguarded civil length for local clearance and later fleet growth.

## Contents

| File | Scope |
|---|---|
| `envelope.md` | Plan + section geometry, ground-level access, egress |
| `canopy.md` | Solar canopy structural envelope + PV sizing + first-pass load calc |
| `accessibility.md` | Step-free path, tactile paving, wheelchair zones, audio+visual per EN 16586 |
| `services.md` | Lighting, fire, drainage, small service cabinet, signage |
| `compliance.md` | Standards matrix (NFPA 130 egress, EN 12464-2 lighting, etc.) |

## Why this is repeatable

The whole point of RFC 0010's six-base-archetype catalogue and its controlled elevated-interchange variant is to avoid bespoke station design per deployment. This envelope is applied unchanged wherever the generated design selects the `standard` archetype. The operator's architect-of-record adapts it only for:

- Site-specific property-line constraints.
- Cardinal orientation (to aim the canopy PV south/north of equator; south-facing in the Iraq worked climate case).
- Pedestrian-connection geometry to the surrounding street network.
- Local material availability for façade finishes (all structural choices stay fixed).

## Licensing

v1 specification: CC-BY-SA 4.0. v2 architectural drawings: CERN-OHL-S v2.

# Accessibility - standard Archetype Worked Example

Repository source: `docs/stations/standard-archetype/accessibility.md`

Per RFC 0010 §7 + `lib/templates/accessibility.toml`. Designed against EN 16586 (PRM — Persons with Reduced Mobility) and the corresponding Iraqi accessibility overlay.

## Step-free path — requirements

Every passenger, including wheelchair users, must have a step-free path from street to any door on any train:

1. Street / footpath  platform: direct paved path at local pedestrian level. Local kerbs are ramped by the municipal footpath standard; the station kit itself adds no raised access.
2. Fare line  paid zone: wide fare gate (min 900 mm clear, per RFC 0010 §8). One per direction on this archetype.
3. Platform  train: the platform walking surface is flat with the adjacent pedestrian pavement, while ToR sits 350 mm below it in the station guideway channel. This matches the consist floor level for level boarding per RFC 0008 §3.3. Horizontal gap is ≤ 75 mm with the retractable skirt on the consist.

## Tactile paving

Per ISO 23599 / Iraqi national code:

- Warning tactile: 600 mm deep along the full platform edge. Bright-colour contrast against the platform deck for vision-impaired users.
- Directional tactile: 300 mm wide strips guiding from footpath entries and fare gates to platform access points.
- Decision-point tactile: 1 500 × 1 500 mm at fare gates, emergency exits, and any local site ramp if one is needed.

## Audio + visual information

Per RFC 0010 §7:

- Visual: next-train display (dot-matrix LED + color LCD) on each platform at 2 m height, 3 units per platform at 25 m intervals. Driven by `osr-pis-station`.
- Audio: PA speakers at 10 m intervals on each platform, weatherproof (IP65), driven by `osr-pis-station`. Volume capped at 85 dB(A) at 1 m to protect hearing.
- Audio-visual synchronisation: PA + visual announce the same next-train at the same time (tested in `osr-pis-station`'s proptest suite).

## Wheelchair spaces

- On platform: 1 marked wheelchair waiting area per 30 m of platform length. For the 75 m worked-example safeguarded platform: 3 marked areas per platform × 2 platforms = 6 per station.
- On train: 2 wheelchair spaces per car × 3 cars = 6 per consist (per RFC 0008 §3.3).

Waiting area location: colocated with door 2 of the nearest car when the train stops — so a wheelchair user doesn't have to travel along the platform to reach the wheelchair-spaced door.

## Vertical circulation

None for the at-grade `standard` archetype. The platform is already at pedestrian level, so lifts, stairs, and station ramps are not part of the base package. If a local site creates a level mismatch, the local approach path must meet ISO 21542 gradients and landing requirements before handover.

## Seating on platform

Per RFC 0010 §7 accessibility (only `halt` archetype omits):

- 3 × 2-seat benches per platform, anchored to the platform back wall (under the canopy).
- Armrest on aisle side to aid stand-up.
- No fixed leg-rests — interferes with wheelchair approach.

## Baggage + mobility aid storage

Not provided at `standard` archetype — passengers carry with them. `major` and `interchange` archetypes add storage lockers (v2 doc).

## Companion-animal policy

Service dogs unrestricted; other pets per operator policy (Iraq typical: service dogs only). No rule in the archetype.

## Accessible toilet

Not at `standard` archetype (per-operator choice). `major` and `terminal` archetypes have accessible toilets (v2).

## Emergency communication

- Help buttons on each platform at 2 m height, 25 m intervals — directly connected to the OCC via the station SCADA. Wheelchair-user reach height max 1 200 mm.
- Audio-induction loop at ticket-gate staff position for hearing-aid users.

## Compliance checklist (pre-opening)

| Item | Status at v1 |
|---|---|
| Step-free path from street to platform | specified |
| Platform-edge tactile paving 600 mm | |
| Directional tactile to platform | |
| Lift ≥ 1 100 × 1 400 mm | n/a at flat at-grade `standard` station |
| Audio + visual PIS | |
| 3 wheelchair waiting areas per platform | |
| Wide fare gate ≥ 900 mm | |
| Accessible seating on platform | |
| Accessible help buttons | |
| Braille + raised-character signage | specified |
| Accessible toilet | n/a at `standard` archetype |
| Changing Places toilet | n/a at `standard` archetype (only at `major` / `terminal`) |
| Audio-induction loop at staffed position | specified |

## v2 deliverables (not in v1)

- Room data-sheet per staff position (reception, security).
- Signage typography + wayfinding ISO 7001 pictogram set.
- Accessibility-focused acceptance test with a local disability-rights advocacy group.

# Solar canopy — first-pass structural envelope

Repository source: `docs/stations/standard-archetype/canopy.md`

> Status: controlled auxiliary-module structural envelope. The passenger platform baseline remains the repeatable 6 m cantilever kit. The 85 × 22 m worked roof below has been decomposed into repeatable 8.5 × 22 m auxiliary bays with shared transverse frames by `osr_mech.station.auxiliary_canopy`. It remains subject to deployment structural/foundation approval and is not a stamped site drawing.

Per RFC 0010 §9, every non-`halt` archetype carries a solar canopy over the platform. The worked `standard` archetype target is 1 800 m² (per `lib/templates/stations.toml`).

This document is the first-pass structural envelope the civil engineer bids against. v2 is the full FEA + wind-tunnel + stamped drawings.

## Geometry

| Parameter | Value |
|---|---|
| Canopy footprint (roof area) | ~1 870 m² worked-example safeguarded roof; 1 800 m² archetype template target |
| Length (along track) | 85 m (75 m safeguarded platform + 5 m each end eave) |
| Width | ~22 m spanning both platforms + track between |
| Height above platform | 2 200 mm clear (min), 3 800 mm roof peak above ToR |
| Pitch | 7° equator-facing (south-facing in the northern-hemisphere worked case) |
| Column spacing along track | 8.5 m (11 shared transverse frames over 10 bays / 85 m) |
| Column spacing across tracks | none — roof spans the whole station column-free between outer columns |

## Structural system

Steel truss roof, tied to steel columns at the platform-back edges. Not concrete — we need the structure to be erectable in a tight urban site by a commodity SMT-style crane (no form shoring). Welded steel plus bolted-steel truss is the simplest build.

### Columns

- Size: HSS 200 × 200 × 8 mm, S355 grade.
- Count: 2 rows × 11 frames = 22 columns for the 10-bay worked row.
- Height above platform: 3.85 m (platform deck to truss bottom).
- Foundation: isolated pad, 1.8 × 1.8 × 0.8 m reinforced concrete, four #25 rebar anchors.
- Anchorage: base plate 400 × 400 × 20 mm, 4 × M30 anchor bolts per column.

### Truss spans

- Span: 22 m (clear between outer-row columns).
- Truss type: Warren truss, 2.0 m depth, 2.5 m panel spacing.
- Top + bottom chords: HSS 150 × 150 × 6 mm S355.
- Diagonals: L90 × 90 × 8 mm angle, S355.
- Truss spacing along track: 8.5 m (matches column spacing).
- Total: 11 shared transverse trusses for 10 adjacent roof bays.

### Roof panels

- Standing-seam sheet steel, 0.5 mm galvanised + powder-coat white.
- PV modules mounted flush on the south-facing slope.
- Sheet metal: 550 × 8 500 mm each (standing-seam stock), 2 200 sheets per station.

## Photovoltaic layout

Per RFC 0010 §9 target 90 % platform shading:

| Parameter | Value |
|---|---|
| Factory roof/PV bay | 8.5 × 22 m, 187 m² gross |
| Roof/PV bays per worked canopy | 10 |
| Effective nameplate after 15 % packing allowance | ~318 kWp |
| Cell/module count | Supplier-controlled within the factory-bonded roof envelope |
| Self-consumption (charging trains + station services) | ~20 % |
| Export to grid | ~80 % |

The controlled calculation uses 200 W/m² gross density and a 15 % packing allowance, matching `station/solar_roof.py`. A deployment energy model applies temperature, orientation, soiling, inverter, and availability losses separately.

# Load cases (first-pass)

Per EN 1991-1 basis. City-instance values for the hot-desert worked example:

| Load | Characteristic value | Source |
|---|---|---|
| Dead load (roof + PV + services) | 0.6 kN/m² | Material build-up |
| Snow load | 0 kN/m² | Hot-desert worked case; override per city |
| Wind load (50-year return) | 1.2 kN/m² | Iraq hot-desert baseline; override per site |
| Dust accumulation | 0.15 kN/m² | 50 mm of desert dust, post-haboob |
| Live load (maintenance) | 0.5 kN/m² | Per EN 1991-1-1 Cat H |
| Seismic (PGA) | 0.1 g | Iraq hot-desert baseline; override per site |

## Governing load combination (first-pass)

1. Wind uplift: 1.2 kN/m² up + 0.6 kN/m² self-weight down  net uplift 0.6 kN/m². Governs roof tie-down + column base anchorage.
2. Gravity (hot-day dust + maintenance): 0.6 + 0.15 + 0.5 = 1.25 kN/m² down. Governs truss chord sizing.
3. Seismic: 0.1 g × 360 t total station structure mass = 360 kN horizontal. Governs the base connection — additional cross-bracing in the longitudinal direction.

## Truss check (first-pass)

At 22 m span, 8.5 m tributary width, 1.25 kN/m² UDL:

- Peak moment M = (1.25 × 8.5) × 22² / 8 = 642 kN·m.
- Truss top-chord axial = M / depth = 642 / 2.0 = 321 kN.
- HSS 150 × 150 × 6 mm S355 capacity: 1 250 kN axial. Ratio 0.26 — plenty of margin.

## Column check (first-pass)

At 8.5 m tributary × 22 m/2 (half-bay) × 1.25 kN/m² = 117 kN axial + lateral wind 1.2 × 8.5 × 3.85 / 2 = 20 kN lateral.

- HSS 200 × 200 × 8 mm S355 capacity: 1 800 kN axial, 90 kN·m bending. Ratios 0.07 axial, 0.42 bending — comfortable.

## Foundation check (first-pass)

Isolated pad 1.8 × 1.8 × 0.8 m on 200 kPa bearing (typical alluvial soil worked case):

- Column ultimate load: 117 × 1.5 = 175 kN.
- Pad bearing pressure: 175 / (1.8 × 1.8) = 54 kPa — well below 200 kPa capacity.

## Uplift check

Net uplift 0.6 kN/m² over the 1 870 m² footprint = 1 100 kN total lift. Distributed across 22 columns = 50 kN per column.

- Anchor bolt pullout (4 × M30 anchors × 380 kN capacity each) = 1 520 kN per column. Ratio 0.036.

## Materials quantities (planning-grade BOM)

| Line | Qty | Unit |
|---|---|---|
| HSS 200×200×8 mm column | 84.7 m | 22 × 3.85 m, S355 |
| HSS 150×150×6 mm truss chord | 484 m | two 22 m chords × 11 frames, S355 |
| Truss web/diagonal set | 11 frame sets | final cut lengths from released frame drawing |
| Plate 400×400×20 mm base plate | 22 ea | S355 |
| Plate 450×450×25 mm foundation plate | 22 ea | S355 |
| M30 anchor bolt, 800 mm long | 88 ea | grade 8.8 |
| C25/30 reinforced concrete (foundations) | 57.2 m³ | planning 2.6 m³ × 22; site calculation governs |
| #25 rebar | ~2.6 t | planning scale; site calculation governs |
| Factory-bonded 8.5×22 m solar-roof bay | 10 ea | supplier panel/cell schedule |
| PV combiner/isolation/downlink group | 1 set | maximum ten roof bays per group |
| Gutter/downpipe/lightning/access kit | 10 bay kits | coordinated to site drainage |

Cost remains open until the frame calculation, factory roof supplier, site foundation design, and electrical string schedule are frozen.

## Per-deployment customisation

The operator's architect-of-record adjusts:

- Cardinal orientation if site geometry forces east-west (acceptable performance loss ~15 %).
- Column finish (paint scheme / cladding — no structural implication).
- PV module brand / wattage (same racking footprint).
- Lightning protection class per local code.

## What v1 doesn't include

- Full FEA / buckling analysis (v2).
- Wind-tunnel or CFD study for vortex shedding (v2 — matters only if slender columns are reduced; the envelope above is conservative).
- Foundation-specific geotech (v2 per-site).
- Detailed PV wiring + string layout (electrical-engineer scope separate from structural).

# Compliance Matrix - standard Archetype Worked Example

Repository source: `docs/stations/standard-archetype/compliance.md`

Candidate standards and verification routes for the planning envelope. No configuration-specific conformity or authority approval is established here. The Digital Standards Thread governs deployment applicability, current adopted editions/clauses, evidence and independent decisions. National construction, fire, access and railway requirements remain project-specific inputs.

## Structural + fire

| Standard | Scope | Evidence status (v1  v2) |
|---|---|---|
| EN 1990 / EN 1991 | Basis of structural design; loads on structures | Load cases enumerated in `canopy.md` (v1)  full FEA (v2) |
| EN 1993 | Design of steel structures | First-pass column + truss check in `canopy.md` (v1)  EN 1993 stamped calc (v2) |
| EN 1997 | Geotechnical design | Planning-grade bearing capacity (v1)  site-specific geotech (v2) |
| EN 1998 | Seismic design of structures | Iraq PGA 0.1 g baseline (v1)  site-specific seismic microzonation (v2) |
| NFPA 130 | Candidate fixed-guideway transit fire/egress route where adopted | Simple planning checks in `envelope.md` do not establish interacting crowd, fire or disruption-case compliance; adopted clauses and fire-engineer assessment open |
| EN 45545 (parts 2 + 3) | Railway-vehicle materials and fire barriers | Vehicle interface only where applicable. Outdoor stations have no automatic HL1 classification; building/station fire rules, installed material build-ups and test evidence require separate adoption |
| EN 1838 | Emergency lighting | Spec'd in `services.md` (v1)  product selection + test (v2) |

## Accessibility

| Standard | Scope | Evidence status |
|---|---|---|
| EN 16586 | Vehicle PRM boarding interface candidate; applicability review required | Planning intentions in `accessibility.md`; actual vehicle/platform compatibility and physical access tests open |
| ISO 23599 | Tactile walking-surface indicators | Candidate tactile layout in `accessibility.md`; installed assessment open |
| ISO 7001 | Public-information pictograms | Candidate signage basis in `services.md`; user and installed evidence open |
| ISO 21542 | Building construction — accessibility | Flat pedestrian-grade access; local ramps only where site grading requires them |
| EN 81-70 | Lifts accessible to persons with disabilities | n/a for flat at-grade `standard`; applies to elevated/stacked overrides |

## Electrical + MEP

| Standard | Scope | Evidence status |
|---|---|---|
| IEC/EN 61439 series | Low-voltage switchgear/controlgear assemblies; select the relevant product part with Part 1 | Exact assembly, adopted edition, design/routine verification and installation evidence open; IEC 60439-1 is replaced |
| EN 61000-6-3 | Candidate generic EMC emission scope; railway/system applicability review required | LED/PIS compliance and installed compatibility unassessed |
| EN 12464-2 | Candidate outdoor workplace lighting scope | Planning illuminance targets in `services.md`; adopted values and installed measurements open |
| IEC 60947-5-1 | Auxiliary contacts for emergency-stop circuits | Used on emergency help buttons |
| ISO 14644 | Cleanrooms / contamination control | n/a for transit station — not specified |

## Environmental

| Standard | Scope | Evidence status |
|---|---|---|
| ISO 3095 | Acoustics — railway applications, noise emitted | Pass-by noise target 80 dB(A) at platform (v1) |
| WHO community-noise guidelines | Night-time outdoor noise | Target 45 dB(A) at façade (RFC 0011 §5.1 acoustic screens on elevated) |
| EN 12101 (applicable parts) | Smoke/heat control candidate | Open-air configuration does not automatically exempt cabinets, enclosed approaches or future variants; applicability assessment open |
| Applicable UPS and emergency-power requirements | Station backup power, battery/fire protection and load endurance | UPS specification, critical-load allocation, product scope, installed runtime and authority decisions open; no NFPA 110 classification claimed |

## Cybersecurity + physical security

| Standard | Scope | Evidence status |
|---|---|---|
| IEC 62443 (parts 2-4 + 4-2) | Industrial automation + control systems cybersecurity | `osr-station-scada` designed per `osr-crypto` discipline |
| EN 50159 | Safety-related railway communications candidate | `osr-station-scada` design intent; channel classification, adopted clauses, configuration-specific tests and acceptance open |

## National overlays (Iraq — per-deployment)

Confirm the actual national/local electrical, fire, accessibility and railway rules, identifiers, editions, competent authorities and approval route. This planning document does not establish their current legal status or adoption. Arabic signage and representative user needs belong in the project access plan.

Publisher scope review: BSI EN 45545-1 concerns onboard vehicle fire protection. IEC 60439-1 is replaced; IEC 61439-1:2020 is a general assembly scope used with the applicable product part. These public records do not establish full-clause conformity.

## Acceptance-test outline (pre-opening)

Unperformed candidate test outline. Adopt configuration-specific procedures, limits, calibration, representative scenarios and independent acceptance before using any entry as a pre-opening sign-off:

1. Structural: inspector visual walk-through + spot-check on column anchorage, truss welds.
2. Accessibility: actual wheelchair user rides from street to train door on both platforms — no step, no gap > spec.
3. Emergency lighting: simulate mains-fail; confirm 1-hour battery operation of exit signs + egress lighting.
4. Fire alarm: test services-cabinet detector  OCC alarm ≤ 30 s latency.
5. PIS: next-train information updates correctly from the OCC's mock schedule.
6. Fare gates: open on valid QR + NFC; deny on invalid; emergency-release works.
7. Platform-screen-door coordination: (if fitted at this station — not `standard` default but per operator choice) door command / confirmation round-trip within `osr-psd`'s FSM.
8. CCTV: OCC receives all cameras at nominal resolution + frame rate.
9. Drainage: pour 1 m³ of water into the low end; confirm it drains to the municipal connection in ≤ 5 min.
10. Noise: train pass-by at design speed ≤ 80 dB(A) at platform (confirm by sound-level meter at the waiting area).

Checklist lands with actual pass/fail values in the deployment's `acceptance/` tree.

## What v1 doesn't commit to

- Stamped structural calculations (v2).
- Product-specific equipment selections (operator discretion).
- Specific lift-service contracts (only for elevated/stacked overrides).
- National approval-body sign-off procedure (per-deployment).

# standard station — architectural drawing register (v2)

Repository source: `docs/stations/standard-archetype/drawing-register.md`

Status: v2 deliverable of RFC 0010. Purpose: a complete list of the architectural drawings an architect-of-record (AOR) produces for a deployment instance of the shared `standard` station archetype. Every drawing is scoped, sized, and keyed to the sections of the v1 envelope documents (envelope.md, canopy.md, accessibility.md, services.md, compliance.md).

## Convention

- All drawings in the register are A1 size at stated scales, except section details which may be A3.
- Revision letters: A = first issue, B = post-coordination revision, C = construction issue.
- Every drawing has a title block referencing this register + the commit hash of the v1 envelope docs.
- Drawing numbers follow a stable scheme:

  `OSR-STD-<discipline>-<sequence>`
- discipline codes: A (architectural), S (structural), M (mechanical), E (electrical), F (fire), T (tactile + signage), L (landscape — if applicable).
- sequence: zero-padded 3 digits within each discipline.

A per-deployment station uses the same numbers; only the title block's site field varies.

## Drawing list

### A — Architectural (15 drawings)

| No. | Title | Scale | Size | Input |
|---|---|---|---|---|
| OSR-STD-A-001 | Site plan + ROW | 1:500 | A1 | Envelope §Plan |
| OSR-STD-A-002 | Platform plan (both platforms) | 1:100 | A1 | Envelope §Plan |
| OSR-STD-A-003 | Fare/TVM plinth plan | 1:50 | A1 | Envelope §Sub-areas |
| OSR-STD-A-004 | Typical cross-section | 1:50 | A1 | Envelope §Section |
| OSR-STD-A-005 | Longitudinal section | 1:100 | A1 | Envelope §Sub-areas |
| OSR-STD-A-006 | West-end elevation (fare/TVM plinths) | 1:50 | A1 | Envelope §Sub-areas |
| OSR-STD-A-007 | East-end elevation (emergency egress) | 1:50 | A1 | Envelope §Egress |
| OSR-STD-A-008 | Canopy plan | 1:100 | A1 | Canopy §Geometry |
| OSR-STD-A-009 | Canopy section | 1:50 | A1 | Canopy §Structural system |
| OSR-STD-A-010 | Fare-zone plan (paid / unpaid) | 1:100 | A1 | Envelope §Fare paid/unpaid |
| OSR-STD-A-011 | Platform-edge detail (tactile + coping) | 1:10 | A3 | Accessibility §Tactile paving |
| OSR-STD-A-012 | Local approach grading details (if needed) | 1:20 | A3 | Envelope §Access modes |
| OSR-STD-A-013 | Equipment plinth + cabinet enclosure schedule | n/a (table) | A1 | Services §Signage |
| OSR-STD-A-014 | Entrance, validator, and fare-plinth elevations | 1:20 | A1 | Envelope §Sub-areas |
| OSR-STD-A-015 | Canopy, cabinet, plinth, and platform finish schedule | n/a (table) | A1 | Canopy §Per-deployment customisation |

### S — Structural (8 drawings)

| No. | Title | Scale | Size | Input |
|---|---|---|---|---|
| OSR-STD-S-001 | Foundation plan | 1:100 | A1 | Canopy §Foundation check |
| OSR-STD-S-002 | Column + footing detail | 1:20 | A1 | Canopy §Columns |
| OSR-STD-S-003 | Canopy truss elevations (typ.) | 1:50 | A1 | Canopy §Truss spans |
| OSR-STD-S-004 | Canopy truss plan | 1:100 | A1 | Canopy §Truss spans |
| OSR-STD-S-005 | Weld details + bolt tables | 1:5 | A3 | Canopy §Structural system |
| OSR-STD-S-006 | Platform slab reinforcement | 1:100 | A1 | |
| OSR-STD-S-007 | Fare/TVM plinth anchorage | 1:50 | A1 | |
| OSR-STD-S-008 | Seismic-bracing plan (when PGA > 0.2 g) | 1:100 | A1 | Canopy §Seismic load |

## M — Mechanical (5 drawings)

| No. | Title | Scale | Size | Input |
|---|---|---|---|---|
| OSR-STD-M-001 | Services-cabinet cooling layout | 1:50 | A1 | Services §HVAC |
| OSR-STD-M-002 | Platform drainage — trough + downspout | 1:100 | A1 | Services §Drainage |
| OSR-STD-M-003 | Canopy-drainage layout | 1:100 | A1 | Services §Drainage |
| OSR-STD-M-004 | Local ramp/kerb interface spec (if needed) | n/a | A3 | Envelope §Access modes |
| OSR-STD-M-005 | Accessible-toilet plumbing (if fitted per operator) | 1:20 | A3 | Services §Utilities |

## E — Electrical (8 drawings)

| No. | Title | Scale | Size | Input |
|---|---|---|---|---|
| OSR-STD-E-001 | Incoming MSB + sub-board schematic | n/a | A1 | Services §Electrical |
| OSR-STD-E-002 | Platform lighting layout | 1:100 | A1 | Services §Lighting |
| OSR-STD-E-003 | Canopy PV layout + string diagram | 1:100 | A1 | Canopy §PV layout |
| OSR-STD-E-004 | Canopy PV combiner + DC cabinet | 1:20 | A1 | Canopy §PV layout |
| OSR-STD-E-005 | Emergency lighting + UPS | 1:100 | A1 | Services §Fire + life safety |
| OSR-STD-E-006 | CCTV camera positions + cable routing | 1:100 | A1 | Services §Communications |
| OSR-STD-E-007 | Help-button + PA loudspeaker layout | 1:100 | A1 | Accessibility §Audio + visual |
| OSR-STD-E-008 | Lightning-protection finial + down conductor | 1:50 | A1 | Canopy §BOM |

## F — Fire + life safety (4 drawings)

| No. | Title | Scale | Size | Input |
|---|---|---|---|---|
| OSR-STD-F-001 | Fire-detection zone plan | 1:100 | A1 | Services §Fire + life safety |
| OSR-STD-F-002 | Fire-extinguisher placement | 1:100 | A1 | Services §Fire + life safety |
| OSR-STD-F-003 | Emergency-egress plan (NFPA 130 compliance) | 1:100 | A1 | Envelope §Egress + Compliance §NFPA 130 |
| OSR-STD-F-004 | Evacuation-signage layout | 1:100 | A1 | Services §Signage |

## T — Tactile + signage (3 drawings)

| No. | Title | Scale | Size | Input |
|---|---|---|---|---|
| OSR-STD-T-001 | Tactile paving layout | 1:100 | A1 | Accessibility §Tactile paving |
| OSR-STD-T-002 | Wayfinding signage positions + typographic spec | 1:100 + swatches | A1 | Services §Signage |
| OSR-STD-T-003 | Accessible signage (Braille + raised-character) details | 1:5 | A3 | Accessibility §Compliance checklist |

# Drawing count + delivery phase

| Discipline | Drawing count |
|---|---|
| A — Architectural | 15 |
| S — Structural | 8 |
| M — Mechanical | 5 |
| E — Electrical | 8 |
| F — Fire | 4 |
| T — Tactile + signage | 3 |
| Total per station | 43 |

For each generated `standard`-archetype station, the same 43-drawing register is reused. Only the site-plan (OSR-STD-A-001) varies meaningfully between sites; the other 42 drawings are near-identical, with per-site parameters (parcel geometry, north arrow, foundation specifics) as the only delta.

# Interaction with per-site adaptation

The v1 envelope docs list per-deployment adaptations that the AOR implements:

- Site plan (A-001): always site-specific.

- Orientation (A-008, E-003): rotate to face equator; swap if southern hemisphere.
- Façade finish (A-015): operator choice reflected in the schedule.
- Parcel-line setbacks (A-001, A-006, A-007): per- municipality.
- Foundation depth (S-001, S-002): per-site geotech.
- Seismic (S-008): applicable only if PGA > 0.2 g.

Everything else is archetype-fixed: one drawing set is reused for every generated `standard` station in a deployment.

## Delivery sequence (typical)

1. Design Development (DD) — all A + S drawings at rev A.
2. Coordination — M + E + F + T drawings at rev A + integrate back into A + S  rev B.
3. Construction Documents (CD) — everything at rev C.
4. Tender — operator's procurement team issues CD to construction-firm bidders.
5. Shop drawings — fabricator's own drawings (steel fabrication, PV module mounts) land as annexes.

## Acceptance criteria for v2

The v2 deliverable of this doc = the architect's drawing register for the deployment, matching the list above drawing-for-drawing. Per-drawing content is the architect's scope; the register + envelope specs are the upstream input.

For a per-deployment tender, the AOR:

1. Downloads this register.
2. Fills in the title-block fields (site, project, AOR firm name).
3. Produces the drawings.
4. Files the commit hash of the envelope docs against which they drew.

## What v2 does NOT include

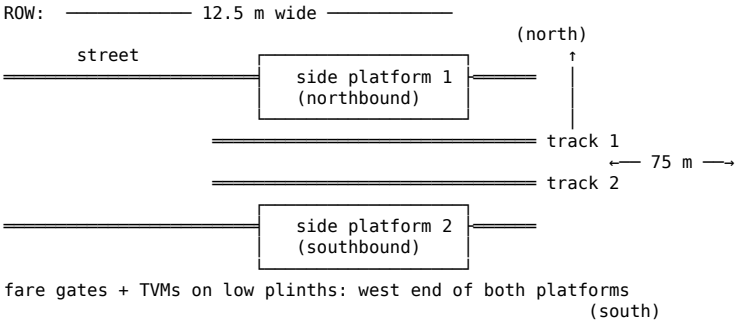
- Actual CAD files (AutoCAD / Revit / ArchiCAD — AOR's tool choice).
- Printed plot files (per-deployment plot shop).
- Renderings (optional operator deliverable).
- Cost estimates (per-deployment QS scope).

# standard Archetype Envelope

Repository source: `docs/stations/standard-archetype/envelope.md`

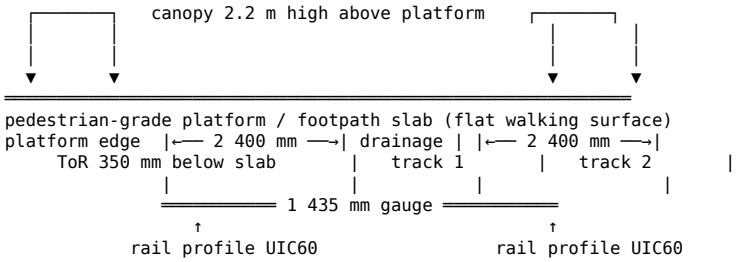
Plan + section geometry of the shared `standard` station archetype, shown with the hot-climate worked-example platform allowance. Every number here is a buildable dimension.

## Plan



- Configuration: two side platforms, double-track.
- Platform length: 75 m safeguarded worked-example build allowance. The generic `light-metro-3car` standard is 59.5 m (49.5 m consist
  - 10 m clearance); this package deliberately reserves more civil length for local clearance and later fleet growth.
- Platform width: 3.5 m each (per RFC 0010 §4.3).
- Track centres: 4.0 m (standard double-track with centre drain).
- Total station ROW width: 3.5 + 4.0 + 3.5 = 11.0 m; +1.5 m buffer for drainage + ROW-line clearance = 12.5 m.
- Pedestrian datum: platform walking surfaces are flat with the adjacent footpath/forecourt. The rail datum drops through the station bay; passengers do not climb onto a raised platform.

## Section through platform



- Platform walking surface: flush with adjacent pedestrian pavement. Top-of-rail (ToR) sits 350 mm below that surface inside the drained guideway channel, matching the `light-metro-3car` low-floor height for level boarding without raising the platform above street level.
- Platform-to-track horizontal gap at door: ≤ 75 mm (UIC 741).
- Canopy clearance: 2 200 mm minimum height over the platform deck. Roof is at 3 800 mm above ToR (matches the consist's max height envelope).

## Sub-areas

| Area | Location | Size (m²) | Function |
|---|---|---|---|
| Platform 1 (northbound) | 75 m × 3.5 m | 263 | Passenger wait + board |
| Platform 2 (southbound) | 75 m × 3.5 m | 263 | Passenger wait + board |
| Cross-platform canopy | 85 m × 22 m | 1 870 | Solar canopy + rain shelter (incl. edges) |
| Fare/TVM plinths (west end) | 2 × 10 m × 2 m | 40 | Fare gates + TVMs + validator line |
| Services cabinet room | 4 m × 3 m | 12 | Station SCADA + sub-MSB + UPS |

Total gross floor area: ~530 m² open platform + ~50 m² compact fare/services footprint. No default ticket hall, lift room, or stair well is included for an at-grade `standard` station.

## Access modes (per RFC 0010 §5)

Each side platform has:

1. Direct paved access from the adjacent footpath/forecourt to the platform slab. Gradient is governed by the surrounding street, not by the station kit.
2. Fare line / validator plinth at the west end, with a wide gate and bypass gate for PRM users.
3. Secondary direct egress at the east end. If the station sits between roads, the crossing is protected and interlocked rather than grade-separated.

No lift, stair, escalator, or overbridge is part of the at-grade `standard` archetype. Those are local overrides for elevated/stacked stations or unavoidable road-barrier sites.

## Egress (per RFC 0010 §6 and NFPA 130 4-minute rule)

Platform occupancy sizing:

- Planning-grade peak: 150 passengers × 2 platforms = 300.
- NFPA 130 egress: must reach a "safe point" within 4 minutes.

Egress paths (per platform):

- Primary: direct west-end paved exit to the footpath/forecourt (≤ 11 m travel from the fare line).
- Secondary: direct east-end paved exit to the footpath/forecourt.

Effective egress width:

- West exit 2.0 m + east exit 2.0 m.
- Total effective width: ≥ 4.0 m per platform.

At 300 pax per platform and NFPA 130 flow 1.3 pax/m/s:

- Clearance time = 300 / (4.0 m × 1.3 pax/m/s) ≈ 58 s. Well under the 4 min target.

## Fare paid / unpaid zones

- Unpaid zone: footpath/forecourt, TVMs, outside fare gates.
- Paid zone: everything platform-side of the fare gates.

`standard` archetype gets 2 fare-gate lanes per direction per RFC 0010 §8 (so 4 total — 2 in, 2 out; 1 wide-gate for wheelchairs). TVMs: 1 per direction (2 total).

## Property-line setbacks (for operator adaptation)

- ROW centreline to property line: ≥ 3 m both sides (municipal code typical).
- Ticket hall at west end can extend into unused ROW corners; operator adapts per parcel.
- If a constrained site can only accept one public entrance, keep the opposite platform end as a normally closed emergency gate. A `standard` archetype still requires at least 2 independent egress directions per platform.

## Site footprint

Total approximate footprint a `standard` station occupies on the ground:

- Platform envelope: 75 × 12.5 = 940 m² main rectangle.
- Fare/TVM west plinths: 40 m² inside the main rectangle.
- Service cabinet: 12 m² west-end addition if it cannot sit under the canopy.
- Canopy shadow (extends slightly beyond platform): 85 × 22 = 1 870 m² — but this is the roof, not ground footprint.

Usable ground footprint: ~950-1 000 m² per station.

## Interface with the simulator

`osr-sim` consumes these archetype numbers via the `lib/templates/stations.toml` schema. The v1 envelope does not require any sim change; all parametric sizing already lives in templates.

## What this doesn't commit to

- Façade finish (brick, stucco, aluminium panel — operator choice).
- Signage typeface / bilingual arrangement (operator choice).
- Paid-zone toilets or vending (operator discretion, not an archetype feature).
- Retail concessions (excluded from `standard`; see `major` archetype at v2).

# Station Services - standard Archetype Worked Example

Repository source: `docs/stations/standard-archetype/services.md`

HVAC, lighting, fire, drainage, signage — the MEP (mechanical / electrical / plumbing) envelope for the station.

Per RFC 0010 §11 an outdoor hot-climate station is passively cooled by the canopy. The at-grade `standard` archetype has no default ticket hall or lift rooms; only the services cabinet gets thermal control if the selected equipment requires it.

## HVAC

- System: none for passenger areas. Optional 1-2 kW cabinet cooling for SSBC, UPS, and fare equipment at design ambient 50 °C.
- Refrigerant: R-32 (commodity).
- Fresh-air intake: n/a for open platform; filtered cabinet intake if active cooling is fitted.
- Heating: none in the hot-climate worked case; if used, reverse-cycle heat pump on the same unit.
- Filters: MERV 8 standard; MERV 14 for heavy-dust days per operator discretion.
- Drain: to condensate pipe  station storm drain.
- Control: `osr-station-scada` with operator override.

## Platform ventilation

None. Platform is open-air under the canopy. Natural cross-ventilation works year-round; on haboob days, platform shelter relies on the canopy, equipment plinth backs, and local wind screens if fitted.

## Lighting

Per EN 12464-2:

| Area | Illuminance | Colour temp | Control |
|---|---|---|---|
| Platform (night) | 100 lx | 4 000 K | Dusk-dawn sensor + schedule |
| Fare/TVM plinth | 200 lx | 4 000 K | Time schedule + occupancy |
| Platform (day) | canopy ambient | daylight | none |
| Emergency egress | 20 lx (1 h battery) | 4 000 K | EN 1838 self-test |
| Exterior approach | 50 lx | 4 000 K | Dusk-dawn |
| Services cabinet room | 500 lx | 4 000 K | Maintenance switch |

All LED, EN 61000-6-3 EMC class B. Total connected load per station: ~4 kW.

## Fire + life safety

Planning fire/life-safety intentions. Applicable station/building rules, adopted NFPA 130 clauses where relevant and competent fire-authority requirements must be resolved through the standards workflow:

- Smoke detection: ceiling detector in services cabinet; open platform has no enclosed smoke zone.
- Heat detection: services cabinet (rate-of-rise).
- Passive protection: qualify installed station material and barrier build-ups against the adopted building/station fire strategy. EN 45545 is a railway-vehicle reference; being outdoors does not establish a station HL1 classification or an exemption from smoke/fire assessment.
- Fire extinguishers: 1× $CO_2$ at services cabinet, 1× water per platform end.
- Fire alarm signal: goes directly to the OCC via `osr-station-scada`; cannot be silenced without OCC OK.
- Emergency power: 1-hour UPS (60 kWh Li-ion battery in services cabinet) keeps PIS + emergency lighting + OCC comms alive.
- Evacuation: direct paved exits at both platform ends (per `envelope.md` §egress).

## Drainage

- Platform: 2 % transverse fall to centre trough drain; longitudinal 0.5 % fall to the low end.

- Track drain: centre trough between the two tracks, 300 mm wide, 400 mm deep, to perforated pipe below the ballast.
- Canopy runoff: gutter + downspout at each column base, discharges to station storm drain.
- Capacity: sized for 50 mm/h 10-year return storm. The hot-desert worked case rarely hits this, but when a sandstorm is followed by rain, the first event of the year can overload the drain — catch pit at storm drain connection.

## Signage

- External: station name + route-map + OSR brand panel at each entrance.
- Internal: wayfinding per ISO 7001 pictograms; bilingual (Arabic + English) text. Signs at 2.5 m height (overhead)
  - 1.2 m height (lateral, for accessibility).
- Line / route diagram: generated route strip for the deployment network at every platform-edge support column.
- Real-time information: `osr-pis-station` drives the LED
  - LCD displays.
- Emergency exit signs: EN 1838 photo-luminescent + battery backup.

## Utilities

### Electrical

- Mains: 3-phase 400 V AC at 50 Hz from the municipal connection (or from the nearest `osr-energy-site` if in island mode).
- Connected load at peak: cabinet cooling 2 kW + lighting 4 kW + services + fare equipment + PIS = ~10 kW total.
- Design demand: 15 kW + 50 % future-growth headroom = 23 kW incoming supply.
- Distribution: MCB board in the services cabinet, RCD- protected sub-circuits.

### Water + waste

- Water: town water for platform cleaning; no drinking fountain at `standard` archetype.
- Waste: municipal connection for storm + sanitary (if the operator adds a future toilet).

### Communications

- Ethernet from the station's S-SBC to the OCC (primary + LoRa backup).
- CCTV camera feeds bonded to the station SCADA, then backhauled to OCC.

## Environmental

- Noise: platform ambient target ≤ 70 dB(A) day, ≤ 55 dB(A) night during no-train condition. Train pass-by peak ≤ 80 dB(A) per ISO 3095.
- Visual impact: canopy form factor + lighting strategy follow the operator's urban-design guidelines.

## v2 deliverables (not in v1)

- Detailed MEP drawings (plans + sections).
- Load schedule per sub-circuit.
- Fire-detection zone plan with alarm-panel layout.
- Lift-room machinery spec.
- PA loudspeaker aiming + acoustic coverage plots.

# Engineering and delivery substance review — 2026-09-09

Repository source: `docs/substance-review-2026-09-09.md`

Historical design snapshot. Fleet, route, station and distributed-stabling figures below describe the earlier controlled revision. The current Samawah example adopts the regenerated central alignment and full-fleet line depots. These earlier figures and operating experiments cannot release the new layout.

This review follows the repository access, persistence and provenance repairs. It examines what the models actually demonstrate, rather than counting files, drawings, tests or completed solver runs. The drainage repairs and electrical connection measurements below have been regenerated. The later ethos audit corrects this review's interpretation of the electrical results: a grid-only stress failure does not establish a shortfall in the solar/storage operating design.

The repository has useful reproducible planning models and explicitly open release registers. The electrical screen now separates grid-only contingency findings from solar/storage snapshot acceptance. Full operating energy validation remains open. Delivery cashflow, depot scope and lifecycle cost also need stronger connections to the physical quantities and operating plan.

## 1. Roof-drainage input and validation repairs completed

Priority: high. Repository model defects repaired; site design remains open.

The original SWMM generator placed width in the imperviousness column. The standard branch represented a 10% impervious roof with a 1 m flow width and 100% slope. Its sparse five-minute rainfall records supplied only 12.5 mm, half the declared 25 mm storm. The correct column order and rainfall format are documented in the EPA SWMM manual.

The investigation also found zero pipe fall. SWMM substituted a minimum elevation drop; correcting only the roof and storm left a distorted kinematic-wave peak. The repaired reference model declares a 0.4 m fall over 40 m, uses dynamic-wave routing, and reduces the runoff/hydraulic steps to 10 s / 1 s. This gradient is an explicit planning assumption requiring survey, not an approved site level.

All seven regenerated variants pass independent checks for 25 mm rainfall, zero infiltration, rainfall-volume/runoff balance, C=1 roof peak, conduit peak, continuity, no flooding and inlet depth. Continuity is captured after SWMM finalizes the simulation. Runoff-volume error is below 0.02% across the family. The standard-station result changes from 5.62 L/s to 37.77 L/s aggregate branch flow, matching the 37.77 L/s C=1 rational calculation. The old comparison used C=0.95 despite the intended zero-loss roof.

The station report records the assumptions and observed quantities. New solver regressions reject incorrect roof columns, missing rainfall intervals and the former flat-pipe kinematic-wave setup; additional cases independently check rainfall × area and intensity × area at three roof sizes.

Still required: local rainfall/return period, surveyed levels, header and municipal-network capacity, tailwater, blockage and exceedance design. The model repair does not close those deployment requirements.

## 2. Electrical measurements verified; grid-only acceptance premise withdrawn

Priority: high. Correct the operating premise before prescribing equipment.

The microgrid model applies a 97% grid rectifier efficiency. A 500 kW residual DC-bus load requires 515.46 kW AC before transformer losses. This is not the grid requirement when PV or station storage supplies the load. It also excludes the separate 98% train-charger DC/DC loss. The original model enlarged the transformer as necessary and declared a pass on solver convergence without checking the connection. The initial all-city arithmetic identified 3,976 sites across 262 cities with insufficient declared import for the grid-only case.

Each site now records solved HV import/export, its separate declared limits, and the exceedance in kW. The test includes transformer and converter losses, with only 0.001 kW numerical tolerance. `solver_passed` records convergence; `passed` additionally requires no connection, transformer, voltage or climate findings. The CLI fails a design with unresolved findings, and batch resume cannot treat it as successful. README tables and engineering plots show the design result and finding count separately from solver convergence.

The audit of the earlier reports confirmed 3,976 sites across 262 cities exceed declared connections only in the case with both PV and battery discharge disabled. Every flagged site has stationary storage. The existing coordinated daylight case has zero connection exceedances across all 266 cities. Its stipulated PV/storage power fractions do not establish endurance or timetable acceptance. The earlier combined gate passed only four cities because it required the grid-only case too. That gate is repaired: all 266 solar/storage snapshots pass, and the 3,976 grid-only findings remain separate contingency diagnostics.

The Samawah result originally recorded seven connections in the grid-only case requiring 519.02 kW each at the HV connection against a declared 500 kW. These stations are not grid-only installations: each has 500 kWh storage, 500 kW battery discharge and 300 kWp PV. Their original coordinated-case import was 73.21 kW each. Including the previously omitted 98% charger DC/DC efficiency gives 529.65 kW grid-only and 83.75 kW coordinated import under the same transformer model. Mosul has 26 exceedances in the same grid-only contingency. Regression tests check import, export, converter and transformer losses, nonconvergence, and the distinction between design failure and convergence. All-city provenance and pass consistency are also checked.

Correction: the earlier instruction to resolve every finding through a connection upgrade or charging change was unsupported and is withdrawn. Evaluate solar generation, stored energy, shared charging, replenishment and the actual service duty together. Grid backup covers residual demand under the project architecture; full charger demand from grid alone is not a default requirement. The software now distinguishes snapshot acceptance from contingency findings and explicitly leaves `operating_energy_validated` false. A passing snapshot does not establish replenishment or endurance. No equipment or connection quantities were increased to obtain these results. The common ideal 33 kV bus does not demonstrate feeder routes, upstream network capacity, protection or utility approval. The stipulated storage snapshot does not establish state of charge or endurance.

# 3. Reconcile depot energy scope across the physical and operating models

Priority: high. Quantity contract repaired; placement and installed cost remain open.

The depot template now selects a tier from the energy-site template. The scenario generator, layout requirements and station BOM consume this common inventory: 5,000 kWp PV and 40,000 kWh storage (80 × 500 kWh modules) for `main-heavy`. The former 600 kWp / 2,000 kWh figures are explicitly retained as baseline allowances, not a competing equipment definition. Conflicting legacy per-depot quantities now fail generation. All 266 generated scenario outputs are unchanged by this repair; stored operating capacities were preserved. This reconciles what the model assumes, not whether that capacity is necessary. Reassess depot and station PV/storage against distributed overnight placement and charging duties before treating the operating inventory as an equipment requirement.

Every city now has a source-hashed depot reconciliation, linked from the catalogue. The Samawah report requires 33,333 m² of PV modules, compared with the 4,000 m² reference canopy. Gross land area and battery compound dimensions still require a controlled layout and supplier/fire-engineering inputs. Existing CAD geometry does not place this complete inventory.

The fixed depot allowance remains $8M, with a $250k station charging interface allowance. The additional 4,400 kWp and 38,000 kWh above the old baseline represent a $5.93M equipment sensitivity at existing repository rates ($700/kW PV and $75/kWh storage). This is neither a supplier quotation nor an amount added to CAPEX: baseline inclusions, conversion equipment, civil works, protection, installation and renewal remain unreconciled. The reports therefore keep physical/cost/stabling acceptance failed.

Remaining amendments: locate the full equipment inventory, obtain itemised installed scope and reconcile allowance inclusions before changing the budget; carry the resulting quantities into procurement and replacement events.

# 4. Prove that the distributed stabling plan fits the railway

Priority: high. Operating candidate implemented; physical allocation remains open.

The intended policy is to keep healthy trains at powered passenger stations near their first morning trips, allowing coordinated starts across the network and limiting depots to maintenance needs. The review preserves that policy; it does not recommend concentrating the fleet at depots. RFC 0014 describes simultaneous morning starts from those locations. However, the simulator fleet initializer distributes trains round-robin over configured dispatch points, without a stabling-track capacity allocation.

The retained canonical scenario still uses endpoint dispatch. Samawah has 108 trainsets, with fleets of 53, 28 and 27, each assigned to just two dispatch points. The first line consequently initializes 27 and 26 trainsets at its two endpoints. Those queues diagnose an incomplete simulator initialization; they are not the intended overnight allocation. The design includes 17 concurrent main-depot workshop bays; workshop capacity is not evidence of adequate overnight parking. The simulator's abstract awaiting-dispatch queue does not establish that these trains fit on passenger tracks or can reach their morning starting locations without conflicts.

Quantification added: all 266 city reports reproduce initial dispatch allocations and calculate train-body and clearance-inclusive slot lengths. Samawah's 27-set queue requires 1,336.5 m of train bodies, or 1,606.5 m of individual slots with the RFC's 5 m clearance at each end. These are capacity requirements, not located tracks or a proven operating arrangement. No workshop bay or passenger platform is credited as verified overnight space. The legacy depot CAD also clamps requested bays to catalogue maxima and retains a ten-bay main-depot default, while the template minimum is four; it

needs explicit oversize handling and city-specific workshop geometry. The legacy Python planner still emits depot exceptions by default and needs alignment with the current Rust emitter policy.

Operating implementation added: the native simulator now supports selected powered-station holding, 150 kW charging to 95% SoC, closing-time stops and schedule/energy/MA-gated morning departures. All 266 cities have separate runnable allocation candidates. The Samawah replay keeps all 108 trains at 20 stations overnight, reduces the largest queue from 27 to eight and restarts all 34 planned line/station/direction combinations within 60 seconds, with no invariant violations. The candidate uses the declared 97 revenue, eight spare and three cold-reserve trains; none of the 11 reserves enters routine service. Its overnight hold has zero departures; the retained endpoint scenario has four. This is a 01:30–06:00 comparison, not full-day energy acceptance. Canonical endpoint scenarios remain retained; candidates do not claim physical capacity or close package gates. See the implementation and limits.

All catalogue plans now compare allocated train lengths and clearances with the reference passenger-platform envelope. Samawah has 62 positions beyond that envelope (3,689 m of usable slots under the initial allocation). These remain unverified space requirements, pending existing-track surveys and allocation changes; they do not justify additional depots by themselves.

Charging-reachability repair: the initial two-day check left six then ten revenue trains at an unpowered Line 1 halt. The distributed departure gate now requires energy through to the next selected charger with the 20% reserve intact, accounting for direction, terminal reversal and active pad/grid outages. The refreshed two-day replay passes its behavior checks: all 108 trains finish both nights at selected powered stations and all 34 departure directions restart. Maximum queues are 18 then 19 trains, with 63 positions beyond the reference platform envelope on each night. The short replay's eight-train maximum cannot establish recurring capacity. The check uses elapsed-time snapshots and recalculates space from observed allocations. Physical capacity, daytime headway delivery, storage-only outage resilience and failed-train recovery remain open; package gates remain failed.

Station/depot allocation corrected: two revenue trains per selected station provide Samawah's morning launch stock (40 sets); the remaining 68 stay on their own lines: 37 on Line 1, 16 on Line 2 and 15 on Line 3 (57 revenue, eight spare and three cold reserve in total). The previous interpretation treated those 68 as unresolved station overflow. The new allocation conserves all 108 trains and passes the two-train station check, with 68 explicit depot storage positions requiring 4,046 m of usable slots, separately from 17 workshop bays. Lines 2 and 3 use existing powered service terminals. No interline depot connection is required.

All 266 city plans now include explicit station/depot allocations and depot storage requirements. Missing morning directions, where a line has insufficient revenue stock, remain visible in the allocation report. The native station-only replays and seven-train redistribution study remain diagnostic benchmarks; they do not simulate this hybrid allocation. Their capacity failures must not be interpreted as a need to park the entire fleet at stations or reduce it.

Native home-return implementation added: explicit per-fleet overnight homes and depot storage counts now drive initialization, same-line return movements after closing, depot holding and morning dispatch. A connected 8-train fixture passes two continuous cycles with six station and two depot trains, preserved inventory and parked reserves. The CSV separates depot stock from station queues. Capacity/role mismatches and disconnected depot homes fail loading. Line-local storage now enables 182 native city candidates, including Samawah; the remaining 84 report incomplete morning allocations. The hybrid city screen checks full-day home returns and station launch stock. Station launch trains have priority over depot stock, with train IDs resolving ties; empty returns use the existing peak-service spacing and have a distinct event kind, so overnight passenger departures cannot be hidden among return moves. Two-day screens pass for Samawah, Uíge, Quelimane and Edéa. Samawah preserves 40 station and 68 line-local depot trains and restarts all 34 directions on each morning; a raw minimum SoC of 0.19999853 is within the city validator’s 0.001-percentage-point numerical tolerance. Yard geometry, turnbacks and city-scale evening timetables remain unverified.

Fleet-sizing documentation drift: RFC 0014's former 35 km/h commercial-speed proxy, fixed 10% recovery factor and 10% charging margin did not match the current emitter. The emitter uses family-specific cruise/stop parameters, recovery factors up to 1.62 and a 25% charging margin. The RFC is corrected to describe that implementation. Retained city fleet counts require a separate regeneration/reconciliation audit before changing inventory or treating fleet size as consistent with a two-train station capacity.

Remaining additions: detailed station and depot storage layouts with usable track lengths, train lengths, clearance points, charger sharing and access; evening run-in, morning run-out and failed-train recovery schedules; reserve activation; maintenance possessions; and an occupancy-constrained simulation. First assess powered station tracks and the morning service pattern. Cost additional station sidings or secure service locations only where that allocation demonstrates a need; fleet-wide depot parking is not the default.

# 5. Make cashflow follow supplier terms and the working calendar

Priority: high for delivery planning. Model integration gap.

The project-twin generator publishes COTS terms of 30% order / 60% delivery / 10% acceptance and a 120-day lead time. Its cashflow calculation does not consume purchase orders. It instead allocates budget contracts using 10% mobilisation / 55% progress / 30% completion / 5% retention, with mobilisation 30 days before task start. Thus the timing and amount of supplier deposits need not appear in the published monthly requirement, even though total cash reconciles to CAPEX.

Budget allocation is weighted by task duration rather than derived from each task's priced quantity. The schedule is labelled in working days, while cashflow maps offsets to months using `floor(day / 30) + 1`. The six-day working week in the manufacturing template is not applied by that mapping. Samawah's example has 1,012 programme working days and 38 cashflow buckets; these are not yet an approved calendar-month financing schedule.

Amendments: derive procurement cash events from quantities, supplier terms and order dates; allocate labour and other residual budget separately to avoid double counting; introduce an explicit project start date and work calendars; map supplier lead times and payment dates consistently. Add a test in which an early supplier deposit changes the appropriate month's cash requirement.

# 6. Turn the battery renewal allowance into a lifecycle calculation

Priority: medium. Unsupported sensitivity relationship.

The finance generator describes a 12-year train-battery renewal cycle, but computes rolling-stock maintenance as 4% of fleet acquisition cost. The 12-year value is output metadata; it does not drive a replacement schedule, reserve calculation or discounted cash event. Stationary renewals are similarly described as included in a general fixed-asset maintenance percentage.

This is a transparent planning allowance, not demonstrated lifetime cost. Changing battery life, utilisation, replacement price or end-of-life capacity does not currently produce the corresponding renewal cashflow. A cheaper factory-gate vehicle also reduces the percentage-based maintenance allowance without proving a proportional reduction in physical maintenance needs.

Additions: separate onboard and stationary battery inventories; calendar and throughput life assumptions with sources; replacement cost, labour and disposal; capacity degradation in the service-energy case; and explicit renewal/reserve cashflows. Reconcile the resulting totals with ordinary maintenance to prevent double counting.

# 7. Distinguish catalogue completeness from pilot evidence completeness

Priority: medium. Publication status repaired; evidence coverage remains open.

Before the repair refresh, 264 city manifests retained a finance-summary hash that no longer matched their source. Those same 264 cities lacked the field-evidence brief required by the current package generator, while their old manifests still reported a passed package. The general repository health check applies the full package-manifest checks only to Samawah and Mosul.

The repair regenerated all twin/operations outputs and their enclosing manifests. That first refresh produced 2 complete packages and 264 incomplete packages. After the electrical correction, the two pilots also have failed energy summaries: the current full-package result is 0 complete and 266 incomplete. Missing evidence remains listed in each manifest; the catalogue now displays this distinction alongside its separate topology results. Completeness does not validate the modelling assumptions identified elsewhere in this review.

The follow-up refresh also found 264 GIS summaries with stale scenario hashes. Those GIS packages and all 266 engineering plot sets were regenerated. It then found 264 native-simulation reports referencing both older scenarios and an older validator. These retained reports require full resilience reruns; their old passing flags are not current operating evidence. The two pilots retain current native-simulation provenance.

The package generator now checks analysis provenance and records each stale source separately. Strict README generation still rejects stale evidence. An explicit `--allow-stale-evidence` audit mode can publish a warning and mark retained passing rows unverified while preserving failed results. That mode was used for the 264 affected catalogue pages; it does not alter solver reports or close package gates.

Amendments: define explicit catalogue-screening and pilot-evidence scopes; validate the current scope and generator for every city; extend the catalogue with resilience/cross-check coverage. The catalogue now exposes each city's electrical result, number of sites exceeding connection limits, and full-package status with links to the detailed findings. The current technical inspection count must not imply equal evidence maturity for all 266 models.

An additional generation comparison found existing energy-site drift in Gulu, Rahim Yar Khan and Tanta: their retained charging/grid settings differed from fresh generation. The 2026-09-10 follow-up traced this to the scenario generator ignoring their existing `costs.technology_basis.station_charging_cabinet_count = 2`. Charging validation, station power and site equipment now use that declared quantity, and regression checks preserve the retained station/site tables for all

three cities. Their broader scenario/evidence refresh remains open; preserving equipment quantities does not establish operating acceptance.

## 8. Extend station analysis from repeatable routes to actual passenger loads

Priority: medium. Acknowledged gap with a concrete next model.

The passenger screen uses 80 people for normal/degraded cases and 120 for egress, with each platform route simulated independently. The elevated/interchange cases reuse the same straight-route result where platform length matches. Stairs, lifts, gates, merging flows and passengers arriving from trains are excluded.

The rolling-stock profiles span nominal train capacities up to 720 and crush capacities up to 960. A 120-person route screen cannot establish evacuation performance for a loaded train plus waiting passengers. The current report discloses this limitation, but the next useful addition is a coupled demand/train/station case rather than another identical route run.

Additions: station-specific arrival and interchange demand; simultaneous train unloading; bottlenecks and platform occupancy; degraded routes and assisted evacuation; and deployment-specific acceptance criteria. Keep route benchmark results separate from station-capacity or evacuation acceptance.

## 9. Schedule the shared national factory across city programmes

Priority: medium. Portfolio delivery assumption not yet enforced.

The capital template costs one shared national plant sized to the largest single-city fleet, assuming phased reuse. Each city twin independently receives the default rolling-stock plant and fabrication resource capacities. There is no country-level resource schedule coordinating concurrent city programmes.

Additions: country programme start windows, shared plant/mould/tooling capacity, supplier bottlenecks, training ramp-up and maintenance downtime; allocate city orders against that resource pool; compare phased delivery with expanded-plant scenarios. Until then, the national factory cost assumption and individual city schedules should be presented as separate planning cases.

## Work order for the next iteration

1. Validate the full solar/storage/top-up operating duty before changing equipment quantities. The grid-only gate, grid-dependent stabling checks and historical-experiment package gates identified in the ethos audit are repaired.
2. Close depot equipment placement, installed cost and physical stabling allocation against the repaired quantity contract and new per-city requirements.
3. Connect procurement, calendars, renewal events and shared factory resources to the delivery and financial model.
4. Extend passenger/station and junction-conflict cases using controlled demand and operating inputs.

Supplier configuration, production drawings, mass/CG measurement, physical testing, site survey, HIL and independent approvals remain the external gates already identified in the roadmap. This review adds specific repository-side work; it does not replace or satisfy those external gates.

## Review method and limits

The review traced source templates, generators, emitted scenarios and tracked reports; checked all-city grid-limit arithmetic and manifest coverage; and replayed the drainage deck with the installed solver using temporary files. The EPA manual was consulted for the SWMM input definition. It did not include supplier quotations, field surveys, a complete structural reassessment, a physical test campaign or an independent railway safety assessment. The original diagnostic replays were followed by the controlled generator repairs, regression tests and regenerated evidence described above. Full deployment packages remain incomplete where physical or operating evidence is open. Repository health now checks truthful package status and current selected evidence; it does not require physical deployment gates to be closed merely to maintain a coherent planning repository.

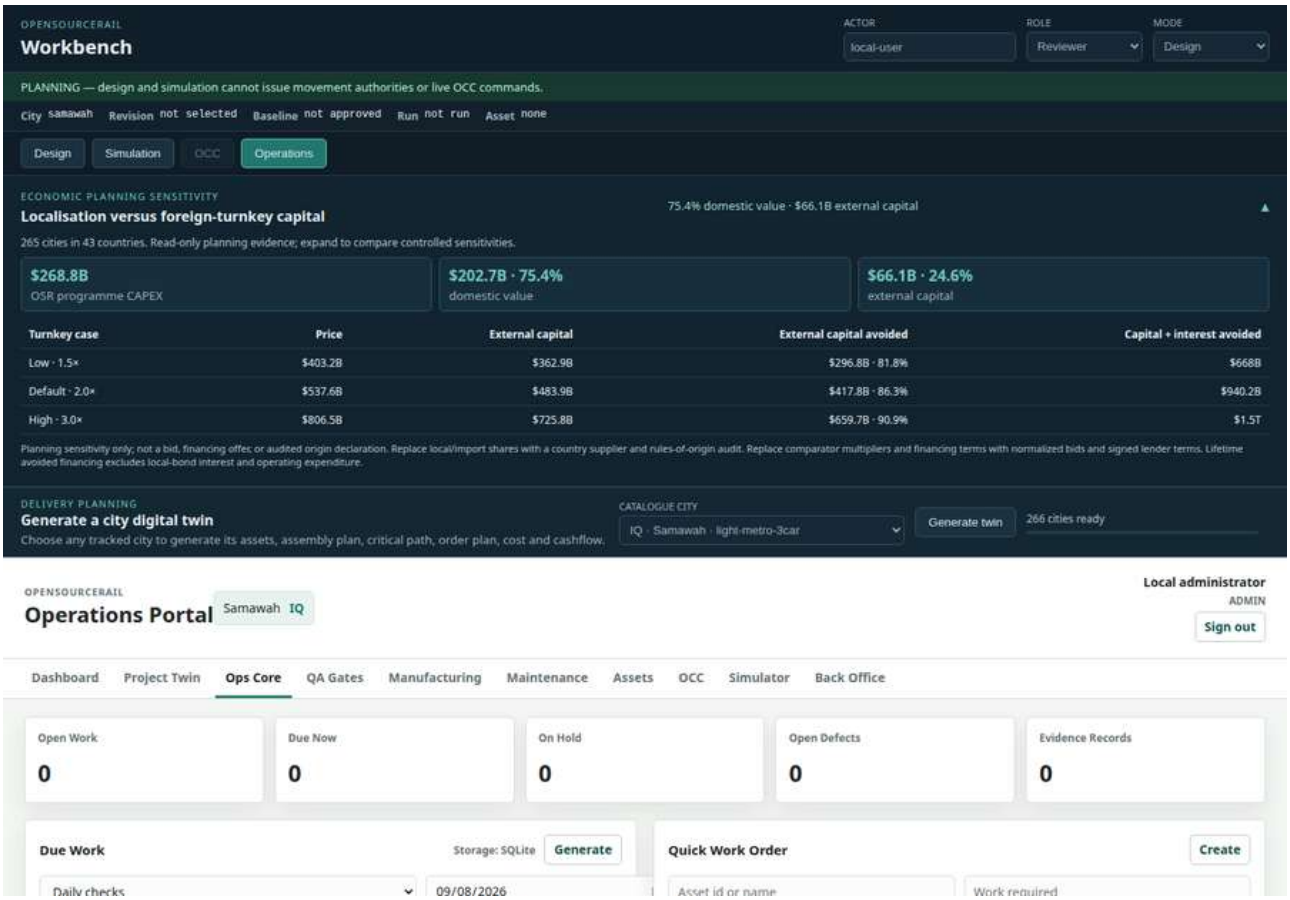
# OSR Workbench

Repository source: `docs/workbench/README.md`

The Workbench presents City Studio, simulation, OCC replay, ERPNext/Frappe HR, FUXA supervision and OSR railway assurance under one origin while preserving their authority boundaries. Six task areas—Plan, Design, Deliver, Operate, Maintain and Assure—retain all 25 existing routes and add the common design/job/part/evidence workflow. Shared URL context links the city, immutable revision, approved baseline, simulation run and selected asset.

The collapsible Economic planning sensitivity panel reads the generated `portfolio-summary.json` through a read-only Workbench endpoint. It shows the current OSR domestic/external capital split and low/default/high foreign-turnkey comparisons without creating or approving a financing record.

The Generate a city digital twin bar lists all 266 tracked catalogue cities. One button creates that city's asset register, family-scoped assembly plan, finite-resource critical path, budget work packages, supplier/order-by plan, monthly local/imported cash requirements, QA and maintenance records, then opens the result in Operations. Generation is an allowlisted background job: the browser cannot supply a command or filesystem path. Output under `build/workbench/project-twins/` retains separate run directories and durable job records across server reload; reviewed compact baselines stay with each city under `engineering/project-twin/summary.json`.



Workbench any-city digital-twin generator

Install and launch it through the root one-command setup.

Open http://127.0.0.1:8090/. Workbench binds only to localhost; its trusted development identity is unsuitable for a shared network endpoint. Use the authenticated standalone Ops Core server for shared operations records. Planning and training modes cannot emit live OCC commands; live mode does not expose design or simulation modules. Actor and role fields provide navigation context, not authentication. The versioned contract is `context-contract.schema.json`. Simulator and OCC replays expose deterministic onboard, infrastructure, and depot-data evidence for the same run; this is software-in-loop, not hardware.

## Operating platform

Decision readiness opens the subsystem qualification view. It recompiles current engineering and measurement inputs, separates six decision areas, and displays quantitative uncertainty, physical-test gaps, production-equivalence findings and changes since review. The reference cooling package is explicitly separate from city acceptance. The qualification workflow explains the controlled rig, model correlation and independent-review inputs.

City execution opens the business operating platform inside the shell. ERPNext and Frappe HR own business records and authentication. Railway works retains the OSR engineering baseline, inspections, NCRs and handback evidence. Set `OSR_ERP_URL` before starting Workbench to use another ERPNext installation.

The city operating twin joins generic and city-specific ERP configurations to each engineering baseline. The local `/api/operating/twins` endpoint reads private ERP feedback snapshots; the operating page shows city, revision, timestamp, task categories, actual task costs and asset workload. The Project Twin panel uses an exact city/revision match and requires a unique operating baseline. Run `./osr erp feedback start` for five-minute refreshes.

# Integrated lifecycle workspace

The Workbench now embeds Connected assets, City execution, the native ERPNext/Frappe HR screens and FUXA supervision alongside City Studio, simulation, OCC and railway works. The default lifecycle overview links plan, design, procurement, manufacture, construction, commissioning, operation, maintenance and renewal. The generic module registry supplies navigation for every city. Existing generic ERP/supervision templates and each city's `operations/` configuration continue to own deployment-specific settings.

The City selector carries city, environment and asset identity through the shell. Changing city clears revision, baseline, run and asset context. Changing the revision clears its preceding baseline and run; changing the baseline clears the preceding run. Embedded tools remove those invalidated references when the shell sends its current context. Without a baseline, live mode returns to training. These context references do not independently authenticate an engineering approval. Railway control and design views are available only for the workspace passed to `workbench-server.py --project`; selecting another city does not rebind its controller. Any catalogue city can use delivery generation and its own operating bundle. Missing ERP, engineering or supervision packages are shown as unavailable. ERP project-linked lists use city filters where supported; City execution opens the exact linked ERP project and its OpenSourceRail  Operating components actions. Native FUXA offers its own city/display selector.

Business and maintenance-case links open inside the shell. ERP Project and Issue Connected lifecycle buttons return to it. A linked condition Issue also offers Prepare repair: a native ERP review of Asset, parts/availability, technician and expected downtime followed by a draft Asset Repair. Its completion remains separate from the Workbench's railway inspection and handback evidence. Direct tool links remain available for a separate window. URL context includes an optional `environment` for simulation/physical asset inspection, independent of railway control mode.

## Authentication and supervisory actions

ERPNext and FUXA keep their native accounts, sessions and permissions. This is a shared interface, not single sign-on. The ERP image permits framing only by itself and the named local Workbench origins in configure-nginx.py. Websocket origin checks remain enabled. For another deployment, configure `OSR_ERP_URL` and `OSR_FUXA_URL` and explicitly allow its Workbench origin at the service; cross-site cookie policies may require a same-site HTTPS deployment.

Connected assets exposes alarm acknowledgement and commands declared by the asset package. Enter an independently provisioned, scoped integration credential in Operator actions; it stays in page memory and is cleared when leaving. The gateway enforces identity, city, environment, role, command bounds, lifetime and controller ownership. The current pilot permits simulated station lighting only. Requested, accepted, completed, rejected and failed states remain visible in command history. A transport error requires checking that history before retrying. Workbench view roles do not grant these permissions.

FreeCAD, Bonsai and QGIS remain desktop editors. The overview exposes versioned, hash-checked engineering downloads; their selection bridge now opens the selected asset inside the Workbench. Browser execution of those desktop applications and physical control deployment are not provided here.

## Verification

Browser tests cover city isolation, embedded links, stale telemetry, command credential handling and the existing design simulation `OCC works` workflow. `test_workbench_actions.py` verifies explicit credentials, same-origin mutation requests, allowlisted endpoints and preservation of gateway denials. The installed-stack check verify-native.mjs signs in through native ERP/FUXA forms, follows an ERP project back to its asset, and checks a simulation lighting request through controller completion. It requires the local pilot services and private credentials and intentionally changes simulated station lighting to 60% and restores it to 75%; it performs no physical command. The local `integrated-stack` validation profile creates those services from a clean checkout, runs this check with the ERP transaction, embedded-condition and FUXA checks, verifies outage recovery, and destroys the disposable data volumes.

# City-aware navigation and deployment inventory

The overview now includes searchable connected equipment, observation timestamps and an explicit inventory refresh. It distinguishes local profile files, prepared engineering/supervision packages, ERP feedback and actual telemetry. Prepared packages do not establish imported FUXA configuration or physical connectivity.

Native Projects & automations opens the uniquely linked city project. Tasks, procurement, receipts, manufacturing, stock, cases and invoices use native Project filters. These filters apply to the document's project field; allocations made only on child lines remain visible in City execution actuals. Quality, maintenance and HR retain their organisation-wide native scope. Missing or ambiguous feedback prevents a city-filtered workflow from silently opening an unrelated project's records. Native permissions still apply to every record.

FUXA navigation requests the generated view for the chosen city, environment and site, preferring the selected asset's site. Verify its displayed city/site name: FUXA may fall back to its default if the prepared view has not been imported. Before import, `preview-fuxa` lists the exact package checksums and all device/view additions, replacements and removals; `import-fuxa` rejects a stale review. The installed-stack check verifies actual Samawah/Mosul display switching, ERP project filtering and a simulation analysis evidence record in addition to its supervisory command check.

# Independent example deployments

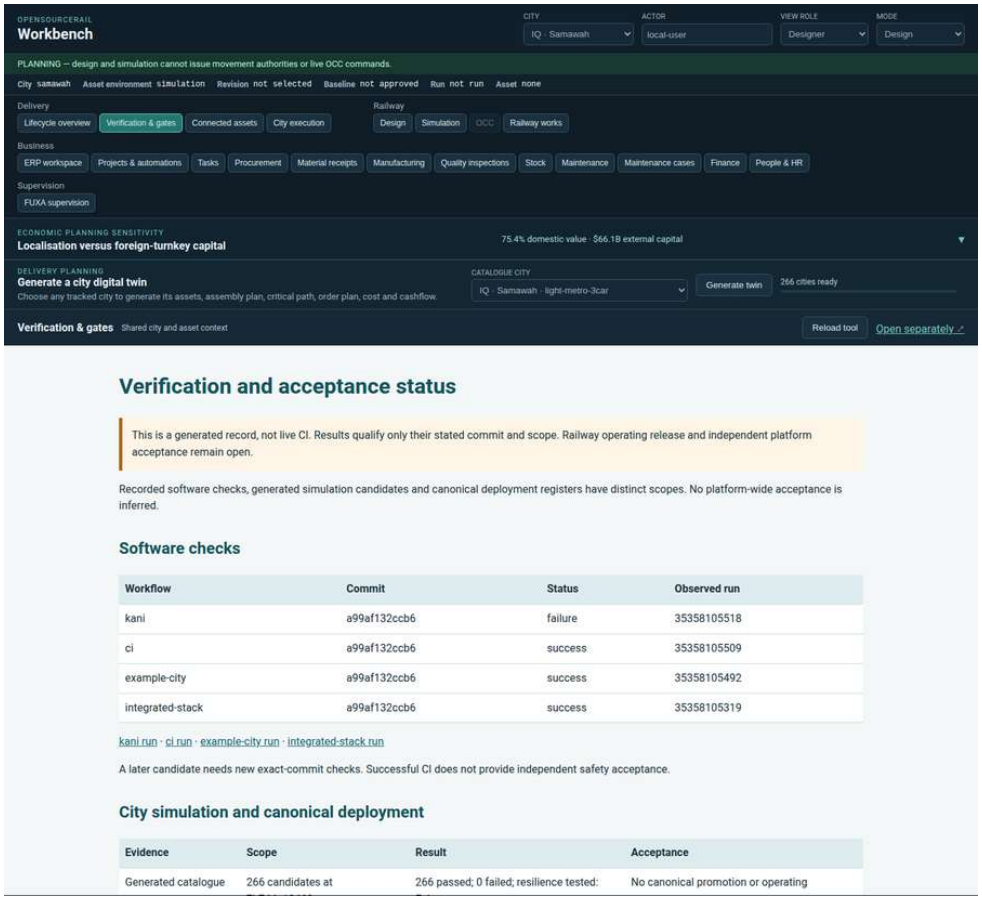
The Samawah acceptance setup runs its own ERP, FUXA, gateway, controller and Workbench without sharing operating records. Workbench accepts these operator-defined environment variables:

| Variable | Purpose |
|---|---|
| `OSR_ERP_URL`, `OSR_FUXA_URL` | Native application origins |
| `OSR_INTEGRATION_URL` | Gateway origin for scoped reads and explicit operator requests |
| `OSR_SUPERVISION_CONFIG` | Private integration credential file |
| `OSR_SUPERVISION_ROOT` | Prepared city packages and engineering manifests |
| `OSR_SUPERVISION_PROFILES` | Directory of per-city JSON project/company/preferred-site profiles |
| `OSR_ERP_SNAPSHOT` | Private ERP operating feedback file |

Defaults continue to use the regular local installation. ERP's site configuration `osr_workbench_origins` controls trusted parent navigation; the frontend's `frame-ancestors` policy must allow the same origins. The example setup configures both for port 8190. The simulator accepts matching `--config`, `--controls` and `--url` arguments, and follows the accepted city's `historian.sampling_seconds`.

# Verification and gates

The Verification & gates module shows recorded CI commits and scopes, generated city candidates, canonical deployment gates, integration coverage and analysis maturity in one view. It is a generated record, not a live CI monitor. Update `docs/operating/status/evidence.json` from actual workflow observations, then run `tools/automation/osr-python tools/automation/platform-status.py`. The generator reads the current coverage, city deployment and analysis registers; every workflow keeps its original commit and link. Later commits require their own checks.



Workbench verification status with exact CI commits and separate canonical deployment gates

# Service And Field Work

Open Service & field work for possession-aware planning, fleet/staff recovery, offline work packs, reliability analysis and operational/GTFS exchange. Use an explicit city-scoped integration credential; the shell view role grants no access. Device evidence survives offline reloads, while gateway/native ERP checks reject stale revisions, serials and assignments on reconnect. See the implementation, pilot and commissioning scope.

# Software, Deployment and Developer Tools

## Editable City Workspaces

Repository source: `cities/workspaces/README.md`

This directory contains the small, Git-reviewable source packages used by OSR City Studio. Generated catalogue outputs remain under cities/catalogue/.

Every project pins its input design/GIS/scenario bytes, records manual network intent separately from generator output, defines weekly service plans, and can materialize content-addressed revision records for pull-request review. Manual lines, stations, and alignment controls live in `network/overrides.toml`; adding or retiring one therefore remains an ordinary, reviewable Git diff. New-line day-type plans are stored beside the other services in `services/service-plan.toml`.

Samawah also commits a compact planning raster under `routing/`. Cost, demand, buildability, water coverage, open-DEM elevation, derived terrain slope, anchors, and derivation provenance are independently SHA-256 locked so demand-aware routes and civil screens are reproducible in a fresh clone.

Start with the Samawah project and the City Studio guide.

# Samawah Design Revisions

Repository source: `cities/workspaces/samawah/revisions/README.md`

OSR City Studio writes deterministic candidate revision JSON files here only when a user selects Materialize revision. Autosaves and map movements do not create Git history by themselves.

Review a candidate in a branch, commit the project inputs and revision file, then submit a pull request. After approval, tag the merge using the prefix `city/samawah/design/` declared in `project.osr.toml`.

The regenerated core alignment uses new station positions and IDs. The older revision JSON and reviews remain historical records; they do not approve the current candidate. Previous platform locks are retained separately in `../network/historical-pre-core-overrides.toml` and are inactive.

The current source lock adopts the 5 October local civil-cost correction on the retained alignment. Earlier revision source hashes and approval records are unchanged; they do not approve the corrected candidate. Compile and validate the current project before reviewing any new revision.

# Samawah City Studio routing bundle

Repository source: `cities/workspaces/samawah/routing/README.md`

This directory contains the source-locked planning surface used when City Studio creates a demand-aware manual line. The raster files are raw little-endian arrays despite their `.npy` suffix, matching `osr-routing`.

The bundle retains the pipeline's 20 m Samawah planning resolution (factor 1). This avoids treating a platform on a narrow dry river bank as a station in a predominantly wet 100 m aggregate cell. Aggregation preserves any buildable cell, water coverage percentage, the minimum buildable cost and maximum demand. Elevation is averaged and slope is recalculated on the retained grid to avoid amplifying one-pixel DEM noise. The derivation record pins the SHA-256 of every upstream file. Elevation comes from the public NASA/NGA SRTM-derived Skadi HGT tiles in the AWS Open Data Terrain Tiles bucket; it is planning evidence, not a surveyed ground model.

Add or refresh open terrain and independent water evidence before downsampling:

```
python3 tools/automation/augment-routing-terrain.py \
  --osm-json .cache/osr-pipeline/osm/samawah.json \
  --sidecar .cache/osr-pipeline/rasters/samawah.grid.json \
  --terrain-cache .cache/osr-pipeline/terrain
```

Regenerate or verify it from a populated local pipeline cache:

```
python3 tools/automation/downsample-routing-bundle.py \
  .cache/osr-pipeline/rasters/samawah.grid.json \
  cities/workspaces/samawah/routing --slug samawah --factor 1

python3 tools/automation/downsample-routing-bundle.py \
  .cache/osr-pipeline/rasters/samawah.grid.json \
  cities/workspaces/samawah/routing --slug samawah --factor 1 --check
```

This surface supports deterministic comparison of city-scale alternatives. It is not survey data, a final alignment, or evidence of detailed constructability.

# Rust Workspace

Repository source: `crates/README.md`

The `crates/` tree is the OpenSourceRail software stack. It contains the simulator, safety evaluators, onboard and wayside services, operator GUIs, design synthesis tools, and evidence generators.

## Common Commands

```
cargo test --workspace
cargo run --release --bin osr-sim -- --duration 3600 --status-every 300
cargo run --release --bin osr-design -- --help
```

## Main Groups

| Area | Crates |
| --- | --- |
| Shared foundations | `osr-core`, `osr-proto`, `osr-crypto`, `osr-secbus`, `osr-supervision-contract`, `osr-lifecycle-identity` |
| Signalling and wayside safety | `osr-consensus`, `osr-interlocking`, `osr-wayside-points`, `osr-level-crossing`, `osr-intrusion-detect`, `osr-hot-axle-wayside` |
| Reference process hosts | `osr-runtime` (development target; qualification pending) |
| Onboard safety | `osr-atp`, `osr-onboard-routing`, `osr-odometry`, `osr-brake`, `osr-bms`, `osr-door-control`, `osr-fire-safety`, `osr-derailment`, `osr-obstacle-detect` |
| Train systems | `osr-tcms`, `osr-ato`, `osr-traction`, `osr-aux-power`, `osr-hvac`, `osr-lighting`, `osr-regen`, `osr-tcn`, `osr-t2g`, `osr-event-recorder`, `osr-cbm-onboard` |
| Stations and passengers | `osr-afc`, `osr-afc-backoffice`, `osr-pis-onboard`, `osr-pis-station`, `osr-psd`, `osr-station-scada` |
| Simulation and design | `osr-sim`, `osr-design`, `osr-alignment`, `osr-routing`, `osr-analytics`, `osr-energy-site`, `osr-balise`, `osr-tvm` |
| Operator tooling | `osr-gui-shared`, `osr-sim-gui`, `osr-occ-gui`, `osr-occ`, `osr-historian` |
| Evidence and images | `osr-safety-case`, `osr-selftest`, `osr-trainset-image`, `osr-cbm-backend` |

The architecture rationale is in `docs/ARCHITECTURE.md`, with the crate-level software map in `docs/rfcs/0005-sbc-software-architecture.md`. The evidence-backed maturity review and executed integration plan are in `docs/rust-codebase-review-and-integration-plan.md`.

# osr-city-studio

Repository source: `crates/osr-city-studio/README.md`

Rust compiler, validator, local HTTP service, and embedded browser interface for Git-backed OSR city projects.

The crate deliberately operates above the safety-critical control stack. It creates design and service-planning candidates; it cannot issue operational movement or route-control commands.

Run the Samawah vertical slice from the repository root:

```
cargo run -p osr-city-studio -- serve
```

The interface can create/move/retire manual stations, create complete manual lines from two endpoints using locked demand/buildability surfaces or an explicit direct chord, edit local alignment controls, plan service by line/day/time over an offline GIS canvas with 20 content-hashed layers, including source-locked open-DEM elevation/slope, an independent water and station-exclusion mask, and likely bridge/viaduct screening, pan/zoom, visibility/opacity controls and feature inspection, and adjust every time-window headway for one line or every route in an atomic day-type transaction, copy a complete plan between day types, author period-specific origin–destination flows, screen them against the conservative scheduled capacity bottleneck, and edit or remove those flows, edit project-level civil construction intent, persist accepted per-line IFC survey/map conversions, and inspect derived thermal-unit, deck-gap and bearing quantities, regenerate GIS and simulator inputs, and compare the working candidate with immutable Git revision records. Its engineering hub runs only allowlisted field-evidence, GIS, simulator, alignment-exchange and civil-BIM adapters and persists their progress, logs, exit state, and immutable artifact copies. The field-evidence adapter also exposes control through per-asset structural-release readiness without claiming missing field data or approvals. The civil BIM adapter emits an IFC4.3 rail federation, object index, quantities, provenance, 19 reusable source-recipe component types, three source-backed material families, one native section profile driving 32 rail extrusions, two typed `IfcVehicle/ROLLINGSTOCK` trainsets with standard measured base quantities, a linked construction sequence that separates 134 physical outputs from 45 virtual review interfaces, 36 native typed bridge bearings and explicit virtual foundation/jacking interfaces, 27 native support connections with 60 bearing realizations, one internal classification with 15 references covering all assets, five native coordination groups, six native functional systems (three specialized as `IfcBuiltSystem`), seven system-to-railway-part references, four native presentation layers, nine native interface constraints with six numeric `IfcMetric` benchmarks, three qualitative-only gates, and 107 scoped project/asset/group/system evidence links, 16 native property/quantity dictionaries with 99 typed fields, native horizontal/vertical planning alignment segments and stationing, one native USD schedule of three generated planning rates, 15 hash-locked native source documents including a link to all nine objectives and six metrics, a machine-readable register of nine external engineering decisions, IDS audit, and BCF 3.0 release issues for Bonsai. The integrated evidence viewer re-verifies each hash before plotting GeoJSON, alignment JSON, civil IFC object tessellated solids with object picking, asset-class inheritance, review-group and functional-system membership, interface-constraint evidence, property-template applicability and definition linkage, alignment layout, stationing, and unresolved cant/transition evidence, planning-rate provenance, quantity drivers, and no-estimate boundaries, source-document records and hashes, IDS specifications, BCF topics, LandXML, railML, stakeout CSV, or simulation results. The civil job also produces source-bound native IFC triangle chunks, loaded through the verified artifact endpoint with stable object identities. The civil viewer joins the verified IFC object index with its verified 4D task sequence, supporting view rotation, presentation-layer, coordination-group, and functional-system visibility, construction-stage scrubbing/playback, task/QA-hold context, and stable object picking for BCF.

BCF decisions are saved to project intent and included in Git revision hashes; immutable job evidence is never edited in place. Resolution and closure require recorded evidence and a reviewer before a regenerated BCF can carry that state. New topics can be authored from one or more searched/selected IFC assets; content-derived issue, topic, and viewpoint IDs keep repeated builds and Git review deterministic. Materialized revisions can also receive append-only approval or changes-requested records with a reviewer, role, date, rationale, and review/PR reference. These records live in project TOML but remain outside the design hash, so approving an immutable revision cannot create a circular new revision.

Demand periods and OD flows live in `demand/od-matrix.toml`. Flow IDs are derived from period/origin/destination identity, capacity screens are rebuilt from the corresponding line/day/time service windows, and both intent and metrics participate in deterministic revision hashes and semantic comparison. The compiler assigns shortest scheduled-time routes through connected, colocated interchanges, combines OD flows on directed sections and reports station boarding, alighting and transfer loads. Periods require full service coverage. This is an all-or-nothing planning assignment; observed OD calibration, capacity-constrained boarding and physical pedestrian acceptance remain open.

Civil settings live in `[civil]` in `project.osr.toml`. The API and GUI reject values outside the controlled product family before atomically persisting the standard span, expansion-unit length, reinforced-soil height, slipform/ST6 methods, mould-cycle target and road crossing-comparison rule. Optional `[[civil.ifc_georeferencing]]` records bind a single accepted EPSG/map conversion and evidence source to a stable line ID. They participate in revision hashes and semantic comparison; the civil job passes only the record for its selected line to the IFC exporter.

Run the complete browser and cross-GUI acceptance suite with:

```
npm run test:frontend
```

Tests use disposable City Studio projects and isolated SQLite databases; the committed Samawah intent is never edited.

See the City Studio guide and RFC 0031.

# osr-occ-gui — operations-control dispatcher console (RFC 0018)

Repository source: `crates/osr-occ-gui/README.md`

Pure-Rust egui front-end for the OCC. v1 ships as a read-only console that attaches to a pre-recorded sim run for demonstration; v3 (per RFC 0018 §9) wires live consensus + RFC 0017 signed action emission.

## Features (v1)

- Live-style playback (speed controls 1× / 10× / 60×) against a pre-recorded sim run.
- Network schematic with per-section intrusion overlays (Present / Unknown colour-coded per RFC 0016).
- Train panel listing every in-service trainset with phase + SoC.
- Embedded telemetry roll-up from the attached deterministic recording: TCMS trip movement holds, CBM service flags, and T2G channel/transmission counts.
- IEEE 1588 acquisition and lock evidence from the same recording.
- Station/wayside roll-up for PSD states, controller ticks, and intrusion verdict transitions.
- Physical HABD passage, warning restriction, trip, active-stop, and inspected-reset evidence.
- Balise registry, accepted odometry fixes, and sighting-audit findings.
- Signed TVM sales, AFC decisions, settlement, and fraud evidence.
- Real OCC roster ingestion, incident lifecycle, and active dispatch-hold evidence from the attached recording.
- Energy-site controller conservation and regenerative-current arbiter evidence from the same deterministic run.
- Track-state wire encode/decode counts and semantic-parity failures.
- Explicit point-machine and applicability-aware level-crossing controller evidence; no crossing is invented for a grade-separated city.
- Five-role software preflight results; any failed known-answer check blocks simulated dispatch. Physical commissioning evidence remains separate.
- Depot roll-up for received CBM payloads, historian samples, analytics, and maintenance work orders.
- Alert feed (info / warn / crit) with category filter checkboxes, pre-seeded with SoC-warning alerts harvested from the recorded run and dispatcher-action entries.
- Dispatcher-action modals with input validation:
  - S2.1 Issue route grant — requires `T<number>` train id + comma-separated numeric section ids.
  - S5.1 Commit MaintenanceOverride — requires numeric section id, non-empty crew id, and expiry 15..=240 min (per RFC 0013 S5.4).
  - Release inspected HABD stop — requires a train, named qualified authority, inspection reference, and explicit examination/line-clear confirmation.
  - Declare degraded mode — selector for Normal / M1 Manual- on-MA / M2 Restricted / M3 Evacuation per RFC 0013 §5.
- Test-mode intrusion injection buttons so a dispatcher can rehearse Present / Clear transitions on SEC1001.

## Run (native)

```
cargo run --release -p osr-occ-gui -- --operator "dispatcher-alpha"
```

Click Attach recording in the left sidebar to run an hour of the Samawah scenario and stream it into the UI.

## Run (WebAssembly)

Same toolchain as `osr-sim-gui`:

```
rustup target add wasm32-unknown-unknown
trunk --version # must report trunk 0.21.8
cd crates/osr-occ-gui
trunk serve web/index.html --open
```

From the repository root, `npm run test:frontend` builds this release bundle and verifies it in pinned Playwright Chromium.

## Security note

v1 is read-only — every dispatcher action emits a stub log line instead of a signed RFC 0017 envelope. A visible "READ-ONLY v1" watermark sits in the bottom-right of the map. v3 wires the operator's signing key from their ATECC608B-backed login and every committed action reaches the consensus cluster as a `SignedBytes` envelope that the interlocking verifies before applying.

# osr-runtime

Repository source: `crates/osr-runtime/README.md`

Thin synthetic process hosts for existing consensus, committed interlocking, ATP, ATO and brake evaluators. No second authority or protection calculator. See RFC 0033 and the process-reference package.

`osr-train-agent` and `osr-wayside-agent` use newline-framed JSON local I/O ports; the application messages exchanged through them are signed versioned postcard packets and existing signed consensus proposals. Filesystem writes precede outbound effects. Reference keys are intentionally public fixtures; operational deployment is rejected. Hardware safety outputs and production radio adapters remain explicit qualification work.

Train binaries require `--safety-channel A|B` and separate journal paths. A owns network publication; B evaluates committed inputs without duplicate proposals. The paired-only safety-output port accepts `feed_pair` with optional A/B feeds; missing either channel trips. `DualGuard` requires exact requests from both and latches discrepancy, stale/replayed feeds, emergency and either feedback failure. Only stopped authorised fresh recovery clears a trip. The coordinator feeds at 50 ms against a 100 ms deadline. A late feed latches even without prior sampling.

The output port defaults to an autonomous monotonic-clock sampler, on a separate thread from bounded input parsing and output writes. It samples even when input is incomplete or its consumer stops reading. Output snapshots carry the process clock epoch and monotonic time. Source requests must retain their original issue time in that epoch; stale, replayed, future or previous-epoch requests cannot renew a deadline. EOF and malformed input fail closed. Clients must also reject stale/missing output frames; a stopped watchdog process cannot actuate hardware.

`--clock virtual` is an explicit deterministic replay mode. The TACS twin uses that mode; its virtual timing does not prove real-time scheduling. Native tests exercise idle input, blocked consumption, caller-time injection, source expiry and stopped-only recovery. Rust's Instant and bounded receive timeout provide the process clock and polling primitive; OS scheduling, suspend behaviour and hardware reaction require measured qualification.

Channel-local independent clocks, authenticated source-issued output identities, power/output isolation and physical braking response remain open integration work. See the default policy; other local protection pairs remain open. No availability claim follows from A loss.

# osr-sim-gui — simulator GUI (RFC 0018)

Repository source: `crates/osr-sim-gui/README.md`

Pure-Rust egui front-end for `osr-sim`. Loads a scenario, runs the sim once to completion, builds a 1 Hz `SimTimeline`, then animates the run at arbitrary playback speed.

## Features (v1)

- Scenario selection via `--scenario <path>` flag (or the Samawah built-in default).
- Play / pause / reset + 0.5× / 1× / 10× / 60× speed controls.
- Timeline scrubber (drag to any second).
- Network schematic with trains coloured by phase (traveling / dwelling / charging / SoC-warning).
- Click-to-inspect sidebar with line, phase, `station_m`, SoC, and last-event details.
- Event log with per-kind filter checkboxes (dispatched, arrive, depart, charging, turnaround, SoC warning).
- Fault-active badges for every `[[faults]]` entry that's firing at the current playback time.
- Embedded evidence for TCMS trip movement holds, event recording, CBM, hot-axle, and T2G primary/backup/offline operation.
- IEEE 1588 acquisition and lock evidence for the shared simulation clock.
- Station and wayside evidence for PSD, PIS, SCADA, and intrusion detection.
- Physical HABD passage, warning restriction, trip, latched-stop, and inspected-reset evidence.
- Balise registry, accepted odometry fixes, and sighting-audit findings.
- Signed TVM sales, AFC decisions, settlement, and fraud evidence.
- Depot evidence for radio-delivered CBM, history, analytics, and work orders.

## Run (native)

```
cargo run --release -p osr-sim-gui
# or with a specific scenario
cargo run --release -p osr-sim-gui -- --scenario cities/catalogue/west-asia/Iraq/Samawah/samawah.toml
```

## Run (WebAssembly)

The same code ships as a WASM app. Build + serve with trunk:

```
rustup target add wasm32-unknown-unknown
trunk --version # must report trunk 0.21.8
cd crates/osr-sim-gui
trunk serve web/index.html --open
```

The HTML file at `web/index.html` pulls the crate's library target, builds it to WASM with `wasm-bindgen`, loads it into the `<canvas id="osr_sim_canvas">`, and the same `SimApp` runs inside a browser tab.

From the repository root, `npm run test:frontend` builds this release bundle and verifies it in pinned Playwright Chromium.

# Host Deployment Baseline

Repository source: `deployment/README.md`

This directory is the reproducible software-composition baseline for the five hardware classes described by RFC 0005. It answers which workspace packages belong on each host, their startup order, commissioning check, log policy, and update/rollback contract.

- `hosts.toml` is the source of truth for host images.
- `components.toml` gives every Cargo workspace package a disposition.
- `config/*.toml` contains the non-secret configuration shipped in an image.
- `tools/automation/validate-host-manifests.py` validates the model against Cargo metadata and rejects incomplete or legacy-contaminated default images.

The current packages are linked evaluator/control libraries, not independently supervised daemons. `osr-selftest` is the executable commissioning boundary. An image builder must statically link the listed packages into its OS-specific tasks and retain the manifest and Git revision beside the executable. Secrets, device identities, trust anchors, calibration values, and site addresses are provisioned after imaging and must never be committed here.

The manifests are an integration and release control. They are not evidence that an image has passed a hardware-in-the-loop, EMC, environmental, or safety assessment.

## Validation

```
python3 tools/automation/validate-host-manifests.py
cargo test -p osr-trainset-image --all-targets
```

The update contract is deliberately fail-safe: stage and verify an image, activate it once, require the role self-test and external watchdog heartbeat, and automatically return to the last-known-good slot if either fails.

## Business operating services

ERPNext deployment runs on an ordinary business server, separate from the five railway control host classes. It provides the operating platform without adding ERP dependencies to onboard or wayside images.

## Equipment supervision

ERPNext + FUXA lifecycle deployment provides generated city equipment packages, a durable telemetry/event gateway and a simulated station pilot. Its prepared-package review traces design and embedded contract changes through installed/evidence/business identities before a baseline can be replaced. The operating-readiness audit compiles all 266 tracked city asset registers through the supervision package and all 266 ERP and component profiles, while retaining operator and physical commissioning inputs as explicit fail-closed states.

The local `integrated-stack` profile builds a clean, disposable Samawah/Mosul deployment from these checked-in inputs. It exercises native ERP transactions, the gateway, embedded simulator, pinned FUXA application and Workbench together, including a gateway outage and recovery, then removes the evaluation volumes. This is software integration evidence; it does not replace commissioning or hardware-in-the-loop acceptance.

# ERPNext operating deployment

Repository source: `deployment/erpnext/README.md`

This composition runs ERPNext, Frappe HR, the OSR reference integration, MariaDB, Redis, workers, scheduler, websocket server and nginx frontend.

Use the root `./osr erp` launcher. Setup, ownership, import and backup procedures are in the operating platform guide. Secrets and local configuration live under `var/erpnext/`, outside this tree.

MariaDB stores its data in the persistent `db-data` volume and temporary InnoDB files in a separate bounded 512 MiB `/tmp` filesystem (mode 1777). A healthy container and a successful `/api/method/ping` response are separate checks from the city planning validators. If MariaDB reports missing temporary files, retain the data volume and restore temporary storage; do not reinitialise the database.

The Baghdad detailed engineering register lists reference parts and ERP handover requirements. These rows are not live Items, submitted BOMs or approved Work Orders; import only a released, priced family MBOM with real company, warehouse, operator and supplier inputs. The generated catalogue readiness report validates all city profiles and component packages and identifies which full task payloads still need on-demand materialisation before import.

The local Workbench embeds native ERP screens with native authentication. The proxy allows framing only by the explicitly listed Workbench origins; see the Workbench integration guide.

A condition-created Issue with a reviewed ERP Asset exposes OpenSourceRail  Prepare repair. Preview validates the Issue/project/Asset identity, technician, city warehouse, stock Item, optional serial/batch bundle and current availability. Apply creates one unsubmitted native Asset Repair and ToDo assignment; it never submits stock consumption, closes the Issue or grants railway handback. Repeating the same reviewed request returns the existing record and preserves operator edits. The native repair form remains responsible for actions performed, completion, actual downtime, parts consumption and accounting. Its OSR provenance fields link back to condition history and the existing lifecycle/serial evidence.

The private city feedback export also carries engineering revision exposure: explicit nested BOMs, draft/unfinished production, potential purchases and linked stock movements. It uses native document permissions and preserves coverage warnings. Workbench displays and downloads these observations. The native Project's OpenSourceRail  Revision dispositions workflow adds assigned, immutable proposals and independent endorsement/rejection records. Stale or incomplete exposure cannot receive an endorsement. Recording never executes the proposed ERP action or grants railway release. Independent native-outcome verification covers retention, cancellation, direct amendments, production stops, corrective Job Cards with accepted inspections, performed stock inspections and native movement traces. Evidence remains immutable and later changes make it stale; see the verification workflow and upgrade limits.

After a backup, rebuild/restart the app, run `./osr erp bench migrate` to install the three disposition record types, then `./osr erp snapshot` to refresh feedback. Manufacturing Manager, Projects Manager and System Manager roles can use the workflow subject to project/exposure access; reviewer, proposer and responsible person must satisfy the independent-review checks. Inspection and trace readers also need native Quality Manager and Stock User access, respectively.

The complete example-city test installs a separate site and checks actual planning, purchasing, manufacturing, serial movements, maintenance and Workbench/FUXA behavior. Native regression scripts accept `OSR_TEST_SITE` (default `osr.localhost`) so the same checks can run in that site.

Condition routing maps `low`, `medium` and `high` alarm priority to native Issue priority when creating a case. Later events preserve operator triage changes. Rules without a priority use `medium`; display-only rules do not create cases on activation or clearance unless an earlier enabled rule already routed the same incident.

The Baghdad qualification package provides ten source-bound evidence Tasks, including the independently operated first-section option. Preview with `bench --site SITE execute osr_erpnext.qualification.import_tasks --kwargs '{"package_path":"/path/to/erpnext-tasks.json"}'`; set `"apply": True` for a reviewed local import; this installed Bench CLI parses Python literals in `--kwargs`. The importer creates open native Tasks and refreshes descriptions by stable subject. It preserves actual assignment, project, dates, priority and status when repeating an import; it never completes an evidence task or grants acceptance. Assign a named accountable person through ERP; role labels are not user assignments. Physical result verification uses independently supplied reviewer keys and signed source/criteria-bound results. Generated templates contain no measurements, quotations, signatures or operating release. Local task mappings belong in `var/erpnext/`, rather than the public proposal archive.

The Baghdad workforce pilot maps workload, recruitment and practical assessment to native HR records. Run `bench --site SITE execute osr_erpnext.workforce.administration_readiness` to inspect local schemas and the caller's read permissions. This does not prove that anyone has been appointed or authorised. The bench-only `osr_erpnext.workforce.preview_assignment` accepts `project`, `task`, `employee` and `authorisation_file`; the

private File must belong to that active Employee and its controlled JSON packet must match the Project baseline and Task. HR Manager or System Manager plus native read permissions are required. This validates the attached snapshot: `snapshot_eligible` describes those assertions, while `eligible` and `live_start_check` remain false. Timestamp rechecks detect expiry; they do not resolve subsequent revocation of authoritative records. Before task start, the human work-release process must resolve current permits, competence, availability, calibration and stock release. The preview creates no assignment, permit, competence record or railway release. Keep native worker records and private attachments out of public exports. The six delivery evidence drafts use the existing Task importer and preserve actual owners/status.

## Local administrative and recovery probes

`bench --site SITE execute osr_erpnext.delivery_admin.read_probe` performs bounded permission-aware native schema/record reads and reports elapsed times; it does not prove city-scale throughput or staffing. `osr_erpnext.delivery_admin.recovery_fingerprint` hashes the evidence Task, DocType, role membership, permission and File inventories for comparison with an isolated SQL restore. Both require System Manager, are bench-only and create no assignments or work-release authority. Rebuild the local image to retain these modules across container recreation.

Use the isolated restore tool with a trusted private SQL backup and matching private native fingerprint. Its temporary database has no network or published ports and is deleted after verification. SQL inventory checks complement the existing full platform recovery procedure; they do not prove encrypted file recovery, production RTO/RPO or field acceptance. Keep backups and receipts in ignored `var/erpnext/`.

# Reproducible example-city acceptance

Repository source: `deployment/example-city/README.md`

This scenario builds a separate Samawah simulation deployment, with Mosul as an independent control city. It runs actual ERPNext, Frappe HR, FUXA, the integration gateway, the native Rust controller bridge and the shared Workbench. Business records are retained for inspection after a successful run. Samawah uses individual asset polling; Mosul uses site polling, with native rendered power checked against the gateway reading. Both retain individual equipment and maintenance identities.

## Run

Use the repository's pinned Docker, Rust, Node/Playwright and Trunk prerequisites in the ERP deployment guide and Workbench guide. Docker must be running. The first ERP build and city imports can take tens of minutes.

```
npm ci
npm run frontend:build
cargo build -p osr-sim --example operating_bridge
PLAYWRIGHT_BROWSERS_PATH="$HOME/.local/share/opensource-rail/toolchains/playwright" npx playwright install chromium
./osr example-city setup
./osr example-city run
./osr example-city restart-check
./osr example-city expand-check
./osr example-city business-check
./osr example-city disposition-check
./osr example-city coverage
```

Open http://127.0.0.1:8190 after success. The report, native record identifiers, source hashes, full-network contract observations, before/after settings observations, browser screenshots and phase logs are under `build/city-example/`. Open `report.html` for the readable summary. The final `report.json` must contain `"passed": true`; an incomplete or failed run is never reported as a pass.

| Service | Example port |
|---|---|
| Workbench | 8190 |
| City Studio | 8191 |
| ERPNext / Frappe HR | 8180 |
| Integration gateway | 8192 |
| FUXA | 1981 |

Private credentials are generated under `var/city-example/` with restricted file permissions. ERP uses `Administrator` and the generated `ADMIN_PASSWORD` in `local.env`; FUXA uses `operator` and `operator_password` in `fuxa.json`. Integration roles are in `integration.json`. These files are not test artifacts.

```
./osr example-city stop    # stop only example services; retain records
./osr example-city start   # reopen the retained successful example
./osr example-city reset   # remove only example services, volumes and local outputs
./osr example-city setup
./osr example-city run     # repeat from a clean city deployment
```

Save reports/screenshots before reset. A run refuses to reuse an existing run marker: this avoids treating records left by a previous attempt as fresh evidence. Setup is repeat-safe and reapplies the source configuration. The regular deployment on ports 8080/8090/8092/1881 has different Compose projects, volumes and credentials.

CI also captures and rehearses a coordinated cold recovery after the native scenarios. Only public result summaries are uploaded; checkpoints, credentials and restored private files remain under `var/`. The rehearsal keeps controllers and background ERP jobs stopped in its isolated clone.

## Connected lifecycle

1. Import the full generic-plus-city planning baselines for Samawah and Mosul. Sweep every configured Samawah equipment position and measurement through the native evaluator/declared fixtures and production historian; save a separate full-network contract report, lower/upper boundary checks for every measurement and a clock-controlled retention change using the production historian.
2. Reopen and hash tracked FreeCAD, IFC, GIS and analysis artifacts. Bind the exact engineering revision to a native Item, production BOM and equipment Asset.
3. Purchase ten cooling modules, receive six, invoice the receipt and observe four outstanding. Manufacture two serialized chargers against a three-unit Work Order, consuming two cooling modules per charger; record an accepted inspection.
4. Transfer a produced serial into the native installed-equipment warehouse, install it at the modeled charger position and record separate design, execution, inspection and simulation commissioning evidence.

5 Inject a controller cooling fault. Observe the alarm, scoped acknowledgement, durable event and native ERP Issue. Complete an Asset Repair consuming a spare.

6 Close the ERP Issue, clear the fault and record maintenance. Replace the serial, transfer the removed unit back to workshop stock, retain its history, reject reuse of the old commissioning test and require fresh independent simulation evidence. Reconcile remaining raw stock and both finished serials against the receipt, production and repair quantities.

7 Inspect these same records in Workbench and native ERP/FUXA without browser request mocks. Send a lighting request and observe controller completion and measured feedback. Seal a City Studio simulation baseline, run the native simulator, hand the run to OCC replay and persist a linked OSR railway work record through the same Workbench.

8 Stop ERP during another fault, recover its queued event without duplication, then restart the gateway and check retained serial history and resumed telemetry. Run `restart-check` to stop/start all example services and verify serial history, OSR work, the retained City Studio configuration and newly received telemetry.

## Findings addressed

The expanded checks led to five integration changes: accepted sampling intervals now control native simulator publication; clearing a maintenance-disabled alarm does not create an ERP case; alarm priority and response reach native ERP triage without overwriting later operator decisions; and separate Workbench deployments can select their own data, gateway and trusted ERP parent origins. Generated FUXA asset links also use the configured Workbench origin, with that choice bound into the reviewed project hash.

## Expanded function and variable coverage

After a successful base run, `./osr example-city expand-check` can be repeated against the retained example. It pauses the example simulator, changes reviewed Samawah configurations, checks actual HTTP effects and restores the baseline and fresh telemetry in a `finally` block. It runs native ERP variations inside a rolled-back transaction and independently compares record counts, the original invoice balance and Item inspection settings before/after. Run this in the isolated example, without another operator editing its configuration during the check.

The recorded expansion passed 389 assertions: 342 live HTTP observations, three explicit HTTP controller-result fixtures, 43 native ERP/rollback observations and one schema-suite summary. The separate generated schema suite passed 230 checks. Schema validation and controller-result fixtures are not physical or native-controller acceptance.

Added variations include:

- Exact minimum, maximum and outside-range readings for all 56 selected measurement contracts; 72 combinations of three positive scales, two offsets, three raw values and four source qualities. Zero/negative scales are rejected.
- Null measurements, malformed sequences, timestamp regression, duplicate concurrent ingestion, five unauthorized roles and competing configuration reviews.
- Pending-command configuration blockers, illegal result transitions, terminal retries, missing permissives and expiry while the source is paused.
- Invalid quality interrupting alarm persistence, inability to clear an active fault with invalid readings, repeated occurrences and stale acknowledgements.
- All eight native maintenance intervals and their expected dates; both assignment strategies across five categories; three production/reorder quantities; all three service priorities; training text changes; both submitted budget policies.
- Native receipt/invoice inspection references with accepted and rejected readings; partial supplier payment, settlement and cancellation, with balanced GL entries and restored outstanding amounts. These temporary transactions are rolled back.

### The coverage register is the acceptance boundary

`coverage-register.md` is the recorded readable register. `./osr example-city coverage` regenerates current evidence under `build/city-example/coverage.json` and `coverage.md`, plus the discovered contracts in `coverage-inventory-current.json`. It inventories 526 registered functions, inputs, shared settings, route prefixes and named workflows. It explicitly excludes an exhaustive inventory of upstream ERPNext/FUXA, every city's override, desktop tool parameters and internal Rust functions.

The recorded classification is 36 scenario, 64 varied, 135 partial and 291 gap entries. These are inventory entries, not counts of broken features or an overall coverage percentage. A gap means no qualifying mapped evidence; partial coverage never counts as a finished workflow. Native budget enforcement, enabled assignment and scheduled replenishment now have varied outcome evidence. The register lists remaining payroll, independent training competence, SLA, capitalization, tax,

desktop engineering, load, backup restoration and physical acceptance work explicitly.

`coverage-plan.json` binds each entry to named evidence and a reviewed contract signature. New entries, removed entries and changed defaults/options fail the inventory check. Review the source change and its tests, then update only the reviewed IDs, signatures and evidence rules using `coverage-inventory-current.json`. Do not regenerate the review list just to silence a failure. Failed/incomplete scenario reports provide no passing coverage credit. After reviewing a new recorded run, refresh this checked-in register with:

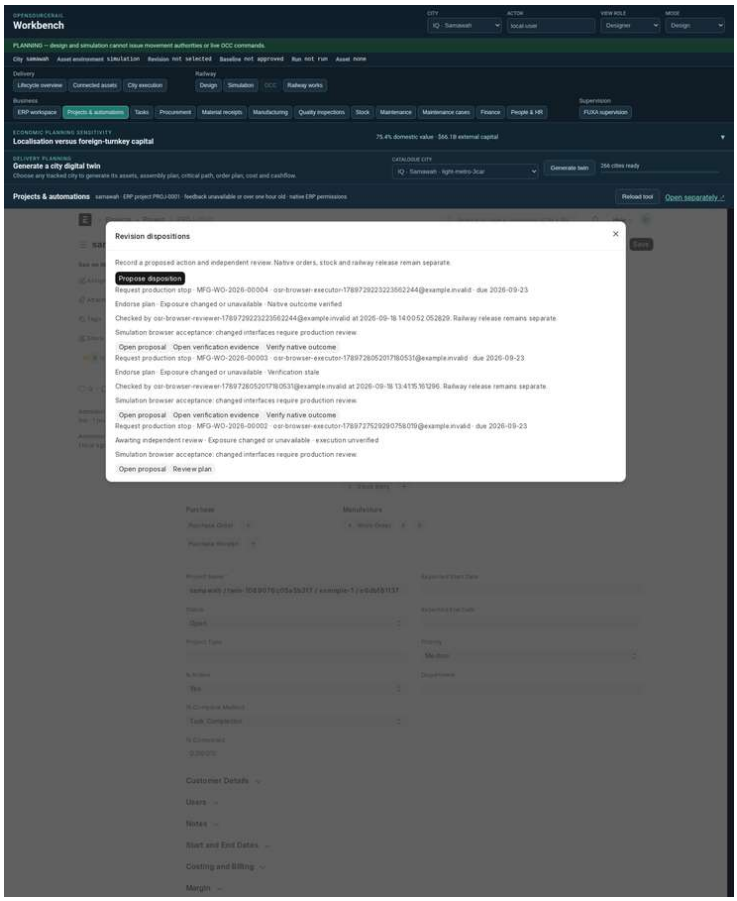
```
cp build/city-example/coverage.md deployment/example-city/coverage-register.md
```

The push/PR/manual CI workflow runs the expansion and always generates the coverage report, including on failure. Regular Python CI guards the reviewed inventory and verifies that missing evidence and newly changed contracts cannot be reported as covered. Local verification does not imply the GitHub workflow has run.

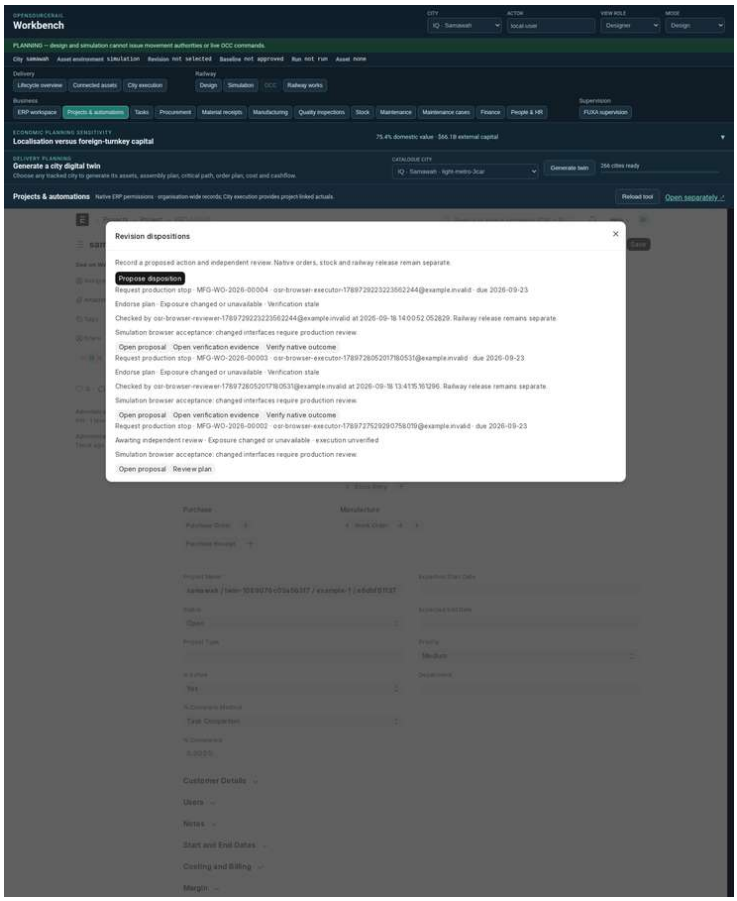
## Native business outcomes and independent browser disposition

`business-check` executes 24 checks, including rollback verification: native Stop/Warn budgets at 50/100/101 against a 100 limit; enabled Round Robin and Load Balancing assignment; scheduler-generated purchase requests at stock 3/2/1 against level 2; preserved city/project identity; conflicting/stale replenishment rules; submitted training events, attendance, Pass/Fail results and invalid time periods. These are simulation fixtures. Training completion does not grant competence.

`disposition-check` executes 9 unmocked browser checks through Workbench's real ERP frame. Three independent native accounts propose, endorse, perform and verify a Work Order stop. Self-endorsement, self-verification and verification before action are rejected. Resuming the Work Order makes its prior verification visibly stale. Fixture accounts and records remain in the isolated example; passwords remain private.



Independent native disposition verification



The same verification becomes stale after a native change

## Commit-bound release evidence

After all checks, `./osr example-city release-evidence` binds the required reports to the clean commit recorded at scenario start. Dirty local demonstrations and reports from an earlier commit are rejected. CI publishes `city-evidence.json`, and release packaging downloads the artifact from the exact successful candidate run. Missing, failed, changed or empty reports fail the gate. This is a software release gate; the review follow-through records the remaining engineering, formal, operating and physical work.

# Configuration coverage

| Area | Variations and observed effects |
|---|---|
| Planning | Five task-family switches in generated plans; changed calendar start, working weekdays, holiday, programme offsets, department and warehouse in actual ERP; repeat import preserves edited progress |
| Business execution | Ordered/received/outstanding quantities, invoice actuals, BOM ratio, planned/produced quantity, native serials, accepted inspection, spare consumption and downtime |
| Native reusable components | Transactional native component, procurement and lifecycle regression suites, including HR/training, budgets, quality, replenishment, maintenance and independent disposition verification |
| Telemetry | Every measurement in the selected equipment package at an in-range value and above maximum; scale/offset, unit, future clock, duplicate sequence, stale/disconnected quality and configured sampling interval |
| Native controllers and factory | Station, BMS, auxiliaries, HVAC, CBM, points and faregate fault inputs through Rust; all nine deployed factory methods with changed cycle progress, availability and quality holds, separate ERP cases and restoration |
| Alarms | Trigger/clear thresholds, persistence, repeat suppression, hysteresis, disabled maintenance routing and changed priority/response in native ERP triage |
| Commands | Several lighting levels with actual measured feedback; configured minimum, maximum, expiry, local-enable rejection, role and environment restrictions |
| Scope and revisions | Restricted city reader, independent Mosul package, stale review rejection and immutable serial/evidence history |
| Browser and recovery | Native login, city navigation, engineering download, ERP records, FUXA live values, UI controller command, ERP outage and gateway restart |

This is a complete representative software lifecycle, with full city planning and selected live station, vehicle, wayside and factory equipment. It does not exercise every possible setting combination or every city equipment instance through the live HTTP/ERP/FUXA path. The whole-city contract sweep is sequential and does not establish full-network real-time throughput or FUXA load capacity. Artifact parsing/hashes do not execute desktop FreeCAD, Bonsai or QGIS editors. Simulator fixtures,

ERP sample inspections and simulation releases are explicitly separate from physical controller, manufacturing, site and railway acceptance. Restarting the simulator resets its volatile controller outputs to fixture defaults; ERP records, equipment history and the retained City Studio workspace persist.

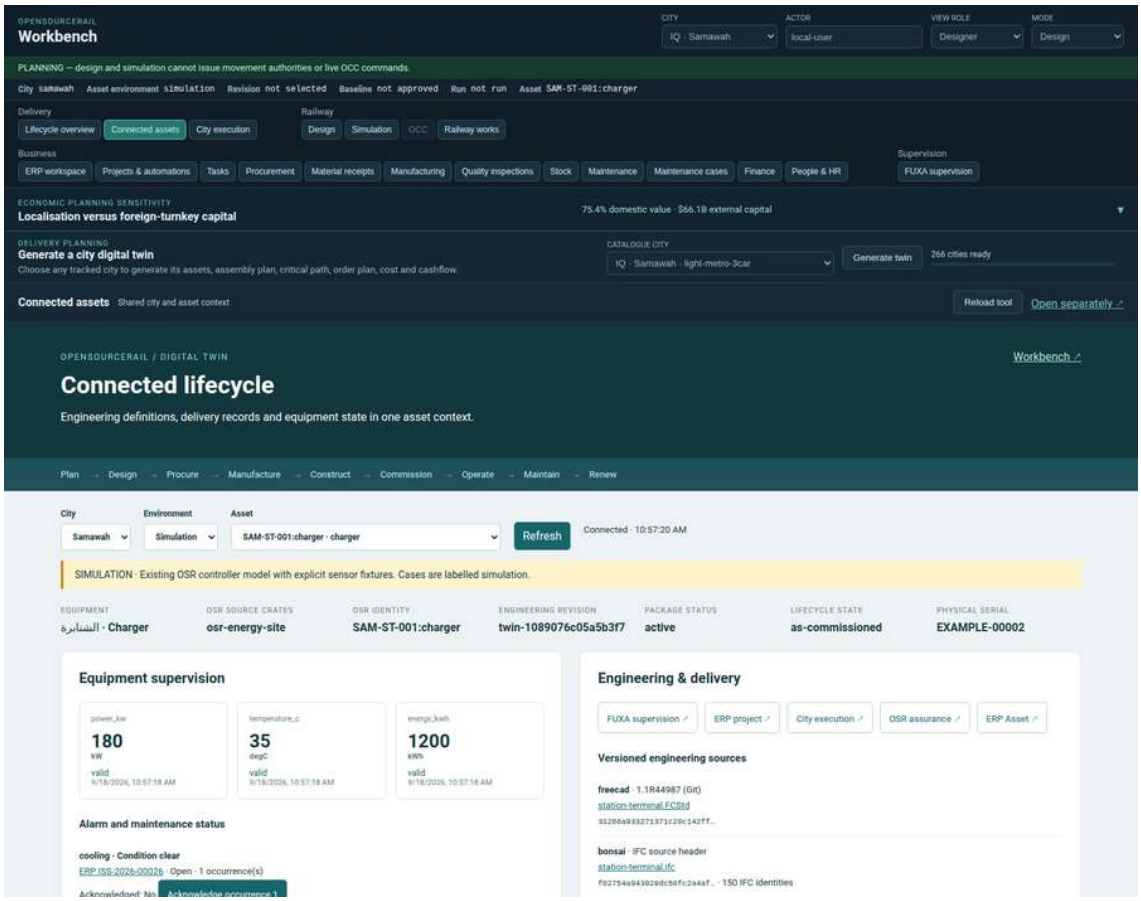
The scenario sources are `scenario.py`, `matrix.py`, `erp-scenario.py`, `network.py`, `restart.py`, `verify-ui.mjs` and `engineering.json`. The expansion and coverage sources are `expansion.py`, `erp-expansion.py`, `contracts.py`, `coverage.py` and `coverage-plan.json`. They reuse the production adapters; fixture setup and assertions are kept in this directory.

## Recorded run and screenshots

The local run on 18 September 2026 passed all 98 lifecycle, configuration and recovery checks, including ten real-service browser assertions and a full stop/start. The regression suite also passed 186 Python tests, 27 frontend browser tests and ten frontend unit tests. It imported 3,254 Samawah tasks and 8,310 Mosul tasks. The whole-city contract sweep checked 573 equipment positions, 1,610 measurements and 6,440 native/boundary sample attempts. The live deployment used 19 Samawah and 10 Mosul equipment positions. Its browser checks used real services without intercepted responses, including FUXA-to-Workbench navigation. The configuration and lifecycle observations are saved with before/after values in `build/city-example/report.html` and `report.json`.

The native capital Asset is a seeded evaluation fixture; this scenario does not demonstrate accounting capitalization of the manufactured serial, tax filing or payroll execution. Supplier payment is now covered by the additional rolled-back native payment sequence above. Fault-recovery cases remain open for inspection: clearing telemetry does not automatically close ERP maintenance work.

Installed replacement serial and engineering context



Samawah replacement serial, live telemetry and engineering evidence in Workbench

Samawah railway work and context in Workbench

# Integration coverage register

Repository source: `deployment/example-city/coverage-register.md`

Audited scope: OSR registered ERP adapters and their input schemas, whitelisted OSR ERP entry points, declared gateway/Workbench/OSR HTTP route prefixes, shared city/supervision settings, simulator controls and named lifecycle workflows. This is not an inventory of every upstream ERPNext/FUXA API, every city override, desktop-tool parameter or internal Rust function.

This is a coverage register, not a claim of exhaustive testing. Each source-discovered entry is tracked even when it has no passing scenario. New entries fail the inventory review check until classified. Evidence requires a completed passing report; individual successes from a failed run are not credited.

Status: `scenario` means the function was exercised; `varied` means named values were changed and checked; `partial` means only part of the behavior is demonstrated; `gap` means no qualifying evidence. None means all combinations are covered.

Native ERP expansion checks run real hooks and ledger posting inside a rolled-back transaction. The live telemetry matrix pauses the example simulator and includes explicitly labelled controller-result fixtures.

Counts: gap: 296, partial: 135, scenario: 36, varied: 64. Inventory consistent: true.

## Remaining workflow gaps

| Workflow | Status | Next acceptance requirement |
|---|---|---|
| Enabled rule to actual task assignment and reassignment | varied | Actual enabled Round Robin and Load Balancing assignment to two users. Holidays, disabled users and concurrent dispatch remain. |
| Restore ERP database, files, gateway and FUXA into a fresh deployment | gap | A separate source-bound cold recovery rehearsal verifies fresh volumes and cross-service data (docs/operating/platform-recovery.md); this register does not yet map that report. Operational cutover, jobs/controllers and recovery objectives remain. |
| Submitted budget to blocked/warned overspend transaction | varied | Submitted actual expenses at/below/above Stop/Warn budgets. Purchase commitments, fiscal-period boundaries and simultaneous posting remain. |
| Manufactured serial to capital Asset and depreciation | gap | Connect received/manufactured serialized equipment to capitalization, depreciation and retirement entries. |
| Seven revision-disposition decisions and independent native outcome checks | scenario | Unmocked browser with three independent accounts covers proposal, endorsement, native stop, verification and stale detection; all target/action/concurrency permutations remain. |
| Edit FreeCAD/Bonsai/QGIS and propagate regenerated outputs to ERP and controllers | gap | Run real FreeCAD/Bonsai/QGIS edits, regenerate artifacts, then propagate changed quantities and mappings downstream. |
| Physical controller bindings, calibration, permissives and independently accepted site tests | gap | Commission real device bindings and calibration, perform HIL/site tests and independently accept results. |
| Simultaneous whole-city telemetry, operators and FUXA displays | gap | Run simultaneous full-city equipment and multiple browser/operator clients; measure latency, loss and resource ceilings. |
| Independent planning, ERP records, gateway packages and UI city context | scenario | Two-city scenario; more city families, mixed timezones and concurrent multi-city load remain. |
| Partial supplier payment, settlement, cancellation and ledger balance | varied | Real partial/full/cancelled payments and ledger balancing in a rollback transaction; multiple currencies, bank reconciliation and bank transport remain. |
| Employee attendance, payroll calculation, posting and payment | gap | Create approved employee/payroll fixtures, attendance/leave variations, salary calculation, posting and payment. |
| City Studio revision to simulator, OCC replay and linked OSR work | scenario | City Studio to simulator/OCC/OSR work in simulation; operating permutations and physical acceptance remain. |
| Stock threshold to scheduled native purchase request | varied | Native scheduler at/below/above threshold, quantities, city identity and stale/ambiguous rules. Multiple suppliers, lead times and live concurrent scheduler cycles remain. |
| Working calendar, response deadline and SLA escalation | gap | Vary working calendars, priorities and elapsed time; observe deadlines and escalation. |
| Tax configuration, calculation, statutory filing and correction | gap | Add jurisdiction-specific approved fixtures, tax calculation, returns and corrections; no statutory filing is performed by these tests. |
| Training events, attendance, assessment and competence decision | partial | Submitted training, attendance and Pass/Fail results; invalid periods rejected. Independent competence decisions and authorization remain. |

# Function and setting inventory

| Entry | Status | Evidence | Remaining coverage |
|---|---|---|---|
| components.profile.defaults.assignment.strategy | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| components.profile.defaults.budget.action | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| components.profile.defaults.quality.reference_type | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| components.profile.defaults.training.description | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| components.profile.defaults.training.title | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| components.profile.instances[].component | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| components.profile.instances[].inputs | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| components.profile.instances[].key | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| components.profile.schema | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| controller.aux_fault | varied | base: Native fault controls change vehicle-aux.fault_count | Native fixture on/off observations; simultaneous fault combinations and physical hardware remain. |
| controller.battery_trip | varied | base: Native fault controls change vehicle-bms.trip | Native fixture on/off observations; simultaneous fault combinations and physical hardware remain. |
| controller.cbm_service | varied | base: Native fault controls change vehicle-cbm.health | Native fixture on/off observations; simultaneous fault combinations and physical hardware remain. |
| controller.cooling_fault | varied | base: Controller fault creates ERP Issue for the manufactured/installed charger | Native fixture on/off observations; simultaneous fault combinations and physical hardware remain. |
| controller.crossing_motor_fault | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| controller.disconnected | varied | base: Source loss becomes disconnected without reusing valid values | Native fixture on/off observations; simultaneous fault combinations and physical hardware remain. |
| controller.factory_cell_unavailable | varied | base: Factory method LM3-MFG-010 routes cycle, availability and quality independently; base: Factory method LM3-MFG-020 routes cycle, availability and quality independently; base: Factory method LM3-MFG-030 routes cycle, availability and quality independently; +6 observations (JSON) | All nine Samawah factory methods with selected progress/hold combinations; physical process data and full Cartesian combinations remain. |
| controller.factory_cycle_progress_pct | varied | base: Factory method LM3-MFG-010 routes cycle, availability and quality independently; base: Factory method LM3-MFG-020 routes cycle, availability and quality independently; base: Factory method LM3-MFG-030 routes cycle, availability and quality independently; +6 observations (JSON) | All nine Samawah factory methods with selected progress/hold combinations; physical process data and full Cartesian combinations remain. |
| controller.factory_method | varied | base: Factory method LM3-MFG-010 routes cycle, availability and quality independently; base: Factory method LM3-MFG-020 routes cycle, availability and quality independently; base: Factory method LM3-MFG-030 routes cycle, availability and quality independently; +6 observations (JSON) | All nine Samawah factory methods with selected progress/hold combinations; physical process data and full Cartesian combinations remain. |
| controller.factory_process_excursion | varied | base: Factory method LM3-MFG-010 routes cycle, availability and quality independently; base: Factory method LM3-MFG-020 routes cycle, availability and quality independently; base: Factory method LM3-MFG-030 routes cycle, availability and quality independently; +6 observations (JSON) | All nine Samawah factory methods with selected progress/hold combinations; physical process data and full Cartesian combinations remain. |
| controller.faregate_denial | varied | base: Native fault controls change faregate.last_decision | Native fixture on/off observations; simultaneous fault combinations and physical hardware remain. |
| controller.local_remote_disabled | varied | base: Controller local-enable setting rejects an otherwise valid command | Native fixture on/off observations; simultaneous fault combinations and physical hardware remain. |

| Entry | Status | Evidence | Remaining coverage |
|---|---|---|---|
| `controller.points_detection_fault` | varied | base: Native fault controls change points.detection_unknown | Native fixture on/off observations; simultaneous fault combinations and physical hardware remain. |
| `controller.station_fault` | varied | base: Native fault controls change facilities.fault_count | Native fixture on/off observations; simultaneous fault combinations and physical hardware remain. |
| `engineering.artifact` | partial | base: CAD, IFC and GIS artifacts reopen with exact content hashes; base: Exact engineering revision maps to native Item and production BOM; base: IFC selection resolves the same physical position and ERP Asset | Actual tracked artifacts and linked execution/IFC identities are checked. Desktop regeneration and all file/geometry transformations remain. |
| `engineering.execution_proposal` | partial | base: CAD, IFC and GIS artifacts reopen with exact content hashes; base: Exact engineering revision maps to native Item and production BOM; base: IFC selection resolves the same physical position and ERP Asset | Actual tracked artifacts and linked execution/IFC identities are checked. Desktop regeneration and all file/geometry transformations remain. |
| `engineering.ifc_overlay` | partial | base: CAD, IFC and GIS artifacts reopen with exact content hashes; base: Exact engineering revision maps to native Item and production BOM; base: IFC selection resolves the same physical position and ERP Asset | Actual tracked artifacts and linked execution/IFC identities are checked. Desktop regeneration and all file/geometry transformations remain. |
| `engineering.package` | partial | base: CAD, IFC and GIS artifacts reopen with exact content hashes; base: Exact engineering revision maps to native Item and production BOM; base: IFC selection resolves the same physical position and ERP Asset | Actual tracked artifacts and linked execution/IFC identities are checked. Desktop regeneration and all file/geometry transformations remain. |
| `erp.api.api.import_plan` | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| `erp.api.city_runtime.city_status` | partial | base: Isolated native procurement adapters and negative cases pass with rollback | Native procurement regression checks readiness and Material Request feedback; all status combinations remain. |
| `erp.api.components.apply` | scenario | base: Isolated native components adapters and negative cases pass with rollback | All eight adapters through native preview/apply and repeat-safe checks; every HTTP permission/prerequisite combination remains. |
| `erp.api.components.catalogue` | scenario | expansion: erp.catalogue | Actual city component/warehouse catalogue; other roles and city profiles remain. |
| `erp.api.components.inspection_lines` | varied | expansion: erp.inspection-lines.Purchase Receipt; expansion: erp.inspection-lines.Purchase Invoice | Both receipt and invoice row selection; cross-city and permission variants remain. |
| `erp.api.components.preview` | scenario | base: Isolated native components adapters and negative cases pass with rollback | All eight adapters through native preview/apply and repeat-safe checks; every HTTP permission/prerequisite combination remains. |
| `erp.api.disposition.catalogue` | partial | base: Isolated native lifecycle adapters and negative cases pass with rollback | Native regression suite exercises this adapter family; endpoint-specific HTTP permissions and all argument variants are not individually established. |
| `erp.api.disposition.preview` | partial | base: Isolated native lifecycle adapters and negative cases pass with rollback | Native regression suite exercises this adapter family; endpoint-specific HTTP permissions and all argument variants are not individually established. |
| `erp.api.disposition.preview_decision` | partial | base: Isolated native lifecycle adapters and negative cases pass with rollback | Native regression suite exercises this adapter family; endpoint-specific HTTP permissions and all argument variants are not individually established. |
| `erp.api.disposition.record` | partial | base: Isolated native lifecycle adapters and negative cases pass with rollback | Native regression suite exercises this adapter family; endpoint-specific HTTP permissions and all argument variants are not individually established. |
| `erp.api.disposition.record_decision` | partial | base: Isolated native lifecycle adapters and negative cases pass with rollback | Native regression suite exercises this adapter family; endpoint-specific HTTP permissions and all argument variants are not individually established. |
| `erp.api.disposition_execution.preview` | partial | base: Isolated native lifecycle adapters and negative cases pass with rollback | Native regression suite exercises this adapter family; endpoint-specific HTTP permissions and all argument variants are not individually established. |
| `erp.api.disposition_execution.record` | partial | base: Isolated native lifecycle adapters and negative cases pass with rollback | Native regression suite exercises this adapter family; endpoint-specific HTTP permissions and all argument variants are not individually established. |
| `erp.api.executive.ingest_draft` | gap | — | Pure contract tests cover checksum, HMAC, allowlist and mutation rejection; a complete example with provisioned external model runners and all four native draft types remains. |

| Entry | Status | Evidence | Remaining coverage |
|---|---|---|---|
| erp.api.field_operations.ingest | gap | — | Isolated operations Python/gateway/browser checks exist; native complete-city ERP delivery and deployed combinations remain unexercised. |
| erp.api.integration.apply_execution | scenario | base: Exact engineering revision maps to native Item and production BOM | Representative connected lifecycle; full input permutations and all permission combinations remain. |
| erp.api.integration.apply_repair | scenario | base: Native repair consumes the purchased spare and keeps railway release separate | Representative connected lifecycle; full input permutations and all permission combinations remain. |
| erp.api.integration.case_status | scenario | base: ERP recovery delivers a new fault once, without reusing the closed case | Representative connected lifecycle; full input permutations and all permission combinations remain. |
| erp.api.integration.condition_event | scenario | base: Controller fault creates ERP Issue for the manufactured/installed charger | Representative connected lifecycle; full input permutations and all permission combinations remain. |
| erp.api.integration.preview_execution | scenario | base: Exact engineering revision maps to native Item and production BOM | Representative connected lifecycle; full input permutations and all permission combinations remain. |
| erp.api.integration.preview_repair | scenario | base: Native repair consumes the purchased spare and keeps railway release separate | Representative connected lifecycle; full input permutations and all permission combinations remain. |
| erp.api.integration.repairs_for_issue | scenario | base: Native repair consumes the purchased spare and keeps railway release separate | Representative connected lifecycle; full input permutations and all permission combinations remain. |
| erp.api.procurement.candidates | partial | base: Isolated native procurement adapters and negative cases pass with rollback | Native regression suite exercises this adapter family; endpoint-specific HTTP permissions and all argument variants are not individually established. |
| erp.api.procurement.create_material_request | partial | base: Isolated native procurement adapters and negative cases pass with rollback | Native regression suite exercises this adapter family; endpoint-specific HTTP permissions and all argument variants are not individually established. |
| erp.component.assignment | partial | expansion: erp.assignment.RoundRobin.manufacturing; expansion: erp.assignment.RoundRobin.maintenance; expansion: erp.assignment.RoundRobin.qa; +7 observations (JSON) | Both strategies across five categories create disabled rules. Enablement, real allocation, reassignment and multi-user fairness remain. |
| erp.component.budget | partial | expansion: erp.budget.Stop; expansion: erp.budget.Warn | Native Stop/Warn expense enforcement also has business-report evidence; commitments and fiscal-period interactions remain. |
| erp.component.maintenance | partial | expansion: erp.maintenance.Daily; expansion: erp.maintenance.Weekly; expansion: erp.maintenance.Monthly; +5 observations (JSON) | All eight intervals produce expected due dates and native logs. Calendar exceptions, overdue servicing and reassignment remain. |
| erp.component.manufacturing | partial | expansion: erp.manufacturing.quantity.1; expansion: erp.manufacturing.quantity.2; expansion: erp.manufacturing.quantity.5 | Draft quantity and BOM requirements vary; base scenario submits and produces once. Other BOMs, scrap, routing and cost combinations remain. |
| erp.component.quality | partial | expansion: erp.quality.PurchaseReceipt.35; expansion: erp.quality.PurchaseReceipt.99; expansion: erp.quality.PurchaseInvoice.35; +1 observations (JSON) | Both receipt/invoice references, sample sizes and accepted/rejected readings are exercised. Inspector permissions and rejection disposition combinations remain. |
| erp.component.replenishment | partial | expansion: erp.replenishment.0; expansion: erp.replenishment.2; expansion: erp.replenishment.10 | Native scheduler behavior also has business-report evidence; supplier, lead-time and concurrency permutations remain. |
| erp.component.service | partial | expansion: erp.service.priority.Low; expansion: erp.service.priority.Medium; expansion: erp.service.priority.High | All three priorities create native Issues. SLA calendars, escalation and customer/service variants remain. |
| erp.component.training | partial | expansion: erp.training.0; expansion: erp.training.1 | Programme title and objectives vary. Events, attendance, results and competence decisions remain. |
| erp.input.assignment.category | varied | expansion: erp.assignment.RoundRobin.manufacturing; expansion: erp.assignment.RoundRobin.maintenance; expansion: erp.assignment.RoundRobin.qa; +7 observations (JSON) | Both strategies across five categories create disabled rules. Enablement, real allocation, reassignment and multi-user fairness remain. |
| erp.input.assignment.strategy | varied | expansion: erp.assignment.RoundRobin.manufacturing; expansion: erp.assignment.RoundRobin.maintenance; expansion: erp.assignment.RoundRobin.qa; +7 observations (JSON) | Both strategies across five categories create disabled rules. Enablement, real allocation, reassignment and multi-user fairness remain. |
| erp.input.assignment.users | partial | contracts: contract.erp.input.assignment.users.missing; contracts: contract.erp.input.assignment.users.boolean; contracts: contract.erp.input.assignment.users.empty; +2 observations (JSON) | Schema boundaries are exercised; a field-specific native change/effect is not established for this entry. |

| erp.input.replenishment.quantity | varied | expansion: erp.replenishment.0; expansion: erp.replenishment.2; expansion: erp.replenishment.10 | Native scheduler behavior also has business-report evidence; supplier, lead-time and concurrency permutations remain. |
| erp.input.replenishment.warehouse | partial | contracts: contract.erp.input.replenishment.warehouse.missing; contracts: contract.erp.input.replenishment.warehouse.boolean; contracts: contract.erp.input.replenishment.warehouse.max-length; +2 observations (JSON) | Native scheduler behavior also has business-report evidence; supplier, lead-time and concurrency permutations remain. |
| erp.input.service.description | partial | contracts: contract.erp.input.service.description.missing; contracts: contract.erp.input.service.description.boolean; contracts: contract.erp.input.service.description.max-length; +2 observations (JSON) | Schema boundaries are exercised; a field-specific native change/effect is not established for this entry. |
| erp.input.service.priority | varied | expansion: erp.service.priority.Low; expansion: erp.service.priority.Medium; expansion: erp.service.priority.High | All three priorities create native Issues. SLA calendars, escalation and customer/service variants remain. |
| erp.input.service.sla | partial | contracts: contract.erp.input.service.sla.missing; contracts: contract.erp.input.service.sla.boolean; contracts: contract.erp.input.service.sla.max-length; +2 observations (JSON) | Schema boundaries are exercised; a field-specific native change/effect is not established for this entry. |

| Entry | Status | Evidence | Remaining coverage |
|---|---|---|---|
| `erp.input.service.subject` | partial | contracts: contract.erp.input.service.subject.missing; contracts: contract.erp.input.service.subject.boolean; contracts: contract.erp.input.service.subject.max-length; +2 observations (JSON) | Schema boundaries are exercised; a field-specific native change/effect is not established for this entry. |
| `erp.input.training.description` | varied | expansion: erp.training.0; expansion: erp.training.1 | Programme title and objectives vary. Events, attendance, results and competence decisions remain. |
| `erp.input.training.title` | varied | expansion: erp.training.0; expansion: erp.training.1 | Programme title and objectives vary. Events, attendance, results and competence decisions remain. |
| `fuxa.deployment_manifest` | scenario | base: Reviewed FUXA import covers both city packages | Reviewed combined city import and browser navigation. All native FUXA settings, deletion/replacement and concurrent editing combinations remain. |
| `fuxa.deployment_review` | scenario | base: Reviewed FUXA import covers both city packages | Reviewed combined city import and browser navigation. All native FUXA settings, deletion/replacement and concurrent editing combinations remain. |
| `fuxa.project` | scenario | base: Reviewed FUXA import covers both city packages | Reviewed combined city import and browser navigation. All native FUXA settings, deletion/replacement and concurrent editing combinations remain. |
| `fuxa.validate_deployment_review` | scenario | base: Reviewed FUXA import covers both city packages | Reviewed combined city import and browser navigation. All native FUXA settings, deletion/replacement and concurrent editing combinations remain. |
| `gateway.GET./affected` | scenario | base: Replacement preserves removed serial history and needs fresh independent release | Removed serial tracing is exercised; batch, missing and all cross-city query combinations remain. |
| `gateway.GET./controller/commands` | scenario | expansion: command.expiry-while-source-offline | Used by the live scenario; exhaustive filter, permission and failure permutations remain. |
| `gateway.GET./evidence` | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| `gateway.GET./executive/decisions` | gap | — | Unit and local HTTP tests cover authenticated model identity, scope, immutability, quorum, diversity, dissent and authority boundaries; the complete example deployment has no configured external model runners. |
| `gateway.GET./health` | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| `gateway.GET./history` | scenario | base: Sampling interval changes actual controller arrival times | Sampling history observed; full query, pagination/limit and access combinations remain. |
| `gateway.GET./operations/` | gap | — | Isolated operations Python/gateway/browser checks exist; native complete-city ERP delivery and deployed combinations remain unexercised. |
| `gateway.GET./outbox` | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| `gateway.GET./snapshot` | scenario | expansion: telemetry.interaction.1; expansion: telemetry.interaction.2; expansion: telemetry.interaction.3; +69 observations (JSON) | Used by the live scenario; exhaustive filter, permission and failure permutations remain. |
| `gateway.POST./alarms/acknowledge` | varied | expansion: alarm.stale-acknowledgement | Named live HTTP scenarios only; request shape limits and all principal/scope/state combinations remain. |
| `gateway.POST./commands` | varied | expansion: command.repeat-idempotency; expansion: command.changed-retry; expansion: command.pending-blocks-rule-change; +12 observations (JSON) | Named live HTTP scenarios only; request shape limits and all principal/scope/state combinations remain. |
| `gateway.POST./controller/result` | partial | expansion: command.transition.accepted; expansion: command.transition.completed | Named live HTTP scenarios only; request shape limits and all principal/scope/state combinations remain. |
| `gateway.POST./evidence` | scenario | base: Replacement preserves removed serial history and needs fresh independent release | Representative installation, test, release, maintenance and replacement; full role/state/revision permutations remain. |
| `gateway.POST./executive/ballots` | gap | — | Unit and local HTTP tests cover authenticated model identity, scope, immutability, quorum, diversity, dissent and authority boundaries; the complete example deployment has no configured external model runners. |
| `gateway.POST./executive/finalize` | gap | — | Unit and local HTTP tests cover authenticated model identity, scope, immutability, quorum, diversity, dissent and authority boundaries; the complete example deployment has no configured external model runners. |

| Entry | Status | Evidence | Remaining coverage |
|---|---|---|---|
| gateway.POST./executive/proposals | gap | — | Unit and local HTTP tests cover authenticated model identity, scope, immutability, quorum, diversity, dissent and authority boundaries; the complete example deployment has no configured external model runners. |
| gateway.POST./operations/ | gap | — | Isolated operations Python/gateway/browser checks exist; native complete-city ERP delivery and deployed combinations remain unexercised. |
| gateway.POST./packages | varied | expansion: configuration.concurrent-review | Named live HTTP scenarios only; request shape limits and all principal/scope/state combinations remain. |
| gateway.POST./packages/preview | varied | expansion: command.pending-blocks-rule-change | Named live HTTP scenarios only; request shape limits and all principal/scope/state combinations remain. |
| gateway.POST./telemetry | varied | expansion: telemetry.boundary.SAM-RS-L1-001:vehicle-aux.comfort_power.below; expansion: telemetry.boundary.SAM-RS-L1-001:vehicle-aux.comfort_power.min; expansion: telemetry.boundary.SAM-RS-L1-001:vehicle-aux.comfort_power.max; +305 observations (JSON) | Named live HTTP scenarios only; request shape limits and all principal/scope/state combinations remain. |
| gateway.POST./telemetry/batch | gap | — | Atomic rollback, bounds, replay and per-member authorization have regression coverage; complete-city native batch failure and recovery scenarios remain. |
| ops.GET./api/operating | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| ops.GET./api/ops-auth/session | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| ops.OPTIONS./api/ | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| ops.POST./api/ops-auth/login | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| ops.POST./api/ops-auth/logout | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| planning.calendar.holidays | varied | base: Calendar start, weekday mask and holiday change actual ERP dates | One combined calendar change reaches actual ERP dates; timezone/DST and other calendars remain. |
| planning.calendar.start_date | varied | base: Calendar start, weekday mask and holiday change actual ERP dates | One combined calendar change reaches actual ERP dates; timezone/DST and other calendars remain. |
| planning.calendar.timezone | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| planning.calendar.working_weekdays | varied | base: Calendar start, weekday mask and holiday change actual ERP dates | One combined calendar change reaches actual ERP dates; timezone/DST and other calendars remain. |
| planning.city_programme | varied | base: City-specific programme, department and additional warehouse reach ERP | One city-specific programme/master change; retirement, renaming and all existing-record conflicts remain. |
| planning.departments.infrastructure_maintenance | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| planning.departments.maintenance | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| planning.departments.manufacturing | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| planning.departments.procurement | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| planning.departments.programme | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| planning.departments.qa | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| planning.organisation.company | gap | — | No mapped executed scenario for this inventory entry; add explicit boundary, permission and interaction checks. |
| planning.organisation.departments | varied | base: City-specific programme, department and additional warehouse reach ERP | One city-specific programme/master change; retirement, renaming and all existing-record conflicts remain. |
| planning.organisation.warehouses | varied | base: City-specific programme, department and additional warehouse reach ERP | One city-specific programme/master change; retirement, renaming and all existing-record conflicts remain. |

| Entry | Status | Evidence | Remaining coverage |

| workflow.backup-restore | gap | — | A separate source-bound cold recovery rehearsal verifies fresh volumes and cross-service data (docs/operating/platform-recovery.md); this register does not yet map that report. Operational cutover, jobs/controllers and recovery objectives remain. |
| workflow.budget-enforcement | varied | business: business.budget.Stop.50; business: business.budget.Stop.100; business: business.budget.Stop.101; +3 observations (JSON) | Submitted actual expenses at/below/above Stop/Warn budgets. Purchase commitments, fiscal-period boundaries and simultaneous posting remain. |
| workflow.capitalization | gap | — | Connect received/manufactured serialized equipment to capitalization, depreciation and retirement entries. |
| workflow.disposition | scenario | disposition: disposition.distinct-authenticated-users; disposition: disposition.browser-proposal-recorded; disposition: disposition.self-endorsement-rejected; +6 observations (JSON) | Unmocked browser with three independent accounts covers proposal, endorsement, native stop, verification and stale detection; all target/action/concurrency permutations remain. |
| workflow.engineering-desktop | gap | — | Run real FreeCAD/Bonsai/QGIS edits, regenerate artifacts, then propagate changed quantities and mappings downstream. |
| workflow.hardware | gap | — | Commission real device bindings and calibration, perform HIL/site tests and independently accept results. |
| workflow.load | gap | — | Run simultaneous full-city equipment and multiple browser/operator clients; measure latency, loss and resource ceilings. |
| workflow.multi-city-isolation | scenario | base: Control city native ERP tasks and transactions remain unchanged; expansion: scope.control-package-unchanged | Two-city scenario; more city families, mixed timezones and concurrent multi-city load remain. |
| workflow.payments | varied | expansion: erp.payment.remaining.40; expansion: erp.payment.remaining.0; expansion: erp.payment.cancel.40; +1 observations (JSON) | Real partial/full/cancelled payments and ledger balancing in a rollback transaction; multiple currencies, bank reconciliation and bank transport remain. |
| workflow.payroll | gap | — | Create approved employee/payroll fixtures, attendance/leave variations, salary calculation, posting and payment. |
| workflow.railway-handoff | scenario | base: Workbench, ERP, FUXA, engineering evidence and lifecycle agree in the browser | City Studio to simulator/OCC/OSR work in simulation; operating permutations and physical acceptance remain. |
| workflow.replenishment-scheduler | varied | business: business.replenishment.threshold.3; business: business.replenishment.threshold.2; business: business.replenishment.quantity.2; +5 observations (JSON) | Native scheduler at/below/above threshold, quantities, city identity and stale/ambiguous rules. Multiple suppliers, lead times and live concurrent scheduler cycles remain. |
| workflow.service-sla | gap | — | Vary working calendars, priorities and elapsed time; observe deadlines and escalation. |
| workflow.tax | gap | — | Add jurisdiction-specific approved fixtures, tax calculation, returns and corrections; no statutory filing is performed by these tests. |
| workflow.training-competence | partial | business: business.training.Fail; business: business.training.Pass; business: business.training.invalid-period | Submitted training, attendance and Pass/Fail results; invalid periods rejected. Independent competence decisions and authorization remain. |

# Equipment supervision and lifecycle integration

Repository source: `deployment/supervision/README.md`

ERPNext owns business execution; FUXA displays equipment; OSR owns engineering, controller behaviour and railway assurance. The integration joins their identities without treating a delivery, alarm clearance or ERP case closure as railway release.

## Run the local pilot

Start the existing ERP stack first (`./osr erp up`). Then:

```
./osr supervision init
./osr supervision up
./osr supervision setup-fuxa
./osr supervision connect-erp samawah mosul
./osr supervision prepare samawah --first-site --first-vehicle --first-plant
./osr supervision prepare mosul --first-site --first-vehicle --first-plant
./osr supervision apply build/supervision/samawah/simulation/package.json
./osr supervision apply build/supervision/mosul/simulation/package.json
./osr supervision preview-fuxa \
  build/supervision/samawah/simulation/package.json \
  build/supervision/mosul/simulation/package.json \
  --output build/supervision/fuxa-import-review.json
./osr supervision import-fuxa \
  build/supervision/samawah/simulation/package.json \
  build/supervision/mosul/simulation/package.json \
  --review build/supervision/fuxa-import-review.json
./osr supervision simulate
```

For a separate Workbench, pass `--workbench-url http://127.0.0.1:8190` to `prepare`, `preview-fuxa` and `import-fuxa`. Use the same origin for preview and import: generated asset links and the origin are bound into the reviewed project hash. The default remains `http://127.0.0.1:8090`.

- Workbench lifecycle: http://127.0.0.1:8090/docs/lifecycle/
- FUXA: http://127.0.0.1:1881/home
- ERPNext: http://127.0.0.1:8080/app/opensourcerail
- Integration health: http://127.0.0.1:8092/health

`./osr supervision init` also installs the private policy-engine/secretariat identities and attestation key for the experimental AI executive council. It creates no pretend model accounts: each real model runner must be separately configured with a scoped `executive-model` principal and fixed provider, family and perspective. The council can emit only inspectable, unsubmitted ERP draft packets; it has no path to the controller command API. `connect-erp` privately provisions the council verification key into ERPNext. The gateway retries authorized draft packets until ERPNext has independently verified and idempotently mapped them to a native unsubmitted document. The service account still needs the least-privilege native create/read permissions for each enabled document type and its referenced masters. Missing permission or native validation rejects the packet visibly; provisioning does not silently add finance, stock, manufacturing or maintenance manager roles.

Use one separately secured `executive-model-runner.py` process per model identity. Its JSON configuration names credential environment variables; it contains no token. The runner accepts only the versioned OSR adapter response contract and records exact prompt/response hashes with its ballot. Submit and seal proposals with `./osr supervision council-propose` and `./osr supervision council-finalize`; finalization cannot manufacture missing quorum or erase dissent.

`var/supervision/fuxa.json` contains editor (`admin`) and operator (`operator`) passwords. Private integration tokens are in `var/supervision/integration.json`. No credentials are included in generated FUXA project exports. The operator cannot change the project. Workbench reads use a scoped viewer token kept on the server. All published ports bind to loopback. This is a local deployment; remote operation requires the organisation's TLS, identity, network and access configuration.

FUXA 1.3.4 and the Python runtime are pinned by image digest. The adapter generates FUXA's project export format and imports it through `/api/project`, also used by its UI. It does not modify FUXA's database. Global tag IDs are unique across cities. FUXA's native connection-status tags hide values when the gateway is stale/offline. Import is review-bound: the preview records every included city/environment package, revision, checksum, site, device and view, then lists live devices/views that will be added, replaced, retained or removed and identifies changes to remaining project settings such as charts/navigation. Because the current generator has no separate custom-display input, `reviewed_display_customisations` is explicitly empty. Move an intentional live edit into a reviewed generator input before import; otherwise the preview correctly identifies it as a replacement or removal.

## ERP integration principal

`./osr supervision connect-erp <city> [<city> ...]` reads each city's configured ERP project, validates the city/project pairing, creates a dedicated Support Team/Projects User and copies its credentials privately into the gateway config. It extends the gateway's simulation city scopes and restarts it. `osr_integration_users` in ERP site config restricts the service principal to those projects and simulation. The service URL is `http://frontend:8080` on the existing ERP network. Neither account is an ERP administrator.

## Reproduce for another city

1. Use its tracked operations asset register and compact project-twin revision. Regenerate the city with `./osr city <slug>` only when those sources are stale.
2. Edit `cities/catalogue/.../<city>/operations/supervision.json`. Omitted fields inherit shared templates; dictionaries merge and lists replace. Set company/project and, optionally, site IDs and equipment bindings.
3. `./osr supervision prepare <slug>` generates every applicable station, depot, vehicle, points, declared-crossing and production-method view; `--first-site` includes that station's real child switch/plant assets, while `--first-plant` can select only the first production asset for a bounded factory pilot. The command no longer needs the large compressed operations payload. `./osr supervision validate` compiles every real asset register, and the generated catalogue audit records counts and hashes.
4. Review package, devices, source bindings, units, ranges, alarm limits, response references and generated screens. Generic limits are simulation examples.
5. Extend the private principal city scopes before applying. For an existing baseline, run `review-package PACKAGE --output REVIEW`, inspect its exact field/category/dependency and affected-record sets, then run `apply PACKAGE --expected PREVIOUS_SHA256 --review REVIEW`. The gateway regenerates the review inside the apply transaction and rejects changed packages, evidence, installations, open cases or pending commands. An identical apply does nothing. An omitted simulation position is retained as retired history; an installed position cannot be retired automatically and a command contract cannot change while a request is pending. Physical mapping changes require a separately commissioned migration.
6. Preview the combined set of desired city packages with `preview-fuxa`, review its manifest and add/change/remove sets, then supply that exact file to `import-fuxa --review`. Any intervening live-project or package change is rejected. Import replaces the complete project and privately saves both the previous export and applied review first.

`--environment physical` produces a commissioning-required package. The service rejects telemetry and commands for those uncommissioned bindings. Vendor register maps, verified limits, real device adapters and OSR operational release must be supplied before physical activation. No railway or protection command is exposed.

## Polling scope

Shared configuration defaults to `"fuxa_polling_scope": "asset"`. A city's `operations/supervision.json` can set `"fuxa_polling_scope": "site"`, or use `./osr supervision prepare mosul --polling-scope site` for a reviewed export. The site setting groups active equipment into one private WebAPI request per city/environment/site. Measurement and alarm tag IDs, quality, timestamps and individual equipment links are retained; one connection-status tag describes each shared transport. It does not change sampling, historian or alarm rules.

Switching scope replaces transport device IDs and changes affected display bindings. Apply the package review and then preview/import the combined FUXA project using the steps above; keep all other cities in that combined import. Existing packages without the field retain asset polling. The example-city scenario exercises both settings. See the measured capacity results.

## Data and failure behaviour

- Stable key: city + environment + planned asset ID. Design revision, ERP project baseline, physical serial, IFC GlobalId and supplier device mapping are separate references. Registry history survives revision changes.
- Telemetry: asset/measurement/source IDs, sequence, source UTC timestamp, reception time, engineering unit, normalized value and quality. Replay conflicts, unknown sources/units, non-finite values and future timestamps are rejected. Stale data cannot activate or clear an alarm.
- SQLite is the pilot's single telemetry historian, sampled every two seconds, retained for seven days; latest values remain marked stale/disconnected. FUXA DAQ is disabled. ERP receives actionable events, never the measurement stream.

- Alarm delay, hysteresis and repeat suppression are persisted. One incident maps to one native Issue. Clearing the signal preserves the case. A later new fault after case closure starts a new incident. Acknowledgement is immutable for one occurrence; a fresh activation resets it, and a stale browser cannot accidentally acknowledge the newer occurrence. Acknowledgement is separate.
- A linked commissioned ERP Asset allows a permission-checked maintainer to preview parts, city-store availability, technician and expected downtime, then create one draft native Asset Repair. ERP completion/stock consumption feeds back to the project, but does not close the Issue or alter railway handback state.
- Outbox events persist across restarts, retry with bounded backoff and preserve per-incident order. ERP's unique incident key and event hashes protect against duplicate requests and lost replies. Reconciliation reads native case status.
- Commands carry request ID, operator identity, parameters, created/expiry times and required conditions. Requested/accepted/rejected/completed/failed states are recorded separately. The pilot supports simulated facility lighting only. The controller checks local enable and bounds; expired requests are never replayed.
- Engineering and commissioning rehearsals are append-only evidence records. The native-stack rehearsal replaces the pilot charger serial, proves the removed serial remains queryable through `/affected`, and requires a new independent test and release. Physical release cannot be granted through this API.

The independent existing OSR assurance records are displayed by Workbench using its existing authenticated city access. No integration event changes them.

## Prepared change impact

The read-only package review compares a prepared package with the accepted live city/environment baseline. It lists exact changed paths and classifies design, asset-topology, embedded-runtime, telemetry, alarm/maintenance, command, business-execution and operator-display consequences. Existing parent/source asset IDs, component type, IFC GlobalId, source crates, ERP project/Item/Asset, installed serials, append-only evidence, open alarm/ERP cases and pending commands are reused as dependencies rather than copied into a new registry. Workbench's Prepared change impact view adds matching native ERP purchase, receipt and production feedback when available.

Preview does not mutate the baseline. Apply requires both the expected prior package hash and the freshly generated review hash, and the audit records both. Another city/environment is outside the transaction. A component-type substitution, retirement of a currently installed serial, physical remapping or pending-command contract change remains blocked for an explicit replacement or commissioned migration workflow. This is configuration impact control; complete CAD/BOM dependency graphs, open-order disposition and released-analysis reruns remain engineering/ERP work.

## Backup and recovery

```
./osr supervision backup
./osr erp backup
```

The first command uses SQLite's consistent backup API, exports the FUXA project and copies private deployment credentials/settings into a private timestamped folder. Restore the SQLite backup into the `integration-data` volume with integration stopped, restore the private settings, then start and import the saved FUXA project. Recreate its users with `setup-fuxa`; they are declared in private configuration. The default pilot uses built-in graphics; separately back up the `fuxa-images` volume if operators add images. FUXA logs are diagnostic, not the command audit; the authoritative command/event audit is in the integration backup.

Database restore equivalence and pending-event survival are covered by tests. FUXA export/import and editor/operator permissions are also exercised against the running pinned version. ERP retains its separate native backup/recovery process.

## Sources

- FUXA 1.3.4 source
- FUXA project import/export
- Frappe REST API

## Validation commands

```
tools/automation/osr-python -m pytest -q tools/automation/tests/test_supervision.py
cargo test -p osr-energy-site --all-targets
npx playwright test tests/frontend/lifecycle.spec.mjs
node deployment/supervision/tests/verify-fuxa.mjs
python3 deployment/supervision/tests/verify-pilot.py
```

The `integrated-stack` GitHub workflow creates a clean disposable ERPNext site, imports both pilot baselines, starts the gateway and pinned FUXA release, runs the native Rust controller bridge and Workbench, then executes the ERP component, procurement, lifecycle, FUXA, embedded-condition, browser and outage/recovery checks together. It destroys its evaluation volumes after collecting failure logs.

`node deployment/supervision/tests/verify-outage.mjs` deliberately disconnects the simulated source, then temporarily stops/restarts the local integration container. It verifies FUXA's disconnected state and hides cached values on gateway loss. Use it only against this evaluation deployment. The script restores the simulator and gateway in its cleanup block.

## Station, vehicle, wayside and factory integration

The simulation source now executes nine existing Rust crates for station energy, station SCADA, vehicle BMS, auxiliary power, HVAC, condition monitoring, points, level crossings and fare gates. Use `prepare CITY --first-site --first-vehicle --first-plant` for the 19-position Samawah or 10-position Mosul pilot: five station views, four vehicle views, the station's existing switch and, for the LM3 family only, nine factory-method views on the real production-plant identity. Across the catalogue, 9,097 real switch IDs are reused. Crossing support remains dormant because no tracked city yet has a `level-crossing` asset; the package builder refuses to invent one. Fare gates are labelled station aggregates rather than claims about physical gate counts. See the native embedded integration contract for mappings, reproducibility, state lifetime and the controller-to-ERP test. `simulate` rebuilds the adapter and restarts its user service so source updates actually take effect. Rebuild/reapply reviewed packages and reimport FUXA views when changing generic measurement templates; take a backup first.

The factory views are generated from the validated `manufacturing-methods.json` rather than a second manually maintained recipe list. They cover the source's 120-product union, nine methods and 30 tooling families, and retain work centre, crew, cycle, step/hold-point, source and release-boundary metadata. The simulator defaults to an idle cell. `factory_method`, `factory_cycle_progress_pct`, `factory_cell_unavailable` and `factory_process_excursion` in the private `simulator-control.json` are explicit test fixtures; no cure temperature or performed quality result is invented. Unavailability or quality-hold persistence can create an ERP Issue. The Workbench lists native Work Orders only when an immutable reviewed execution mapping joins the method/product identity to its ERP Item/BOM. A hold does not modify a Work Order, create a Quality Inspection, accept/reject output or grant manufacturing/railway release.

The Workbench default is `preferred_supervision_site` in the city profile, validated against the prepared package; otherwise a vehicle site is preferred. An explicitly selected equipment position takes precedence. An unavailable configured preference never silently opens another site. Factory applicability is read from the city project-twin family; a profile cannot override that baseline. Cross-family method reuse is blocked pending a reviewed mapping.

# City Generation

Repository source: `design/city-generation/README.md`

This Python package owns the deterministic geospatial side of city generation: OSM acquisition and caching, demand/cost/buildability/water rasters, source-locked open-DEM elevation and terrain slope, batch catalogue generation, station and line planning, and simulator-scenario emission. Rust routing and design crates consume its outputs.

| Package | Responsibility |
|---|---|
| `osr_osm` | OSM/Geofabrik acquisition with a local cache |
| `osr_geo` | Demand, cost, buildability, water and open-terrain raster preparation |
| `osr_batch` | Catalogue batch import and regeneration |
| `osr_planner` | Lines, stations, anchors and deterministic network synthesis |
| `osr_scenario` | City design to simulation/finance/README outputs |

After using the root setup instructions, test this package with:

```
pytest design/city-generation/tests -q
```

Editable inputs live in `../../cities/workspaces/`; published results live in `../../cities/catalogue/`.

The current package pipeline preserves adopted layouts during ordinary refreshes. New cities and explicit `--resynthesise-design` runs also execute `tools/automation/correct-city-network.py` after the core planner. It retains source corridor shapes instead of forcing radial core chords, preserves selected residential stop cells, and joins disconnected route components with bounded land/water/terrain-constrained extensions or continuous diversions. Small raster knots have a 200 m total removal bound per line; any wider city-specific scope requires a named line and recorded basis in `network-layout-policy.toml`.

Correction inputs, routing costs, population pixels and OSM demand anchors are retained with hashes. The raster CLI reuses a matching, checked city population crop before downloading another whole-country raster. Its nearest-pixel values are a relative routing index; resident coverage uses the original native pixels. The independent `audit-city-geography.py` checks the actual regenerated geometry and grouped platforms, including networks without rings, disconnected components and self-intersections. A geometric crossing remains a proposed interchange; walking access, levels, property and engineering acceptance need separate evidence.

After changing a controlled route, regenerate its stations/maps and downstream service, civil, energy and cost evidence. The pipeline reimports building and terrain evidence when its retained corridor hash differs. The named-city batch can be run with:

```
.venv/bin/python tools/automation/generate-city-packages-fast.py \
  --only kisangani,lubumbashi,garissa --resynthesise-design --jobs 2
```

# Machine-Readable Inputs

Repository source: `lib/README.md`

The `lib/` tree holds the data that drives generated city designs, simulator examples, and reusable planning assumptions. These files are intended to be edited, reviewed, and versioned alongside the code.

## Contents

| Folder | Purpose |
|---|---|
| `templates/` | Shared TOML assumptions for rolling stock, stations, track geometry, signalling, demand, costs, finance, climate, and regulatory context |
| `city-batches/` | Batch lists for generated city catalogues, including the world sample and calibration set |
| `recipes/` | End-to-end recipe inputs that combine templates into deployment designs |
| `examples/` | Small hand-authored simulator/design examples |
| `fault-injection-scenarios/` | Scenario files for degraded-mode and safety-path demonstrations |

The generated outputs from these inputs live under `cities/catalogue/`, and the design synthesis crate is `crates/osr-design`.

The shared `templates/field-evidence.toml` drives the pre-mobilisation survey/site brief for any city. Generated briefs remain unaccepted until the named project authorities approve the requirements and field deliveries. `templates/survey-control-processing.toml` defines the corresponding GNSS receipt roles and provisional RTKLIB screen; neither automated processing nor a quality code is survey acceptance. `templates/ground-model-processing.toml` then defines the QGIS/ODM/CloudCompare derivative, checkpoint, master- GeoPackage and authority gates without duplicating raw field data in Git. `templates/surveyed-alignment-processing.toml` adds the subsequent per-line OSR-ALN, LandXML round-trip, platform/yard/turnout interface and multi-discipline acceptance contract. `templates/route-station-fit-processing.toml` then defines the utility, land, flood, access, integration, road, construction- logistics, possession, issue-closure and coordinated route-fit contract. `templates/drainage-ground-design-processing.toml` defines the subsequent SWMM replay, hydrology, geotechnical zoning, foundation/ ground-treatment schedule, conditional OpenGeoSys and authority gate. `templates/structural-release-processing.toml` defines the subsequent per-asset OpenSees/CalculiX, load-case, fatigue, movement, independent-check and authority-release contract.

`templates/digital-assurance.toml` and `templates/system-fmea.toml` define the deterministic cross-domain pre-build assurance gate. The generated Markdown and JSON reports hash their sources and evidence, require component/subsystem/system coverage, and deliberately keep physical tests and independent acceptance open. `templates/corridor-resilience.toml` controls every-third-station recovery sites, remote shunt limits, constrained single-track passing loops and the retained protection functions for the distributed onboard-control research profile.

Civil cost inputs are split deliberately: edit `templates/civil-cost-calibration.toml` and the parametric civil geometry, then run `python3 tools/automation/generate-civil-cost-model.py`. The generated `templates/civil-cost-model.toml` is the contract used by city synthesis, finance, IFC provenance and documentation.

# Scenario files

Repository source: `lib/examples/README.md`

OpenSourceRail simulator scenarios are plain-text TOML files describing a city's rail network: stations, lines, fleets, schedules, and climate. This directory holds the reference scenarios. Copy one and edit it to design a network for your own city.

## Running a scenario

```
cargo run --release --bin osr-sim -- --config scenarios/my-city.toml \
    --duration 3600 --status-every 300
```

Useful flags:

| Flag | Purpose |
|---|---|
| `--config PATH` | Path to a scenario TOML file |
| `--duration SECS` | How long to simulate (sim-seconds). Multi-day runs are supported — the clock wraps at midnight, dispatch schedules re-arm at service_start, and PV cycles through subsequent days. 86400 = 1 day, 604800 = 1 week. |
| `--time-step SECS` | Simulation tick length (default 1 s) |
| `--status-every SECS` | Print a status snapshot every N sim-seconds; 0 disables |
| `--json-out PATH` | Write the full event trace + summary as JSON |
| `--csv-out PATH` | Write per-train periodic snapshots as CSV, including SoC, cumulative kWh, section position, speed, acceleration, battery-draw power, roof PV, and station-charge power |
| `--csv-every SECS` | CSV snapshot interval (default 60 sim-seconds) |

## Visualization

A companion tool `osr-vis` turns a scenario TOML into a self-contained HTML file showing the network diagram:

```
cargo run --release --bin osr-vis -- --config scenarios/my-city.toml \
    --out /tmp/my-city.html
```

No runtime dependencies — open the HTML file in any browser. Useful for reviewing station placement, line structure, and energy-site distribution at a glance.

## Reference scenarios

| File | What it is |
|---|---|
| `example-simple.toml` | Three-station shuttle, one train. The smallest viable config — copy this as a template for a new city. |
| `minimal-city.toml` | Slightly richer fixture exercising every required block. |
| Default Samawah scenario (omit `--config`) | Compiled canonical Samawah input. Use `--config` to select another file; the CLI has no `--scenario` flag. |
| `hybrid-stabling.toml` | Connected three-station fixture: six station launch trains and two depot trains, for continuous return/restart tests. |
| `cities/catalogue/west-asia/Iraq/Samawah/samawah.toml` | The auto-planned three-line `light-metro-3car` Samawah network emitted by `osr-design` from real OSM + WorldPop data. Pass via `--config` to `osr-sim`. |

## File format

A scenario has the required blocks below plus optional consist, energy, fault, HABD, and inspection-reset arrays. Here's the minimum viable shape:

```
[scenario]
name = "My City Metro"
start_time = "06:00"        # sim wall-clock start, HH:MM

[climate]
ambient_c = 30.0             # degrees Celsius
peak_sun_hours = 5.0         # used by station/depot PV and onboard roof PV

[[stations]]
id = "terminal-a"            # string ID, used by lines & fleets below
name = "Terminal A"          # human-readable
charging_power_kw = 1000     # 0 or omit for no charging pad
dwell_seconds = 60
is_terminal = true           # trains turn around here (linear lines)
# is_depot = false           # optional; marks a depot location

# ... more [[stations]] ...

[[lines]]
id = "line-1"
name = "Line 1"
is_ring = false              # true for a closed loop
```

```
# ring_wrap_length_m = 1600  # required if is_ring = true
stations = [
    { id = "terminal-a", distance_from_prev_m = 0 },
    { id = "stop-1",     distance_from_prev_m = 1500 },
    { id = "terminal-b", distance_from_prev_m = 1500 },
]

[[fleets]]
line = "line-1"              # must match a line id above
trainset_count = 4
dispatch_points = [          # where trains start AND where dispatches are
    { station = "terminal-a", heading = "forward" },
    { station = "terminal-b", heading = "reverse" },
]                            # throttled to honor the schedule
service_start = "05:30"
service_end   = "23:30"
schedule = [
    { from = "05:30", to = "07:00", headway_min = 10 },
    { from = "07:00", to = "22:00", headway_min = 5 },
    { from = "22:00", to = "23:30", headway_min = 15 },
]
```

## Field reference

### `[scenario]`

- `name` — any string, shown at run start.
- `start_time` — `"HH:MM"`, the sim's wall clock at tick 0. Set it earlier than the schedule's `service_start` to watch the morning startup; set it later to focus on midday or evening service.

### `[climate]`

- `ambient_c` — ambient temperature in °C. Drives the HVAC uplift applied to traction energy consumption.
- `peak_sun_hours` — average daily peak sun-hours used by trackside station/depot PV and onboard roof PV.
- `hvac_uplift_frac` (optional) — override the automatic calculation of HVAC load. If omitted, a linear curve from 25 °C baseline, capped at 25 % at 50 °C, is used.

### `[consist]` **(optional)**

Overrides the reference 3-car light-metro consist. All fields are optional; omitted ones fall back to the reference values.

```
[consist]
car_count = 3
length_m = 49.5
mass_kg = 78750
max_speed_kmh = 90
battery_capacity_kwh = 540
passenger_capacity = 360
seat_count = 60
crush_capacity = 480

[consist.roof_pv]             # optional trainset-level onboard solar
nameplate_kw = 15.12
usable_factor = 0.65          # heat/MPPT/cable/soiling derate
charges_while_moving = true
charges_while_dwelled = true

[consist.roof_pv.air_cleaner]  # optional low-pressure air-knife cleaner
enabled = true
compressor_power_kw = 0.9      # trainset-level parasitic draw
dust_loss_recovery_frac = 0.75 # fraction of dust loss recovered
```

`[consist.roof_pv]` applies the shared PV curve from `[climate]`, then `usable_factor`, then any fleet-wide dust derate. If `[consist.roof_pv.air_cleaner]` is enabled, the simulator recovers the configured fraction of dust-driven PV loss and subtracts the compressor load from the net PV credited to the train battery. Energy is credited every tick while moving or dwelled according to the boolean flags. The CSV trace reports this as `roof_pv_charged_kwh`, `roof_pv_kw`, and `roof_pv_cleaner_power_kw`; JSON summaries include `total_roof_pv_charged_kwh`.

### `[[stations]]`

Declare each station once. Referenced by `id` from lines and fleets.

- `id` — string ID, unique within the scenario.
- `name` — human-readable; appears in logs and abbreviations.
- `dwell_seconds` — how long trains pause here. Longer at interchanges and terminals; short (20–30 s) at mid-line stops.

- `charging_power_kw` (default 0) — opportunity-charging capability. Terminals typically 1000; mid-line charging stations 300–500.
- `is_terminal` (default false) — trains flip direction here on linear lines. Rings have no terminals.
- `is_depot` (default false) — marks a maintenance/layup site. Held trains can receive low-C top-up toward 95% SoC, subject to energy-site supply and charging-pad availability.

### `[[lines]]`

- `id`, `name` — identification.
- `is_ring` (default false) — true for a closed loop.
- `stations` — inline array of `{ id, distance_from_prev_m }`. The first entry must have `distance_from_prev_m = 0`. Subsequent distances are metres between consecutive stations.
- `ring_wrap_length_m` — required for rings, forbidden for linear lines. The distance of the closing segment that connects the last station back to the first.

### `[[fleets]]`

- `line` — must match a line `id`.
- `trainset_count` — total train inventory assigned to this line, including reserves.
- `spare_count`, `cold_reserve_count` (default 0 each) — included in the total inventory; their sum must not exceed `trainset_count`. These trains remain parked and can charge, but do not enter routine service. Automatic reserve activation is not yet modelled.
- `station_stabling` (default false) — enables overnight holding and low-C charging at the selected powered dispatch stations. Departure also requires enough energy to reach a selected charging station along the route while retaining the 20% reserve; active pad/grid outages exclude that destination. See the station-stabling workflow for location requirements and evidence limits.
- `overnight_allocations` (optional) — explicit `{ station, heading, location_type, service_role, trainset_count }` homes. `location_type` is `"station"` or `"depot"`; roles are `"revenue"`, `"spare"`, `"cold_reserve"`. Requires `station_stabling` and a complete allocation for every fleet. Station homes total at most two per physical station. Depot homes require explicit `depot_stabling_positions` on an existing `is_depot = true` station, and every home must be a powered dispatch point on the fleet's own line. Assigned trains return home after closing and appear as `station` or `depot` in CSV `stabling_location`. Empty returns emit `ReturnToStabling` events and use the line's peak-service headway. Station launch stock precedes depot stock, with train ID resolving ties; yard tracks and turnbacks remain abstract.
- `dispatch_points` — an array of `{ station, heading }`. Trains are distributed round-robin across this list at start-up unless explicit overnight homes are supplied, and each entry acts as a throttle point: trains arriving or re-dispatching here must wait their scheduled slot. `heading` is `"forward"` or `"reverse"`, interpreted relative to the line's station order.
- `service_start`, `service_end` — `"HH:MM"`. Outside this window, passenger dispatches are blocked; explicitly assigned home-return moves may continue with energy, movement-authority and return-headway checks. If `service_end` is earlier than `service_start`, the service window crosses midnight, e.g. `05:30` to `02:00`.
- `schedule` — ordered array of `{ from, to, headway_min }` windows. Any point in time within service hours should be covered by exactly one window. A schedule window may also cross midnight, e.g. `{ from = "23:30", to = "02:00", headway_min = 12 }`.

### `[[sites]]`

Trackside energy sites — each co-located with a station and providing the energy that the station's charging pads deliver to trains. A site has PV, battery storage, and an optional grid tie. Stations without a matching site cannot deliver charging energy.

```
[[sites]]
station = "east-depot"          # must match a station id with charging
pv_nameplate_kw = 5000          # solar nameplate (AC)
storage_capacity_kwh = 40000    # stationary LFP battery size
storage_max_charge_kw = 10000   # battery inbound rate limit
storage_max_discharge_kw = 10000 # battery outbound rate limit
storage_initial_soc = 0.6       # optional; default 0.5
grid_import_kw = 3000           # 0 = no grid tie
grid_export_kw = 3000           # 0 = no export capability
```

Energy flow per tick:

1. PV generation — sinusoidal curve peaking at solar noon, integrated so the daily total equals `peak_sun_hours × pv_nameplate_kw` kWh.
2. Storage charging — PV goes into the battery first, rate-limited by `storage_max_charge_kw` and capped by remaining capacity.
3. Excess PV — goes to `grid_export_kw` if configured; otherwise curtailed (and reported as waste).
4. Train charging — draws from battery first (rate-limited by `storage_max_discharge_kw`); any shortfall pulled from `grid_import_kw`.

PV sources not modeled yet: right-of-way vertical bifacial panels and between-rail ("Sun-Ways-style") PV are treated as future extensions. For now, allocate the ROW PV generation to nearby stations' `pv_nameplate_kw` or to a dedicated depot site. Onboard roof PV is modeled under `[consist.roof_pv]`.

## `[[habd_detectors]]` and `[[habd_resets]]` (optional)

HABDs are explicit bidirectional route-book assets. `after_station` identifies the lower-chainage end of an interstation section; `offset_m` must lie inside it. A trip stays latched until a named inspection reset occurs after the wayside overheat clears.

```
[[habd_detectors]]
id = "line-1-terminal-approach"
line = "line-1"
after_station = "stop-1"
offset_m = 1000

[[habd_resets]]
at = "08:15"
train = "T4"
authorised_by = "rolling-stock-technician"
inspection_reference = "inspection-2026-0042"
```

## `[[faults]]` (optional)

Inject scheduled energy, onboard, station, or wayside faults. Every fault has `name`, `kind`, `from`, `to`, and optional `day`; its remaining fields select the affected asset and stimulus.

```
[[faults]]
name = "morning dust storm"
kind = "dust_event"
from = "07:00"
to   = "11:00"
day  = 1                       # optional, defaults to 1
pv_output_factor = 0.3         # 30% of normal PV → 70% loss

[[faults]]
name = "substation fire"
kind = "grid_outage"
from = "13:00"
to   = "16:00"
# station = "east-depot"       # omit for system-wide outage

[[faults]]
name = "AMU pad service"
kind = "charging_pad_outage"
from = "14:00"
to   = "18:00"
station = "al-muthanna-university"

[[faults]]
name = "T4 early battery warning"
kind = "battery_off_gas"
from = "14:10"
to   = "14:15"
train = "T4"                  # omit for every train

[[faults]]
name = "T4 mist commissioning failure"
kind = "battery_mist_failure"
from = "14:10"
to   = "14:15"
train = "T4"

[[faults]]
name = "T4 containment escalation"
kind = "battery_fire_escalation"
from = "14:13"
to   = "14:15"
train = "T4"
```

Fault kinds:

- `dust_event` — scales PV output at affected sites. `pv_output_factor` is required (0.0 to 1.0). Omit `station` for a system-wide event.

- `grid_outage` — disables grid import and export at affected sites. Sites ride through on PV + storage. Omit `station` for a whole-grid failure.
- `charging_pad_outage` — disables a station's charging pad. Requires `station`. Trains dwelling there can't charge.
- `battery_off_gas` — trips the affected train's battery detection path, inhibits charging, isolates car HV, starts localized mist when healthy, alerts OCC, and requests a controlled stop.
- `battery_mist_failure` — makes the per-car reservoir/pump/pressure/flow checks fail. Combine it with `battery_off_gas` to exercise suppression failure without changing the safe-stop policy.
- `battery_fire_escalation` — declares immediate danger and continued movement unsafe, escalating the controlled stop to emergency braking.
- `t2g_primary_offline` — removes 5G and verifies backup-radio failover.
- `t2g_all_offline` — queues telemetry until either radio recovers.
- `hot_axle_overheat` — injects a dual-channel bearing-temperature trip.
- `wayside_habd_warning` — injects a warning-band bearing temperature at a physical HABD; the affected train is capped at 40 km/h until its next station.
- `wayside_habd_overheat` — injects a hot bearing only when the affected train crosses a physical HABD, exercising the authoritative trackside stop path.
- `cbm_degradation` — injects service-level bearing, motor, pad, and wheel data.
- `balise_missed` — suppresses the affected train's expected absolute fix.
- `balise_position_mismatch` — offsets the claimed balise position; the registry audit rejects it rather than passing it to odometry.
- `fare_token_tamper` — flips a TVM-issued token signature before the AFC gate. Optional `station`; omission affects every station and repeated denials exercise back-office fraud signalling.
- `platform_door_obstruction` — asserts PSD obstruction sensing. Optional `station`; omission applies it to every station.
- `station_scada_failure` — degrades reference SCADA equipment. Optional `station`; omission applies it to every station.
- `wayside_intrusion` — runs the configured section's detector with `state = "present"` or `"unknown"`, then publishes verdict transitions to consensus. Requires numeric `section_id`.
- Onboard fault kinds accept an optional `train = "T4"`; omit it to affect the fleet. Other onboard kinds are `lidar_offline`, `radar_offline`, `ultrasonic_channel_stale`, `obstacle_peer_disagreement`, and `passenger_intercom_press`. The four embedded faults above use the same optional train scope.

Fault timing:

- `from` and `to` are `"HH:MM"` on the specified `day` (1-based).
- `day = 1` means the first day of the sim; `day = 2` means the second, etc.
- Faults with windows entirely before sim start are silently skipped.

Compositional behavior:

- Multiple simultaneous dust events compose multiplicatively.
- The per-fault effects are independent: a dust event and a grid outage at the same site both apply.

At end of run, each fault that fired is listed in the ■■■■■■ `Faults` ■■■■■■ section of the summary. The per-site table shows the effects: sites with blocked grid export show zero in the `grid→` column; sites with dust events show reduced `PV kWh`.

# Common patterns

## A simple shuttle

See `example-simple.toml`. Two terminals, one mid stop, one train doing lazy back-and-forth.

### A proper metro line

Build it like Samawah's Line 1: ~10 stations, two terminals marked `is_terminal = true`, a couple of mid-line `charging_power_kw = 500` pads, a higher-power pad at each terminal.

### A ring

See line-2 in the built-in `samawah` scenario, or any auto-planned megacity design at `cities/catalogue/.../<City>/<slug>.toml` whose population band carries a ring (e.g. Baghdad's line-9). Set `is_ring = true` and `ring_wrap_length_m` to close the loop. Typical ring fleets dispatch both clockwise and counterclockwise from 1–2 major interchange stations.

### Multiple lines sharing interchanges

An interchange station is defined once and referenced by `id` in both lines' `stations` arrays. In Samawah, Eastern Bridge and Al-Muthanna University appear in both `line-1` and `line-2`.

## Troubleshooting

Validation errors are printed with the context of what went wrong. Common ones:

- "duplicate station id" — the same `id` appears twice in `[[stations]]`.
- "station '…' referenced by … is not defined" — a line or fleet refers to an `id` you didn't declare.
- "line '…' is a ring but missing ring_wrap_length_m" — set the wrap distance.
- "dispatch point station '…' is not on line '…'" — the `station` in `dispatch_points` must be in the line's `stations` list.
- "schedule window …–… has headway_min = 0" — headways must be positive.
- "site for station '…' has storage_initial_soc=X.Y; must be in [0.0, 1.0]" — SoC is a 0–1 fraction, not a percentage.
- "duplicate site for station '…'" — each station may have at most one `[[sites]]` entry.
- "unknown fault kind '…'" — use one of the fault kinds listed above.
- "fault '…' (dust_event) requires pv_output_factor in [0.0, 1.0]" — dust events must specify how much PV is lost (as a fraction, not a percentage).
- "fault '…' (charging_pad_outage) requires a 'station'" — pad outages must name the specific station.

## Contributing scenarios

If you develop a scenario for a real city you'd like to share, PRs to this directory are welcome. Please include:

- A header comment naming the city and the design intent.
- A note on what data the alignment and station properties are based on (surveyed, desk study, or indicative).
- Expected ridership if you have it.

The goal is to build up a library of concrete urban rail designs that other cities can learn from.

# Fault-injection scenarios

Repository source: `lib/fault-injection-scenarios/README.md`

Reference simulation scenarios that stage specific failure modes for exercising the safety-critical subsystems. Each file is a complete scenario (currently built on top of the Samawah network in `cities/catalogue/west-asia/Iraq/Samawah/samawah.toml`) with an additional `[[faults]]` / event-schedule section that the sim replays against the network.

| File | RFC | What it exercises |
|---|---|---|
| `dust-storm.toml` | RFC 0002 §5.4 + RFC 0001 §8 | AM-peak dust storm with PV derating + late-afternoon depot grid outage — tests degraded-mode energy operation. |
| `obstacle-fault.toml` | RFC 0015 | Staged onboard sensor failures — LIDAR offline, ultrasonic stale, peer 2oo2 disagreement, LIDAR+radar offline at mainline speed. Validates the five O-series SIL-4 properties of `osr-obstacle-detect`. |
| `wayside-intrusion.toml` | RFC 0016 | Three staged section-intrusion events (Present, Unknown, Present) on Samawah Line 1 — validates the interlocking's gate (d) `section_intrusion_permits` check prevents MA issuance on non-Clear sections. |

## Current status

These scenarios are Samawah-based full scenarios — they replicate the whole Samawah network in-file, then append the fault schedule. A future refactor should decompose each into a small overlay (just the `[[faults]]` + schedule sections) that can be merged on top of any city's base scenario, so the same fault fixtures exercise e.g. the Baghdad network. Until then, re-running the fault scenarios against a different city means copying the base scenario's content in.

## Running

```
cargo run --release --bin osr-sim -- \
    --config lib/fault-injection-scenarios/dust-storm.toml \
    --duration 54000 --status-every 3600
```

End-of-run summary prints per-fault tick counts under the scenario's safety-subsystem monitors.

# Tools

Repository source: `tools/README.md`

| Area | Kind | Purpose |
|---|---|---|
| `automation/` | Internal orchestration | Build, regeneration, publishing, validation and repository health |
| `osr-aln-convert/` | Installable utility | OSR-ALN/LandXML conversion and validation |
| `reference-ma/` | Installable reference utility | Independent movement-authority reference model |

User workflows start with `../osr`; domain rules stay in their owning Rust or Python packages rather than accumulating in automation scripts.

## Shared local design workflows

`./osr design problems/run/refine/search/jobs/verify/compare/cancel/resume/export` delegates to the shared package; the original Rust design compiler remains available for its legacy arguments. `./osr doctor`, `./osr capabilities`, `./osr catalogue` and `./osr check` provide preflight, the generated directory, selected-city generation and local test tiers. See acceptance limits.

# Repository Automation

Repository source: `tools/automation/README.md`

This folder contains small orchestration helpers for regeneration, documentation publishing, and repository health checks. Scripts should stay thin: domain logic belongs in Rust crates, `design/city-generation`, or `design/component-catalogue`.

# Commands

| Script | Purpose |
|---|---|
| `release-evidence.py` | Require a clean software tag and all four exact-commit local release profiles; package public city/proof evidence, PDF, overview, readiness and checksums; historical GitHub evidence is an explicit option |
| `local-validation.py` | Run/plan/verify source-bound local checks via `./osr validate`; keep logs locally and GitHub for storage; see the local validation guide |
| `safety-case-summary.py` | Generate or check GSN inventory counts without claiming successful proofs or independent acceptance |
| `build-all.sh` | One-command regeneration of shared product/cost/catalogue data, browser and native applications, BOM/IFC packages, the root reader PDF, and documentation checks; invoked as `./osr build` |
| `../../osr` | Root user command for the Workbench, build, simulator, tests and engineering workflows |
| `verify-civil-native-cad.py` | Run with FreeCADCmd to verify native solids and independent net volumes for all registered civil families; retains a source-bound kernel receipt |
| `regenerate-city.sh` | Regenerate one city design from the batch catalogue |
| `regenerate-all.sh` | Cached design synthesis plus complete city-package refresh under `cities/catalogue/`; use `--from-scratch` to force source-data rebuilding |
| `generate-city-packages-fast.py` | Refresh current-source city designs, scenarios, maps, engineering, resilience simulation, screenshots, operations, design-status reports and manifests; existing layout replacement is explicit |
| `generate-design-index.py` | Rebuild the complete city catalogue index in `cities/catalogue/README.md`; `--check` rejects stale metrics and rows |
| `digital-assurance.py` | Compile the Digital Standards Thread: publisher review deadlines, profiles, control coverage, FMEA/inventory screening, evidence hashes, change-impact index and generated Markdown/JSON/baseline; `--impact-from` compares a prior report |
| `component_assurance.py` | Generate one fail-closed G0–G4 passport for every current engineering inventory item and configured owner/operator platform service |
| `connected_assurance.py` | Compile the configuration-bound battery-cooling graph; `--changed-item`, `--impact-from` and `--batch` traverse dependencies; `--run-scenarios` captures actual Rust controller results with physical evidence and deployment gates remaining open |
| `subsystem_qualification.py` | Compile quantitative RAMS screens and six separate readiness states; validate rig measurements, model correlation, production equivalence and scoped signed reviews; `--export` packages original evidence bytes for review |
| `generate-cost-model.py` | Rebuild `docs/cost-model.md` from the CAPEX template, generated civil rate contract, finance/benefit assumptions, and rolling-stock BOM |
| `generate-civil-cost-model.py` | Convert canonical CAD quantities and reviewed benchmark shares into the generated civil planning-rate contract; `--check` detects drift |
| `generate-acceptance-evidence-report.py` | Build the acceptance/accreditation evidence-basis report and matrix from the operations bundle |
| `export-light-metro-bom.py` | Export the rolling-stock BOM CSV from the Markdown BOM source plus the generated COTS fit-out cost/source CSV |
| `generate-qa-maintenance-data.py` | Generate operations portal assets, manufacturing schedule/materials/verification, QA register, maintenance CSVs, and a deterministic gzip JSON bundle with integrity manifest |
| `audit-project-twins.py` | Reconcile city family scope, source hashes, finance buckets, CPM/cashflow totals and the mechanical/civil reference evidence |
| `operating-readiness.py` | Compile every tracked city ERP/component/supervision/lifecycle-governance profile against its own asset and twin evidence, report exact on-demand and operator-owned inputs, and detect report drift |
| `component_rfc_readiness.py` | Validate and render requirements, ICD, hazard, BOM/drawing, assembly, test, owner, assumption and release-blocker coverage for RFCs 0023–0027 |
| `baghdad_delivery_stress.py` | Audit frozen production/civil lanes, fixed process holds, priced recoveries, funding pauses and reconciled native-currency cash/debt; `--check` validates inputs and outputs |
| `baghdad_qualification.py` | Build temporary-facility RFQs, source-bound ERP evidence tasks, denied-placement gates and a separately operated first section; verify measured results with independent signatures |
| `build-baghdad-proposal.py` | Publish the complete Baghdad proposal, detailed registers and evidence archive, with a separately reconciled future Iraqi programme; `--check` validates hashes and archive integrity |
| `build-doc-book.py` | Build the complete reader-edition PDF, including current reconciled city totals, every route, and the Baghdad-only Iraqi funding appraisal; paginate long evidence rows |
| `generate-doc-index.py` | Rebuild the exhaustive Markdown inventory used for search and CI diagnostics; it is not a second documentation guide |
| `render-sim-screenshots.py` | Generate city-local simulator screenshots from any scenario |
| `render-city-engineering.py` | Render hash-linked QGIS engineering-layer and SUMO validation visuals for city READMEs |
| `validate-ring-interchanges.py` | Fail close ring/radial approaches without a shared transfer, flag radial corridors that double back on themselves, and report genuinely disconnected route layouts |
| `validate-station-clusters.py` | Fail same-line spacing below 1.2 km, unmerged cross-line stops within the 600 m station-complex envelope, and missing explicit interchange-complex records |
| `design-iterate.sh` | Iterate the rolling-stock design hierarchy across external components, fabricated parts, subassemblies, and final assemblies |
| `buildable-trainset.sh` | Generate the LM3 product tree, supplier/COTS registers, 29 factory drawing briefs covering all 62 locally made rows, package readiness, first-article work packages and evidence status |

| Script | Purpose |
|---|---|
| buildable-civil.sh | Reconcile all 19 reference IFC types into six accountable civil/interface release packages and nine non-issued drawing briefs; reject unclassified type-hash changes |
| freecad-generate.sh | Repository-level FreeCAD/Blender generator for mechanical review models, assemblies, FEM screens, screenshots, and animated digital twins |
| bonsai-civil.sh | Generate deterministic IFC4.3 civil federations with IDS audits and BCF 3.0 release issues, import through Bonsai, and render the linked 4D construction review scene |
| engineering-toolchain.sh | Install/check the engineering environment; run atomic baseline assurance, smoke tests, JuPedSim/SUMO benchmarks, analysis-register validation, and station IFC interchange checks |
| generate-city-engineering.py | Generate city-local QGIS packages, geometry-shaped SUMO runs, pandapower/pvlib energy screens and station-to-product mappings |
| generate-city-finance.py | Reconcile CAPEX; split localization-first external/local capital; compare variable foreign-turnkey cases; emit OPEX, revenue, NPV/IRR/DSCR, renewal, and risk screens |
| generate-iraq-funding-programme.py | Reconcile Baghdad and one plant only; publish native USD/IQD capital, priced gap finance, tariff/OPEX sensitivities and monthly/six-month early repayments |
| baghdad_financing_redesign.py | Compare opening-linked credit, 15-year insured tenor, station rights, energy/factory/developer ledgers and consolidated appraisal; emit six-month placements and a 90-day evidence programme |
| baghdad_equity.py | Model mixed holding-company ordinary shares, staged primary/secondary cash, dilution, tax/accounts, dividends, failed issues and six-month capital gates; `--check` validates sources and outputs |
| baghdad_viaduct_rentals.py | Screen civil-linked retained premises, generate pilot units/parts/hazards, and price leasing, deposits, vacancy/refurbishment/tax scenarios without assuming eligibility; `--check` rejects source/output drift |
| baghdad_delivery_baseline.py | Reconcile scope, depot/stabling quantities, six-car BOM/mass/labour, hourly energy, opening fleet, workload/competence and Baghdad governance; unquoted alternatives preserve the published funding baseline |
| bootstrap_baghdad_tests.py | Restore the exact ignored operations input from the tracked proposal archive for clean-checkout tests; rejects drift and preserves differing workspace data |
| refresh-city-controls.py | Refresh current finance, operations, project controls and documentation while preserving retained solver evidence and open release gates |
| apply-city-overrides.py | Apply controlled city operating policy before scenario emission; retains Samawah HABD configuration through synthesis |
| refresh-city-design-costs.py | Refresh controlled layout costs without letting an unreviewed corridor cache remove rings or replace station identities; resynthesis requires an explicit flag |
| generate-national-briefs.py | Generate concise country-specific city/factory/capital aggregates linked to the common deployment planning reference |
| generate-portfolio-summary.py | Aggregate the current city and national-factory models into human-readable `docs/portfolio-summary.md` and machine-readable `docs/portfolio-summary.json` evidence |
| generate-public-overview.py | Generate and drift-check the GitHub-native Markdown brief and landscape HTML/print edition from the design catalogue and LM3 build-cost record |
| recalculate-city-capex.py | Recalculate civil, station, depot, charging and family fleet CAPEX from controlled rates; write a cost migration receipt without rewriting historical evidence hashes |
| validate-city-simulation.py | Run nominal and mandatory degraded-energy OSR simulations on distinct physical cores, including combined aged/hot, consecutive missed-charge and late-running charger-overlap cases, and write compact reproducible evidence |
| check-tracked-file-sizes.py | Keep useful GitHub artifacts in-tree while enforcing the 50 MiB per-file repository ceiling |
| generate-lm3-first-article-work.py | Freeze `LM3-FA-001` and export its 81 gaps with controlled closure state and evidence routes |
| validate-lm3-first-article-evidence.py | Reject missing, unaccountable or checksum-drifted LM3 physical/supplier evidence submissions |
| publish-lm3-work-packages.py | Preview or idempotently reconcile LM3 work packages with public GitHub issues |
| ops-user-admin.py | Create/update a private PBKDF2 Ops Core user store with city-scoped roles |
| ops-core-backup.py | Create and verify a consistent SQLite plus managed-evidence backup archive |
| validate-simulation-components.py | Fail closed unless every deployed software component has one explicit simulation treatment and every tick-linked component remains an `osr-sim` dependency |
| generate-city-package-manifest.py | Fail closed unless a full city package contains passing design, engineering, simulation, resilience, operations, and hash-linked acceptance artifacts |
| operations-pilot.py | Reproduce the combined possession/train/charger/staff recovery pilot or serve an isolated gateway/Workbench for offline field acceptance |
| repo-health.py | Check generated artifact drift, required files, and repository hygiene |
| check-markdown-links.py | Check that local links in tracked Markdown resolve inside the repository |
| platform-recovery.py | Capture private coordinated platform checkpoints and rehearse fresh-volume recovery; see the recovery guide |
| check-readmes.py | Enforce titles, whitespace, provenance, concise size limits, complete Markdown indexing, and current LM3 contract counts/links across tracked READMEs and national briefs |
| export-gis-context.py | Convert a cached city OSM snapshot into deterministic local roads, buildings, water, protected-land and existing-rail GeoJSON layers, refreshing project source locks when present |
| validate-host-manifests.py | Validate all five host compositions and the complete Cargo component inventory |
| validate-city-projects.py | Compile and validate every Git-backed OSR City Studio project, including source locks and weekly service plans |
| build-web-frontends.sh | Build City Studio and the simulator/OCC production WASM bundles with pinned Trunk 0.21.8 |

| Script | Purpose |
| --- | --- |
| workbench-server.py | Serve the same-origin Workbench, proxy City Studio, mount simulator/OCC WASM, and persist Ops Core records |
| test-city-studio-gui.mjs | Drive the real City Studio GUI with Playwright Chromium, run every adapter, restart the server, and verify project/job persistence in an isolated disposable project |

For a single city, nominal runs and resilience cases are assigned to distinct physical cores. The default all-city run preserves each existing controlled route and station inventory, refreshes its current-source quantities, then regenerates engineering and dependent planning artifacts. It executes the engineering generators again rather than accepting an old successful batch summary. New cities adopt the current city-specific planner automatically; Baghdad retains its separately controlled alignment policy. It also fails if the compact engineering or operations review package for any generated city is excluded by Git ignore rules. Missing source caches are created when rerouting; `--from-scratch` forces them to be rebuilt.

Use `--resynthesise-design` to permit replacement of an existing layout; `--current-design-logic` remains a compatibility flag because current-source generation is now the default. A frozen, already reviewed design can be refreshed without local raster preparation using:

```
tools/automation/osr-python tools/automation/generate-city-packages-fast.py --only baghdad --jobs 1 --finish-only
```

The same workflow applies to other catalogue slugs. Their own route, population, terrain, water, operating and finance inputs remain authoritative; Baghdad's site assumptions and six-car configuration are not copied into another city. Every complete refresh writes `engineering/design-system/` with source-bound design status and outstanding gates. A successful package is a reproducible planning and simulation delivery; manufacturing and physical acceptance still require their specified evidence. Compact simulator output retains acceptance counters while omitting the detailed event trace; validation's explicit `--ma-check-every 0` uses the same movement-authority gates with bounded derived state instead of retaining three full Raft histories. `regenerate-all.sh --jobs N` automatically limits each city to one simulator when `N > 1`, leaving CPU scheduling to the operating system and preventing nested parallelism.

Typical verification:

```
python3 tools/automation/repo-health.py --quiet
python3 tools/automation/generate-civil-cost-model.py --check
python3 tools/automation/validate-host-manifests.py
tools/automation/design-iterate.sh
tools/automation/buildable-trainset.sh
tools/automation/freecad-generate.sh --check
tools/automation/bonsai-civil.sh --check
```

Build the complete documentation book with one command:

```
./osr book
```

The book includes canonical project and technical prose, software, deployment, control-electronics, formal-assurance, engineering and high-level manufacturing documentation, 44 developing-country briefs, and concise briefs generated from all 266 city models. `./osr book --list-sources` prints the exact validated manifest. Generated search indexes, duplicate city pages, component definitions and signable travelers remain linked repository records rather than repeated chapters. The illustrated build fails if a referenced local image is missing or unreadable. Chapter source bars link to GitHub and the PDF outline provides part, chapter, region, and country navigation.

The Samawah worked example is regenerated separately because it consumes the city-local alignment, station, energy, simulation, and fleet package:

```
tools/automation/freecad-generate.sh --samawah-line-twin
tools/automation/freecad-generate.sh --fabrication-twin
tools/automation/bonsai-civil.sh --render

# Baghdad financing redesign

The twelve-case redesign preserves the existing baseline and distinguishes core unlevered appraisal, company cash, public transfers and consolidated resources. New term sheets, equity, development values and public payments are sensitivities. Native ERP imports of its six evidence tasks use the existing qualification importer and preserve actual owner/status; no model run accepts those tasks.

When shared debt logic changes, regenerate in dependency order:

```
.venv/bin/python tools/automation/generate-iraq-funding-programme.py
.venv/bin/python tools/automation/baghdad_delivery_stress.py
.venv/bin/python tools/automation/baghdad_qualification.py
.venv/bin/python tools/automation/baghdad_viaduct_rentals.py
.venv/bin/python tools/automation/baghdad_financing_redesign.py
.venv/bin/python tools/automation/baghdad_equity.py
.venv/bin/python tools/automation/baghdad_delivery_baseline.py
.venv/bin/python tools/automation/baghdad_delivery_closure.py
.venv/bin/python tools/automation/build-baghdad-proposal.py
```

The last six tools support `--check` to reject source/output drift. Delivery stress also supports `--check`. Monthly company cash and principal balances, six-month capital funding and internal transfers must reconcile before publication. Land opportunity cost and extra availability payments remain visible outside the government's 25% original-capital contribution.

The ordinary-equity study proposes a 100%-owned subsidiary holding group, retaining open licences. Government shares reclassify existing money; only primary subscriptions fund company invoices. Failed subscriptions cannot expand capital-credit envelopes. Consolidated accounts, conservative separate-business tax, investor returns and an indicative Iraqi liabilities threshold remain conditional, with no accepted incorporation/admission evidence. Its six native ERP tasks use the same source-bound qualification importer.

The retained viaduct-premises package has a civil-linked candidate register, open independent unit, 30-unit draft pilot, hazards and leasing/deposit/renewal ledgers. No area is surveyed or accepted. The large unmapped area is blocked; smaller cases feed both the ring-fenced and wholly owned financing alternatives. Equity outputs distinguish actual dividends from an unapproved coverage policy and independent terminal-cash diagnostics. Its six evidence Tasks require actual local market/engineering/quote/lease evidence; model output grants no occupancy or operating permission.

The delivery reconciliation exposes unresolved scope and overlap alongside quantity/rate/workload sensitivities. Run its generator after physical/finance inputs, then regenerate the proposal. `--check` validates its inputs, outputs and current-review document. Alternatives and uncalibrated risk quantiles are not adopted budgets. The native ERP workforce observer reads a private Employee authorisation attachment and checks project/task/company and read permissions; it creates no assignment or railway authority.

For a fresh checkout, install the existing test/render dependencies and run `.venv/bin/python tools/automation/bootstrap_baghdad_tests.py` before `.venv/bin/python -m pytest tools/automation/tests design/component-catalogue/tests -q`. The hash-bound archive supplies the exact operations input; resynthesis is not required for tests. `--check` verifies an existing payload without writing.

The delivery continuation supplies nine depot/slot drawings, yard-slab mould capacity, child-part RFQs, per-site hourly energy, all maintenance intervals, restricted renewal cash, opening corridor break-even, practical assessment forms and six reconciled finance sensitivities. `baghdad_delivery_closure.py --check` rejects changed sources or outputs. These remain unquoted alternatives with unaccepted field evidence.

`verify_baghdad_erp_restore.py --backup PRIVATE.sql.gz --expected PRIVATE-fingerprint.json --receipt PRIVATE-receipt.json` restores a trusted native backup into a new network-isolated disposable MariaDB container, compares six native data/schema/permission/file-inventory fingerprints and removes the container. It never restores into the source database. Receipts contain counts/hashes, remain private and do not establish full file recovery or production RTO/RPO. The corresponding bench-only probe is `osr_erpnext.delivery_admin.recovery_fingerprint`; `read_probe` measures bounded permission-aware reads, not city-scale capacity.

# osr-aln-convert — civil-tool bridge for OSR-ALN

Repository source: `tools/osr-aln-convert/README.md`

RFC 0009 v3 deliverable. Reads the alignment file every civil- engineering firm already produces and emits the OSR-ALN TOML that the OSR pipeline ingests.

## What converters ship today

| Source tool | Export format | Converter | Status |
|---|---|---|---|
| Autodesk Civil 3D | LandXML | `landxml-to-osr-aln` | v1 |
| Bentley OpenRail | LandXML | `landxml-to-osr-aln` | v1 (same converter — OpenRail emits a compatible LandXML subset) |
| Trimble Business Center | LandXML | `landxml-to-osr-aln` | v1 |
| Trimble Business Center | CSV | `tcl-to-osr-aln` | pending v1.1 |
| QGIS + rail-path plugins | LandXML via plugin | `landxml-to-osr-aln` | v1 |
| OSR generated city design | `design.toml` + corridor GeoJSON | `current-network-to-osr-aln` | planning export |

One converter covers the three LandXML-emitting tools; they share the `<Alignments>` + `<Profiles>` schema that Civil 3D defined and Bentley + Trimble adopted.

## Usage

```
# One-time install (stdlib-only converter; no wheels to build).
pip install -e .

# Convert a LandXML dump from Civil 3D / OpenRail / Trimble.
landxml-to-osr-aln \
    --input  ./exports/samawah-line1.xml \
    --output ./cities/catalogue/west-asia/Iraq/Samawah/engineering/alignment/samawah-line1.aln.toml \
    --line-id samawah-line1 \
    --preset standard-urban \
    --consist light-metro-3car \
    --crs EPSG:32638 \
    --surveyor "Samawah Civil Associates"
```

The `--line-id`, `--preset`, `--consist`, `--crs`, `--surveyor` flags populate the `[meta]` block in the output TOML; the rest of the document is derived from the LandXML geometry. Station placeholder platform lengths default from the selected `--consist` per RFC 0008/0010; use `--platform-length-default` when a civil package deliberately safeguards a longer local platform.

To regenerate a current OSR planning network directly from checked-in city artifacts:

```
current-network-to-osr-aln \
    --design ../../cities/catalogue/west-asia/Iraq/Samawah/design.toml \
    --geojson ../../cities/catalogue/west-asia/Iraq/Samawah/samawah.corridor.geojson \
    --output-dir ../../cities/catalogue/west-asia/Iraq/Samawah/engineering/alignment \
    --design-date 2026-08-12
```

This path emits one file per current line, verifies line/station IDs and civil coverage against `design.toml`, and embeds input hashes for drift review. It is explicitly planning-only: the generated GIS trace has no fitted curves, surveyed vertical profile, or designed cant. See the `Samawah package notice` for the replacement gates.

## Explicit station, civil and cant companion data

Use `--sidecar line.mapping.toml --design design.toml` with the LandXML command above to import reviewed station IDs, civil spans and cant. The companion is TOML, so one file holds the three mappings and their provenance. It selects a named alignment, including from a multi-alignment XML file.

```
schema_version = 1
# Use cant = [] here only when the supplied design explicitly has no cant.

[source]
landxml_sha256 = "<SHA-256 of the exact XML bytes>"
design_sha256 = "<SHA-256 of the exact design.toml bytes>"
alignment_name = "Survey A"
line_id = "line-1"
crs = "EPSG:32638"
vertical_datum = "<datum of the supplied elevation data>"

[[station]]
id = "<station ID on line-1 in design.toml>"
source_name = "<matching LandXML Station name>"
station_m = 100.0
platform_length_m = 61.0

[[civil]]
from_station_m = 0.0
```

```
to_station_m = 1000.0
class = "at-grade"

[[cant]]
from_station_m = 400.0
to_station_m = 600.0
max_cant_mm = 30
transition_in_m = 50.0
transition_out_m = 50.0
```

This is a schema illustration, not deployment data. Replace the placeholders, include every station on the selected design line, and cover the complete alignment with contiguous civil spans. Every XML station name must map once, at its original chainage. Additional stations may supply chainages without `source_name` when the XML has no corresponding station object. Civil and cant spans cannot overlap; cant limits follow the selected preset, with nonzero ramps fitting inside each nonzero-cant span.

The importer checks the two source hashes, line/consist/preset/ring identity, CRS agreement, finite values, metric metre units and zero-origin chainage. It rejects station equations, nonzero chainage origins, incomplete mappings and unknown fields. The existing OSR-ALN hard gates also run before output is written. CRS and vertical datum are declarations of the supplied coordinates; the converter does not transform or independently verify them. Output retains all three input hashes and `deployment_release_ready = false`. Passing these checks does not replace engineering review or authority approval.

Without `--sidecar`, the existing placeholder workflow and golden fixture remain unchanged.

## What the converter reads

From the input LandXML:

- `<Alignments>/<Alignment>` — one alignment per output file.
- `<Alignment>/<CoordGeom>/<Line>` + `<Curve>` + `<Spiral>` — horizontal alignment elements, emitted as `[[horizontal]]` rows.
- `<Alignment>/<Profile>/<ProfAlign>/<PVI>` — vertical profile points, emitted as `[[vertical]]` rows. Sag/crest curves (`<CircCurve>`) carry `vc_radius_m`.
- The companion-file path rejects `<Alignment>/<StaEquations>`; station-equation transforms are not implemented. The legacy path does not interpret them and must not be used for those exports.

## Remaining format limits

- Station pin-pointing. LandXML has `<Station>` on an alignment but most civil tools write stations as offsets on a separate `Survey` object. In v1 the converter emits a placeholder `[[station]]` for each input `<Station>`; the deployment engineer can use the companion file above to map names to design.toml station IDs or supply externally derived station chainages. Direct Survey-object interpretation and CSV mapping are not implemented.
- Civil classes (at-grade / elevated / bridge). LandXML has no civil-class annotation. The converter emits a placeholder `[[civil]]` covering the full length as `at-grade`; the companion file replaces this placeholder with explicit RFC 0011 spans.
- Cant (superelevation). Bentley OpenRail writes cant into a non-standard `<Cant>` extension; Civil 3D writes it as a separate file. The companion file imports explicit `[[cant]]` rows; direct interpretation of vendor cant extensions remains unimplemented.

The companion file closes the explicit station/civil/cant mapping task while keeping vendor-specific parsing and survey acceptance separate.

## Synthetic round-trip fixture (not deployment data)

The converter ships with a deliberately abbreviated golden fixture at `samples/samawah-line1.xml` and the corresponding golden output at `samples/samawah-line1.aln.toml`. The historical name is retained to avoid disguising fixture provenance, but the 3 km illustrative geometry is not a surveyed or current Samawah alignment; see the `samples/` fixture notice. The test suite (`tests/test_round_trip.py`) runs the converter against the sample and asserts byte-identical output. Run with `pytest`.

## Coding-standard compliance

Per the `reference-ma` precedent: stdlib only, no numpy, no pydantic. Every byte of behaviour should be readable by a civil-engineering reviewer without chasing into a framework. The one imported module outside the stdlib is `pytest`, dev-only.

# Converter Golden Fixtures

Repository source: `tools/osr-aln-convert/samples/README.md`

The files in this directory are synthetic, abbreviated golden fixtures for `osr-aln-convert`. They are retained because the round-trip test compares the generated OSR-ALN output byte-for-byte.

Despite the historical `samawah-line1` filename and plausible coordinates, these files are not survey data, not the current Samawah network, and not a deployment alignment. The geometry is only 3 km long, station IDs are placeholders, and the civil class is intentionally all at grade so every converter review hook remains visible.

Deployment-controlled alignments live under `docs/civil/` and require the survey and approval fields specified by `docs/civil/osr-aln-format.md`.

# reference-ma — Python reference interpreter for osr-interlocking

Repository source: `tools/reference-ma/README.md`

Independent implementation of the Movement Authority state machine specified in RFC 0001 §7 and RFC 0004 §M4. The Rust crate `osr-interlocking` is the production code; this Python twin exists so that differential fuzzing against both implementations can catch bugs in either one.

The public surface mirrors `osr-interlocking`:

- `derive_state(entries) DerivedState`
- `compute_self_ma(train_id, entries, network, now_ns) MovementAuthority`
- `section_available_to(train_id, section, state) bool`
- `forward_chain`, `footprint_from`, `far_end_of`, `locate_section`

Wire format is whatever `serde_json` produces for the Rust types — IDs are plain `u64`s (`#[serde(transparent)]`), enums are externally tagged when they carry data, and every struct is field-by-field. The `__main__.py` CLI reads a case JSON on stdin and writes the same `MovementAuthority` JSON shape to stdout. The Rust differential test in `crates/osr-interlocking/tests/differential.rs` serialises random log prefixes and compares byte-for-byte.

## Running

Stdlib-only — no dependencies. Quick sanity run:

```
cd tools/reference-ma
PYTHONPATH=src python3 -m unittest discover -s tests -v
```

Full differential round-trip from the workspace root:

```
cargo test -p osr-interlocking --test differential
```

The Rust test skips itself if `python3` is missing or if `OSR_SKIP_PY_DIFF=1` is set, so CI on hosts without a Python toolchain still passes.

## CLI

Input (stdin or `--input case.json`):

```
{
  "network":  { "stations": {...}, "sections": {...}, "lines": [...] },
  "entries":  [ { "entry_id": 1, "term": 1, "timestamp_ns": 0,
                  "payload": { "TrainRegistration": {...} } }, ... ],
  "train_id": 1,
  "now_ns":   1000000000
}
```

Output (stdout):

```
{
  "train_id": 1,
  "end": { "section": 1001, "offset_mm": 1000000, "direction": "Forward" },
  "applicable_restrictions": [],
  "valid_until_ns": 4000000000,
  "derived_from_entry_id": 3,
  "has_known_position": true
}
```

## Status

| Entry variant | Supported | Notes |
|---|---|---|
| `TrainRegistration` | yes | full |
| `TrainPositionReport` | yes | full |
| `TrainDeparture` | yes | clears occupancy + route grants |
| `SwitchObservation` | yes | full |
| `RouteGrant` / Release | yes | full |
| `SpeedRestriction` | yes | v1 heuristic matches Rust |
| `MaintenanceOverride` | yes | full |
| `Heartbeat` | yes | monotonic-seq guard matches Rust |
| `FormatVersion` | yes | stores `current` |
| `SwitchCommand` | no-op | advisory; matches Rust |
| `RouteRequest` | no-op | advisory; matches Rust |

The differential test currently covers registrations and position reports under a fixed linear network. Expanding to include switches, route grants, and multi-line networks is a straightforward next pass — the primitives are all in place.

# Engineering, Control Electronics and Formal Assurance

## OpenSourceRail Control Electronics

Repository source: `control-electronics/README.md`

The reference integration source and revised host bench requirements include the corrected power, watchdog, bus and pin interfaces. The Baghdad detail register adds six-car fleet quantities and required supplier/qualification evidence. No complete onboard target image or qualified host BOM is released.

This directory owns the physical electronic hosts for the software stack: processors, safety I/O, sensors, power interfaces, wiring, connectors and enclosures. It does not contain embedded software, rolling-stock mechanical parts, track products or civil works. Embedded implementations remain under `../crates/`; mechanical and civil component geometry remains under the `../design/component-catalogue/`.

Reference electronic designs are scoped in RFC 0007; schematics and board-release artifacts land under each subdirectory as the RFC 0007 rollout matures.

Control electronics have two valid release tracks:

1. Pilot / DIY integration track. RFC 0019 assembles commodity SBCs, Pi Pico 2 boards, sensor modules, HATs, relays, power supplies, terminal blocks, DIN-rail enclosures, and prepared SD-card images. No KiCad or gerbers are required when the build uses only COTS modules. The release evidence is the controlled integration pack: exact SKUs, wiring/harness maps, connector maps, enclosure drawings, power and thermal margins, firmware images, self-test output, and bench records.
2. Custom-board fabrication track. RFC 0007 board-level specs can be captured into KiCad when a deployment needs OSR-specific carrier boards, power conditioning, safety I/O, or sensor-interface boards. That track needs KiCad, gerbers, board BOMs, DFM/DFT review, assembly drawings, and board bring-up evidence.

Commodity application hosts; separately qualified safety channels. Raspberry Pi and Radxa remain the simple pilot, application and diagnostic palette. Safety-output hardware follows the assessor-controlled `safety-controller-selection.md` gate and may use an industrial safety-MCU family. A commodity processor never bypasses the external fail-safe output path.

| Class | Role | SoC baseline | RFC 0007 § |
|---|---|---|---|
| `t-ecu-s/` | SIL-4-target train safety kernel | Qualified safety-channel pair to be frozen; 2 × RP2350 pilot rig + CM5 app processor | §4 |
| `t-ecu-a/` | Train application (SIL-2/-0) | Raspberry Pi CM5 (Radxa CM5 drop-in) | §5 |
| `t-obs/` | SIL-4-target obstacle verdict interface | Qualified evaluator channels to be frozen; 2 × RP2350 pilot rig + CM5 pre-processor | RFC 0015 §5 |
| `w-sbc/` | Wayside application host | Radxa CM5; safety outputs through a separately qualified controller | §6 |
| `s-sbc/` | Station / depot (SIL-0) | Raspberry Pi CM5 + commodity carrier | §7 |

0-SRV (ops server) is a commodity computer and has no reference design in tree.

### Layout

Each class subdirectory has the same shape:

```
<class>/
├── README.md          class overview, SoC rationale, peripherals list
├── diy-assembly/      COTS/SBC pilot assembly notes per RFC 0019
└── schematics/        board-level specs; KiCad projects once custom boards are drawn
```

`bom/` and `gerbers/` are created only when they contain real release artifacts; empty placeholder directories are not retained.

Current status:

| Class | Pilot / COTS integration | Custom-board package |
|---|---|---|
| `t-ecu-s` | `diy-assembly/` present; build evidence pending | Complete `schematics/v2-spec/` package; KiCad / gerbers / board BOM pending |
| `t-ecu-a` | `diy-assembly/` present; build evidence pending | `schematics/v2-spec/` overview and block diagram; KiCad / gerbers / board BOM pending |
| `t-obs` | `diy-assembly/` present; build evidence pending | Complete `schematics/v2-spec/` package; KiCad / gerbers / board BOM pending |

| Class | Pilot / COTS integration | Custom-board package |
|---|---|---|
| `w-sbc` | `diy-assembly/` present; build evidence pending | `schematics/v2-spec/` overview and block diagram; KiCad / gerbers / board BOM pending |
| `s-sbc` | `diy-assembly/` present; build evidence pending | `schematics/v2-spec/` overview; custom board usually unnecessary |

Bring-up procedures are colocated with their host: `T-ECU/S`, `T-ECU/A`, `T-OBS`, `W-SBC` and `S-SBC`.

The release gates for both tracks are tracked in `release-checklist.md`. Until a host class meets the pilot track it is a design concept, not integration-qualified pilot hardware. Until it meets the custom-board track it is not released fabrication hardware.

For trainset quantities and the boundary between control-electronics records, mechanical CAD envelopes, and the rolling-stock procurement BOM, see `rolling-stock-integration.md`.

## Licensing

Electronic designs (schematics, layouts, gerbers, board BOMs, and integration drawings) are licensed under CERN-OHL-S v2. Firmware stays under Apache-2.0 (inherited from the Rust crates). Documentation under CC-BY-SA 4.0. See ARCHITECTURE.md §9 for the project-wide licensing rationale.

## Contributing

High-leverage contributions are DIY/COTS build feedback against `diy-assembly/`, integration BOM completion, wiring and enclosure review, KiCad capture where custom boards are justified, and board DFM review for the custom-board track.

# Bench assembly workflow

Repository source: `control-electronics/diy-assembly/README.md`

Start with the host requirements, reference integration, candidate catalogue and release checklist. These specify integration work; no qualified plug-and-play railway assembly or downloadable target image is released.

1. Freeze exact compute/carrier, peripherals, interfaces and target firmware.
2. Calculate bus range, converter capacity, inrush, fuse selectivity and thermal/EMC design.
3. Release harness cavities, cable/terminal list, isolation topology and enclosure drawings.
4. Build a simulated-load bench unit; verify continuity, voltage domains and fault states before connecting power.
5. Run measured device/HAL, boot, heartbeat, output, sensor, thermal and EMC tests; retain hashes and instrument records.
6. Review qualification evidence and supplier substitutions before authorising any field function.

A USB isolator does not connect two USB-device Pico boards or carry SPI. Use a correctly specified SPI isolator and controller/peripheral link. An AC-input HDR-60-24 supplies 24 V output, not a 24-to-5 V conversion. Board-package pins cannot be copied into a Pico header wiring table. See image status before preparing boot media.

# DIY parts catalogue

Repository source: `control-electronics/diy-assembly/parts-catalogue.md`

Every SKU used across the five host classes, consolidated for sourcing in bulk. Every item has ≥ 2 distributors so supply- chain disruption at one source does not block a deployment.

Prices are 2026 retail in USD, at quantities of 1–10 units. Bulk (50+) pricing typically 20–40 % lower per unit.

## Compute modules

| Part | SKU | Distributor 1 | Distributor 2 | Retail (USD) |
|---|---|---|---|---|
| Raspberry Pi Pico 2 | SC1630 | Official Pi Foundation | Mouser, DigiKey | $5 |
| Raspberry Pi CM5 8 GB Lite | CM5 configuration/SKU pending freeze | Official Pi Foundation | Mouser | $85 |
| Raspberry Pi CM5 IO Board | CM5IO vendor SKU pending freeze | Official Pi Foundation | Pimoroni | $35 |
| Radxa CM5 industrial-temp | rock-cm5-industrial | Radxa store | ALLNET china | $110 |
| Radxa CM5 IO Board | rock-cm5-io | Radxa store | ALLNET china | $40 |

## Communications HATs

| Part | SKU | Distributor 1 | Distributor 2 | Retail (USD) |
|---|---|---|---|---|
| Waveshare 2-CH CAN-FD HAT | 2-CH-CAN-FD-HAT | Waveshare | AliExpress-commodity | $28 |
| Waveshare SX1262 LoRa HAT (868 / 915 MHz) | SX1262-LoRa-HAT | Waveshare | Mouser | $18 |
| Quectel RM500Q-GL 5G modem (M.2) | RM500Q-GL | DigiKey | AliExpress | $80 |
| Quectel antennas (2 × 4 MIMO) | YQ500-B7B | DigiKey | Mouser | $35 / set |

## SIL-4 actuator path

| Part | SKU | Distributor 1 | Distributor 2 | Retail (USD) |
|---|---|---|---|---|
| 8-channel 24 V relay board, opto-isolated | SainSmart SSR-8DC24 | SainSmart | Amazon / AliExpress | $12 |
| Adafruit USB isolator | Adafruit 2107 | Adafruit | Mouser | $25 |
| SparkFun ADUM1401 isolator breakout | BOB-14712 | SparkFun | DigiKey | $25 |
| Adafruit ATECC608B breakout | Adafruit 4374 | Adafruit | DigiKey | $4 |
| ADS1115 16-bit ADC breakout | Adafruit 1085 | Adafruit | DigiKey | $15 |
| MCP23017 I/O expander breakout | Adafruit 732 | Adafruit | DigiKey | $7 |

## Obstacle-detect sensors (RFC 0015)

| Part | SKU | Distributor 1 | Distributor 2 | Retail (USD) |
|---|---|---|---|---|
| HC-SR04 ultrasonic transceiver (dev grade) | HC-SR04 | AliExpress | Amazon | $2 each |
| Murata MA40H1S-R (historical candidate; lifecycle and environmental qualification open) | MA40H1S-R | Mouser | DigiKey | $25 each |
| TI AWR1843BOOST 77 GHz radar eval | AWR1843BOOST | ti.com | Mouser | $500 |
| Livox HAP solid-state LIDAR | LIVOX-HAP | Livox direct | B&H Photo | $1500 |
| Raspberry Pi Camera Module 3 | SC0872 | Official Pi Foundation | Mouser | $35 |
| ArduCam stereo camera bracket | B0203 | ArduCam | Amazon | $18 |

## Wayside-intrusion sensors (RFC 0016)

| Part | SKU | Distributor 1 | Distributor 2 | Retail (USD) |
|---|---|---|---|---|
| Senstar FlexZone fence-line (per 100 m) | FlexZone-100 | Senstar dealers | — | $300 |
| Livox Mid-360 360° LIDAR | LIVOX-MID-360 | Livox direct | — | $900 |
| TI AWR1843BOOST (ROW-mounted) | AWR1843BOOST | ti.com | Mouser | $500 |
| Reolink RLC-810A 4 K IP camera | RLC-810A | Reolink | Amazon | $130 |
| Coral USB Accelerator (TPU) | coral-usb | Coral | Mouser | $60 |

## Enclosures + mechanical

| Part | SKU | Distributor 1 | Distributor 2 | Retail (USD) |
|---|---|---|---|---|
| UCTRONICS DIN rail Pi 5 case | U6277 | UCTRONICS | Amazon | $25 |
| Radxa CM5 industrial DIN enclosure | rock-cm5-din-industrial | Radxa store | — | $45 |
| Phoenix Contact 12-position 24 V terminal block strip | UT 2.5 DIN | DigiKey | Mouser | $8 |
| IP67 pole-mount cabinet 400 × 300 × 200 mm | RBM-5 | DigiKey | Allied Electronics | $110 |
| Cat 6a patch cable 1 m (TSN grade) | generic | Amazon / DigiKey | Any IT supplier | $5 |

## Field-wiring consumables

| Part | SKU | Distributor 1 | Distributor 2 | Retail (USD) |
|---|---|---|---|---|
| Insulated ferrules kit (0.5 / 0.75 / 1.5 mm²) | Knipex 97-99-910 | DigiKey | Amazon | $30 |
| Knipex ferrule crimper | 97-62-145-A | DigiKey | Amazon | $60 |
| Stranded wire 1.5 mm² (500 m spool, colour-coded) | LAPP 4520015 | LAPP catalogue | Amazon | $180 |

## Total first-article deployment cost

For one Samawah line-1 trainset + adjacent 1-km wayside section:

| Bucket | Unit cost (USD) | Units | Subtotal |
|---|---|---|---|
| T-ECU/S per trainset | 240 | 2 | 480 |
| T-ECU/A per trainset | 300 | 2 | 600 |
| T-OBS per trainset (includes LIDAR) | 2 410 | 2 | 4 820 |
| W-SBC per junction box | 350 | 2 | 700 |
| Fence-line sensor (1 km) | 3 000 | 1 | 3 000 |
| ROW LIDAR × 5 + radar × 2 | 4 500 + 1 000 | 1 | 5 500 |
| CCTV + TPU | 190 | 2 | 380 |
| Enclosures, cabling, consumables | — | — | 1 500 |
| Total | | | ~$17 000 |

Scale per trainset (electronics + sensors only): ~$5 900. Scale per km of wayside (section + sensors): ~$10 000.

For a full Samawah deployment (10 trainsets + 30 km of track = ~30 sections): ~$360 000 in electronics. Compares to a legacy CBTC system at ~€50M for an equivalent network — two orders of magnitude difference dominated by NRE on the legacy side.

## Interface correction, 3 October 2026

This is a historical candidate/retail list, not a complete qualified procurement BOM. Reference integration and revised host assembly requirements supersede earlier wiring and subtotals. Exact supplier SKUs, lifecycle and alternates require verification. A raw piezo transducer is not a plug-compatible ultrasonic ranging module; an ADS1115 is not a timed digital-echo capture device. USB isolation does not implement an SPI link. Include external heartbeat watchdogs, DC/DCs, driver feedback, connectors, fuses, harness, thermal and test hardware before quoting totals.

# DIY SD-card images

Repository source: `control-electronics/diy-assembly/sd-card-images.md`

The planned application-host deployment boots from a prepared microSD card carrying a minimal Linux base, an OSR role runner, `osr-selftest`, and the per-deployment configuration. This page distinguishes that target from the artifacts actually shipped today.

## Current source-build boundary

No signed OSR SD-card or Pico firmware image is published by v0.3.1. The Rust workspace provides reusable control logic, simulation integration and the `osr-selftest` software harness; it does not yet provide a board-support package, bootable image recipe, hardware drivers or deployable RP2350 binary.

The commands below validate that the host-side integration libraries compile. They do not create the `/usr/local/bin/osr-trainset-image` executable or a `.uf2` file described by older drafts:

```
# On a build host (x86-64 Linux dev machine):
cd OpenSourceRail

# Cross-check the onboard integration library for the CM5 target.
rustup target add aarch64-unknown-linux-gnu
cargo build --release --target aarch64-unknown-linux-gnu \
    -p osr-trainset-image
```

Before any image can be flashed to pilot hardware, a deployment must add and review all of the following:

- an operating-system image recipe with a pinned upstream base and packages;
- a role runner that drives the relevant libraries through reviewed hardware interfaces;
- CM5/Radxa board-support, device-tree and hardware-driver configuration;
- a genuine `no_std` RP2350 application and its watchdog/safety-I/O drivers;
- secure provisioning, update, rollback and key-rotation procedures;
- hardware bench tests, signed artifacts and reproducible-image checksums.

These are tracked as release gates in `../release-checklist.md`. A deployment may use an upstream operating-system image for bench development, but that is not an OSR release image and must not command railway actuators.

## Planned signed artifacts

When the hardware gates close, each release must use filenames containing the actual host, semantic version, hardware revision and content checksum. Paired safety-channel firmware must identify its channel and refuse an incompatible peer. Do not reserve fictional filenames in advance.

Every published image must be:

- Signed with the OSR project's ed25519 release key.
- SHA-256 checksummed for supply-chain verification.
- Reproducible — given the tagged workspace commit and pinned base-image digest, anyone can rebuild identical bytes.

Only flash an artifact after verifying its release signature, checksum, target host and hardware revision. The release procedure will carry the exact command; this document deliberately does not provide a destructive dd example for an artifact that does not exist.

## Configuration

The planned image boots to a default config that will not proceed past self-test until `/etc/osr/config.toml` is populated with:

- `deployment_id` — string identifier for the operator.
- `entity_id` — the unique ATECC608B-backed id for this specific unit (RFC 0017).
- `role` — host class (`t-ecu-s-A`, `t-ecu-s-B`, `t-ecu-a`, etc.).
- Deployment key registry — path or URL to the per- deployment `KeyRegistry` (RFC 0017 §3.2).
- Network endpoints — TSN neighbour list, OCC address.

Sample configs ship in each `<class>/diy-assembly/sample-config.toml`.

## Boot flow + self-test

The target systemd unit at `/etc/systemd/system/osr.service` will:

1. Wait for hardware-clock sync (PTP, if available, else NTP).
2. Validate the deployment config — reject if missing required fields.
3. Load the ATECC608B trust anchor — reject if absent or disagreeing with `deployment_id`.
4. Run `osr-selftest`:
   - Ping both Pico 2 channels (for 2oo2 boards).
   - Exercise each sensor's health check.
   - Confirm every RFC 0005 crate for this role loads.
5. Emit "ready" on the LED + TSN heartbeat.
6. Enter the main role loop.

If any step fails the unit holds in a red-LED fault state and refuses to drive actuators. The custom-PCB v2 spec's watchdog supervisor has an equivalent role; the DIY path relies on systemd + the Pico 2's own watchdog.

# DIY assembly — tools + materials

Repository source: `control-electronics/diy-assembly/tooling.md`

## Required tools

| Tool | Purpose | Typical source |
|---|---|---|
| PH1 + PH2 Phillips screwdriver | Enclosure + terminal-block + DIN-rail screws | Any hardware store |
| 2.5 mm flat-head screwdriver | Small terminal block screws | Any hardware store |
| Wire cutter / stripper for 0.5 – 2.5 mm² stranded | Field wiring + terminal-block jumpers | Any electronics supplier |
| Ferrule crimper for 0.5 – 2.5 mm² ferrules | Stranded-wire termination into terminal blocks (do not tin with solder) | Knipex / generic |
| Micro-HDMI  HDMI cable | First-boot commissioning via CM5's micro-HDMI + a monitor | Generic |
| Keyboard (USB) | First-boot commissioning | Generic |

That is the entire tool list. No soldering iron, no hot-air station, no benchtop power supply, no logic analyser, no oscilloscope. The safety-case argument (RFC 0019 §7) does not require per-unit scope capture — the Pico 2's own self-test plus `osr-selftest` provides the verification.

## Optional but recommended

| Tool | Purpose |
|---|---|
| Multimeter | Spot-check 24 V power continuity at the DIN-rail terminal |
| ESD wrist strap | Good practice around the CM5 module; not strictly required once it's seated in the IO Board |
| Labelmaker | Cable labels per the wiring map; saves hours at commissioning |
| Torque screwdriver (0.5 Nm preset) | For enclosure screws on shock-rated field units (EN 50155 OT4) |

## Consumables (per host class)

| Consumable | Spec | Qty per unit |
|---|---|---|
| Ferrules | 0.5 / 0.75 / 1.5 mm² insulated colour-coded | ~50 |
| Cable ties | Nylon 2.5 mm × 100 mm | ~20 |
| Heat-shrink sleeve | Ø 3 mm + Ø 6 mm, any colour | ~5 pieces |
| Labels | Adhesive printable | ~30 |

## Hygiene rules

1. Never power up with the CM5 not fully seated. The SO-DIMM pins will short on a partial insertion.
2. Strip to the ferrule's depth, no more. Over-strip = exposed copper outside the terminal = creepage violation.
3. Separate safety-critical wiring. The 2oo2 A-channel and B-channel wiring must route through different cable trays / different bundles. A common single-point cable-bundle damage incident defeats the 2oo2 safety argument. Use different insulation colours (A = black, B = brown, per RFC 0007 §safety-nets convention).
4. Label everything at assembly time. `A-CROSS-CHECK-IN`, `A-CROSS-CHECK-OUT`, `B-CROSS-CHECK-IN`, `B-CROSS-CHECK-OUT` — at 3 AM during a field incident nobody can guess.
5. Terminal-block torque is 0.5 Nm. Factor applies to every screw terminal in every host class.

# Hardware Release Checklist

Repository source: `control-electronics/release-checklist.md`

This checklist turns the hardware gap into concrete release gates for each host class. OSR has two hardware release tracks:

- Pilot / DIY integration release: commodity SBCs, Pi Pico 2 boards, sensor modules, HATs, relay modules, power supplies, terminal blocks, and DIN-rail enclosures per RFC 0019. This track does not require KiCad or gerbers when no custom PCB is used.
- Custom-board fabrication release: OSR-specific carrier, power, safety-I/O, or sensor-interface boards per RFC 0007. This track requires KiCad, gerbers, board BOMs, DFM/DFT review, and board bring-up evidence.

## Pilot / DIY Integration Track

| Host class | COTS BOM | Wiring / harness map | Enclosure + mounting | Power / thermal margin | SD image + self-test | Bench / safety evidence |
|---|---|---|---|---|---|---|
| T-ECU/S | Pending freeze | Pending | Pending | Pending | Pending | 2oo2 watchdog, relay-stage, cross-check, and power-fault bench logs |
| T-ECU/A | Pending freeze | Pending | Pending | Pending | Pending | Non-safety host self-test and communications fault-injection logs |
| T-OBS | Pending freeze | Pending | Pending | Pending | Pending | 2oo2 obstacle-clear output, sensor-fault injection, heater/washer tests |
| W-SBC | Pending freeze | Pending | Pending | Pending | Pending | Wayside power, network isolation, intrusion/points IO fault-injection logs |
| S-SBC | Pending freeze | Pending | Pending | Pending | Pending | Station/depot host self-test and safe-failure procedure evidence |

### Pilot Integration Artifacts

Each pilot integration release creates:

- `control-electronics/<class>/diy-assembly/README.md` with assembly order and role-specific commissioning steps.
- `control-electronics/<class>/diy-assembly/bom-vN.csv` with exact SKUs, alternates, lifecycle status, supplier links, and substitution rules.
- `control-electronics/<class>/diy-assembly/wiring-map-vN.md` with terminal blocks, connector pinouts, cable labels, ferrule sizes, and harness routing.
- `control-electronics/<class>/diy-assembly/enclosure-vN.md` with DIN-rail, cabinet, sensor-mount, ingress-protection, and service-clearance notes.
- `control-electronics/<class>/diy-assembly/power-thermal-vN.md` with input ranges, fuse ratings, rail loads, heat budget, and derating limits.
- `control-electronics/<class>/bring-up/vN.md` with SD-card image checksum, boot log, `osr-selftest` output, smoke-test results, and known issues.
- `control-electronics/<class>/evidence/vN/` with photos, oscilloscope captures where relevant, watchdog/reset tests, safety-output truth tables, sensor-fault logs, and commissioning sign-off.

# Custom-Board Fabrication Track

| Host class | KiCad capture | Gerbers | Board BOM | Bring-up evidence | Safety evidence |
|---|---|---|---|---|---|
| T-ECU/S | Pending | Pending | Pending | Pending | 2oo2 watchdog, relay-stage, cross-check, and power-fault bench logs |
| T-ECU/A | Pending | Pending | Pending | Pending | Non-safety host self-test and communications fault-injection logs |
| T-OBS | Pending | Pending | Pending | Pending | 2oo2 obstacle-clear output, sensor-fault injection, heater/washer tests |
| W-SBC | Pending | Pending | Pending | Pending | Wayside power, network isolation, intrusion/points IO fault-injection logs |
| S-SBC | Usually unnecessary | Usually unnecessary | Usually unnecessary | Pending | Station/depot host self-test and safe-failure procedure evidence |

## Custom-Board Artifacts

Each custom-board release creates:

- `control-electronics/<class>/schematics/vN-kicad/` with the KiCad project.
- `control-electronics/<class>/gerbers/vN-rev-X/` with the fabrication ZIP and drill files.
- `control-electronics/<class>/bom/vN-rev-X.csv` with manufacturer part numbers, alternates, lifecycle status, and supplier links.
- `control-electronics/<class>/bring-up/vN-rev-X.md` with power-rail checks, programming steps, smoke-test results, and known issues.
- `control-electronics/<class>/evidence/vN-rev-X/` with oscilloscope captures, watchdog/reset tests, safety-output truth tables, and DFM/DFT review.

# Release Rule

A host class may be referenced by the certification pack as `pilot integration hardware` after the Pilot / DIY Integration Track is closed for the same revision. It may be referenced as `released fabrication hardware` only after the Custom-Board Fabrication Track is closed for the same revision.

# Rolling-stock hardware integration

Repository source: `control-electronics/rolling-stock-integration.md`

This file is the hardware-side bridge to the `light-metro-3car` trainset BOM and mechanical CAD. It keeps electronic host-class documentation in `control-electronics/`, while the consist-level quantities and physical envelopes remain owned by:

- `docs/rolling-stock/light-metro-3car/bom-skeleton.md`
- `docs/rolling-stock/light-metro-3car/README.md`
- `design/component-catalogue/src/osr_mech/rolling_stock/systems.py`

## Canonical light-metro-3car fit

| Hardware class | Consist quantity | Mechanical envelope | BOM lines | Notes |
|---|---|---|---|---|
| T-ECU/S safety kernel | 2 | Per-end electronics cabinet | E1, E3-E6, E22 | One A-end unit and one B-end unit; active/hot-standby at train level |
| T-ECU/A application | 2 | Per-end electronics cabinet | E2, E7-E12, E22 | One A-end unit and one B-end unit; non-safety, single-redundant |
| T-OBS obstacle-detection ECU | 2 | Nose sensor pack | E18, E19 | One behind each cabless nose cowl |
| Trainset interior COTS modules | 3 car sets | Car systems + fit-out envelopes | B12-B20, A1-A5 | Quantities scale per self-contained car unless BOM says per consist |
| W-SBC wayside controller | route dependent | Wayside cabinet/pole, not trainset CAD | Wayside BOM | Not part of trainset material BOM |
| S-SBC station/depot host | station dependent | Station/depot cabinet, not trainset CAD | Station BOM | Not part of trainset material BOM |

## Ownership rule

- `control-electronics/` owns board architecture, DIY/COTS integration packs, schematics, custom-board gerbers, board-level BOMs, wiring maps, enclosure notes, and bring-up evidence.
- `design/component-catalogue/` owns physical CAD envelopes, FreeCAD review artifacts, and generated screenshots for train components.
- `docs/rolling-stock/light-metro-3car/bom-skeleton.md` owns procurement quantities per consist.

If a board changes size, connector side, heat dissipation, or service clearance, update the matching mechanical envelope and drawing register. If a consist quantity changes, update the rolling-stock BOM first, then mirror that quantity here and in the host-class README.

# S-SBC — Station / Depot

Repository source: `control-electronics/s-sbc/README.md`

Role: Host for `osr-psd`, `osr-pis-station`, `osr-station-scada`, `osr-afc`, `osr-tvm`.

Indoor deployment; no rail-industry environmental rating required.

## SoC + baseboard

Raspberry Pi CM5 on a commodity carrier (e.g. Waveshare CM5-IO). No custom baseboard. The station enclosure carries the I/O.

This is a deliberate deviation from the other classes: sheltered indoor environments don't warrant the custom engineering, and every hour saved on baseboard bring-up goes into the passenger-facing work that actually differentiates an OpenSourceRail deployment.

See RFC 0007 §7 for the commodity-carrier rationale.

## Peripherals (from the commodity carrier)

- 2 × Gigabit Ethernet (station LAN + PSD/gate network)
- 4 × USB 3.0 (QR scanner, NFC reader, receipt printer, TVM bill acceptor)
- HDMI for passenger-facing display
- USB-C console
- ATECC608 add-on over I²C (the only custom piece — a small 30 × 20 mm PCB that plugs onto the CM5 I/O header)

## Target BOM

~€130 total — CM5 module + carrier + small SE add-on.

## Status

Pilot / DIY track: the station-side software stack already runs on stock Waveshare carriers in the development lab. Integration evidence is still pending.

Custom-board track: usually unnecessary for S-SBC. The only custom piece is the small ATECC608 add-on (two ICs + passives), tracked as a v2 deliverable alongside the other classes for consistency.

# S-SBC bring-up — RPi CM5 on Waveshare CM5-IO

Repository source: `control-electronics/s-sbc/bring-up.md`

Goal: confirm the station / depot host runs `osr-psd` + `osr-afc` + `osr-tvm` + `osr-pis-station` + `osr-station-scada` on a stock commodity carrier, with the small ATECC608 add-on as the only custom-PCB piece.

## Dev kits + parts

| Part | Qty | Notes |
|---|---|---|
| Raspberry Pi CM5 (4 GB + 32 GB eMMC) | 1 | |
| Waveshare CM5-IO (commodity) | 1 | |
| ATECC608 breakout on I²C | 1 | The only custom PCB — a 30 × 20 mm carrier for the SE chip. |
| QR scanner (USB) | 1 | |
| NFC reader (USB, ACR122U or equivalent) | 1 | |
| Thermal receipt printer (USB) | 1 | |
| 10-inch HDMI screen | 1 | PIS display. |
| Test bench | — | |

## Steps

### X1 — Boot Debian

Same as T-ECU/A step A1, same image, same hostname pattern (`ssbc-devkit`). No RT configuration — station role is SIL-0.

### X2 — Workspace build

Subset build: station-side crates only.

```
cargo build --release -p osr-psd -p osr-afc -p osr-tvm \
    -p osr-pis-station -p osr-station-scada
```

### X3 — ATECC608 add-on enumeration

```
i2cdetect -y 1        # see ATECC608 at 0x60
```

Expected: chip responds. Provision a test key via the `osr-crypto` provisioning tool.

### X4 — Fare gate (osr-afc)

Connect QR scanner + NFC reader to USB. Run the AFC gate simulator:

```
cargo run --release -p osr-afc --example gate-demo
```

Present a test QR code; present a test NFC token.

Expected: both decode + produce `FareAccepted` events within 100 ms.

### X5 — Ticket vending (osr-tvm)

Connect the receipt printer. Run:

```
cargo run --release -p osr-tvm --example tvm-demo
```

Drive a scripted purchase: scan product QR, submit mock mobile- money payment, confirm printed receipt.

Expected: receipt prints within 3 s of payment confirmation.

### X6 — Passenger information (osr-pis-station)

Connect the HDMI screen. Run:

```
cargo run --release -p osr-pis-station --example display-demo
```

Expected: next-arrival list displays; mock incoming MA updates refresh the arrival times.

### X7 — PSD controller (osr-psd)

With no physical PSD on the bench, use the crate's software-only simulator. Run:

```
cargo run --release -p osr-psd --example psd-demo
```

Expected: the five-state PSD FSM transitions correctly on simulated train-arrival + door-open / close events.

## X8 — Station SCADA

Launch:

```
cargo run --release -p osr-station-scada --example scada-demo
```

Simulate HVAC / lighting / escalator status inputs.

Expected: status dashboard populates; threshold alarms fire within one tick of exceeding setpoint.

## X9 — Sustained run

Run all five station crates simultaneously for 1 hour.

Expected: CPU load ≤ 30 %, RAM ≤ 1 GB, no process restarts.

# Bring-up report template

```
# S-SBC bring-up report

- Runbook commit: <hash>
- Date: <YYYY-MM-DD>
- CM5 serial: <nnn>

## Results
| Step | Status |
|---|---|
| X1 (boot)     | PASS / FAIL-\* |
| X2 (build)    | PASS / FAIL-\* |
| X3 (ATECC608) | PASS / FAIL-\* |
| X4 (AFC gate) | PASS / FAIL-\* |
| X5 (TVM)      | PASS / FAIL-\* |
| X6 (PIS)      | PASS / FAIL-\* |
| X7 (PSD)      | PASS / FAIL-\* |
| X8 (SCADA)    | PASS / FAIL-\* |
| X9 (1 h run)  | PASS / FAIL-\* |
```

# S-SBC bench assembly requirements

Repository source: `control-electronics/s-sbc/diy-assembly/README.md`

Status: bench integration reference; hardware BOM, image, wiring and qualification are open. The release checklist governs the assembly. Exact SKUs and total prices are not frozen; previous retail subtotals omitted integration parts.

| Block | Required detail before assembly release |
|---|---|
| Compute and carrier | Exact CM5 configuration, compatible carrier, storage and cooling; 5 V input supplied correctly |
| Field power | Approved input range, DC/DC, fuse/selectivity, surge/EMC, inrush and hold-up |
| I/O and network | External CAN controller/transceiver where required, Ethernet switching, isolation, termination and pin map |
| Security | Channel-local I2C secure element, provisioning and recovery process |
| Harness/enclosure | Mating connectors, contacts, terminals, ferrules, wire cut list, clamps, labels, grounding and thermal design |
| Output chain | Simulated loads for bench; qualified drivers, feedback and actuator interfaces before deployment |
| Firmware/image | Real target HAL/driver mapping, immutable build, configuration/signature hashes and measured startup behaviour |

Mean Well HDR-60-24 converts AC/high-voltage DC input to 24 V output. It may supply a suitable isolated laboratory or mains-fed wayside setup, but cannot convert a 24 V field bus to 5 V. Onboard hosts require protected DC/DC supplies. No wiring from a mains terminal is released here.

For the safety-host bench use the validated exposed-pin allocation as a proposed starting point and freeze any host-specific changes. SPI needs a digital isolator and controller/peripheral wiring; a USB isolator does not provide SPI or a direct link between two USB devices. Pico 2 GPIO30/31 and chip-package-only pins are not available on its header. Do not assume that a Pi CAN HAT independently serves both Pico channels.

For application/wayside/station hosts, the modem needs a compatible carrier and power/USB interface; multiple HATs require connector and pin conflict review. Size UPS, enclosure and converter loads from the complete host BOM. Application, station and wayside software disposition comes from deployment/components.toml; TACS runtime remains a reference tooling host until qualified hardware composition is released.

Confirm GPIO voltage domains, loss-of-power state, wiring continuity/insulation, bus timing, EMI, thermal soak, image boot and recorded self-test on the actual revision. Procurement, construction and train actuation require the released package, not this list.

# S-SBC v2 schematic specification

Repository source: `control-electronics/s-sbc/schematics/v2-spec/README.md`

Status: RFC 0007 v3 deliverable. Specification for the station / depot SBC per RFC 0007 §7.

## Scope

S-SBC hosts the station-tier and depot-tier crates, all SIL-2 or SIL-0 — station operation is not safety-critical because passenger safety on the platform is delegated to PSDs (SIL-4 hardware at the door itself) + station-staff supervision per RFC 0013 T2, with the interlocking handling train-side safety autonomously.

- `osr-psd` — PSD controller (SIL-2 logic; the SIL-4 mechanical interlock is inside each PSD unit).
- `osr-station-scada` — station SCADA / HMI.
- `osr-pis-station` — passenger-information displays.
- `osr-afc` — automatic fare collection logic.
- `osr-tvm` — ticket-vending-machine controller.
- `osr-historian` — metric ring-buffer storage (when station hosts a regional historian).
- `osr-cbm-backend` — deployment-side CBM for depot-adjacent S-SBCs.

At depots, the S-SBC also hosts the depot-automation crate that orchestrates overnight trainset movements (stall allocation, charging-pad assignment, pre-service brake tests).

## SoC

Raspberry Pi Compute Module 5 (BCM2712) on a commodity carrier — no custom baseboard required.

- 4-core Cortex-A76, 4–16 GB LPDDR4X.
- eMMC on-module.
- Wide availability, mature Linux, broad spares pool in target deployment markets.

S-SBC stays on the RPi CM5 (not Radxa RK3588S industrial) because station cabinets are temperature-controlled — the commercial OT3 temperature grade is sufficient indoors. For outdoor TVMs in extreme climates, deploy a Radxa CM5 drop-in replacement under the same carrier pinout (§3.2 of RFC 0007).

## Architecture

Non-safety, non-redundant per station. Typical station carries one S-SBC with cold-spare kept at the depot. If a station's S-SBC fails:

- PSDs lock open (fail-safe for passenger egress) per `osr-psd`'s PSD-controller contract.
- Fare gates default to open (paid-area unlocked).
- PIS displays show the emergency-only banner.
- OCC dispatches a maintainer per RFC 0013 T5 ticket.

Recovery is swap-in of the cold spare (5–15 minute task per RFC 0013 M5 depot procedure).

## Peripherals (commodity carrier)

| Peripheral | Qty | Purpose |
|---|---|---|
| Gigabit Ethernet | 2 | Backhaul to W-SBC + OCC; station-local PIS LAN |
| USB 3.0 | 4 | TVMs, fare gates, PSD console |
| HDMI | 2 | Station-master console + PIS display (small stations) |
| MIPI-CSI | 2 | Station-monitoring cameras |
| microSD | 1 | Boot image (eMMC is primary) |
| ATECC608B (optional) | 1 | Trust anchor for station-originated consensus entries (e.g., PSD-state) |
| 12/24 V DC input | 1 | Either building DC or adapter from 230 VAC mains |

## Power budget

| Rail | Voltage | Max power |
|---|---|---|
| CM5 core + RAM | 5 V | ~10 W |
| USB downstream (TVM, gates) | 5 V | ~8 W (at 2 × TVM idle) |
| Camera MIPI-CSI | 3.3 V | ~1 W |
| Fans, lights | 12 V | deployment-specific |
| Baseboard total | — | ~20 W sustained |

Cooling: natural-convection in a temperature-controlled station equipment room. Fan-forced air in TVM outdoor kiosks.

## Environment

- Typical: indoor station equipment room, 0–45 °C.
- Outdoor TVM: −10 to +55 °C with sun-shield; consider Radxa drop-in for the RK3588S industrial-temp variant if local climate is harsher than that.
- IP43 for indoor cabinet, IP65 for outdoor TVM.

## Form factor

Commodity off-the-shelf RPi CM5 IO Board (official Raspberry Pi carrier) is sufficient for most deployments. A custom low-cost carrier is v3.1 if a particular deployment wants a single integrated SKU.

## Target BOM

~€150 per board total (CM5 ≈ €85 + commodity carrier ≈ €65).

## Expected v2-spec file set

- `block-diagram.md` — functional block diagram.
- `power-budget.md` — station + depot power profile.
- `connector-tables.md` — HMI + PIS + fare-gate connector pinouts.
- `deviations-log.md` — design-review notes.

No safety-nets.md because S-SBC does not drive any SIL-4 actuator — the PSD SIL-4 interlock is inside the PSD hardware, not on this board.

# Safety-controller selection gate

Repository source: `control-electronics/safety-controller-selection.md`

OSR has not frozen a revenue-service safety MCU. Raspberry Pi and Radxa hosts remain the inexpensive pilot and non-safety application baseline; they are not the certification rationale for a SIL-4-target function.

## Required selection envelope

A deployment safety controller must be selected with the independent safety assessor and demonstrate:

- manufacturer safety manual, diagnostic-coverage evidence and FMEDA inputs;
- lifecycle and supply assurance appropriate to the fleet life;
- independent watchdog, power, clock, I/O isolation and fail-safe output path;
- a justified redundancy, diversity and common-cause strategy at system level;
- qualified compiler/runtime, traceable configuration and hardware-in-loop tests;
- environmental, EMC, vibration and board-level evidence for the actual host.

No MCU establishes SIL-4 by part number alone. SIL capability, hardware fault tolerance and systematic capability must be argued for the complete subsystem.

## Candidate families—not a supplier freeze

| Family | Appropriate use | Available manufacturer evidence | v0.3 decision |
|---|---|---|---|
| Infineon AURIX TC3xx | Candidate safety channel for train or wayside controller | IEC 61508 SIL 3 / ISO 26262 ASIL D capability, safety manual and FMEDA support package | Shortlist; assessor and lifecycle review required |
| TI Hercules TMS570/RM | Candidate safety channel, including long-lifecycle variants | Dual lockstep cores, ECC/BIST and IEC 61508 SIL 3 collateral | Shortlist; assessor and lifecycle review required |
| Raspberry Pi RP2350 | Software bring-up, low-cost I/O rigs and prototype 2oo2 experiments | Public datasheet; two processor sockets each boot-select Cortex-M33 or Hazard3, with the unused implementation held in reset | Prototype only; not the default certification baseline |

Primary manufacturer references:

- Infineon AURIX TC3xx functional-safety documentation
- Infineon IEC 61508 certification support
- TI TMS570 safety manual
- Raspberry Pi RP2350 datasheet

For the v0.3 pilot, the existing RP2350 boards remain useful evidence rigs. For a revenue-service design, the operator records the selected channels, safety package revision and architectural rationale in its controlled hardware baseline. CM5/Radxa processors may host diagnostics, logging and applications, but cannot bypass or command a safety output.

## Development redundancy default

The controlled policy requires two logical protection channels: both permit, either trips, and loss stops the affected function. Train A/B software processes share code, sensor fixtures, host, clock and a synthetic comparator; they do not establish independent hardware or availability after a channel failure. Remaining local pairs are explicitly open. Reconcile existing hot-standby boards/two-MCU quantities with real serials, power domains, firmware, calibration, independent watchdogs and output feedback at hardware freeze. No process count is an installed BOM.

# T-ECU/A — Train Application

Repository source: `control-electronics/t-ecu-a/README.md`

Role: Host for the SIL-2 / SIL-0 onboard crates — `osr-ato`, `osr-tcms`, `osr-pis-onboard`, `osr-hvac`, `osr-lighting`, `osr-aux-power`, `osr-event-recorder`, `osr-regen`, `osr-hot-axle`, `osr-cbm-onboard`, `osr-t2g`, `osr-tcn`.

Canonical `light-metro-3car` fit: 2 boards per trainset, one in the A-end electronics cabinet and one in the B-end electronics cabinet. T-ECU/A is single-redundant and non-safety; the T-ECU/S + T-OBS safety chain continues without it.

Environment: EN 50155 OT4, single-redundant.

## SoC

Raspberry Pi CM5 (BCM2712, Cortex-A76 4-core, 4–16 GB LPDDR4X, eMMC on-module) on a custom baseboard. Radxa CM5 (RK3588S) is the pin-compatible drop-in via the same SO-DIMM footprint — only the device-tree blob changes. Operators may source whichever module is locally stocked.

See RFC 0007 §5.

## Peripherals

| Peripheral | Qty | Purpose |
|---|---|---|
| TSN Ethernet | 2 | TCN-E A/B |
| CAN-FD | 2 | HVAC + lighting |
| USB-C host+device | 2 | Depot console + diag loader |
| HDMI | 1 | Commissioning display |
| USB 2.0 | 2 | Diagnostics and PIS service |
| M.2 2280 NVMe | 1 | Event recorder + OTA staging |
| M.2 2230 Cat.22 5G | 1 | TRG-1 primary radio |
| LoRa SX1276 on SPI | 1 | TRG-2 backup radio |
| SPI bridge to T-ECU/S | 1 | One-way feed from the safety board |
| ATECC608B SE | 1 | Trust anchor |

## Form factor

160 × 100 mm Eurocard (same DIN slot as T-ECU/S). Heatsink  enclosure conduction cooling, no fans.

## Target BOM

~€220 per board (CM5 ≈ €85, baseboard ≈ €75, radios ≈ €60). The consist-level procurement quantity is tracked in `../rolling-stock-integration.md` and line E2 of the rolling-stock BOM.

## Status

- Pilot / DIY track: `diy-assembly/` uses a stock RPi CM5 IO Board + Waveshare M.2 HAT + generic Cat.22 5G M.2 module to validate peripheral enumeration before any custom baseboard is drawn. Integration evidence is still pending.
- Custom-board track: `schematics/v2-spec/` is the board-level v2 specification overview and block diagram. `gerbers/` and `bom/` remain pending until a KiCad layout and board BOM are released.

# T-ECU/A bring-up — Raspberry Pi CM5 IO Board

Repository source: `control-electronics/t-ecu-a/bring-up.md`

Goal: validate the application-tier host runs every non-safety onboard crate and the TCN-E + TRG radios enumerate on a stock CM5 carrier.

## Dev kits + parts

| Part | Qty | Notes |
|---|---|---|
| Raspberry Pi CM5 (4 GB + 32 GB eMMC) | 1 | |
| Raspberry Pi CM5 IO Board | 1 | |
| M.2 Hat+ (Waveshare or Pimoroni) | 1 | For NVMe + 5G modem. |
| NVMe SSD 256 GB | 1 | Event recorder ring buffer target. |
| Cat.22 5G M.2 module (unlocked) | 1 | TRG-1 primary radio. |
| LoRa SX1276 breakout on SPI | 1 | TRG-2 backup radio. |
| Mikroe CAN-FD Click 3 (x2) | 2 | Onto the IO Board's mikroBUS slots. |
| USB-C PD 5V/3A supply | 1 | |

## Steps

### A1 — Boot mainline Debian

1. Write Debian 13 `arm64` (with RPi kernel) to the CM5 eMMC via `rpiboot`.
2. First-boot: set hostname `tecus-devkit`, expand rootfs to NVMe.
3. Install Rust toolchain: `curl ... | sh`, `rustup default stable`.

Expected: ssh login within 60 s of power-on.

### A2 — Clone + build the workspace

```
git clone https://github.com/modernecotech/OpenSourceRail.git
cd OpenSourceRail
cargo build --release --workspace
```

Expected: clean build; 46 crates compile. Wall-clock ≤ 20 min on a 4 GB CM5.

### A3 — Enumerate peripherals

Confirm each peripheral shows up in the kernel:

```
ip link show               # two Ethernet interfaces
ls /sys/class/net          # eth0, eth1
lspci                      # NVMe, 5G M.2
ls /dev/ttyAMA*            # UARTs
ls /dev/spidev*            # SPI buses
ls /sys/bus/i2c/devices    # I2C (TCN-E + ATECC608)
```

Tick each off in the report. Missing devices  check device-tree overlay; common culprit is missing `dtoverlay=pcie2-1lane` or equivalent in `config.txt`.

### A4 — TCN-E mock loopback

```
cargo test -p osr-tcn --lib -- --nocapture
cargo test -p osr-tcn --test roundtrip_single_payload -- --nocapture
```

Expected: both green. The UDP-over-loopback path (RFC 0006 v1.5) is the surrogate for the eventual TSN link.

### A5 — TRG-1 (5G) bring-up

Insert the 5G module into the M.2 slot. Install `ModemManager` and `NetworkManager`.

1. Confirm `mmcli -L` lists the modem.
2. Activate a test APN: `mmcli -m 0 --simple-connect="apn=..."`.
3. Confirm IPv4 connectivity to a public endpoint.

Expected: working PDP context within 60 s of modem boot.

Carrier choice: bring-up is carrier-agnostic. For deployment use, the `osr-t2g` SIM-profile spec (RFC 0005 §3.2) handles the operator's choice.

## A6 — TRG-2 (LoRa) bring-up

Connect SX1276 breakout to SPI0.

1. Build the `osr-t2g` diagnostic binary.
2. Run `osr-t2g-diag --link lora --tx-power 14dbm --channel 868.1`.
3. Confirm a second LoRa node (can be another dev board) receives the test packets with RSSI ≥ −110 dBm at 50 m line-of-sight.

Expected: ≥ 99 % packet delivery at 10 Hz test rate.

## A7 — CAN-FD bus test

Install two CAN-FD Clicks on the mikroBUS slots. Connect via a CAN-FD transceiver test harness.

1. `ip link set can0 up type can bitrate 500000 dbitrate 2000000 fd on`.
2. `cansend can0 100##1.01020304`.
3. `candump can0` on the second Click receives the frame.

Expected: no frame loss at 1 kHz for 5 minutes.

## A8 — Shadow onboard stack in `osr-sim`

From the workspace:

```
cargo run --release --bin osr-sim -- \
    --scenario cities/catalogue/west-asia/Iraq/Samawah/samawah.toml --duration 900 --status-every 60
```

Expected: the shadow onboard stack ran on every tick on the CM5, consuming ≤ 20 % CPU, with zero invariant violations.

## A9 — Event recorder

```
osr-event-recorder-cli --tail 100 /var/log/osr/event.bin
```

Expected: the last 100 TCN-E frames from step A4 are extractable. Ring buffer is working.

# T-ECU-A bench assembly requirements

Repository source: `control-electronics/t-ecu-a/diy-assembly/README.md`

Status: bench integration reference; hardware BOM, image, wiring and qualification are open. The release checklist governs the assembly. Exact SKUs and total prices are not frozen; previous retail subtotals omitted integration parts.

| Block | Required detail before assembly release |
|---|---|
| Compute and carrier | Exact CM5 configuration, compatible carrier, storage and cooling; 5 V input supplied correctly |
| Field power | Approved input range, DC/DC, fuse/selectivity, surge/EMC, inrush and hold-up |
| I/O and network | External CAN controller/transceiver where required, Ethernet switching, isolation, termination and pin map |
| Security | Channel-local I2C secure element, provisioning and recovery process |
| Harness/enclosure | Mating connectors, contacts, terminals, ferrules, wire cut list, clamps, labels, grounding and thermal design |
| Output chain | Simulated loads for bench; qualified drivers, feedback and actuator interfaces before deployment |
| Firmware/image | Real target HAL/driver mapping, immutable build, configuration/signature hashes and measured startup behaviour |

Mean Well HDR-60-24 converts AC/high-voltage DC input to 24 V output. It may supply a suitable isolated laboratory or mains-fed wayside setup, but cannot convert a 24 V field bus to 5 V. Onboard hosts require protected DC/DC supplies. No wiring from a mains terminal is released here.

For the safety-host bench use the validated exposed-pin allocation as a proposed starting point and freeze any host-specific changes. SPI needs a digital isolator and controller/peripheral wiring; a USB isolator does not provide SPI or a direct link between two USB devices. Pico 2 GPIO30/31 and chip-package-only pins are not available on its header. Do not assume that a Pi CAN HAT independently serves both Pico channels.

For application/wayside/station hosts, the modem needs a compatible carrier and power/USB interface; multiple HATs require connector and pin conflict review. Size UPS, enclosure and converter loads from the complete host BOM. Application, station and wayside software disposition comes from deployment/components.toml; TACS runtime remains a reference tooling host until qualified hardware composition is released.

Confirm GPIO voltage domains, loss-of-power state, wiring continuity/insulation, bus timing, EMI, thermal soak, image boot and recorded self-test on the actual revision. Procurement, construction and train actuation require the released package, not this list.

# T-ECU/A v2 schematic specification

Repository source: `control-electronics/t-ecu-a/schematics/v2-spec/README.md`

Status: RFC 0007 v3 deliverable (partial). This folder holds the board-level specification (net list, pinouts, power budget, connector tables) for the T-ECU/A v2 application-tier ECU per RFC 0007 §5.

KiCad capture + gerbers + BOM are v3.1, deferred alongside T-ECU/S and T-OBS.

## Scope

T-ECU/A hosts the SIL-2 + SIL-0 onboard application crates:

- `osr-ato` — Automatic Train Operation (GoA 4 default).
- `osr-tcms` — Train Control and Management System.
- `osr-event-recorder` — black-box circular storage.
- `osr-tcn` — TSN Ethernet trainbus (RFC 0006).
- `osr-t2g` — train-to-ground radio adapter.
- `osr-regen`, `osr-aux-power`, `osr-hvac`, `osr-lighting` — comfort + auxiliary systems.
- `osr-pis-onboard` — passenger information displays.
- `osr-hot-axle` — onboard hot-axle-box advisory (SIL-2).
- `osr-cbm-onboard` — condition-based-maintenance telemetry.

## Architecture

Single-redundant at each end: the standard trainset fit carries two T-ECU/A units, one behind each nose. Unlike T-ECU/S this is not 2oo2: its crates are non-safety-critical. A failure of one T-ECU/A degrades comfort (HVAC, lighting, PIS) and costs diagnostics visibility, but the safety chain (T-ECU/S + T-OBS + brake relay stage) continues to function.

| Block | Qty | Role |
|---|---|---|
| RPi CM5 / Radxa CM5 | 1 | Application processor (4-core A76, 4–16 GB LPDDR4X) |
| TSN Ethernet switch | 1 | 88E6321 — redundant TCN-E A/B |
| CAN-FD transceivers | 2 | HVAC bus + lighting bus (TCAN1462) |
| 5G modem socket | 1 | M.2 Cat.22 — TRG primary |
| LoRa radio | 1 | SX1276 on SPI — TRG backup |
| NVMe slot | 1 | M.2 2280 for event recorder + OTA staging |
| USB-C | 2 | Depot console + diag loader |
| HDMI | 1 | Commissioning display output |
| ATECC608B | 1 | Trust anchor |
| Power input | 1 (redundant) | 24 V DC from aux bus |

## Power budget (target)

| Rail | Voltage | Load | Max power |
|---|---|---|---|
| CM5 core | 5 V | CM5 + RAM under load | ~12 W |
| 3.3 V | 3.3 V | Ethernet PHY + CAN + ATECC | ~2 W |
| 1.8 V | 1.8 V | MIPI + TSN | ~1 W |
| 5G radio | 5 V | M.2 modem at full tx | ~8 W |
| LoRa | 3.3 V | SX1276 tx | ~0.5 W |
| Total at 24 V in | — | — | ~28 W peak, ~18 W sustained |

Natural-convection cooling. Conduction path to DIN rail chassis for the CM5 heatsink. No fans.

## Environment

- EN 50155 OT4 (-25 °C to +70 °C with +85 °C 10-minute peak).
- IP54 enclosed; DIN-rail mount.
- Conformal coated (MG Chemicals 419).

## Form factor

160 × 100 mm Eurocard — same footprint as T-ECU/S so a cabinet slot can host either without re-mounting.

## Target BOM

~€220 per board (CM5 ≈ €85, baseboard ≈ €75, radios ≈ €60 volume).

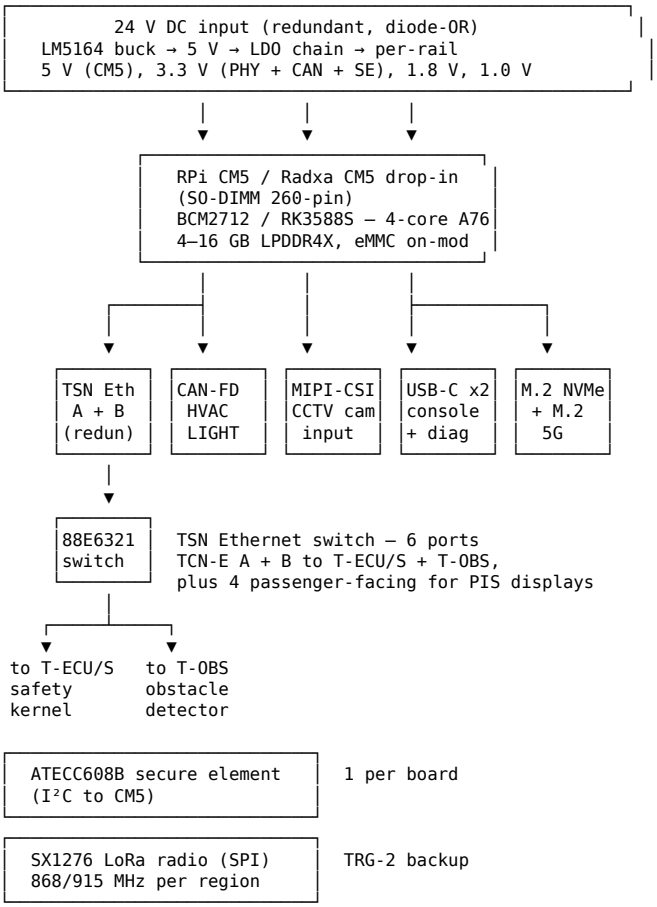
## Expected v2-spec file set

- `block-diagram.md` — functional block diagram.
- `power-budget.md` — rail-by-rail load + headroom.
- `pinout-cm5.md` — CM5 SO-DIMM pin assignments.
- `connector-tables.md` — external M12 + FFC pinouts.
- `deviations-log.md` — design-review notes.

This README provides the summary; individual files fill in per-block detail as the v2-spec milestone matures.

# T-ECU/A v2 — block diagram

Repository source: `control-electronics/t-ecu-a/schematics/v2-spec/block-diagram.md`



## Block inventory

| Block | Ref | Purpose |
|---|---|---|
| Power input A | J1 | 24 V DC primary |
| Power input B | J2 | 24 V DC redundant |
| Main buck | U1 | LM5164 245 V, 4 A |
| LDO 3.3 V | U2 | TPS7A52 53.3 V for PHY/CAN/SE |
| LDO 1.8 V | U3 | For MIPI + TSN PHY |
| CM5 module | U4 | RPi CM5 on SO-DIMM (Radxa CM5 pin-compatible) |
| TSN switch | U5 | Marvell 88E6321 — 6-port TSN-capable |
| Ethernet PHY ×2 | U6, U7 | 88E1512 on TSN A/B uplink to T-ECU/S |
| CAN transceiver A | U8 | TCAN1462 — HVAC bus |
| CAN transceiver B | U9 | TCAN1462 — lighting bus |
| USB hub | U10 | USB 3.1 Gen 1 — depot console + diag loader |
| M.2 slot (NVMe) | M1 | 2280 — event recorder ring buffer |
| M.2 slot (5G) | M2 | 2230/3042 Cat.22 modem |
| LoRa radio | U11 | SX1276 on SPI from CM5 |
| ATECC608B | U12 | Trust anchor, I²C |
| HDMI header | J3 | Commissioning display output |
| TSN connector A | J4 | M12 X-code — TCN-E A |
| TSN connector B | J5 | M12 X-code — TCN-E B |
| USB-C | J6, J7 | Depot console + diagnostics |
| M.2 antenna ports | J8, J9 | 5G (4 × 4 MIMO) |
| LoRa antenna | J10 | 868/915 MHz |

## Non-safety architecture

T-ECU/A is single-redundant, not 2oo2. A failure degrades comfort and diagnostics but not safety:

- TCMS stops publishing rollup state  OCC supervisor sees "trainset silent" and dispatches recovery per RFC 0013 C1.3.
- HVAC fails  passenger discomfort, not a safety event.
- Event recorder fails  forensic gap, recoverable from the T-ECU/S black-box mirror.
- TRG silent  `osr-atp` continues on the last-known MA until the validity window expires, then trips EB.

The safety chain (T-ECU/S + T-OBS + W-SBC interlocking) does not depend on T-ECU/A being healthy.

# T-ECU/S — Train Safety Kernel

Repository source: `control-electronics/t-ecu-s/README.md`

Role: Host for the SIL-4 onboard crates — `osr-atp`, `osr-odometry`, `osr-brake`, `osr-bms`, `osr-fire-safety`, `osr-derailment`, `osr-door-control`, `osr-traction` (MCU bring-up only).

Canonical `light-metro-3car` fit: 2 boards per trainset, one in the A-end electronics cabinet and one in the B-end electronics cabinet. The train-level role is one primary + one hot-standby per consist; neither unit depends on a driver cab being present.

Environment: EN 50155 OT4 (−40…+85 °C), IEC 61373 Cat 1 Class B, EN 50121-3-2 EMC.

## Pilot 2-out-of-2 evidence rig

The current low-cost board carries two Raspberry Pi RP2350 MCUs in a 2oo2 voting arrangement. Both chips receive the same sensor inputs on separate pins, both run identical Rust `no_std` code, both outputs are AND-gated through an external 2oo2 relay network. Each tick they cross-check their computed safety decisions over SPI; on mismatch, both chips fail-safe open and a hardware watchdog asserts the emergency brake relay directly.

This is useful for software, I/O and fail-safe-output experiments. It does not by itself establish SIL-4: identical devices/software carry systematic and common-cause obligations. Revenue-service hardware must pass the `safety-controller-selection.md` gate.

## SoC picks

- Prototype MCU × 2: Raspberry Pi RP2350. Two processor sockets; each selects Cortex-M33 or Hazard3 at boot while the unused implementation is held in reset. 520 KB SRAM, 150 MHz, TrustZone-M, HW RNG. ~€1.10 in 1k volume. QFN-56 0.4 mm pitch — routine SMT.
- App processor × 1: Raspberry Pi CM5 (BCM2712). Hosts TCN-E, logging, OTA, event recorder — never on the safety path. Subscribes to a one-way SPI feed from the RP2350 pair.

## Peripherals

| Peripheral | Qty | Purpose |
|---|---|---|
| CAN-FD | 4 | Door, brake, traction, BMS (each on both RP2350s) |
| TSN Ethernet (CM5 + KSZ9031 PHY) | 2 | TCN-E A/B |
| Isolated DI | 8 | Plunger, cab, depot enable, deadman (routed to both RP2350s) |
| Isolated DO | 4 | EB relay, traction cut, park, fire (via 2oo2 relay stage) |
| Tach inputs (quadrature 5–24 V) | 2 | Wheel encoders (both RP2350s) |
| Bosch BMI088 IMU | 1 | Derailment + odometry, SPI (both RP2350s) |
| u-blox NEO-F10N GNSS | 1 | UART to CM5 |
| PN5180 NFC balise reader | 1 | SPI to CM5 |
| PT100 thermistors | 4 | Battery, traction, HVAC, ambient |
| Microchip ATECC608B SE | 2 | Trust anchor per RP2350 |

## Form factor

160 × 100 mm Eurocard, DIN-rail mount, conduction-cooled. No fans. Conformal-coated (MG Chemicals 419) before integration. IP54.

## Target BOM (volume 100+)

~€280 per prototype board. This is a pilot estimate, not the frozen revenue-service safety-controller cost. The consist-level quantity is tracked in `../rolling-stock-integration.md` and line E1 of the rolling-stock BOM.

## Status

- Pilot / DIY track: `diy-assembly/` uses two Raspberry Pi Pico 2 boards (each carrying one RP2350) in a 2oo2 test jig, plus a stock RPi CM5 IO Board for the app processor. Boots `osr-atp` + `osr-brake` + `osr-odometry` + the SPI cross-check harness. Integration evidence is still pending.

- Custom-board track: `schematics/v2-spec/` is the board-level v2 specification: block diagram, power budget, connector tables, CM5/RP2350 pinouts, and safety-net rules. `gerbers/` and `bom/` remain pending until a KiCad layout and board BOM are released.

# T-ECU/S bring-up — two Raspberry Pi Pico 2 boards in 2oo2

Repository source: `control-electronics/t-ecu-s/bring-up.md`

Goal: validate that the RFC 0007 §4 2oo2 safety architecture works on real silicon before we draw the custom baseboard. After this runbook, a pair of Pico 2 boards runs `osr-atp` + `osr-brake` + `osr-odometry` in composite fail-safe mode with per-tick SPI cross-check.

## Dev kits + parts

| Part | Qty | Notes |
|---|---|---|
| Raspberry Pi Pico 2 | 2 | Each carries one RP2350 — the safety MCU. |
| ST-Link V3 or Pico probe | 2 | SWD debugger per Pico. |
| Breadboard + jumpers | 1 set | SPI cross-link + shared inputs. |
| 3-phase quadrature encoder sim | 1 | Can be an Arduino-generated square-wave pair. |
| BMI088 breakout | 1 | Feeds both Picos via separate SPI chip selects. |
| 24 VDC bench supply | 1 | Via an ADuM isolator IC for input simulation. |
| Relay 2oo2 stage (optional) | 1 | Two SPDT relays in AND — validates the final actuator gating. |

## Steps

### S1 — Build the harness

Wire each Pico to:

- Shared inputs (both Picos read the same signal, on separate pins): one pulse input (sim wheel tach), one digital input (sim emergency plunger), IMU chip-select line.
- Private SPI cross-check link: Pico-A SPI0  Pico-B SPI0 (CLK, MOSI, MISO, CS). ~1 MHz clock.
- Debug UART: each Pico's UART0 to a USB-serial adapter for log capture.

Write the topology into the bring-up report at step R0.

### S2 — Flash the Pico test firmware

From the workspace:

```
cargo build --release --target thumbv8m.main-none-eabihf \
  --bin tecus-bringup
```

(The `tecus-bringup` binary is a dev-only test harness in `deployments/devkit/tecus-bringup/` — planned for landing alongside this runbook; for v1 of this document the binary is a future session's deliverable.)

Flash each Pico with the same binary via SWD. Both Picos boot into the identical code path; 2oo2 runs at identical-software redundancy.

Expected: green LED blinks at 1 Hz on both Picos. Red LED off.

FAIL-HW if either Pico fails to boot: replace Pico. FAIL-SW if the binary fails to flash: check toolchain pin.

### S3 — Verify the SPI cross-check

Connect a logic analyser between the two Picos on the SPI lines.

1. Power both Picos.
2. In the analyser, expect a message exchange every 10 ms: frame format is `[seq: u32][osr_atp_output: u32][osr_brake_output: u32][crc16: u16]`.
3. Ground-truth: both messages must match byte-for-byte after the first 5 exchanges.

PASS: 100 consecutive 10 ms frames match.

FAIL-SW if frames diverge: inspect the `tecus-bringup` log output via UART; there will be a divergence report.

### S4 — Simulate an input disagreement

On the harness, break one of the shared input lines — e.g. cut the wire to Pico-B's wheel-tach input.

Expected within 100 ms: both Picos:

1. Halt their computed brake output (emit `BrakeCommand::Emergency`).
2. Drop their relay-drive outputs.
3. The relay 2oo2 stage (if wired) opens, releasing the test brake pressure.
4. Both Picos' red LEDs solid.

PASS: emergency-brake actuation within 100 ms of the input disagreement.

FAIL-SW if either Pico keeps driving its output: bug in the cross-check invariant — file against `osr-atp` + `osr-brake`.

## S5 — Verify the wheel-tach input

Drive the shared pulse input at 500 Hz (≈ 4.2 m/s with a 410 pulses/m calibration).

Expected: UART log from both Picos shows `odom.speed_mmps ≈ 4200`; the two speeds must match within 50 mm/s.

FAIL-SW if speeds diverge > 50 mm/s with identical input: likely a timing-quantization bug — file against `osr-odometry`.

## S6 — Verify the emergency plunger

Assert the sim plunger input.

Expected: both Picos immediately command `BrakeCommand::Emergency` on their output pins. The 2oo2 AND gate in the harness sees both high  drives the relay drop  test brake applies.

PASS: relay drop latched within 50 ms.

## S7 — CM5 handshake (optional)

If an RPi CM5 IO Board is also present, wire an SPI-slave link between Pico-A and the CM5. Boot the CM5 with the app-side bring-up test binary.

Expected: CM5 receives the same per-tick cross-check messages over SPI and logs them in JSON to `/var/log/osr/ecus.log`. This proves the one-way safety  app data path (RFC 0007 §4.2).

## S8 — Performance envelope

Run the 2oo2 cross-check harness for 1 hour. Measure:

- Cross-check message rate: must stay at 100 Hz ± 1 Hz.
- Missed frames: 0.
- Cross-check mismatches: 0.
- Average tick jitter: ≤ 1 ms.

A 1-hour clean run is the "boot certifiable" bar for the v2 baseboard proceed-gate.

# T-ECU-S bench assembly requirements

Repository source: `control-electronics/t-ecu-s/diy-assembly/README.md`

Status: bench integration reference; hardware BOM, image, wiring and qualification are open. The release checklist governs the assembly. Exact SKUs and total prices are not frozen; previous retail subtotals omitted integration parts.

| Block | Required detail before assembly release |
|---|---|
| Compute and carrier | Exact CM5 configuration, compatible carrier, storage and cooling; 5 V input supplied correctly |
| Field power | Approved input range, DC/DC, fuse/selectivity, surge/EMC, inrush and hold-up |
| I/O and network | External CAN controller/transceiver where required, Ethernet switching, isolation, termination and pin map |
| Security | Channel-local I2C secure element, provisioning and recovery process |
| Harness/enclosure | Mating connectors, contacts, terminals, ferrules, wire cut list, clamps, labels, grounding and thermal design |
| Output chain | Simulated loads for bench; qualified drivers, feedback and actuator interfaces before deployment |
| Firmware/image | Real target HAL/driver mapping, immutable build, configuration/signature hashes and measured startup behaviour |

Mean Well HDR-60-24 converts AC/high-voltage DC input to 24 V output. It may supply a suitable isolated laboratory or mains-fed wayside setup, but cannot convert a 24 V field bus to 5 V. Onboard hosts require protected DC/DC supplies. No wiring from a mains terminal is released here.

For the safety-host bench use the validated exposed-pin allocation as a proposed starting point and freeze any host-specific changes. SPI needs a digital isolator and controller/peripheral wiring; a USB isolator does not provide SPI or a direct link between two USB devices. Pico 2 GPIO30/31 and chip-package-only pins are not available on its header. Do not assume that a Pi CAN HAT independently serves both Pico channels.

For application/wayside/station hosts, the modem needs a compatible carrier and power/USB interface; multiple HATs require connector and pin conflict review. Size UPS, enclosure and converter loads from the complete host BOM. Application, station and wayside software disposition comes from deployment/components.toml; TACS runtime remains a reference tooling host until qualified hardware composition is released.

Confirm GPIO voltage domains, loss-of-power state, wiring continuity/insulation, bus timing, EMI, thermal soak, image boot and recorded self-test on the actual revision. Procurement, construction and train actuation require the released package, not this list.

# T-ECU-S board design requirements

Repository source: `control-electronics/t-ecu-s/schematics/v2-spec/README.md`

Status: reference integration requirements; exact supplier BOM, schematic capture, pin/connector freeze, enclosure/thermal design and qualification evidence are open. This is not sufficient information to fabricate a railway control board.

| File | Current purpose |
|---|---|
| block-diagram.md | Functional paths and remaining common-cause boundaries |
| power-budget.md | Capacity calculation or required complete load study; no released converter/fuse rating |
| pinout-rp2350.md | Exposed-pin bench allocation or custom-board allocation requirements |
| connector-tables.md | Interface/harness schedule; supplier cavities and exact connector variants open |
| safety-nets.md | Hardware watchdog, permission/feedback and end-to-end fault contract |

See reference integration, host bench requirements and release checklist. T-ECU/S additionally carries CM5 carrier requirements in its own folder.

A custom-board release needs the actual KiCad schematic/layout, ERC/DRC, controlled fabrication/BOM files, supplier interfaces and instrumented bring-up/fault/thermal/EMC evidence. Create fabrication directories when those artifacts exist. Do not manufacture from historical guessed pinouts or treat passing software/library tests as hardware acceptance.

# T-ECU/S reference functional diagram

Repository source: `control-electronics/t-ecu-s/schematics/v2-spec/block-diagram.md`

```
Actual auxiliary bus -> protected channel A power -> evaluator A + external watchdog A
                     -> protected channel B power -> evaluator B + external watchdog B
                     -> protected application branch -> CM5 carrier

Qualified field sensors and external bus controllers -> validated timestamped A/B ingress
Evaluator A <-> isolated peer cross-check <-> evaluator B
Local permission AND watchdog health -> independent driver A / driver B
Series monitored contacts -> qualified brake / traction actuator interface
Contact feedback / power monitoring -> fault latch and event recording
```

This is a requirements diagram. Shared inputs, grounds, buses and application-derived data remain common-cause paths requiring analysis. Native Pico CAN/RMII, fictitious CM5 SODIMM wiring, single-voltage-detector watchdogs and unqualified relay lifetime/safety claims are withdrawn. See power, MCU allocation, carrier, harness and fault contract.

# T-ECU/S external interface schedule

Repository source: `control-electronics/t-ecu-s/schematics/v2-spec/connector-tables.md`

Status: connector series and cavity-by-cavity harness drawings open. The earlier invented HSD/M12 pin tables are not a compatible train harness release.

| Interface | Required design record |
|---|---|
| Power A/B | Actual bus range, protected input, connector/current/derating, return/earth, mating halves and fuse coordination |
| Safety output A/B | Driver/series contact/feedback nets, actuator polarity and load, loss-of-power truth table |
| Brake/traction/door/fire and field inputs | Supplier signal/voltage, isolation, diagnostic coverage, channel topology and protected harness |
| CAN-FD | External controller/transceiver, termination, speed/topology, shield and supplier connector |
| Redundant network | Full Ethernet pair map, switch/controller topology, actual connector; Gigabit copper needs four pairs |
| Tachometer/IMU/temperature | Actual sensor type, excitation and data interface, protection, shielding and calibrated transfer |
| Recovery/debug | Separate keyed SWD/UART/USB interfaces, voltage, access controls and approved recovery role |

Every connector record needs part/variant, mating half, cavity view, terminal/seal, wire ID/gauge/length, shield/chassis termination, pull/reset state and continuity/insulation test. Do not share a debug header, shield or ground path across safety channels without reviewing the resulting fault path. Vendor diagrams and the actual protection study control pin assignment and rating.

See MCU allocation, carrier interface, output contract and bench workflow.

# T-ECU/S application carrier interface requirements

Repository source: `control-electronics/t-ecu-s/schematics/v2-spec/pinout-cm5.md`

CM5 uses dual 100-pin connectors, not a 260-pin DDR4 SODIMM. Use the official module/carrier documentation and exact selected module revision; none of the previous fictitious connector pin assignments release a PCB. The official CM5IO provides one Gigabit Ethernet port. A redundant train network needs an explicitly designed second interface or suitable switch/controller topology, not two assumed native Ethernet MACs.

Define carrier power/boot/recovery, storage variant, Ethernet topology, buses, GPIO voltage domains, clock/reset, debug and isolation in a controlled interface drawing. I2C secure elements and PCIe/USB peripherals need supported buses, driver/role mapping and a bandwidth/power budget. SPI peripheral/slave support and one-way isolation must be proven on the chosen host/driver; controller direction or an isolator alone does not prove that application faults cannot affect protection.

Freeze boot permissions, supply sequencing and output inhibition from actual module reset/power signals. The prior 2 ms MCU and 60 s Linux boot numbers are not acceptance limits. Timing comes from measured revision-specific evidence. Protect access to boot/recovery and keys; record image and configuration hashes.

Official CM5 hardware, power requirements, safety contract.

# T-ECU/S MCU allocation requirements

Repository source: `control-electronics/t-ecu-s/schematics/v2-spec/pinout-rp2350.md`

Status: exact custom-board pin allocation open. The prior native CAN0/CAN1, SPI2, dedicated PIO pins and package-independent output map are withdrawn. RP2350 uses GPIO-multiplexed supported peripherals; PIO state machines do not add physical pins. External CAN-FD controllers and transceivers are required. ATECC608B uses its selected I2C/single-wire interface, not SPI.

The Pico 2 bench allocation is an exposed-pin example for peer SPI, I2C trust element, external CAN controller, permission and watchdog functions. It belongs to the T-OBS bench; T-ECU/S must additionally allocate IMU, tachometers, brake/traction/door/fire inputs, feedback and temperature sensing. Freeze a host-specific resource map before wiring.

The board designer must provide: package and silicon revision; pin/pad/header views; alternate function; direction and voltage domain; reset pull/state; controller/peripheral role; isolation; required peripheral/interrupt/DMA resources; channel A/B separation; harness/net identity; and test point. Validate that each required function has a physical pin and that pins, hardware peripherals and interrupt resources are not allocated twice.

Do not copy the Pico header into a custom RP2350A/B board or add cab/deadman functions to the cableless train without an approved requirement. Permission outputs default low, with external watchdog inhibition and contact feedback; see safety contract. Firm deadline and fault tests bind the released HAL to the exact board revision.

Primary source: Raspberry Pi chip documentation.

# T-ECU/S host power design requirements

Repository source: `control-electronics/t-ecu-s/schematics/v2-spec/power-budget.md`

The former chip-level budget and converter/inrush claims are withdrawn as a complete host design. A CM5IO carrier alone has a 5 V / 5 A input envelope; dual MCU boards, secure elements, external bus controllers, isolators, relay drivers, watchdogs and field I/O must be added. The T-OBS sizing calculation provides a reproducible example; its sensor loads do not automatically apply to T-ECU/S.

| Design record | Required input / calculation |
|---|---|
| Input contract | Actual auxiliary range, loss-of-power requirement, surge, reverse polarity and hold-up |
| Per-branch load sheet | Complete vendor assembly input, peak/inrush and sustained measured duty; do not add chip internal rails to an already counted module |
| Capacity | Simultaneous required output / actual efficiency, derating and margin; each surviving leg sized for its required failure duty |
| Protection | Fault current, fuse coordination, connector/contact rating, wire voltage drop and transient suppression |
| Independent channels | Separately controlled power and watchdog inhibition, with documented common-cause boundary |
| Monitoring | Rail-specific UV/OV detectors plus separate external heartbeat watchdogs; TPS3701 has no watchdog function |
| Thermal | Hot ambient, enclosure conduction, solar/dust exposure, full duty and abnormal modes |
| EMC and evidence | Actual revision burst/surge, conducted/radiated and immunity tests, instrument results and configuration hashes |

No converter, capacitor, fuse or certified thermal/EMC rating is selected from this requirements table. Inrush cannot be cleared by an uncalculated bulk capacitor or fixed delay. Complete the power/harness drawings and bench fault tests before board release. CM5 carrier specification, TPS3701 specification.

# T-ECU-S hardware permission and fault contract

Repository source: `control-electronics/t-ecu-s/schematics/v2-spec/safety-nets.md`

Status: requirements for a board designer; schematic, safety analysis and bench evidence remain open. Two evaluator channels are a reference architecture, not proof of a safety integrity level or independent hardware.

| Function | Required behaviour | Evidence before release |
|---|---|---|
| Channel A/B permission outputs | Default low at boot/reset; valid fresh agreement and local health required for high | GPIO startup, stuck-high/low and timeout traces |
| Independent heartbeat watchdog A/B | Directly inhibit the respective hardware driver on missing or invalid heartbeat | Window/deadline design; early/late/stuck tests |
| Voltage monitoring A/B | Detect local rail UV/OV; inhibit local output and reset as designed | Threshold, hysteresis, delay and transient tests |
| Peer cross-check | Isolated SPI, age/sequence/integrity checks; disagreement restricts permission | CRC/age/babble/open/short tests |
| Series output contacts | Both must close for permission; opening either removes permission | Actual series wiring, driver fault and welded-contact tests |
| Contact feedback | Detect discrepancy before movement and in periodic proof tests | Diagnostic coverage and proof-test interval analysis |
| Brake/traction interface | End-to-end fail-restrictive behaviour established with supplier actuator | Polarity, load, loss-of-power and recovery truth table |

TPS3701 has no heartbeat watchdog input. It is a voltage window detector and may be considered for voltage sensing only. Specify separate external watchdog functions for A and B, with channel-local reset/inhibition. A global reset, if used, cannot be the only safety output control. See TI's specification.

No relay part number, coil current, lifetime, EN 50155 qualification or failure-rate claim is released. A commodity SSR board is a bench simulated-load interface only. Select contacts and drivers from actual load and failure requirements, add suppression without unacceptable release delay, and diagnose welded contacts. The previous claim that two relays always fail safe is withdrawn: common power/ground, shared sensors, fused application data, wiring shorts, welded contacts and common firmware require explicit analysis.

Physical segregation, clearance/creepage, connectors, routing and insulation must follow the voltage/environment and fault study. A 1.5 mm layout target or successful KiCad DRC cannot establish independence, EMC or a safety case. Complete FMEA/common-cause analysis, fault injection, output proof tests and the board-specific release checklist.

The bench integration source defines a Pico 2 allocation and reference output semantics. Custom RP2350A/B pins require a package-specific allocation; no native CAN-FD or Ethernet/RMII peripheral is assumed.

# T-OBS — Train Obstacle Detection

Repository source: `control-electronics/t-obs/README.md`

Role: Nose-mounted obstacle-detection ECU for cabless GoA 4 operation. Each module fuses ultrasonic transducers, solid-state LIDAR, mmWave radar, and a stereo camera pair, then sends a fail-restrictive brake-demand/verdict interface to T-ECU/S.

Canonical `light-metro-3car` fit: 2 modules per trainset, one behind the A-end nose cowl and one behind the B-end nose cowl. The matching mechanical envelope is `trainset-tobs-sensor-pack.png` and `design/component-catalogue/src/osr_mech/rolling_stock/systems.py`.

## Architecture

The pilot T-OBS mirrors the T-ECU/S evidence rig: two RP2350 evaluator channels cross-check each other, while a CM5 performs non-safety sensor pre-processing and logging. The RP2350 pair owns the final obstacle-detection verdict. This is not a SIL qualification claim; production channels follow the shared safety-controller selection gate.

See:

- `schematics/v2-spec/` for the board-level v2 schematic specification.
- `diy-assembly/` for the off-the-shelf first-article build.
- `../rolling-stock-integration.md` for trainset quantities and BOM alignment.

## Target BOM

The historical custom-board planning allowance is carried by rolling-stock BOM line E18. The former ~$2.4k DIY subtotal is withdrawn as an assembled-host price: power, watchdogs, output feedback, harness and environmental integration were incomplete. Freeze and quote the complete assembly before reconciling the planning allowance. See reference integration.

## Status

- Pilot / DIY track: `diy-assembly/` uses commodity SBC, Pi Pico 2, and sensor-evaluation modules. Integration evidence is still pending.
- Custom-board track: `schematics/v2-spec/` is the board-level v2 specification. `gerbers/` and `bom/` will be created when a KiCad layout and v2 board BOM are released.

# T-OBS bench integration design

Repository source: `control-electronics/t-obs/diy-assembly/README.md`

Status: supplier and hardware freeze open; no train operation authority. Two end assemblies represent one trainset. The component and pin schedules are in reference-integration.json; the Baghdad register expands fleet quantities and missing integration parts.

| Block | Per end host | Required integration |
|---|---|---|
| Pico 2 evaluator | 2 | Separately protected supply branches, hardware watchdogs and permission outputs |
| CM5 and compatible carrier | 1 | Exact memory/storage/carrier SKU to freeze; compatible 5 V supply and camera flex cables |
| I2C secure element | 2 | Separate local channel wiring, provisioning and credentials |
| SPI digital isolator | 1 link | Channel A controller and channel B peripheral; correct directionality and separately powered sides |
| External CAN-FD controller/transceiver | Per network design | Pico 2 has no native CAN-FD; a Pi HAT does not automatically connect both evaluators |
| Radar | 1 candidate | AWR1843BOOST is an EVM; adapter harness, 5 V barrel input, micro USB debug and J3 CAN interface |
| Lidar | 1 candidate | Select HAP TX for 100BASE-TX; separate 9–18 V power and manufacturer cable; T1 requires an automotive Ethernet adapter |
| Stereo cameras | 2 | Rigid calibration bar and CM5IO-compatible 22-pin cable family; exact cable length to freeze |
| Ultrasonic sensing positions | 4 | Weatherproof transducers/AFE to select; HC-SR04 is a laboratory candidate, not qualified outdoor equipment |
| Hardware permission chain | 2 series contacts | Independent drivers/watchdog inhibition and contact feedback; relay part and failure analysis open |
| Harness/enclosure/protection | 1 kit | Fuses, TVS/filter, DC/DCs, connectors, glands, terminals, labels, heat spreader and test points |

Historical retail subtotals are withdrawn: they excluded essential power, isolation, harness and watchdog parts and did not identify a qualified complete assembly. Unit costs stay open until the complete supplier BOM is quoted.

## Bench signal path

Use the shared GPIO allocation with its pin names, not physical header numbers. A and B have separate local I2C buses and power branches. SPI peer wiring includes clock, select and correctly crossed TX/RX through a suitable isolator; a USB isolator cannot carry SPI or connect two USB device endpoints directly.

HC-SR04-style modules need VCC, GND, TRIG and timed digital ECHO. Level-shift each echo to the Pico's 3.3 V domain. Capture pulse duration using timer/PIO, not an ADS1115 analog sample. Raw piezo transducers need an excitation driver, receiver/AFE and sampling/timing design; they are not interchangeable with a four-wire ranging module. Shared transducers or an application-generated fused list are common inputs; duplicating evaluators does not make them independent sensing channels.

Mount ultrasonic acoustic faces in qualified apertures. Do not put them behind the radar radome or claim that an 8 mm polycarbonate panel is acoustically transparent. Radar needs a tested radome; lidar and cameras need separate optical windows and contamination controls. Verify alignment, weather sealing, vibration, field overlap and stopping-distance coverage on a representative nose.

## Power and outputs

Use the power envelope and output contract. No connection to actual brake or traction actuators is permitted before qualification; bench outputs drive simulated loads. Exact wire gauge, fuse, connector rating, coil suppression and contact rating follow the protection and load study.

Run bench tests for boot-low permission, stale/disagreeing sensor reports, both single-channel power failures, stuck-high/low heartbeat, welded contact, driver short, bus faults, reverse polarity, brownout, inrush and hot soak. Retain instrument traces and configuration hashes; the software self-test alone cannot establish those results.

# T-OBS board design requirements

Repository source: `control-electronics/t-obs/schematics/v2-spec/README.md`

Status: reference integration requirements; exact supplier BOM, schematic capture, pin/connector freeze, enclosure/thermal design and qualification evidence are open. This is not sufficient information to fabricate a railway control board.

| File | Current purpose |
|---|---|
| block-diagram.md | Functional paths and remaining common-cause boundaries |
| power-budget.md | Capacity calculation or required complete load study; no released converter/fuse rating |
| pinout-rp2350.md | Exposed-pin bench allocation or custom-board allocation requirements |
| connector-tables.md | Interface/harness schedule; supplier cavities and exact connector variants open |
| safety-nets.md | Hardware watchdog, permission/feedback and end-to-end fault contract |

See reference integration, host bench requirements and release checklist. T-ECU/S has its own carrier interface requirements; its custom pinout is not inherited by T-OBS.

A custom-board release needs the actual KiCad schematic/layout, ERC/DRC, controlled fabrication/BOM files, supplier interfaces and instrumented bring-up/fault/thermal/EMC evidence. Create fabrication directories when those artifacts exist. Do not manufacture from historical guessed pinouts or treat passing software/library tests as hardware acceptance.

# T-OBS reference functional diagram

Repository source: `control-electronics/t-obs/schematics/v2-spec/block-diagram.md`

Status: integration requirements, not a released PCB. See machine-readable integration, power envelope, harness schedule and output/fault contract.

```
Nominal 24 V auxiliary inputs
  -> protected DC/DC branches -> evaluator A + external watchdog A
                              -> evaluator B + external watchdog B
                              -> application carrier and sensors

Radar EVM -> external CAN interface -> timestamped, validated ingress
HAP TX -> 100BASE-TX + separate power -> application preprocessing
Stereo pair -> compatible CSI flex -> application preprocessing
Ultrasonic positions -> qualified driver/AFE or bench timed-echo inputs

Evaluator A <-> directionally isolated SPI peer link <-> evaluator B
Local valid agreement + watchdog health -> independent permission drivers
Permission contact A -- series -- permission contact B -> simulated brake interface
Contact feedback + rail monitoring -> diagnostics / output inhibition
```

The production brake-demand interface may also carry a diagnostic network verdict, but the network does not replace the qualified physical output path. Shared sensors, preprocessing, buses and supplies require common-cause analysis. Neither direct CAN-FD nor Ethernet/RMII is a native Pico 2 interface. Converter, transducer AFE, board/chip package, relay and cooling selection remain open until supplier and measured bench evidence close their gates.

# T-OBS connector and harness design schedule

Repository source: `control-electronics/t-obs/schematics/v2-spec/connector-tables.md`

Status: interface schedule; connector series, contact numbers and cable assemblies are not released. All external connectors need mating-half, keying, wire/contact rating, sealing, shield termination and label definitions. The former fabricated M12/PoE pinouts are withdrawn.

| Interface ID | Function | Design requirement |
|---|---|---|
| PWR-A / PWR-B | Nominal 24 V input branches | Power-keyed connectors, individually protected; sized from corrected load/inrush/derating, not an Ethernet D-code connector |
| NET-A / NET-B | Redundant train network | Approved Ethernet connector and full pair map; 1000BASE-T needs four data pairs; controller/switch topology remains open |
| RAD-DATA | Radar EVM CAN | AWR1843BOOST J3 CAN adapter; vendor board revision and termination; external connector chosen separately |
| RAD-PWR | Radar EVM supply | 5 V barrel interface; dedicated protected branch; micro USB is debug/configuration |
| LID-DATA | HAP TX data | 100BASE-TX with the vendor cable; HAP T1 needs a different physical interface |
| LID-PWR | HAP supply | Separate vendor 9–18 V input, 12 V reference branch; no 12 V PoE over spare Gigabit contacts |
| US-01..04 | Ultrasonic position | Candidate-specific excitation/receive or TRIG/ECHO, level shifting and shield; raw piezo is not plug compatible |
| CAM-L / CAM-R | Stereo CSI | CM5IO 22-pin family with the appropriate camera adapter; internal flex length and cable orientation frozen |
| PERMIT / FEEDBACK | Channel permissions and contact monitoring | Segregated channel circuits, load/polarity truth table, test point and actuator supplier interface |
| DEBUG-A / DEBUG-B | MCU SWD | Package/board-specific keyed debug connector; production access control |

Do not fabricate a harness from this table. Release a cavity-by-cavity drawing, wire cut list, ferrule/terminal/seal list, formboard and continuity/insulation test after vendor freeze. The TI EVM does not ship a standard M12 radar interface. Radar needs an RF-qualified radome; ultrasonic faces need acoustic apertures and lidar/cameras need qualified optical paths. Fixed mounting angles, bracket hole patterns and cable limits require coverage/clearance studies.

See bench integration and reference source. Primary interfaces: TI EVM guide, Livox specification, CM5 hardware.

# T-OBS pin allocation and peripheral boundary

Repository source: `control-electronics/t-obs/schematics/v2-spec/pinout-rp2350.md`

The machine-readable Pico 2 bench allocation is the reference for both A and B local channels. It uses exposed GPIOs only. It replaces the former GP30–39 Pico allocation, GP14–17 ADC inputs, SPI secure-element and native CAN/RMII claims.

| GPIO | Bench function |
|---|---|
| 0 / 1 | I2C SDA / SCL for the channel-local ATECC608B breakout |
| 2 / 3 / 4 / 5 | SPI0 peer SCK / TX / RX / CS; suitable isolator, A controller and B peripheral |
| 10 / 11 / 12 / 13 | SPI1 external CAN-FD controller SCK / TX / RX / CS |
| 14 | Permission output to simulated-load driver |
| 15 | External hardware watchdog heartbeat |
| 16 / 17 / 18 / 19 | Laboratory ultrasonic triggers |
| 20 / 21 / 22 / 26 | Corresponding level-shifted timed digital echoes |

This is a proposed bench allocation. Peripheral IRQs, Ethernet controller bus, custom analog transducer AFE, debug pins and exact protocol/firmware mapping must be frozen before a board or image is released. Bench GPIO14 is not ADC0: Pico 2 exposes analog inputs on GPIO26–28. The custom chip package has a separate pinout; use its datasheet and never extrapolate the Pico header.

Pico 2 needs an external CAN controller plus transceiver. Ethernet also needs an external controller with a demonstrated data-rate/deadline budget. ATECC608B uses the selected I2C or single-wire interface, not SPI. Peer firmware and hardware tests must prove timing and fault behaviour; listing source filenames does not mean device drivers have been implemented.

Sources checked 3 October 2026: Pico 2 datasheet, Microchip ATECC608B.

# T-OBS reference power and thermal envelope

Repository source: `control-electronics/t-obs/schematics/v2-spec/power-budget.md`

The source is reference-integration.json. This is a sizing envelope for the bench candidates, not measured train duty or a qualified converter/fuse selection.

| Load | Output allocation | Basis |
|---|---|---|
| CM5IO with attached cameras | 25 W | Carrier 5 V / 5 A interface envelope |
| AWR1843BOOST radar EVM | 12.5 W | 5 V / 2.5 A interface envelope |
| Livox HAP startup | 26 W | Vendor startup specification; 12 W typical |
| Dual evaluators and integration | 8 W | Unmeasured engineering allowance |
| Total simultaneous output envelope | 71.5 W | Sum of the four branches |
| Input at 90% conversion efficiency | 79.44 W | 71.5 / 0.90 |
| Capacity including 25% margin | 99.31 W | 79.44 × 1.25; 100 W reference supply envelope |

At an assumed 18 V minimum bus, the input envelope is 4.41 A, or 5.52 A including the capacity margin. The real auxiliary bus range, inrush, hold-up, cable drop and selective branch protection require a released electrical load study. Each surviving power leg must support the complete required fault-state load if redundant operation is claimed. Do not reuse the former 1 A fuse or claim that a 40 W host allowance covers this assembly.

The 100 W value is capacity, not sustained energy consumption: no OPEX/traction-energy uplift is calculated from it. Update the train auxiliary energy model after measured duty and production sensor choice. Do not double-count cameras included within the carrier allocation. The 18 V sizing assumption is not a claimed train-bus standard.

Mean Well HDR-60-24 is an AC/high-voltage DC input supply with 24 V output. It does not convert a 24 V train bus to 5 V or 12 V. Choose protected DC/DC branches with approved voltage range, isolation, derating and transient behaviour.

Passive cooling, junction temperatures and EMC compliance remain unverified. Calculate conduction, enclosure thermal resistance, solar load and dirty-filter performance; test startup and sustained operation at the declared hot-desert ambient. Keep sensing and event capture powered during a commanded brake when the fault permits; thermal throttling or application-fusion loss must be handled as stale data rather than assumed harmless.

Primary specifications checked 3 October 2026: CM5 carrier, TI radar EVM, Livox HAP, HDR-60.

# T-OBS hardware permission and fault contract

Repository source: `control-electronics/t-obs/schematics/v2-spec/safety-nets.md`

Status: requirements for a board designer; schematic, safety analysis and bench evidence remain open. Two evaluator channels are a reference architecture, not proof of a safety integrity level or independent hardware.

| Function | Required behaviour | Evidence before release |
|---|---|---|
| Channel A/B permission outputs | Default low at boot/reset; valid fresh agreement and local health required for high | GPIO startup, stuck-high/low and timeout traces |
| Independent heartbeat watchdog A/B | Directly inhibit the respective hardware driver on missing or invalid heartbeat | Window/deadline design; early/late/stuck tests |
| Voltage monitoring A/B | Detect local rail UV/OV; inhibit local output and reset as designed | Threshold, hysteresis, delay and transient tests |
| Peer cross-check | Isolated SPI, age/sequence/integrity checks; disagreement restricts permission | CRC/age/babble/open/short tests |
| Series output contacts | Both must close for permission; opening either removes permission | Actual series wiring, driver fault and welded-contact tests |
| Contact feedback | Detect discrepancy before movement and in periodic proof tests | Diagnostic coverage and proof-test interval analysis |
| Brake/traction interface | End-to-end fail-restrictive behaviour established with supplier actuator | Polarity, load, loss-of-power and recovery truth table |

TPS3701 has no heartbeat watchdog input. It is a voltage window detector and may be considered for voltage sensing only. Specify separate external watchdog functions for A and B, with channel-local reset/inhibition. A global reset, if used, cannot be the only safety output control. See TI's specification.

No relay part number, coil current, lifetime, EN 50155 qualification or failure-rate claim is released. A commodity SSR board is a bench simulated-load interface only. Select contacts and drivers from actual load and failure requirements, add suppression without unacceptable release delay, and diagnose welded contacts. The previous claim that two relays always fail safe is withdrawn: common power/ground, shared sensors, fused application data, wiring shorts, welded contacts and common firmware require explicit analysis.

Physical segregation, clearance/creepage, connectors, routing and insulation must follow the voltage/environment and fault study. A 1.5 mm layout target or successful KiCad DRC cannot establish independence, EMC or a safety case. Complete FMEA/common-cause analysis, fault injection, output proof tests and the board-specific release checklist.

The bench integration source defines a Pico 2 allocation and reference output semantics. Custom RP2350A/B pins require a package-specific allocation; no native CAN-FD or Ethernet/RMII peripheral is assumed.

# Trainset interiors and closures — COTS equipment catalogue

Repository source: `control-electronics/trainset-interiors.md`

The `light-metro-3car` body is a welded steel primary frame with composite non-structural side/roof/nose panels. Passenger-facing equipment is not bespoke OSR hardware: doors, windows, HVAC, lighting, seats, grab rails, PIS, CCTV, and intercom are COTS rail or heavy-duty bus modules installed into reserved envelopes.

This file is the supplier-neutral catalogue promised by RFC 0008. The envelope is the contract; named SKU classes are examples only. Any replacement is acceptable if it fits the envelope, stays inside the mass/power budget, exposes the required interface, and arrives with usable certification evidence.

Related rolling-stock package:

- `body.md`
- `fabrication-plan.md`
- `bom-skeleton.md`

## Qualification classes

| Class | Meaning | Typical procurement path |
|---|---|---|
| COTS-R | Rail-certified COTS module | Preferred for doors, windows, HVAC, intercom |
| COTS-B | Heavy-duty bus module with rail-compatible evidence | Acceptable for seats, lighting, PIS, CCTV where authority allows |
| COTS-I | Industrial module needing enclosure and vibration evidence | Acceptable for non-safety displays/cameras only |
| MAKE-ADAPT | Local adapter plate, harness tail, duct, or bracket | Allowed when it does not change the primary steel frame |

Safety-critical rotating, braking, traction, battery, and door-lock parts are not downgraded to generic commodity components. They remain supplier-certified modules with incoming inspection and type-test evidence.

## Reserved module envelopes

Per 17 m self-contained car:

| Module | Qty / car | Envelope | Mass limit | Power budget | Interface |
|---|---|---|---|---|---|
| Door cassette | 2 | clear opening 1 250 × 2 000 mm; cassette ≤ 1 850 W × 2 450 H × 260 D mm | 180 kg each | 600 W peak each | 24/110 V DC, Ethernet/CAN, hardwired closed/locked loop |
| Side glazing | 4 | nominal 900 × 1 200 mm aperture | 35 kg each | 0 | Bonded/gasketed cassette, drain path |
| Roof HVAC | 1 | ≤ 2 700 L × 1 900 W × 450 H mm | 420 kg | 20 kW cooling electrical allowance | Direct-HV DC input, condensate drain, CAN/Ethernet diagnostics |
| Interior lighting | set | two 17 m ceiling runs + door-zone lights | 45 kg | 350 W | 24 V DC, emergency-light input |
| Exterior marker/head/tail lights | set | nose/cowl mounted | 25 kg | 150 W | 24 V DC, hardwired marker functions |
| PIS displays + speakers | set | above-door and saloon ceiling mounts | 45 kg | 250 W | Ethernet, 24 V DC, audio line |
| CCTV | set | door sill, saloon, and nose service views | 20 kg | 180 W | PoE or 24 V DC + Ethernet |
| Passenger intercom | 4 | recessed wall modules | 12 kg | 80 W | Ethernet/SIP, 24 V DC, OCC call button |
| Longitudinal seats | 20 seats | under-window modules over battery covers | 120 kg | 0 | M10 floor/side inserts |
| Grab rails/stanchions | set | centre-door and vestibule zones | 45 kg | 0-80 W | M8/M10 floor/ceiling inserts |
| Interior wall/ceiling panels | set | FRP/phenolic cassettes | 220 kg | 0 | Clip/bolt to secondary rails |
| Floor boards + hatches | set | full saloon floor | 280 kg | 0 | Removable panels over battery/HV zones |

Per `light-metro-3car` consist, multiply by three cars. HVAC dominates auxiliary power; the aux converter and station-energy models should assume roughly 60 kW HVAC peak plus lighting, PIS, CCTV, intercom, control electronics, and battery thermal loads.

## COTS Reference Baselines

The CAD now uses COTS-inspired integration geometry rather than plain boxes. These references are not sole-source selections; they define the type of commodity/supplier evidence the v2 drawing pack must accept or replace.

| Function | Reference family | CAD/design implication |
|---|---|---|
| Automatic coupler | Dellner / Voith Scharfenberg Type 10 family | Coupler head, guide horns, electrical-head carrier, brake-pipe hoses, bolted shear plate, EN 15227 crash absorber pocket |
| Door cassette | Knorr-Bremse/IFE, Wabtec/Faiveley, Kangni electric rail sliding or plug door systems | Top operator rail, hanger rollers, controller/diagnostics box, two sliding leaves, bonded glass, obstruction light curtain, anti-pinch edge, lock/release unit, threshold drainage, gap-filler hinge |
| Nose sensing | Rail Vision MainLine / Ouster OS1 / LSLiDAR train-end intrusion class | Rail-grade LIDAR shroud, heated optical window, wide/narrow/thermal camera pods, radar, wash/wipe, service fasteners, 24 V feed allowance |
| Radar | TI AWR1843BOOST class 77 GHz radar module | Nose-centred radar envelope, radome window, CAN-FD harness clearance |
| Power connector | Anderson SB50 class connector | Keyed service/traction connector envelope with cable strain-relief allowance |
| Access fastener | Camloc quarter-turn class fastener | Quarter-turn retainers on removable skirts, panels, and service lids |
| Linear guide | HIWIN HG class guide block | Guide-block envelope for removable bogie/motor service adapters |
| Gas spring | Stabilus LIFT-O-MAT class gas spring | Rod/cylinder/end-fitting envelope for supported service flaps |

The matching mechanical reference models are generated under `design/component-catalogue/catalog/fixtures/` and the rolling-stock system assemblies under `design/component-catalogue/catalog/rolling_stock/`.

The passenger fit-out source now generates a separate cost/source CSV at `build/bom/rolling_stock_cots_fitout_bom.csv`. Each row carries quantity per car, quantity per consist, low/base/high unit cost, mass, power, public source URL, and the geometry basis used for the supplier-neutral CAD envelope.

Reference datasheets/product pages used for the current supplier-neutral envelope geometry: Dellner automatic coupler Type 10, Knorr-Bremse/IFE train entrance systems, Rail Vision MainLine, Ouster OS1 LIDAR, LSLiDAR train-end railway intrusion detection, TI AWR1843BOOST, Anderson SB50 datasheet, HIWIN HGW25CC catalogue page, and Stabilus LIFT-O-MAT.

# Vendor fit-in shortlist

These supplier families are now reflected in the CAD labels and BOM notes. The exact SKU remains a v2 procurement decision.

| Module | Reference families | Current envelope reservation |
|---|---|---|
| Door cassette | Knorr-Bremse/IFE entrance systems, Wabtec/Faiveley, Kangni | 1 250 × 2 000 mm clear opening; cassette controller, light curtain, pressure edge, drain scuppers |
| Side glazing | AGC Lamisafe/Heatlight W, Pilkington rail glazing, Saint-Gobain transport glazing | 1 400 × 900 mm laminated cassette with heated busbar option and drain channel |
| Floor covering | Altro Transflor Tungsten, Forbo transport flooring | 2 mm pre-cut anti-slip sheets bonded over removable floor and hatch panels |
| Seats | Compin-Fainsa SB09, Kiel, Grammer, McConnell | Cantilevered longitudinal bench over the under-seat battery strake |
| Lighting | Teknoware rolling-stock lighting, Luminator rail lighting | Continuous main/emergency ceiling channels plus sealed exterior head/tail/marker cassettes |
| PIS and audio | Luminator onboard displays/audio, Televic TRACS/GSP | Above-door VESA plates, PA speaker backboxes, amplifier/controller trays |
| HVAC | Liebherr rail HVAC, Knorr-Bremse Merak, Wabtec/Faiveley, Hispacold | Roof curb, compact/split unit envelope, pressure damper, filter cassette, drains, drop ducts |
| Battery package | EVE or qualified equivalent high-power LFP system | Under-seat sealed modules with cold plates, BMS/HVIL harness, outward vent, off-gas detection, and water-mist interface |
| Motor/brake | TSA/ABB/Skoda PMSM motors; Knorr-Bremse WheelAct/AxleAct or Wabtec Faiveley brakes | Axle-hung motor package and compact caliper package with mounting/diagnostic details |
| Coupler | Dellner Type 10, Voith Scharfenberg class | Crashworthy pocket, gas-hydraulic/deformation unit allowance, D-REX Ethernet and pneumatic heads |
| T-OBS nose module | Rail Vision MainLine, Ouster OS1, LSLiDAR train-end intrusion | LIDAR, thermal/wide/narrow camera pods, radar, ultrasonic, heater/wash/wipe service hardware |

# Generated fit-out cost band

Generated from `design/component-catalogue/src/osr_mech/rolling_stock/cots_equipment.py` for one `light-metro-3car` consist:

| Module | Qty / consist | Base USD | Low-high USD | Shape basis |
|---|---|---|---|---|
| Side glazing panel | 18 | 27 000 | 17 100-46 800 | Laminated/heated rail glazing cassette |
| Rooftop HVAC unit | 3 | 75 000 | 54 000-126 000 | Compact/split passenger-saloon rail HVAC |
| Continuous LED ceiling strip | 6 | 9 000 | 5 400-15 000 | Serviceable main/emergency lighting rail |

| Module | Qty / consist | Base USD | Low-high USD | Shape basis |
|---|---|---|---|---|
| Passenger-information LCD | 12 | 9 600 | 5 400-21 600 | Luminator rail display datasheet dimensions |
| Longitudinal bench run | 18 | 24 000 | 14 400-45 000 | SB09-style removable-pad light-alloy bench |
| Vertical grab pole | 24 | 7 992 | 3 840-16 800 | Stainless modular stanchion with flanges |
| Emergency intercom / help-point | 6 | 4 800 | 2 100-10 800 | Recessed SIP/audio help-point module |

## Candidate supplier classes

Named suppliers are examples of the class of product, not a locked vendor list.

| Module | Example class | Required evidence |
|---|---|---|
| Door cassette | Knorr-Bremse/IFE, Wabtec/Faiveley, Fuji, Nanjing Kangni rail door family | EN 14752 or equivalent, obstruction detection, lifecycle test, emergency release |
| Side glazing | AGC/Pilkington/Saint-Gobain rail laminated safety glass | EN 15152 or equivalent, impact, fire/smoke data for seals |
| HVAC | Liebherr, Knorr-Bremse Merak, Wabtec/Faiveley, Hispacold roof HVAC | EN 50155/50121 where applicable, +50 °C performance curve, refrigerant data |
| Lighting | Teknoware/Luminator rail LED strip or troffer modules | EN 45545 material data, EMC evidence, emergency-mode behaviour |
| Seats | Compin-Fainsa, Kiel, Grammer, McConnell, local bus/rail equivalent | EN 45545 R7, static strength, vandal-resistance data |
| Grab rails | Stainless modular rail/bus stanchion system | Pull-load data, corrosion grade, fastener spec |
| PIS displays | Luminator/Televic/IEI/Litemax rail LCD class | EN 50155 preferred or vibration/temperature evidence |
| CCTV | Axis/Hikvision/industrial PoE camera class in rail enclosure | EMC/vibration evidence, cybersecurity hardening path |
| Intercom | Televic TRACS, Luminator audio, Zenitel/Vingtor, Commend rail SIP intercom class | EN 50155 preferred, audio intelligibility, emergency-call behaviour |
| Floor/interior panels | Altro/Forbo rail flooring plus phenolic/FRP rail interior panel supplier | EN 45545 HL2 R1/R5 evidence, cleanability, repair method |

## Supplier-change rule

A supplier change is valid without changing the carbody if all are true:

1. The replacement fits inside the reserved envelope.
2. Mass is no more than the row limit, or the weight budget is updated and bogie axle-load margins still pass.
3. Power draw is no more than the row budget, or aux-power sizing is updated and thermal checks still pass.
4. Mounting can be handled by adapter plates or harness tails.
5. The primary steel frame, door posts, bolsters, and coupler pockets are unchanged.
6. Required fire, EMC, vibration, lifecycle, and maintainability evidence is present.

If any supplier change needs new primary steel, it is a body-design change and must go through v2 CAD/FEA release.

## Incoming inspection

| Module | Incoming checks |
|---|---|
| Door cassette | Dimensional check, serial/cert pack, lock loop continuity, manual release |
| Window cassette | Glass marking/cert pack, edge damage inspection, seal/adhesive shelf life |
| HVAC | Nameplate, refrigerant record, factory test sheet, drain and duct fit |
| Lighting/PIS/CCTV/intercom | Power-on test, firmware version, MAC/serial register, mounting hardware |
| Seats/grab rails | Fire certificate, pull-test certificate or batch test, finish defects |
| Panels/floor | Fire certificate, flatness, insert locations, repair kit present |

## Installation evidence

Each car receives a COTS fit-out evidence pack:

- Supplier certificate and installation manual for every COTS-R/B item.
- Envelope compliance sheet signed by production engineering.
- Mounting torque record for seats, rails, doors, HVAC, and hatches.
- Water ingress test for doors/windows/roof equipment.

- HVAC drain test.
- Door obstruction and emergency-release test.
- Lighting lux test and emergency-light mode test.
- PIS/CCTV/intercom network enumeration report.
- Material fire certificate index.

This evidence pack becomes part of the trainset technical file and feeds the compliance matrix in `docs/rolling-stock/light-metro-3car/compliance.md`.

# W-SBC — Wayside

Repository source: `control-electronics/w-sbc/README.md`

Role: Host for `osr-consensus`, `osr-interlocking`, `osr-wayside-points`, `osr-level-crossing`, `osr-hot-axle-wayside`, `osr-balise` (reader side), `osr-energy-site`.

Deployed in pole-mounted IP67 cabinets along the corridor and at junctions.

Environment: IP67, EN 50121-4 EMC, −40…+70 °C.

## SoC

Radxa CM5 (RK3588S — Cortex-A76 4-core + Cortex-A55 4-core big.LITTLE, 4/8/16 GB LPDDR4X, eMMC on-module) on a custom baseboard. Radxa's industrial-temperature variant (−20…+85 °C rated) is the baseline; pole-mount cabinets in hot climates routinely hit +60 °C internal, so the extra margin over the consumer-grade CM5 matters.

Raspberry Pi CM5 is the pin-compatible drop-in on the same SO-DIMM slot for mild-climate deployments.

For safety-related wayside logic, the CM5 hosts application, diagnostics and communications only. A separately qualified controller owns field proving, watchdogs and fail-safe actuator outputs; see the selection gate. Core pinning or a separation kernel on a shared SBC is defence in depth, not a SIL-4 boundary. Non-safety sites (balise-only, energy-site) run Debian straight-through.

See RFC 0007 §6.

## Peripherals — one SKU fits every wayside role

| Peripheral | Qty | Role |
|---|---|---|
| TSN Ethernet | 2 | WAY-E A/B |
| RS-485 | 4 | Switch motor, crossing barrier, HABD bus, balise reader |
| Isolated DI | 8 | Switch end-of-travel (A+B), strike detectors, field faults |
| Isolated DO | 4 | Motor direction contactors, barrier lift/drop |
| 4-wire PT100 | 4 | Hot-axle IR temperature |
| 802.11ax AP | 1 | Depot maintenance (disabled in service) |
| Dual 24 V DC-in | 2 | Primary + backup site supplies |
| ATECC608B SE | 1 | Trust anchor |

Selective population per role — switch site leaves PT100 inputs unpopulated, HABD site leaves motor-direction DOs unpopulated. One SKU, one spares stock.

## Form factor

120 × 80 mm PCB inside an IP67 aluminium extrusion with M12 penetrations. Conduction-cooled.

## Target BOM

~€280 per board, ~€550 with enclosure + mounting hardware.

## Status

- Pilot / DIY track: `diy-assembly/` uses the Radxa CM5 IO Board + a SparkFun RS-485 breakout to validate the `osr-consensus` + `osr-interlocking` + `osr-wayside-points` stack on a real RK3588S module. Integration evidence is still pending.
- Custom-board track: `schematics/v2-spec/` is the board-level v2 specification overview and block diagram. `gerbers/` and `bom/` remain pending until a KiCad layout and board BOM are released.

# W-SBC bring-up — Radxa CM5 IO Board

Repository source: `control-electronics/w-sbc/bring-up.md`

Goal: validate the wayside host runs `osr-consensus` + `osr-interlocking` + `osr-wayside-points` on a RK3588S Radxa CM5, with the A55 little cluster isolated for the SIL-4 partition and the A76 big cluster carrying non-safety services.

## Dev kits + parts

| Part | Qty | Notes |
|---|---|---|
| Radxa CM5 (8 GB + 32 GB eMMC, industrial-temp) | 1 | |
| Radxa CM5 IO Board | 1 | |
| SparkFun RS-485 breakout | 2 | One for switch-motor sim, one for HABD sim. |
| Test bench: 5-node consensus cluster | — | 4 more CM5 carriers OR a docker-compose simulator. |
| 24 VDC bench supply via ADuM isolator | 1 | |

## Steps

### W1 — Boot Debian with RK3588S BSP

1. Write Radxa Debian 13 image to eMMC via `rkdeveloptool`.
2. Expand rootfs, ssh login.
3. Update `/etc/default/cpufrq`: pin A55 cluster to 1.4 GHz, A76 to ondemand.
4. Install Rust toolchain (same as T-ECU/A).

Expected: ssh login within 90 s of power-on.

### W2 — Workspace build

Same as T-ECU/A step A2. Build times on 8 GB A76 ~10 min.

### W3 — RT partition setup (safety role)

Configure the kernel for PREEMPT_RT on A76 and the A55 cluster isolated for the safety partition:

```
isolcpus=0-3          # reserve A55 cores for safety
nohz_full=0-3         # tickless on safety cores
rcu_nocbs=0-3
```

Reboot. Verify `/proc/cmdline` contains the flags and `htop` shows no processes scheduled on CPU 0-3.

### W4 — Consensus cluster bring-up

This step proves the W-SBC can host a consensus replica.

1. On the dev kit, run a local 3-node simulated cluster:

   ```
   cargo run --release -p osr-consensus --example local-cluster
   ```

2. Confirm leader election within 1 s.
3. Drive 100 proposals through; confirm all commit on every follower.
4. Kill one node; confirm re-election and continued progress.

Expected: clean leader election + commit progression + crash recovery on the RK3588S silicon.

### W5 — Interlocking on the safety partition

Pin `osr-interlocking`'s MA computer to the isolated A55 cores:

```
taskset -c 0-3 cargo run --release --bin osr-sim -- \
  --config cities/catalogue/west-asia/Iraq/Samawah/samawah.toml --duration 600
```

Expected: the 10-minute Samawah run completes with zero invariant violations; the MA computer's tick jitter (measured via `osr-sim`'s internal timing) ≤ 5 ms.

### W6 — Wayside-points driver over RS-485

1. Connect one SparkFun RS-485 to a motor-driver sim (can be an Arduino reading the bus and toggling a digital output).

2. Build the `osr-wayside-points` standalone:

   ```
   cargo run --release -p osr-wayside-points --example switch-drive
   ```

3. Send alternating `SwitchCommand::Normal` / `SwitchCommand::Reverse` every 5 seconds.

Expected: motor drive toggles faithfully, detection (simulated end-of-travel sensors) mirrors the command within the 5 s RFC 0012 §4.2 throw budget.

## W7 — HABD input over RS-485

Simulate a hot-axle reading (raw temperature values) over the second RS-485 link. Build the `osr-hot-axle-wayside` driver:

```
cargo run --release -p osr-hot-axle-wayside --example demo
```

Expected: temperature thresholding fires at configured setpoint; the crate emits a `SpeedRestriction` event to the consensus log simulator.

## W8 — Industrial-temp headroom

Place the Radxa CM5 in a 65 °C test oven (pre-deployment IP67 cabinet simulator) for 30 minutes with the W5 workload running.

Expected: no throttling, no CPU errors, no log anomalies. RK3588S junction temp stays < 90 °C per the on-die sensor.

FAIL-HW if the board throttles or errors: the industrial- temp variant may not be the one installed; confirm the P/N.

## W9 — PoE or dual-PSU input (optional)

If the cabinet-form-factor of the IO Board is present, validate the dual-24V redundancy:

1. Run both PSU inputs; cut one; verify no service interruption.
2. Re-apply; confirm re-detection.

Expected: < 5 ms dropout at changeover.

# Bring-up report template

```
# W-SBC bring-up report

- Runbook commit: <hash>
- Date: <YYYY-MM-DD>
- Radxa CM5 serial: <nnn>

## Results
| Step | Status |
|---|---|
| W1 (boot)        | PASS / FAIL-\* |
| W2 (build)       | PASS / FAIL-\* |
| W3 (RT + isol)   | PASS / FAIL-\* |
| W4 (consensus)   | PASS / FAIL-\* |
| W5 (interlocking)| PASS / FAIL-\* |
| W6 (points)      | PASS / FAIL-\* |
| W7 (HABD)        | PASS / FAIL-\* |
| W8 (thermal)     | PASS / FAIL-\* |
| W9 (dual-PSU)    | PASS / FAIL-\* / N-A |
```

# W-SBC bench assembly requirements

Repository source: `control-electronics/w-sbc/diy-assembly/README.md`

Status: bench integration reference; hardware BOM, image, wiring and qualification are open. The release checklist governs the assembly. Exact SKUs and total prices are not frozen; previous retail subtotals omitted integration parts.

| Block | Required detail before assembly release |
|---|---|
| Compute and carrier | Exact CM5 configuration, compatible carrier, storage and cooling; 5 V input supplied correctly |
| Field power | Approved input range, DC/DC, fuse/selectivity, surge/EMC, inrush and hold-up |
| I/O and network | External CAN controller/transceiver where required, Ethernet switching, isolation, termination and pin map |
| Security | Channel-local I2C secure element, provisioning and recovery process |
| Harness/enclosure | Mating connectors, contacts, terminals, ferrules, wire cut list, clamps, labels, grounding and thermal design |
| Output chain | Simulated loads for bench; qualified drivers, feedback and actuator interfaces before deployment |
| Firmware/image | Real target HAL/driver mapping, immutable build, configuration/signature hashes and measured startup behaviour |

Mean Well HDR-60-24 converts AC/high-voltage DC input to 24 V output. It may supply a suitable isolated laboratory or mains-fed wayside setup, but cannot convert a 24 V field bus to 5 V. Onboard hosts require protected DC/DC supplies. No wiring from a mains terminal is released here.

For the safety-host bench use the validated exposed-pin allocation as a proposed starting point and freeze any host-specific changes. SPI needs a digital isolator and controller/peripheral wiring; a USB isolator does not provide SPI or a direct link between two USB devices. Pico 2 GPIO30/31 and chip-package-only pins are not available on its header. Do not assume that a Pi CAN HAT independently serves both Pico channels.

For application/wayside/station hosts, the modem needs a compatible carrier and power/USB interface; multiple HATs require connector and pin conflict review. Size UPS, enclosure and converter loads from the complete host BOM. Application, station and wayside software disposition comes from deployment/components.toml; TACS runtime remains a reference tooling host until qualified hardware composition is released.

Confirm GPIO voltage domains, loss-of-power state, wiring continuity/insulation, bus timing, EMI, thermal soak, image boot and recorded self-test on the actual revision. Procurement, construction and train actuation require the released package, not this list.

# W-SBC v2 schematic specification

Repository source: `control-electronics/w-sbc/schematics/v2-spec/README.md`

Status: RFC 0007 v3 deliverable (partial). Per-board specification of the wayside SBC per RFC 0007 §6.

## Scope

W-SBC hosts the wayside SIL-4 crates + non-safety energy-site management:

- `osr-interlocking` — Movement Authority computer (SIL-4).
- `osr-consensus` — Raft log, distributed across 3 W-SBC nodes minimum per line.
- `osr-wayside-points` — switch-machine controller (SIL-4).
- `osr-balise` — balise registry + sighting audit (SIL-2).
- `osr-level-crossing` — SIL-4 five-state LX controller.
- `osr-hot-axle-wayside` — SIL-4 HABD at wayside.
- `osr-intrusion-detect` — RFC 0016 wayside intrusion evaluator (SIL-4).
- `osr-energy-site` — PV + battery + grid-tie dispatch (SIL-0).

One physical W-SBC may host multiple roles depending on its location — a junction box near an LX + switch + intrusion pack runs three SIL-4 crates concurrently.

## SoC

Radxa CM5 (RK3588S industrial-temp variant) — Cortex-A76 × 4 + A55 × 4, 4–16 GB LPDDR5, eMMC on-module. Industrial temp grade is the important selector — the RPi CM5 BCM2712 is OT3 commercial; the RK3588S-industrial is rated for +85 °C ambient which is needed for pole-mounted and cabinet-mounted wayside service in hot climates.

## Architecture

Single-role W-SBC is not 2oo2 at the CPU level; safety redundancy lives in the 3-node Raft consensus cluster per line. Any single W-SBC losing its CPU means the cluster still has quorum.

For safety-critical roles (level-crossing, switch-machine), the actuator-output stage is still hardware-2oo2 via external relay stages on the same board: the W-SBC drives both sides of an external AND-gate exactly like T-ECU/S, even though the consensus layer provides the cross-CPU redundancy.

## Peripherals (baseboard, selectively populated)

| Peripheral | Qty | Purpose |
|---|---|---|
| TSN Ethernet | 2 | Backbone to adjacent W-SBCs + back-office |
| CAN-FD | 2 | Switch-machine motor drivers, LX barriers |
| Isolated DI | 8 | Fence-line contact sensors, LX inductive loops, SIL-4 switch position |
| Isolated DO | 4 | Relay drives to switch motors + LX barriers |
| 1000BASE-T LIDAR | 1 | ROW-mounted LIDAR (RFC 0016) |
| CAN-FD radar | 1 | ROW-mounted mmWave radar (RFC 0016) |
| MIPI-CSI | 1 | ROW-mounted CCTV camera (optional) |
| GPIO (3.3 V tolerant) | 16 | General I/O — balise triggers, axle-counter inputs |
| PTP PHY | 1 | 1588v2 time sync for consensus cluster |
| M.2 NVMe | 1 | Local log shadow + OTA staging |
| USB-C | 1 | Depot console + OTA |
| 24 V DC input | 2 | Redundant, diode-OR |
| ATECC608B | 1 | Trust anchor — signs SectionIntrusion / SwitchObservation entries |

## Power budget

Depends on populated roles. Bounds:

| Configuration | Sustained | Peak |
|---|---|---|
| Interlocking + consensus only | ~8 W | ~12 W |

| Configuration | Sustained | Peak |
|---|---|---|
| + switch-machine control (one switch) | ~12 W | ~60 W (during throw) |
| + level-crossing control (4 barriers) | ~18 W | ~50 W (during barrier transition) |
| + intrusion-detect (LIDAR + radar + camera) | +14 W | +22 W |
| Worst-case combined | ~44 W | ~90 W |

Input range 9 – 36 V DC to accommodate both the 24 V wayside cabinet bus and the 12 V battery-backup mode. An LTC7803 wide- input buck handles the range.

## Environment

- Industrial temp: −40 °C to +85 °C ambient.
- IP67 enclosure — pole-mountable; no cabinet required for the harsh-climate configuration.
- EN 50121-4 EMC compliance for wayside equipment.
- EN 50125-3 environmental conditions for signalling.
- Vibration + shock: IEC 61373 Cat 2 (wayside).
- Conformal coat: MG Chemicals 419 before integration.

## Form factor

180 × 130 mm — slightly larger than T-ECU/S to accommodate the wide 24 V + 12 V PSU and the 8+4 isolated I/O pool. DIN-rail + pole-mount bracket options. No fans.

## Target BOM

~€340 per board (CM5 ≈ €110 industrial-temp premium, baseboard ≈ €95, I/O isolators ≈ €55, RF + sensor headers ≈ €30, PSU + passives ≈ €50).

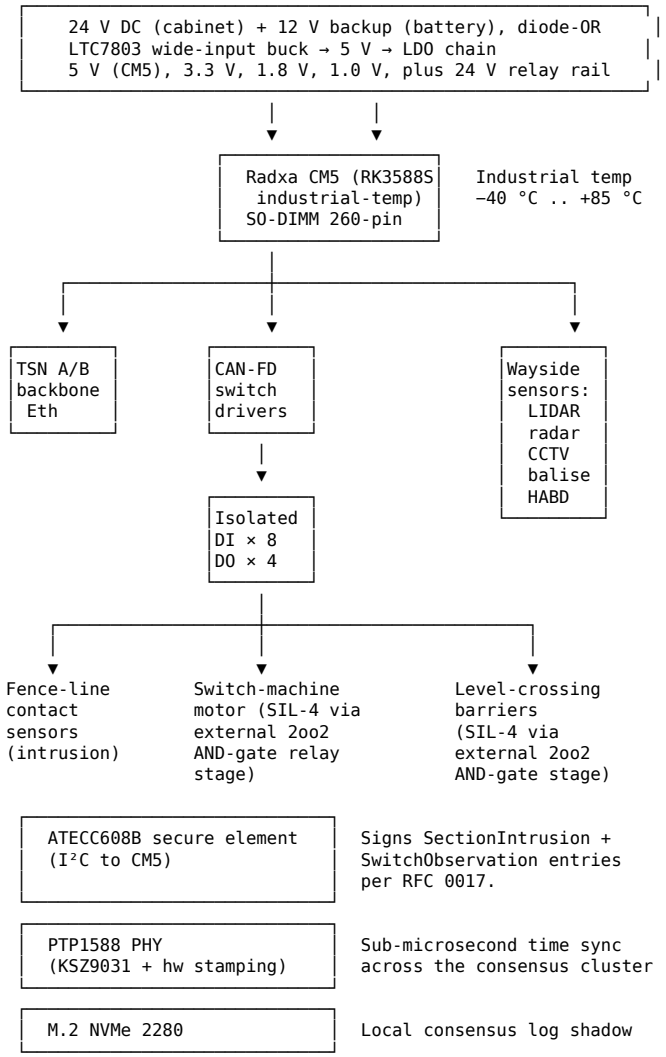
A typical wayside deployment uses three W-SBCs per line as the minimum Raft quorum; larger networks scale the cluster up as needed.

## Expected v2-spec file set

- `block-diagram.md` — functional block diagram.
- `power-budget.md` — per-role power profile.
- `pinout-cm5.md` — CM5 SO-DIMM pin assignments.
- `safety-nets.md` — switch-motor + LX actuator safety-critical nets with 2oo2 AND-gate relay stages.
- `connector-tables.md` — M12 + terminal-block pinouts.
- `deviations-log.md` — design-review notes.

# W-SBC v2 — block diagram

Repository source: `control-electronics/w-sbc/schematics/v2-spec/block-diagram.md`



## Safety-critical actuator path

All SIL-4 actuator outputs (switch throw, LX barrier drop) flow through the same 2oo2 AND-gate relay pattern as T-ECU/S: the CM5 drives both channels via a pair of independent GPIOs through optoisolators, and the relay stage is passive-AND. Loss of either channel drops the actuator.

The CM5 is not itself 2oo2 in silicon. Safety redundancy at the CPU level is provided by the 3-node consensus cluster — if this CM5 fails, the other two nodes continue, and the cluster re-elects a leader within 1.5 s. Actuator state on this board may freeze at the last-committed value but cannot enter an unsafe state because the CM5 no longer drives the AND gate's input (fail-restrictive).

## Non-safety accessory path

The non-safety crates (`osr-energy-site`, non-critical `osr-balise` logging) share the same CM5 but do not drive any actuator. Their faults are diagnostic, not safety-critical.

## Interfaces to sensor suite (RFC 0016)

The intrusion-detect sensor pack lives near the W-SBC on the same pole or in the same cabinet:

- LIDAR connects via the 1000BASE-T Ethernet (using a separate PHY from the TSN backbone, so LIDAR traffic does not steal backbone bandwidth).
- Radar connects via CAN-FD.
- Stereo camera connects via MIPI-CSI-2 (optional — many junction boxes omit the camera to reduce cost).

- Fence-line contact sensors feed in via the 8 isolated digital inputs.

The CM5 runs `osr-intrusion-detect::evaluate` at 5 Hz and emits one `SectionIntrusion` consensus entry per tick (signed by the ATECC608B).

# Engineering Integration and Assurance

Repository source: `engineering/README.md`

This domain combines reusable design sources with city alignment and accepted engineering inputs. It owns analysis and exchange evidence, not the canonical component geometry.

| Area | Contents |
| --- | --- |
| `analysis/analysis-register.toml` | Machine-readable source of truth for current analysis status and remaining evidence |
| `analysis/` | Field-to-drainage/ground deployment gates, station evidence and solver inputs |
| `interchange/` | Deterministic IFC4.3 and station-interchange generators; `ifc_mesh.py` converts indexed native solids into bounded, source-bound browser geometry |
| `models/bim/reference/` | Public IFC, IDS, BCF, validation and coordination review set |
| `models/digital-twins/` | Source-linked fabrication and construction review scenes |
| `assurance/` | Formal specifications and simulation-component coverage evidence |
| `baghdad_detail.py` | Source-bound six-car Baghdad parts, software/ERP allocation and electronics sizing register; design and Iraqi slab manufacture |
| `assembly_design/` | Source-linked Baghdad requirements, generated assembly alternatives, native correspondence and isolated capability development with independent research review; first retained campaign |
| `toolchain/` | Pinned external engineering applications and validation commands |

Structural release calculations, surveys, ground data, supplier drawings and jurisdictional approvals remain deployment-specific gates.

City `engineering/depot-scope/` reports reconcile the operating depot inventory with the station BOM, reference canopy, cost allowances and initial dispatch requirements. See the Samawah reconciliation. These reports quantify outstanding work; they do not establish equipment placement, an installed budget or overnight stabling feasibility.

# City organisation and design work

Repository source: `engineering/analysis/city-delivery-index.md`

> Retained delivery comparison: 39 city alignments were refreshed on 20 October 2026. These older delivery figures require source-specific revalidation. Use the current map audit and city manifests to distinguish current geometry from retained analyses.

Generated from current city finance, work orders, climate presets and mapped soil. All figures remain planning quantities pending local workforce and design qualification.

# Catalogue deployment evidence

Repository source: `engineering/analysis/deployment-summary.md`

> Retained delivery comparison: 39 city alignments were refreshed on 20 October 2026. These older delivery figures require source-specific revalidation. Use the current map audit and city manifests to distinguish current geometry from retained analyses.

City registers distinguish completed screening and data work from field investigation, physical design and operating release. Soil means and uncertainty are planning inputs.

| City | Soil complete / sampled locations | Open deployment gates | Soil inputs | Deployment work |
|---|---|---|---|---|
| bukavu | 452 / 463 | 13 | soil | register |

# Depot thermal and fire mitigation work packages

Repository source: `engineering/analysis/stations/mitigation-work-packages.md`

Generated from `mitigation-work-packages.toml`, which is the canonical owner/evidence/closure register.

Design response: Keep charger power stages and stationary storage in a physically separated outdoor/open-sided energy compound; keep controls and switchgear in a separate room with 2 x 30 kW packaged DX cooling (one duty, one standby).

> The deterministic comparison supports layout development only. No package closes without project inputs, signed supplier evidence and competent local approval.

| ID | Package | Owner role | Related products | State |
|---|---|---|---|---|
| `STN-MIT-001` | Charger and battery supplier evidence freeze | depot electrical lead | `STN-DEP-P040`, `STN-DEP-P050` | `open-deployment` |
| `STN-MIT-002` | Energy-compound site and fire-strategy release | architect/engineer of record and fire engineer | `STN-DEP-P010`, `STN-DEP-P040`, `STN-DEP-P050` | `open-deployment` |
| `STN-MIT-003` | Controls-room cooling detailed design | mechanical services lead | `STN-DEP-P070` | `open-deployment` |
| `STN-MIT-004` | Energy-compound detection and protection integration | electrical and fire systems leads | `STN-DEP-P040`, `STN-DEP-P050`, `STN-DEP-P070` | `open-deployment` |
| `STN-MIT-005` | Factory and site acceptance evidence | depot commissioning manager | `STN-DEP-P040`, `STN-DEP-P050`, `STN-DEP-P070` | `open-deployment` |
| `STN-MIT-006` | Independent review and operating handover | operator design authority | `STN-DEP-SA850` | `open-deployment` |

## Evidence required

### `STN-MIT-001` — Charger and battery supplier evidence freeze

- selected manufacturer/model and controlled datasheets
- maximum-ambient derating and charger loss/duty map
- cell-to-pack propagation and credible heat-release data
- fault response, remote isolation and maintenance clearances

### `STN-MIT-002` — Energy-compound site and fire-strategy release

- surveyed compound location and code-compliant separation distances
- wind-sensitive fire/smoke cases and occupied-building exposure assessment
- outward access, fencing, emergency response and firefighting provisions
- spill/firewater drainage, containment and environmental approval

### `STN-MIT-003` — Controls-room cooling detailed design

- project weather and envelope model
- selected 2 x 30 kW units with site-ambient derating
- duty/standby controls, high-temperature alarm and loss-of-cooling response
- refrigerant, condensate, maintainability and power-failure design

### `STN-MIT-004` — Energy-compound detection and protection integration

- detection technology and coverage drawings
- cause-and-effect matrix including alarm, charger abort and remote isolation
- protection coordination, earthing and emergency-stop design
- interface test procedure with OCC and depot maintenance systems

### `STN-MIT-005` — Factory and site acceptance evidence

- charger, battery and cooling FAT records
- installed thermal-load and duty/standby changeover test

- alarm, abort, isolation and loss-of-comms test
- fire-system integrated test witnessed by the approving parties

### `STN-MIT-006` — Independent review and operating handover

- closed design comments and statutory approvals
- approved emergency and degraded-operation procedures
- as-built model, asset register, spares and maintenance plan
- training, drill and operator acceptance records

# Station systems screening

Repository source: `engineering/analysis/stations/screening-summary.md`

Deterministic design-reference checks for all seven station variants. These are reproducible engineering screens, not construction release or authority approval.

- Screening execution: passed
- Deployment release: not ready
- Manifest: `design/component-catalogue/catalog/buildable-stations/station-kit-manifest.json` (`b6a0f2be36ac…`)

## Results

| Domain | Engine | Scope | Result | Remaining gate |
|---|---|---|---|---|
| Structure | OpenSeesPy 3.8.0.0 | 22 m shared canopy truss, gravity + uplift | PASS | Site loads, 3D stability, joints, foundations and code combinations |
| Passenger flow | JuPedSim 1.4.2 | normal, degraded and egress route for 7 variants | PASS | Calibrated demand, conflicts, assisted evacuation and authority criteria |
| Roof drainage | EPA SWMM via PySWMM 2.1.0 | 7 canopy catchments, 75 mm/h input storm | PASS | Local rainfall, survey, tailwater, blockage and exceedance |
| Depot thermal | EnergyPlus | baseline room + separated/cooled controls-room comparison | input-prepared | Project climate, supplier losses, detailed HVAC, controls and commissioning |
| Depot fire | FDS | enclosed room + separated/open compound comparison at prescribed 250 kW | input-prepared | Supplier fire data, separation/wind cases, suppression and fire-engineer acceptance |

## Structural cases

| Case | Load kN | Displacement / limit mm | Stress / allowable MPa | Result |
|---|---|---|---|---|
| `gravity` | 205.7 | 18.65 / 91.67 | 62.9 / 213.0 | PASS |
| `wind_uplift` | 224.4 | 20.34 / 91.67 | 68.6 / 213.0 | PASS |

## Passenger-flow cases

| Variant | Normal s | Degraded s | Egress s | Result |
|---|---|---|---|---|
| `halt` | 58.50 | 61.80 | 68.20 | PASS |
| `standard` | 62.75 | 65.15 | 71.35 | PASS |
| `major` | 62.75 | 65.15 | 71.35 | PASS |
| `interchange` | 62.75 | 65.15 | 71.35 | PASS |
| `interchange-elevated` | 62.75 | 65.15 | 71.35 | PASS |
| `terminal` | 62.75 | 65.15 | 71.35 | PASS |
| `depot-terminal` | 62.75 | 65.15 | 71.35 | PASS |

## Drainage cases

The storm supplies 25 mm over 20 minutes. The roof and rational check both use C=1 (no losses). Each 300 mm branch assumes a 0.4 m fall over 40 m; these are planning levels requiring site survey. Dynamic-wave routing uses a 1 s hydraulic step and 10 s runoff step. Rainfall, zero infiltration, runoff volume/peak, conduit peak, continuity and no flooding are separate pass gates.

| Variant | Catchment / branches | SWMM branch / aggregate L/s | Rational aggregate L/s | Rain mm / volume error % | Inlet depth m | Result |
|---|---|---|---|---|---|---|
| `halt` | 439.0 m² / 11 | 0.83 / 9.15 | 9.15 | 25.00 / 0.019 | 0.020 | PASS |
| `standard` | 1813.0 m² / 27 | 1.40 / 37.77 | 37.77 | 25.00 / -0.009 | 0.025 | PASS |
| `major` | 2115.0 m² / 19 | 2.32 / 44.06 | 44.06 | 25.00 / -0.050 | 0.032 | PASS |
| `interchange` | 2921.0 m² / 31 | 1.96 / 60.85 | 60.85 | 25.00 / -0.038 | 0.030 | PASS |
| `interchange-elevated` | 3348.0 m² / 32 | 2.18 / 69.75 | 69.75 | 25.00 / -0.046 | 0.031 | PASS |
| `terminal` | 2561.0 m² / 31 | 1.72 / 53.35 | 53.35 | 25.00 / -0.025 | 0.028 | PASS |
| `depot-terminal` | 1626.0 m² / 26 | 1.30 / 33.88 | 33.88 | 25.00 / -0.004 | 0.024 | PASS |

## Release boundary

A passing row means only that the deterministic catalogue assumption completed and met its stated screening threshold. Before procurement or construction, the deployment team must substitute surveyed/site inputs, local statutory criteria, supplier performance data, detailed connections and independent competent review. EnergyPlus/FDS solver completion and a mitigation screen pass confirm only input execution and the direction of the catalogue design response. The baseline findings, supplier evidence, project-specific design and independent approvals remain open release gates.

# Baghdad assembly development

Repository source: `engineering/assembly_design/README.md`

This programme enriches source requirements and executes provisional assembly experiments. Its supported scope is one LV/ventilation cassette, one replaceable bearing seat, a provisional 1.2 m structural floor bay and an executable cassette interlock. It does not complete the train, civil works or all remaining component generators.

The input registry separates published supplier/reference facts, repository planning values and proposed pilot assumptions. Every fact has a source, locator, unit, scope and non-approved status. Country climate observations do not establish a site design extreme. Supplier headline limits do not establish combined performance or an offered railway configuration. Proposed manufacturing tolerances, loads, stress screens and productivity values are not approved limits.

The 345 pre-existing records retain their identities and architecture boundaries; 246 have the LM3 namespace. The 69 Baghdad reference-part records are separately allocated, giving 414 scoped records without claiming physical BOM completeness. Four Baghdad records currently connect to three pilot generators. Remaining records produce family-specific generator/evaluator work orders; the crosswalk groups all 414 records by architecture/function and flags duplicate records.

Cassette definitions include a perforated tray, individual rail plates/webs, mount pads and fasteners, duct walls/feet, eight conductors and jackets, drilled clamp bars/standoffs, earth hardware and an exact GB-origin Harwin reference connector. The connector is a coordination envelope with published mass, not a reconstruction of its internals. Mating/termination geometry, clamp retention, seals, bond conductors, insulation/derating, vibration and whole-car HVAC remain open. The software trials test a latching permission interface, not train control.

Bearing-seat studies include drilled plates, guide members, grout, anchor hardware envelopes, local uniform-bedding/plate-strip and elastic bolt-group screens, and thermal travel. One revision-bound complete reference-kit reaction ledger includes the formerly omitted 60,000 kg track-support allocation and all retained permanent units. Signed bearing and downstream support resultants are reconciled; the represented seat replaces the prior bearing mass once. Six-car uniform planning cases remain explicit provisional hypotheses. Axle loads, dynamic interaction, contact, prying, fatigue, local concrete/anchor resistance, offered bearing configurations and the fixed/guided/free arrangement still require their own verification.

Candidate revisions cover the actual generated geometry, interfaces, materials and metadata. A source/runtime-bound SQLite queue deduplicates trials, recovers sealed results after interrupted database writes, retains partial evidence and vetoes failed native confirmations. Native checks reopen FCStd, reconcile mass, CG/inertia and STEP, and screen static solid intersections. They do not verify moving paths, welds, threads, anchor development or physical performance.

```

The five-minute timer runs six pending experiments per cycle and retains a portable local report at `~/.local/state/opensourcerail/assembly-design/latest/`. The current bounded domain has 90 physical recipes and two software implementations. Once these finish, the same runner executes a bounded companion study: twelve detailed cassette variants, twenty-seven civil cap-cage variants and the same fifty-four structural variants. The expanded structural grammar includes two crossmembers nearer the equipment feet; it counts both feet on each loaded strip and independently checks the added support beams. Replayed structural variants are not additional unique designs. A registered companion also compares 172 aluminium/GFRP panel hypotheses and confirms six explicitly scoped owned-section CAD exhibits. Full installed panels, formed roofs and qualification remain open. It confirms the best analytical alternatives in native CAD, retaining failed confirmations and trying up to three alternatives per family. Tool unavailability holds the family instead of spending this fallback budget. After exhaustion it explicitly waits for new requirements or capabilities; it does not repeat identical trials. A separate hourly capability service assigns missing Baghdad component work to an isolated developer and a separate critic. It retains proposed source, declared assumptions, native evidence and the exact review, with two provider calls per hour and at most two attempts per component. A known native failure or unavailable tool cannot become a successful research improvement. Reviewed proposals are not automatically imported into the runner; independent numerical benchmarks and adapter/interface registration remain required before a new evaluator becomes trusted research infrastructure. Resource limits are 2 GiB of programme output, a 20 GiB free-space reserve, 2 GiB service memory and a 15-minute service timeout. Portable assembly publication has a 48 MiB cap, including retained site inputs and the six additional panel-section CAD/IFC/image exhibits. Raw evidence is preserved; no result gains engineering acceptance through publication.

Exports contain exact original receipts/evidence, the requirements and fact registry, qualification log, candidate CAD, drawings, BOM/process data, unexecuted QA plans and software tests. Verification compares exported copies and report

metrics with archived originals, including after outer checksums are regenerated. XY inspection layouts and native previews are explicitly unissued. The initial repository snapshot is under `docs/design-engine/assembly-design`; subsequent automatic reports remain local until a reviewed repository publication.

The capability worker reuses the already configured proposal executable/model. It writes only to an owned sparse Git worktree, checks that protected tracked source remains unchanged, executes the proposed generator with bounded time and output, and runs the trusted native-contract checks. A separate read-only critic reviews exact proposal/source digests. Git worktrees isolate source changes, not the operating system. All qualification/release flags remain false. The worker preserves private source/output before deleting reproducible clean checkouts; failed protected-source edits remain held for inspection. It does not contact suppliers, send messages, merge code or claim an approved design.

# Full design closure plan

The controlled source is `OpenSourceRail_Full_Design_Closure_Plan_2026-10-19.pdf`. Its 88 deliverables and 13 work packages are tracked in `data/closure-plan.json`. Every engineering exit remains open. `partial-provisional` in the report describes implemented code and its limited evidence, not a completed engineering task. Named engineering owners, independent reviewers and acceptance authority remain unappointed.

The tracker now consumes the controlled `data/closure-evidence.json` index and separately pinned `data/closure-trust.json` keys. Original digital-author and independent digital-review signatures bind each task's required scope, component/interface revisions, engineering inputs, drawings, analyses and inspection/process artifacts. Missing, failed or stale evidence cannot close a gate. Original referenced bytes are included in portable publications. Historical records are retained; a new valid revision can replace stale coverage, while a known failure on the current revision remains a veto. Digital specification, physical-record coverage and manufacturing release are reported separately. The current index is empty, so no accepted completion is invented. When a physical unit and adopted method exist, its serial, component/interface revision and method/standard applicability belong in that controlled task's `physical_expected` field in `data/closure-plan.json`. A submission cannot set its own applicability; original measurement/calibration and independent review envelopes still pass the existing authenticated-record adapter.

`data/equipment-layout.json` is the shared provisional instance layout: eight complete LV/ventilation cassettes and three refrigeration boundaries per car. The detailed mass/inertia, pigtail/conductor quantities, known fan/LV model power, thermal counts and electrical group mappings derive from the same definition. All48cassettes are counted. Refrigeration mass, trunk routes, actual vehicle packaging, maintenance access and costs remain unknown; gross additions earn no removal credit and do not revise the adopted planning train mass.

Site catchment replay uses the existing numerical-reproduction utility with a local whitelist for sub-micrometre sampling diagnostics. Report self-hashes, source/geometry bytes, population values, integer counts and decisions remain exact. These replay tolerances do not relax engineering acceptance limits.

The cap companion retains six round bent-link/hook/coupler schedules, including mandrel radii, hook arcs/tails, congestion checks and manufacturing/inspection steps. They are excluded from cap selection while curved native geometry, development, anchorage, coupler ratings and resistance remain unconfirmed.

The existing programme now carries a named provisional configuration, source and standards registers, a 414-record family crosswalk, typed component/interface contracts and dependency invalidation. Door/low-floor/route/charging adoption and conflicting mass definitions remain explicit holds. IEC 61373:2026 requires an edition impact review; the lithium-ion scope of IEC 62928 is enforced rather than transferred to another chemistry.

The cassette supplement uses exact Harwin solder-contact female/male kits, eight active and two reserved positions, and different-gauge harness halves. It executes DC power/fault controls, a precharge energy control, air/heat/moisture balances, a process/removal dependency graph and worst-case tolerance stacks. The initial guide/connector fit and some airflow scenarios fail. Missing simultaneous derating, protection coordination, installed access and physical evidence keep the complete chain out of system acceptance. Assumed fan curves and circuit disconnects are identified as hypotheses.

Supplemental cassette failures propagate into its parent result and downstream integration eligibility. A failed candidate can still have valid native geometry for inspection. Such evidence is published under `diagnostics/`, with explicit exclusion from shortlists; its CAD image is not a successful design selection.

The structural pilot includes RHS rails and crossmembers, a drilled floor, four bolted equipment mounts and a steel test block. Independent analytical/FEM, mesh, equilibrium, acceleration and support-fixity controls check only the equivalent longitudinal elastic model. Local floor/joint resistance, buckling, fatigue, modal transfer and the complete carbody remain unresolved.

## Additional closure-plan executions

`design_studies.py` extends the existing epoch, qualification and publication paths. Its source-bound `studies/` report adds:

- A detailed cassette and proposed host fixture, with routed conductors, solder-cup envelopes, cover, seals, bond, guides, retention and actual rigid insertion/removal/tool-envelope checks. Original failed guide/connector assumptions remain in the original evidence. Replacement checks identify exactly which revised interfaces supersede them. Carrier/mount loads include the newly represented mass.
- Structural mount bearing washers and adaptive bolt stacks, local floor/joint checks, proposed weld details, modal/refinement controls and manufacturing instructions. Thin floors fail the new local screens. A 16 mm floor is a heavy research sensitivity; it does not establish an optimal complete carbody.
- Actual round bars, welded links, embedded lift/jacking parts and spacers in a hollow pier-cap segment. Concrete is not counted again in this cage model. The retained complete cap mass and unresolved allowance remain visible. Construction checks use the actual asymmetric permanent mass distribution.
- Hierarchical six-car electrical nets and isolation/bond/signal boundaries, twelve coupled HVAC/battery/controller duty cases, independent RC and heat balances, electrical cooling demand, and separate cabin/battery cooling failures. Synthetic equipment maps remain uncalibrated. A complementary cassette campaign retains $I^2t$, electrothermal, $CO_2$ and map sensitivities.
- Native FreeCAD/STEP/IFC, unissued inspection layouts, exact part/joint/QA handoffs, revision-specific unissued prototype test requests, native previews, a rigid fixture-motion video and an animation of executed thermal traces. These are distinct from a force/contact simulation or an installed vehicle.

All 88 PDF tasks remain tracked individually. Missing full carbody/bogie, refrigeration/CFD, complete prestress/reinforcement, ground, coupled train passage, physical correlation, production and authority exits are not closed by these software executions. Named engineering reviewers, offered equipment data, manufactured samples and calibrated test results remain external work.

The shared integration adapter propagates represented mass, CG and inertia, power/heat and complete reference reactions, with exact source/configuration identities and child-failure vetoes. It references existing spatial/flexible physics adapters. A full, converged six-car passage has not been executed for these new pilot revisions.

The local weekly `osr-assembly-verification.timer` re-runs the complete test profile, including native checks, before running a cycle. A required native skip prevents qualification. Fast adverse tests also run in the existing design-twin CI workflow. Each export includes its actual test log and receipt.

External evidence can be checked with `design-assemblies.py ingest --record ... --calibration ... --review ... --trust ... --expected ... --evidence-root ...`. The operator supplies pinned public keys and authorised roles in a separate trust configuration. Measurement, calibration and independent applicable review are Ed25519-signed envelopes; raw files, instrument/fixture revisions, calibrated ranges, method edition, uncertainty and exact serial/interface revision must agree. No private keys or invented laboratory records are provided. Successful authentication does not issue a manufacturing or railway release.

Three unissued RFQ/test data requests identify fixture/calibration requirements, raw-data and holdout outputs, scope and data rights. Laboratory availability, commercial terms and supplier qualification require actual responses. No outreach has been performed.

# Baghdad desktop investigations

The site supplement uses actual open data, with retained samples and hashes: WorldPop 2026 native population counts; separately scoped GHSL 2025 and WorldPop 2020 comparisons; SRTM-derived terrain; ESA WorldCover 2021 land/water samples; a fresh 7,045-feature OSM snapshot; and existing proposed routes, roads and building extracts. It produces a detailed GeoJSON/SVG map, 80 context cells, route-level water/infrastructure exposure, land-use investigation candidates and 250/500 m chainage investigation scenarios. These are planning quantities, not an adopted borehole programme or a declaration that land is available.

Context estimates cover 44.1–44.6°E, 33.1–33.5°N. Population corridor estimates use a different retained extent, 44.2–44.75°E, 33.05–33.5°N, and count each native pixel once in the network union. They measure proximity to concept lines, not station walking access or ridership. The ±25 m line-sampling bound, separate pixel-footprint sensitivity, unknown route accuracy and population-model uncertainty remain explicit. Different model vintages are not measured growth.

WorldCover lacks the requested western strip. Road/building coverage also has limits. OSM way water polygons are incomplete and omit multipolygon relations; river centrelines support investigation priorities but do not establish bank positions or flood risk. Terrain is not a surveyed ground profile. Groundwater, design flood level, soil resistance, parcel ownership and buried utility clearance remain unknown. The estimates can scope surveys, investigations and supplier enquiries; physical design must retain the corresponding holds.

`site_context.verify`, `site_catchments.verify` and `site_screening.snapshot` verify or recompute the retained estimates. `site_bundle` adds their raw inputs to the existing portable publication, which independently checks displayed quantities and rebuilds the map outside the original GIS paths. Online GIS extraction is separate from offline reporting and requires Shapely/pyproj; raster cropping additionally needs rasterio. Ordinary report replay downloads no data.

# Population access, transfers and viaduct obstacle review

Repository source: `engineering/assurance/access-clearance/README.md`

> Historical aggregate: city alignments refreshed on 20 October 2026 invalidate parts of this retained review. Use the current independent network audit for topology and each city's package manifest for stale evidence. Clearance and full engineering revalidation remain pending.

All 266 cities retain separate population/transfer and beam/support/terrain reports. 247 have usable native WorldPop 2020 count evidence; 19 have explicit missing or zero-count evidence. No routing score is multiplied by city population.

243 line networks are fully connected through declared interchanges; 23 retain disconnected components. Direct line-pair transfers are reported separately. Geometry crossing alone creates no passenger transfer.

The historical demand score counts high-demand cells near tracks, including areas between stations; it is not population access. Native station catchment unions can be higher or lower. Radial distance ignores walking barriers; wider radii require feeder/walking evidence and do not create extra fare revenue. Source year, bounding-box denominator, native pixel resolution and nodata remain explicit.

Input finding — Wau: Wau is in South Sudan. The canonical jurisdiction and national aggregation now use SS; the historical slug waw remains an alias. Finance uses an explicitly uncalibrated generic scenario, with SSP currency; Sudan SD/SDG assumptions are excluded. Evidence.

Terrain is retained for 266 cities; gaps remain visible elsewhere. Zero cities are physically obstacle-released. Beam overflight, foundations and terrain are checked separately. Known provisional clashes and unknown heights require survey and design changes; no accepted route clearance or unpriced height increase is invented.

# Current Baghdad test inputs

Repository source: `engineering/assurance/baghdad-test-inputs/README.md`

This snapshot contains the exact current operations, solver and GIS inputs used by repository tests. Its manifest binds every member, archive part and producer source by SHA-256. It is separate from the historical Baghdad proposal snapshot. Physical and operating release remain false.

Restore a clean checkout with:

```
tools/automation/osr-python tools/automation/bootstrap_baghdad_tests.py
```

After a deliberate input update, regenerate from current local files with:

```
tools/automation/osr-python tools/automation/pack-baghdad-test-inputs.py
```

The bootstrap preserves differing local inputs and rejects changed source, archive or member receipts. Archive parts remain below 50 MiB.

# Battery-cooling qualification readiness

Repository source: `engineering/assurance/battery-cooling/qualification-report.md`

> Generated by `tools/automation/subsystem_qualification.py`.

Package `QP-COOLING-001` / configuration `CFG-DEMO-COOL-A`. QUALIFICATION-OPEN.

Quantitative screens retain their stated input evidence basis. Physical qualification and accepted use require the separately listed measurements and authenticated decisions.

|---|---|---|
| | | engineering configuration is stale.; Operating envelope,restrictions and handback conditions are unresolved.;Reference configuration has no deployment-specificaccepted use. |

# RAMS allocation outcomes

| Allocation / metric | Target | Result bounds | Outcome |
|---|---|---|---|
| ALLOC-COOL-reliability / pump_failure_rate | <= None 1/h | [1e-05, 5e-05] | undetermined — Allocated operating conditions do not match the analysed conditions.; RAMS target, comparison or allocation review remains open.; Result uses assumptions, unknown events or an unvalidated model. |
| ALLOC-COOL-availability / function_availability | >= None probability | [0.9996700950723632, 0.9999979999740007] | undetermined — Allocated operating conditions do not match the analysed conditions.; RAMS target, comparison or allocation review remains open.; Result uses assumptions, unknown events or an unvalidated model. |
| ALLOC-COOL-maintainability / pump_mean_repair_time | <= None h | [2.0, 6.0] | undetermined — Allocated operating conditions do not match the analysed conditions.; RAMS target, comparison or allocation review remains open.; Result uses assumptions, unknown events or an unvalidated model. |
| ALLOC-COOL-safety / thermal_time_to_limit | >= None s | None | undetermined — Allocated operating conditions do not match the analysed conditions.; RAMS target, comparison or allocation review remains open.; Quantitative result is unresolved.; Result uses assumptions, unknown events or an unvalidated model. |

# Scoped graph findings

Graph `a9fbc74b72573ba519b66109d396955f126f8b76ab80593b39c2e5157bdb948f`; 79 scoped records. Every scoped blocker requires closure or an authenticated, baseline-bound exclusion.

| RIG-AUX — Loss of shared auxiliary power | draft-A | max_temperature_c, max_detection_delay_s, max_isolation_delay_s, maximum_sample_gap_s; duration, repetitions and model tolerance require review |

# Catalogue network geometry audit

Repository source: `engineering/assurance/catalogue-geography/README.md`

The current independent audit checks all 266 city examples against their exported route geometry, proposed platform groups and retained independent water evidence. All 266 networks form one connected line graph and one connected proposed transfer graph. No missing grouped platforms at checked dry crossings, wet platform cells, unknown platform cells or unapproved water runs above 1 km are reported.

The complete geometry audit remains open: 31 self-intersecting lines remain in 29 older city layouts. Connectivity is not sufficient for a usable alignment. These findings are retained explicitly below; they are not engineering or operating releases.

39 regenerated cities and correction evidence include Kisangani, Lubumbashi, Garissa, the other disconnected examples, and all nine Angola cities. All 39 pass the expanded local map audit. Angola is classified as Central Africa (UN M49 Middle Africa).

The common planner restores source-routed radials where forced core chords distorted them, removes only bounded local raster knots, and joins disconnected components using constrained continuous corridors. Protected land, known water, unknown coverage, retained population-priority stops and maximum added route scope remain explicit. Larger unresolvable loops require another controlled alignment decision.

Checks use Shapely independently of native station generation. Projected line crossings over mapped water cannot create passenger transfers. Dry geometric crossings require grouped proposed platforms within the native 60 m raster tolerance. Continuous geometry, walking access, levels, foundations and site acceptance remain open.

| City with remaining self-intersections | Lines |

| aleppo | line-1 |
| damascus | line-6 |
| hama | line-3 |

The earlier baseline audit records the previous water-placement campaign. Its narrower checks did not establish whole-network connectivity or absence of self-intersections. Earlier operating and energy results remain valid only for their recorded source revisions. Changed alignments require new runs; each updated city publishes an incomplete package manifest and an explicit revalidation notice.

Each city retains its grid, ESA WorldCover 2021 class samples, OSM water geometries, combined mask and source receipts. Checks reconstruct these masks from retained inputs. Historical satellite classification and mapped features are planning evidence, not current shoreline surveys. Attribution: © ESA WorldCover project 2021 / Contains modified Copernicus Sentinel data; OSM supplement © OpenStreetMap contributors, ODbL.

Sources: ESA WorldCover, UN Angola classification.

# Catalogue map corrections — 20 October 2026

Repository source: `engineering/assurance/catalogue-network-layout/README.md`

39 city layouts were regenerated. Kisangani and Lubumbashi retain source-routed radial geometry instead of forced straight core chords. Garissa and the other disconnected examples now form connected proposed networks with grouped platforms at checked dry crossings. All nine Angola cities have moved to Central Africa, following UN M49 Middle Africa.

The independent whole-catalogue audit now reports 266 connected networks, zero missing grouped platforms at checked dry crossings and zero detected wet platforms. 31 self-intersecting lines in 29 other cities remain open. Each of the 39 regenerated cities passes all expanded local map checks. A geometric or proposed transfer pass is not evidence of walkability or physical approval.

Qena's rejected source route required a separate constrained Nile-bank reroute. Its final reversal is about 49 m; independent water, connectivity and terminal checks pass. The original source failure remains recorded.

The shared planner restores source corridor shapes, keeps protected land and unknown/wet transfer exclusions, preserves population-priority stops, removes only bounded local raster knots and connects components through continuous constrained routes. Native radial/ring extensions now reject self-retracing paths. Independent graph and geometry checks hold publication on new failures. Every city retains the pre-correction geometry, exact dependency hashes and final map audit.

Population demand uses hash-checked retained WorldPop city pixels and actual OSM anchors; resampled relative demand is never summed as a resident count. OSM acquisition requests relation members and geometry, retries gateway failures with the identical GET query, and rejects partial responses.

Source-bound planning finance was recalculated from the current geometry, fleet and controlled assumptions; the book uses these reconciled quantities. These calculations do not execute an operating or energy campaign.

Dependent engineering revalidation remains pending. Updated city pages show current geometry and quantities only. Package manifests flag stale operating, energy, clearance and delivery evidence; retained numerical reports remain linked with their source revisions. Retained numerical results are preserved; they are not rehashed as new executions. No complete engineering, manufacturing, operating or physical release is claimed.

Verification: 381 Python tests passed, one skipped; 49 Rust tests passed, and the native `osr-design` release binary rebuilt successfully. Python log · Rust log · Build log. These are code/planning checks; a new full operating campaign for changed alignments has not completed.

Exact candidate and source receipts · Whole-catalogue remaining findings.

Additional publication checks: 22 archive tests and 18 reader/network tests passed. Two reader hygiene guards were excluded after confirming their violations already existed at the starting revision: 20 unchanged files with host-specific paths, and a 225-line root README against a 220-line limit. Baseline comparison. The broader repository scan also reported legacy publication drift; no whole-repository green check is claimed.

# Civil reference demonstration A

Repository source: `engineering/assurance/civil-reference/README.md`

Status: awaiting site design, physical evidence and independent review. Release is blocked.

The reference contains 4 beam assets with 20/25 m spans and 20 m of adjoining at-grade transition. It provides quantities, connection briefs, construction hold points, option comparisons and a connected civil FMEA. It is a review package for engineers and suppliers; it has no accepted construction drawings.

## Layout and quantities

| Asset | Family | Chainage (m) | Supports |
|---|---|---|---|
| PI20-T1 | Pi20 | 0–20 | SUP-00, SUP-20 |
| PI20-T2 | Pi20 | 0–20 | SUP-00, SUP-20 |
| PI25-T1 | Pi25 | 20–45 | SUP-20, SUP-45 |
| PI25-T2 | Pi25 | 20–45 | SUP-20, SUP-45 |
| TRANS-01 | trackform-comparison-required | 45–65 | SUP-45, SUP-65 |
| TRANS-02 | trackform-comparison-required | 45–65 | SUP-45, SUP-65 |

4 bare beams contain 107.91 m³ of envelope concrete over 261.0 m² of deck. Foundation, reinforcement, prestress and installed cost quantities remain unresolved. 3 elevated support lines are identified. The candidate arrangement has 16 bearing seats; capacities and fixity are unresolved.

## Mass and lifting

| Family | Bare mass (kg) | Margin under 75 t (kg) | Complete lift |
|---|---|---|---|
| Pi20 | 59,950.0 | 15,050.0 | blocked-incomplete-mass-or-lift |
| Pi25 | 74,937.5 | 62.5 | blocked-incomplete-mass-or-lift |

Net diaphragms, bulk-density reinforcement adjustment, prestress steel, anchorages, embedded lifting hardware, attachments, retained temporary works, slings, spreader and hook/block masses must be measured or substantiated. The overlapping CAD diaphragm zones cannot be summed as additional fabrication concrete. The actual crane/launcher chart, configuration, radius, dynamic allowance, utilisation, centre of gravity, ground support and lateral stability must be reviewed.

## Foundation and trackform comparison

Candidate foundations: bored-shaft, pile-group. None is selected. A measured comparison must cover axial/lateral resistance, total and differential settlement, groundwater, chemistry, liquefaction/scour where relevant, utilities and installation constraints. Calcium-based treatment needs reviewed chemistry compatibility. Reinforced-soil approaches need railway deformation, stability and scour justification.

Ballasted track, slipformed slab and precast panels remain explicit alternatives. Compare settlement, drainage, local material and maintenance capability, repair possessions and whole-life cost for the layout-defined transition before selection.

## Conventional girder comparator

Locally manufactured prestressed I-girders with a separate railway deck is retained for the 20/25 m span families. Supplier section, girder count, deck quantities and price are pending; no system is declared cheapest.

- moulds and prestress beds.
- reinforcement/end zones and transfer strength.
- girder/deck quantities and foundation reactions.
- transport and number/weight of lifts.
- temporary bracing and deck erection.
- railway deck and connection compatibility.
- bearings, jacking and replacement access.
- inspection and maintenance.
- installed time and cost.
- whole-life cost and uncertainty.

Use equivalent railway actions, geometry and service-life assumptions for both systems. Record initial capital, construction possessions, inspection, cleaning, bearing/track replacement, discount rate and uncertainty before calculating whole-life net present cost.

# Controlled connection briefs

Numerical loads, tolerances, resistance and movement limits are pending for every connection. Each requires an engineered drawing, first-article qualification and independent review.

## C-01 — Pier to foundation

Loads: axial, moment, shear, seismic cyclic demand.

Install: Survey starter bars/socket; trial fit; brace; grout/cure before loading.

Inspect: Survey alignment; reinforcement/coupler record; grout strength and fill evidence.

Repair/replacement: Engineer-designed local repair or replacement; retain access.

## C-02 — Cap to column

Loads: vertical reactions, torsion, transverse loads and seismic.

Install: Brace cap; verify interface; complete continuity/grout; strength hold point.

Inspect: Joint dimensions, engagement and void checks; as-built survey.

Repair/replacement: Accessible repair ports and approved temporary support.

## C-03 — Girder bearings and restraints

Loads: vertical uplift, braking, lateral, thermal, seismic and derailment.

Install: Survey seats; set orientation and movement datum; place beam; engage restraints.

Inspect: Seat levels, bearing rotation/contact, travel, fixity and restraint witness.

Repair/replacement: Isolate traffic; use reviewed jacking seats; replace bearing and resurvey.

## C-04 — Walkway and containment attachments

Loads: egress crowd, containment impact and fatigue.

Install: Cast inserts; gauge fit; install panels and barriers with movement allowance.

Inspect: Anchor engagement/proof evidence, gaps, containment continuity and access.

Repair/replacement: Remove replaceable panels and bolts from protected work area.

## C-05 — Track plinth and fastener anchors

Loads: vertical axle, lateral, braking, fatigue and rail interaction.

Install: Survey rail seats; qualify anchor/grout system; fit and gauge fasteners.

Inspect: Gauge, level, pull-out qualification, torque and electrical insulation.

Repair/replacement: Exchange fasteners or local plinth repair with track possession.

## C-06 — Drainage and utility crossings

Loads: water pressure, utility weight, thermal movement and accidental loads.

Install: Set falls and movement loops; separate utilities; seal joints; commission drainage.

Inspect: Survey falls; leak/flow and blockage-access checks; utility clearance.

Repair/replacement: Accessible clean-outs and replaceable flexible connections.

## C-07 — Jacking and bearing replacement

Loads: jacking reactions, temporary redistribution, lateral stability.

Install: Approve possession/supports; install synchronised monitored jacks at designed seats.

Inspect: Jack calibration, seat capacity, lift limits and stable temporary load path.

Repair/replacement: Replace bearing; controlled lowering; movement datum and track survey.

## Construction sequence and hold points

| Stage | Activity | Hold point |
|---|---|---|
| ST-01 | Freeze layout, railway loads and surveyed ground/drainage basis | Independent reviewed design and safe working constraints |
| ST-02 | Compare foundations and ground treatment; install/test supports ahead of erection | Measured load tests, settlement and chemistry compatibility; released temporary works |
| ST-03 | Fabricate beams and connection mock-ups | Reviewed reinforcement/prestress, transfer strength, mass and lifting hardware records |
| ST-04 | Survey bearing seats and install bearings/restraints | Seat levels, orientation, capacities and movement datum accepted |
| ST-05 | Transport and lift first beam; brace before releasing rigging | Reviewed actual lift configuration, stability and equipment support; witness first article |
| ST-06 | Erect paired beam and finish connections, walkway and containment | Connection strength/fill, engagement, survey and temporary support release |
| ST-07 | Construct approach/trackform, catchment and drainage interfaces | Settlement/drainage/scour criteria and blockage access checks |
| ST-08 | Commission, inspect and establish maintenance access | Geometry, drainage scenarios, jacking/replacement rehearsal; independent and authority acceptance |

## Calculations and drainage demonstration

Native model/result files preserve the reproducible elastic calculation and drainage replay. The beam comparison uses E = 30 GPa, bulk-envelope self-weight, an illustrative 20 kN/m additional service load and endpoint supports. OpenSees uses the Pi-section area/inertia; CalculiX uses an equal-area/inertia rectangular surrogate. Prestress, reinforcement, torsion, fatigue, derailment, seismic response, actual lift support positions and rail interaction are unresolved.

The elastic hand check is $5wL^4/(384EI)$. This checks software and units; its deflections are not accepted railway limits.

| Span / stage | Hand deflection (mm) | OpenSees (mm) | CalculiX (mm) |
|---|---|---|---|
| 20 m / construction | 14.280 | 14.280 | 14.363 |
| 20 m / service | 23.993 | 23.993 | 24.132 |
| 25 m / construction | 34.864 | 34.864 | 34.980 |
| 25 m / service | 58.576 | 58.576 | 58.772 |

The synthetic drainage system uses a 1 ha catchment, a 50 m conduit and a storm independent of any site. The blockage sensitivity reduces the 0.5 m conduit to 0.1 m; the backwater sensitivity fixes tailwater at 1.5 m. Reviewed project blockage/debris and flood boundaries may require different cases.

- backwater: routing continuity error 0%; 6 hydraulic limit exceedances in the illustrative screen.
- blocked-drain: routing continuity error 0%; 1 hydraulic limit exceedances in the illustrative screen.
- normal: routing continuity error 0%; 0 hydraulic limit exceedances in the illustrative screen.

Adequate continuity does not establish adequate drainage. Flooding volume, surcharge duration, peak head, conduit depth and outfall flow are checked using engine statistics across every routing step. Culvert debris, outfall consent, erosion/scour, flood pathways and cleaning access need site design. Consider ANUGA when 2D surface overflow changes the risk.

# Connected civil FMEA

| ID / stage | Failure chain | Controls and evidence |
|---|---|---|
| CF-01 / service | blocked drain  saturated formation  foundation movement  bearing displacement  track geometry deterioration  operating restriction | Accessible drains; redundant route where justified; geometry monitoring and intervention. Evidence: Blockage/backwater replay, cleaning trial, settlement model and geometry intervention review. Open. |
| CF-02 / construction | eccentric lifting  girder roll or lateral instability  dropped member or collapse | Reviewed sling geometry, centre of gravity, temporary bracing and exclusion zone. Evidence: Weighed member, lift chart/radius, stability calculation and witnessed first lift. Open. |
| CF-03 / construction | wrong orientation or level  restraint or loss of bearing contact  unexpected forces or support loss | Surveyed seats and movement/fixity datum; witness installation. Evidence: Bearing schedule, seat survey and installation inspection. Open. |
| CF-04 / construction | voids or incomplete engagement  connection resistance loss  progressive cracking or collapse | Qualified grouting procedure, mock-up, fill witness and strength hold. Evidence: Batch/strength records, void/engagement inspection and connection qualification. Open. |
| CF-05 / construction | early prestress transfer  anchorage/end-zone cracking loss of prestress or handling failure | No transfer or handling before reviewed measured strength. Evidence: Specimen maturity/strength, transfer procedure and end-zone inspection. Open. |
| CF-06 / construction | weak support or excessive ground pressure  support settlement/overturning  equipment and member collapse | Ground investigation, outrigger/launcher foundation and temporary works review. Evidence: Support loadcase, bearing/settlement calculations, survey and trial load. Open. |
| CF-07 / service | outfall erosion or transition stiffness change  differential movement  track geometry deterioration  operating restriction or derailment hazard | Scour protection, graded stiffness and drainage access. Evidence: Flood/scour assessment, transition settlement model and inspection trigger. Open. |

The shared schema allocates the coupled drainage chain to these planned assets and responsibilities:

| Failure / asset | Owner | Calculation or observation | Required response |
|---|---|---|---|
| CF-01 / DRAIN-01 | Drainage maintainer | engineering/assurance/civil-reference/calculations/drainage-sanity.json | Clean/inspect drain and invoke reviewed adverse-rain response |
| CF-01-BEARING / BEARING-20 | Bridge maintainer/structural engineer | bearing inspection and rail-structure movement calculation required | Inspect bearing travel/fixity and review jacking/repair plan |
| CF-01-FOUNDATION / FOUND-20 | Structural/geotechnical engineers | site support survey and geotechnical movement calculation required | Survey support position; impose reviewed movement intervention |
| CF-01-OPERATION / CIVIL-SYSTEM | Operator/control centre | controlled operator decision and effectiveness check required | Apply restriction or stop service pending engineering handback |
| CF-01-SATURATION / FORMATION-45 | Geotechnical engineer | site groundwater/formation observation and coupled settlement calculation required | Inspect groundwater and formation; reassess settlement model |
| CF-01-TRACK / TRACK-20 | Track engineer | track geometry observation and adopted railway limit calculation required | Measure geometry; compare approved limits; request restriction |

The physical hierarchy connects parts to subassemblies, the reference bay and the civil system. Foundation–bearing–track interfaces and the saturation common cause are explicit. Planned member occurrences link concrete mix revision, constituent batches, curing, transfer/lifting strength, test records and nonconformances to the member. The planned drainage inspection links its work order, model reassessment, effectiveness check and engineering handback to the same failure chain. These templates contain no manufactured members, measured strengths or completed maintenance.

Machine-readable report contains the typed graph and drain-change trace. It uses the existing connected-assurance traversal, including both old and new relationships. The civil assembly is validated through the same configuration, ownership, effect, mitigation, evidence and decision schema as the component example. A drain change reaches formation, foundation, bearing and track failures, required operator response and blocked civil gates. All physical and independent evidence remains missing.

# Unresolved site inputs

- Adopted railway standards and code editions.
- Survey/alignment, curvature, skew and rail movement datum.
- Railway service, derailment, fatigue, wind and seismic actions.
- Boreholes, groundwater, axial/lateral soil response and settlement.
- Sulfate/chloride exposure where present and treatment compatibility trials.
- Liquefaction, flood levels, scour and surface flood pathways where relevant.
- Supplier reinforcement/prestress, end zones, transfer/handling strengths and mould/bed limits.
- Measured net detail masses, centre of gravity, transport axle loads and route clearances.
- Lifting chart/configuration/radius, rigging, temporary stability and support-ground capacity.

- Accepted rainfall/storm ensemble, catchments, culvert sizing and outfall consent/tailwater.
- Connection tolerances, loads, movement and inspection acceptance values.
- Supplier-installed cost/time, service life, maintenance capability and discount basis.
- Independent check, physical first article evidence and signed authority release.

## Public references and reuse rights

No external drawing or code was copied into this package. Record drawing-specific rights before incorporation; software licences do not grant rights to unrelated drawings.

| Reference | Intended use | Rights/access status |
|---|---|---|
| FHWA-PBES | Prefabrication, connections, tolerances and erection practice; highway examples need railway adaptation | Reference only; individual drawing/third-party reuse rights not established; page reviewed |
| WSDOT-DRAWINGS | Conventional bridge detail benchmark | Reference only; drawing reuse permission pending; 403 on review; obtain controlled drawing set |
| PGSUPER | Conventional prestressed girder comparison; agency/highway assumptions need railway adaptation | Alternate Route Open Source License 1.1; no code incorporated; license reviewed; application not executed |
| RDSO | Railway bridge arrangement and detail references | Reference only; drawing access and reuse permission pending; portal unavailable on review; obtain applicable set |
| XC | Candidate additional structural check after validating one model | No code incorporated; check pinned license before adoption; repository reference only; not integrated |
| SWMM | Drainage network simulation | Existing tool integration; no external drawing incorporated; repository/API reviewed; existing solver executed |
| ANUGA | Optional 2D surface flood assessment when overflow pathways matter | No code incorporated; check pinned license before adoption; repository reviewed; not required or executed |
| FHWA-GROUND | Investigate soil chemistry before calcium-based ground treatment | Reference only; no extracts or drawings copied; primary reference supplied; site testing required |
| FHWA-GRS | Candidate reinforced-soil approaches; railway deformation, stability and scour review required | Reference only; no drawings copied; primary reference supplied; not a selected design |

## Reproduction

From the repository root:

```
.venv/bin/python tools/automation/civil_reference.py --run-solvers
.venv/bin/python tools/automation/civil_reference.py --check
.venv/bin/python tools/automation/civil_reference.py --verify-native-replay
```

OpenSeesPy, PySWMM and native `ccx` are needed for replay. The default compiler and `--check` validate recorded files and provenance without running native solvers. The release gates require a separately reviewed, design-hash-bound asset register, per-asset numerical outputs and accepted limits. This concept register is deliberately pending and cannot satisfy them.

# Civil calculation records

Repository source: `engineering/assurance/civil-reference/calculations/README.md`

Small native CalculiX input/result files and OpenSees nodal results accompany `beam-sanity.json`. `drainage-sanity.json` records SWMM engine statistics for all three synthetic scenarios. Their source and output digests are validated by the civil compiler.

Reproduce from the repository root with `.venv/bin/python tools/automation/civil_reference.py --run-solvers`. The package describes the elastic formulas, surrogate section and synthetic hydraulic limits. These are software/calculation demonstrations with project acceptance explicitly false.

# Synthetic drainage scenarios

Repository source: `engineering/assurance/civil-reference/drainage/README.md`

These small models adapt the repository's SWMM installation benchmark for the civil demonstration. They retain the synthetic 1 ha catchment and storm and use dynamic-wave routing at a one-second routing step.

- `normal.inp`: 0.5 m circular conduit and free outlet.
- `blocked-drain.inp`: 0.1 m effective conduit diameter as a blockage sensitivity.
- `backwater.inp`: fixed 1.5 m outlet stage.

The reduced diameter is an illustrative sensitivity, not a calibrated debris model. Rainfall, catchment geometry, flood levels, culvert/outfall design, blockage and scour assumptions need site-specific review. Recorded statistics show hydraulic failures despite acceptable continuity.

# Transport and erection mass summary

Repository source: `engineering/assurance/civil-reference/transport-and-erection.md`

Equipment selection and lifting release are pending.

This summary is generated from the layout and complete mass-budget fields. The 75 t product envelope and equipment capacity are separate requirements. A larger crane cannot waive the member envelope; an independently reviewed, mass-basis-bound deviation is required.

| Family | Bare member (kg) | Complete member (kg) | Missing fields | Equipment check | Overall |
|---|---|---|---|---|---|
| Pi20 | 59,950.0 | Unresolved | net_diaphragms, reinforcement_adjustment, prestress_steel, anchorages, embedded_lifting_hardware, curbs_and_attachments, retained_temporary_works, slings, spreader, hook_and_blocks, lift.equipment_id, lift.chart_reference, lift.configuration, lift.radius_m, lift.capacity_at_radius_kg, lift.dynamic_factor, lift.permitted_utilisation, lift.review_reference, lift.support_check_reference, lift.stability_check_reference, lift.mass_basis_reference | Unresolved | blocked-incomplete-mass-or-lift |
| Pi25 | 74,937.5 | Unresolved | net_diaphragms, reinforcement_adjustment, prestress_steel, anchorages, embedded_lifting_hardware, curbs_and_attachments, retained_temporary_works, slings, spreader, hook_and_blocks, lift.equipment_id, lift.chart_reference, lift.configuration, lift.radius_m, lift.capacity_at_radius_kg, lift.dynamic_factor, lift.permitted_utilisation, lift.review_reference, lift.support_check_reference, lift.stability_check_reference, lift.mass_basis_reference | Unresolved | blocked-incomplete-mass-or-lift |

Confirm net detail masses, centre of gravity, transport axle loads/clearances, storage and transport support positions, lifting anchors/strength, lateral stability, temporary bracing, actual chart radius/configuration and ground support before release. Benchmark beam calculations do not qualify these stages. Earlier approximate handling guidance cannot establish feasibility of a complete member.

Complete controlled package · Machine-readable budgets and provenance

# Design-closure review follow-up — 20 October 2026

Repository source: `engineering/assurance/closure-review-2026-10-20/README.md`

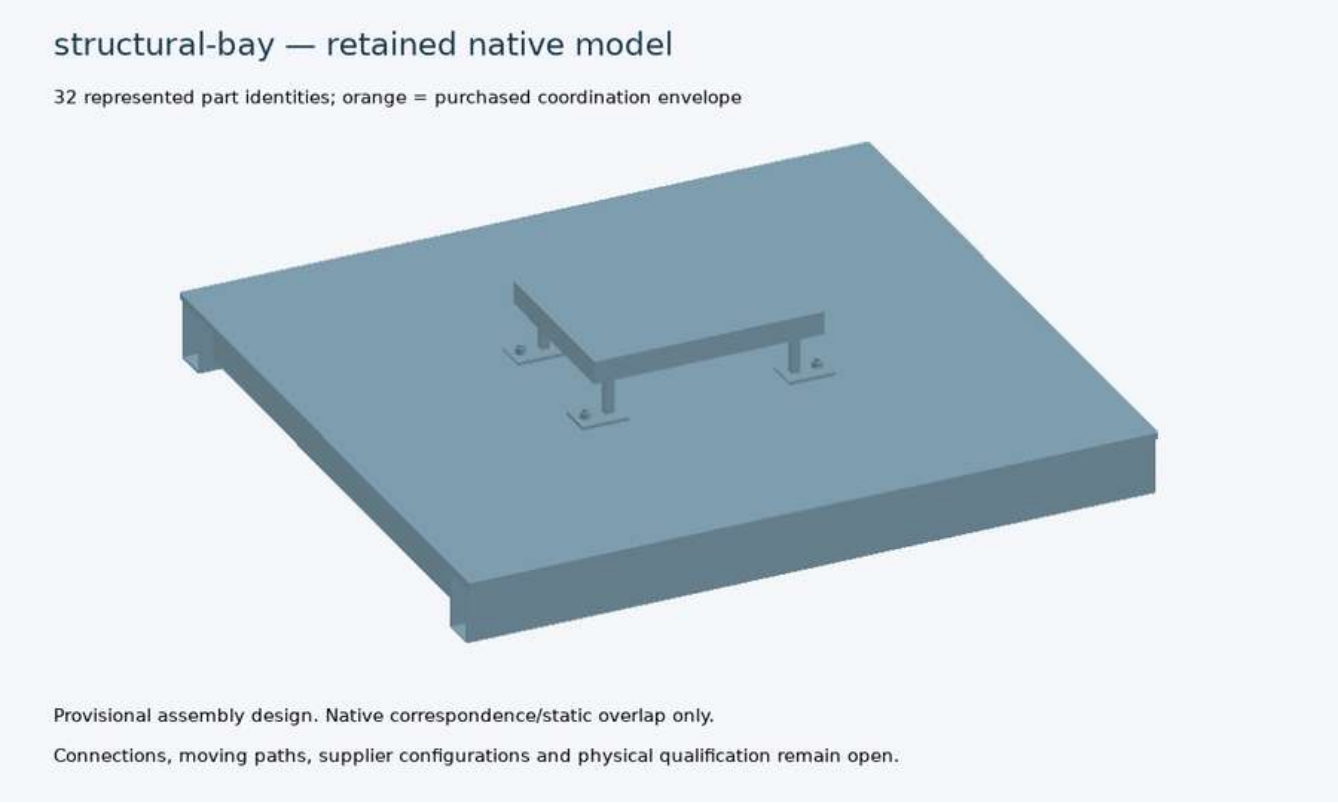
The review through `f6d7a790` has been followed by a new qualified source epoch, an executed design campaign and a verified portable publication. These remain provisional research designs. No engineering task, digital specification, physical validation or manufacturing release is claimed complete.

Publication · Executed qualification · 338-test log · Exact results and limitations · All 88 closure tasks

| Review priority | Delivered change | Remaining boundary |
|---|---|---|
| Numerical portability | The existing reproduction utility permits round-off only in named catchment sampling diagnostics. Retained self-hashes, source/geometry bytes, populations, counts and decisions stay exact. | Replay tolerances do not relax engineering acceptance. |
| Evidence-driven completion | Source-bound task/component/interface contracts consume original signed author/reviewer records and artifact bytes. Stale history is retained; new valid revisions can replace stale coverage. Current failures remain vetoes. Original evidence travels with the export. | Trust pins and the real submission index are empty. The tests use synthetic keys and fixtures; they are not accepted project records. |
| Installed equipment | One provisional instance layout defines 48 complete LV/ventilation cassettes and 18 refrigeration boundaries. Mass/inertia, cut conductors, known model power/conditioning demand, electrical group IDs and thermal quantities use the same definition. Rebuilt checksums cannot conceal inconsistent duty inputs or counts. | Refrigeration mass, trunk routing, host packaging, maintenance access, actual ratings and costs remain unknown. Gross additions earn no removal credit or adopted train-mass change. |
| Structural alternatives | The domain now has 54 frame/floor/support alternatives. A 12 mm floor with four crossmembers has 200.708 kg represented mass, versus 230.395 kg for the retained 16 mm/two-crossmember comparison. Both feet per loaded strip and both added support beams are checked. The 8 mm alternative remains rejected. | These are isolated bay screens; weld/coating/services, full carbody behaviour and qualified connections remain open. |
| Reinforcement choices | Six round bent-link/hook/coupler schedules include bend radii, hook arcs/tails, congestion, assembly and inspection requirements. | Curved native geometry, actual closures, development, confinement and resistance are incomplete. These alternatives are excluded from cap selection. |
| Panel workflow | The registered runner companion evaluates 172 aluminium/GFRP hypotheses, including continuous rear insulation and a coupled higher-temperature core alternative. Six owned-section native CAD/IFC/image exhibits and independent metal bending controls were executed. | These are unadopted panel research footprints. Complete core/potting, fastenings, formed roofs, joints, whole-stack temperature/fire and manufacturing acceptance remain open. |

Executed: 92 queued experiments, with no execution errors: 69 research rejections, 21 held cases and two offline software trials. Research-screen failures remain recorded separately from execution failures. The companion retains 93 detailed variations: 12 cassette, 27 civil and 54 structural recipes. The structural recipes repeat the queue domain and are not additional unique designs. All three detailed exhibits passed native correspondence: cassette 184 parts, civil cap detail 47 parts and structural bay 32 parts. All six panel section exhibits also passed their scoped native checks.

Validation: 338 qualification tests passed, with no required native tests skipped. Another 31 panel/numerical and 20 city federation/status tests passed. The rebuilt proposal and archive checks added 22 passing tests: 411 scoped tests passed across these groups. The approximately 36.1 MiB portable assembly export is below its 48 MiB cap; its source, receipts, raw archives, original-byte checks and report consistency were verified. See the publication manifest for exact bytes.



Native 32-part structural bay; isolated research assembly

Native panel pictures and CAD · Detailed cassette, civil, system and manufacturing studies · Cassette fixture insertion/removal video · Synthetic system-duty trace video

The next engineering exits still require an adopted six-car layout/load/duty baseline; complete carbody and foundation-to-track designs; current supplier configurations; site investigations; calibrated physical correlation and independent acceptance. Passing native or publication checks cannot close those gates.

# Formal Models

Repository source: `engineering/assurance/formal/README.md`

The `engineering/assurance/formal/` tree holds machine-checkable specifications that support the safety case, including signalling consensus models and bounded evaluator verification.

## Contents

| Folder | Purpose |
|---|---|
| `tla/` | TLA+ `SMRaft` model and TLC configurations for the restricted consensus protocol |
| `topology-adapters.md` | Shared evaluator interface, validated static tables and bounded proof scope |
| `consensus-refinement.md` | State/action abstraction map, assumptions and the remaining proof obligation |

See `tla/README.md` for model-checking commands and the connection to `osr-consensus`.

# SMRaft-to-Rust refinement argument

Repository source: `engineering/assurance/formal/consensus-refinement.md`

This document records the v0.3 abstraction map between `SMRaft.tla` and `osr-consensus`. It is a reviewable refinement argument and test plan, not a machine-checked refinement proof. That distinction remains a release gate for any stronger safety claim.

## Abstraction relation

One TLA server is one Rust `RaftNode`. `Server` is `Config.peers`; TLA sequences are Rust `Vec<Entry>` with `LogIndex` preserving the model's one-based index; `messages` are the network's queued `Action::Send` values; and `allCommitted` is observed through committed actions/prefixes in a simulated cluster.

| TLA+ state/action | Rust representation or handler | Current evidence |
|---|---|---|
| `currentTerm`, `votedFor`, `state` | `RaftNode.current_term`, `voted_for`, `role` | Unit and cluster property tests |
| `log`, `commitIndex` | `log`, `commit_index` | Invariant and randomized cluster tests |
| `nextIndex`, `matchIndex` | `next_index`, `match_index` | Replication tests |
| `votesGranted` | `votes_granted` | Election tests |
| `lastQuorumConfirmedTerm` | `last_quorum_confirmed_term`; Rust also has bounded wall-clock freshness | Fail-restrictive tests |
| `Timeout`, `RequestVote`, `BecomeLeader` | `on_tick`, `start_election`, `emit_request_votes`, `become_leader` | Rust tests plus TLC model exploration |
| `HandleRequestVote*` | `handle_request_vote*` | Rust tests plus TLC model exploration |
| `AppendEntries`, `HandleAppendEntries*` | `emit_append_entries*`, `handle_append_entries*` | Rust tests plus TLC model exploration |
| `AdvanceCommitIndex` | `advance_commit_index` | Safety-invariant tests |
| `ClientRequest` | `propose` | Category and quorum-freshness tests |

## Assumptions that must remain explicit

- static membership; no joint consensus or online reconfiguration;
- no log compaction in this module;
- persistent term, vote and log writes complete atomically before dependent network output in the integrating host;
- authenticated transport and issuer policy are outside the abstract TLA model;
- Rust time is monotonic and the deployment validates timer bounds;
- finite TLC bounds establish bounded model results, not an unbounded theorem.

## v0.3 closure work

1. Run TLC for the checked configuration and archive its result.
2. Run fast release-selected interlocking and fail-restrictive ATP properties in CI; archive full bounded runs separately once topology unwind limits and tool versions have been frozen and reviewed.
3. Maintain this action/state map under code review.
4. Add a tool-backed trace/refinement proof or an assessor-accepted refinement argument covering initialization, every step action and stuttering.

Items 1–3 are repository evidence. Full ATP/interlocking bounded-proof completion and item 4 remain open in the certification gap register. They prevent the project from describing bounded coverage as exhaustive or consensus refinement as formally proved.

## Proposed process-reference extension (RFC 0033)

The runtime reference calls the existing Rust step function with bounded contiguous append batches of twelve (default remains one). It records volatile current-term per-peer acknowledgement ages, including empty-log responses, for quorum freshness. Historical replication indices alone cannot refresh quorum. The original one-entry TLA+ action map does not establish refinement of these extensions. Independent review, response-age abstraction and batching simulation relations remain open. DiskJournal adds actual exclusive-writer filesystem persistence and full-log checkpoint compaction; SIGKILL, torn-file and fsync ordering tests are software evidence. Flash power-loss behavior and persistent output timing require hardware qualification. TACSResources is a separate bounded resource abstraction with qualified no-reentry/clearance assumptions; its checked invariants do not prove this combined implementation.

# Bounded control proof results

Repository source: `engineering/assurance/formal/results/README.md`

## Current follow-through — 19 September 2026

Two of the four previously open obligations have passing executions.

| Original obligation | Recorded result |
|---|---|
| ATP determinism — E4.1a | Passed locally and in CI on `2bf8b7717` |
| Interlocking determinism — E3.1a | Passed locally on `2bf8b7717`; repeated with the memory-capped runner |
| Odometry determinism — E4.4a | Still open; CI timed out after 1800 seconds |
| Two-train non-overlap — E1.1a and its seven paired companions | Still open; all eight local partitions exhausted their 4096 MiB address-space allowance |

The summary and complete retained evidence include successes, failures, input hashes, commands, manifests, source changes and regression logs. No diagnostic run with omitted checks or unverified contracts is counted as a pass.

CI run 35403962318 on commit `2bf8b7717aea09436cbcd588fa1e084ef907e1f9` retained seven package artifacts: 36 passes and one odometry timeout across 37 properties. Its interlocking runner received a shutdown signal before uploading an artifact. That interruption is not a counterexample or a passing execution.

The subsequent local interlocking run retained all 11 declared interlocking results: three passes and eight memory failures. Its Rust and GSN inputs match the CI candidate; only the source-bound runner and workflow inputs differ because they add recorded memory limits. These groups are recorded separately. They are not a successful, complete CI run on one final commit and do not satisfy the release gate or independent acceptance.

### Reproduce

For the CI candidate, check out `2bf8b7717`, install Kani 0.67.0 and run:

```
python3 tools/automation/assurance-evidence.py run \
  --timeout 1800 --output build/assurance/reproduced-candidate
```

To reproduce the memory-capped local run, extract the archive at that checkout and apply `build/assurance/closure-capped/source.patch`, then run:

```
python3 tools/automation/assurance-evidence.py run \
  --package osr-interlocking --timeout 600 --memory-mib 4096 \
  --output build/assurance/reproduced-interlocking
```

Use a new output directory so historical evidence is preserved. The source patch covers the runner/workflow changes, and each manifest binds the complete Rust, Cargo and GSN inputs. The JSON lists the archive and member SHA-256 values.

The next unresolved work is a verified decomposition of variable-time odometry arithmetic and two-train state replay, or a verifier configuration that completes the full existing obligations. The isolated arithmetic and contract experiments did not establish closure and were not adopted. Increasing time alone did not resolve odometry. A separate non-overlap diagnostic with a 12,800 MiB address-space allowance also timed out after 300 seconds; its complete log is retained without counting it as a controlled pass. See the component and partition contracts.

# Historical topology proof rehearsal

The summary records 37 passes and four 300-second timeouts across all 41 declared Kani properties. Each of those four properties was then rerun with a 900-second budget and timed out again; their original manifests, results and logs are included under `extended-budget/`. The archive preserves the original logs, per-package TOML results and execution manifests, plus the Rust workspace, Clippy and 27 evidence-packaging regression-test outputs. The JSON lists the archive SHA-256 and every archived member's SHA-256.

## Reproduce

The execution started from checkout `0a694f8cf7af9a77fcc49dee0c342553057c1297` with the recorded Rust changes. Restore that checkout into a separate working directory, extract the archive there and apply `build/assurance/static-final/source.patch`. Every execution input is listed in the summary's `source_sha256`; the patch reproduces those source bytes. Install the reviewed Kani 0.67.0 toolchain, then run into a new output directory:

```
python3 tools/automation/assurance-evidence.py run \
  --timeout 300 --output build/assurance/reproduced
```

The command exits unsuccessfully if any proof fails or times out, while retaining all completed outcomes. The extended attempts use the same command with `--solution <ID> --timeout 900`. Runtime depends on the host and concurrent

load. These runs shared a development host with other proofs and simulations; they are not a controlled sizing benchmark. The archive is a local, unattested rehearsal and includes failures. It cannot satisfy the clean-commit CI release gate or independent safety acceptance.

See topology adapters for the fixture bounds, storage contract and limitations of the comparison tests.

# Formal specs (TLA+)

Repository source: `engineering/assurance/formal/tla/README.md`

This directory holds TLA+ specifications that anchor OpenSourceRail's formal safety argument.

## Files

| File | Purpose |
|---|---|
| `SMRaft.tla` | Core protocol spec: Static-Membership Raft + Fail-Restrictive Timeout. Referenced by RFC 0001 §11.1. |
| `MCSmall.tla` | Minimum-viable TLC harness (3 nodes, 2 values). |
| `MCSmall.cfg` | TLC config for the small harness. |
| `TACSResources.tla` / `TACSResources.cfg` | Separate train-centred resource model: retained approach rights, occupancy, expiry, restart, qualified release and blocking. Two trains, two conflicting resources, two epochs. |

## Running TLC

Install the TLA+ toolbox (or `tla2tools.jar` from https://github.com/tlaplus/tlaplus).

```
# from this directory
java -jar tla2tools.jar -config MCSmall.cfg MCSmall.tla -workers auto -deadlock
```

Expected outcome on the small harness: all invariants hold, state-space exploration completes in minutes on a developer workstation.

## What this spec does and does not prove

Proves (via TLC on small bounded models + TLAPS on the general spec, once we write the TLAPS proofs):

- `ElectionSafety`, `LogMatching`, `LeaderCompleteness`, `StateMachineSafety` — the classical Raft safety properties, inherited from Ongaro's proof and re-checked under our specialization.
- `FailRestrictive` — the novel property introduced by this variant: no Safety-category entry is committed under a leader whose quorum confirmation is stale.

Does not prove (out of scope here; covered elsewhere):

- Refinement from the Rust implementation to this spec (future `SMRaftImpl` module once `crates/osr-consensus` exists).
- The rail-domain state machine (non-overlap of MAs, etc.) — that is Kani territory, see RFC 0001 §11.2.
- Byzantine behaviour — explicitly out of scope for v1 (RFC 0001 §3).
- Log compaction / snapshotting — orthogonal to safety; separate module.

## Known limitations of the current spec

1. `QuorumConfirmationExpires` is modeled as an explicit action; in the real system it is a wall-clock timeout. A timed refinement would sharpen the liveness argument but is not needed for the safety properties above.
2. The message bag is unbounded in principle; TLC terminates only because of the `MaxTerm` / `MaxLogLen` bounds. Production verification should use TLAPS for the unbounded spec.
3. No explicit modeling of crash + restart persistence. Standard Raft arguments apply; add a `Restart` action when we want to cover this explicitly.

## Executed TACS invariant checks

The TACS package records the actual pinned-TLC run and source/log hashes for `TACSResources`. It checks six invariants in a finite model; qualified physical no-reentry and clearance are explicit assumptions. It proves neither Rust refinement nor unbounded liveness. The Rust core has separate bounded transition and property tests. See RFC 0032 for contracts.

# Read-only topology adapters

Repository source: `engineering/assurance/formal/topology-adapters.md`

The movement-authority, ATP braking and odometry evaluators share a small `TrackTopology` interface: line count, borrowed forward/reverse section ordering, ring status and section lookup. This separates the safety calculation from how a city stores its geometry. A bounded fixture can use prevalidated constants, so the verifier spends less work constructing unrelated map and station metadata before it reaches the property being checked.

## Two storage forms, one evaluator

- `Network` retains the existing city schema, maps, station metadata and normal simulator/control callers. Its adapter delegates section lookup to the original method and borrows the original line arrays.
- `StaticTopology` borrows immutable section and line tables. Construction and lookup allocate nothing. `try_new` rejects duplicate section IDs and dangling forward/reverse references. It can validate runtime slices or run at compile time for constant tables. Private fields prevent bypassing that constructor.

The constructor checks ID uniqueness and reference integrity. Surveyed alignment, section dimensions, direction pairing and operating speed limits still require their own engineering validation.

Both preserve unknown-section lookup failure. The static adapter performs a linear section search; it is useful for small fixed configurations and bounded verification, not a measured performance improvement for the full city simulator. It does not make the existing crates `no_std`, remove allocations from the evaluators, or constitute a deployed embedded image.

The public interface requires stable line views and unique section resolution. A new adapter needs its own validation. No ERPNext document, FUXA tag, city schema, railway command format or deployed control setting is changed by choosing a Rust storage implementation.

## Verification scope

The Kani fixtures use constant, validated tables with the same two/three forward sections, paired reverse sections, lengths, directions and speed limits as their previous network fixtures. Station business metadata is outside the evaluator's interface. The topology migration preserves the original fixture geometry. Subsequent proof partitions and configuration compilation are described below. The normal static lookup and normal evaluator code execute under Kani; there are no stubs, unverified function contracts or disabled safety/unwinding checks.

A proof over these fixtures establishes the property within their stated bounds. It is not a proof for every topology adapter, arbitrary city geometry or the Rust standard library's map implementation. The default `Network` adapter is additionally compared with static tables through generated tests of movement authorities, braking outcomes, track advancement and sensor fusion. These cover reversed table order, forward/reverse tracks, direction mismatches, rings, position/speed uncertainty, expired authorities and GNSS/balise inputs. Constructor tests reject malformed tables. Finite comparison tests are not a universal refinement proof.

Proof outcomes are recorded by the existing source-bound runner:

```
python3 tools/automation/assurance-evidence.py run \
  --package osr-odometry --timeout 600 --output build/assurance/my-odometry
```

Timeouts and failed checks remain unproved. Independently accepted safety evidence, consensus refinement, hardware integration and operating release remain separate. Historical city simulation bundles still verify as historical artifacts; changed Rust dependencies require new qualification before claiming current-source results. Both successful Samawah and Mosul design options were requalified against commit `a5edbbe84`: nominal service and all eight degraded cases passed. Those bundles are historical evidence for that commit; they do not qualify the later state-storage and arithmetic changes.

## Reusing the interface

Existing calls with `&Network` keep their behaviour and city serialization. A consumer with fixed geometry can build borrowed tables and pass the checked adapter to those same functions:

```
use osr_core::{StaticTopology, TrackLine};

// `network` is an existing, validated city Network.
let sections: Vec<_> = network.sections.values().cloned().collect();
let lines: Vec<_> = network.lines.iter().map(TrackLine::from).collect();
let topology = StaticTopology::try_new(&lines, &sections)?;
// compute_self_ma(..., &topology, ...)
// atp_evaluate(..., &topology, ...)
// odom_step(..., &topology)
```

The example allocates its input vectors; the adapter itself only borrows them. Fixed deployments can instead use constant arrays, as the Kani fixtures do. Storage selection is a Rust integration choice, not an operator setting or a change to the ERP/FUXA control boundary.

# Reusable calculation and state components

`AuthoritySnapshot::from_log` folds a committed prefix once. Call `authority` for multiple trains against that owned state, then apply the next committed entry with `apply_committed_entry` or append a committed suffix with `append_committed`. The caller retains consensus ordering; this API does not validate or commit log entries. Exclusive mutable access prevents concurrent reads during an update. Generated tests compare batching and append operations with complete normal log replay and movement-authority calculation.

Derived-state tables use `OrderedMap`, a sorted vector of keys and boxed values. It preserves unique sorted keys and the existing JSON map representation. Lookup is O(log n); insertion and removal are O(n), and repeated removal during `retain` is $O(n^2)$ in the worst case. Each stored value adds an allocation. These tradeoffs are explicit: no city-size bound is introduced, but throughput and allocation behavior must be measured before deployment. Generated operation sequences compare lookup, mutation, removal, iteration and serialization with `BTreeMap`.

ATP accepts a reusable immutable `BrakeProfile`. `from_consist` applies the same conservative braking-curve conversion as the existing consist adapter; `try_new` rejects nonpositive deceleration. Compile a new profile when vehicle configuration changes. Existing calls with `ConsistDescriptor` continue to compile the profile for each evaluation. The determinism harness checks the fixture's compiled profile against the real reference consist before evaluating twice. It retains the original position, speed and time domains and compares complete outputs.

`forward_chain_view` borrows validated topology tables without allocating a section vector. ATP distance and odometry advancement use it. The original vector-returning walk remains available; generated comparisons cover linear and ring traversal, direction mismatches, offsets and distance budgets. Movement authority calculates its forward chain and footprint once per evaluation.

Odometry retains exact integer rounding and fallback behavior across full-width inputs. Fast paths use narrower arithmetic only when it is equivalent to the original expression. Boundary and generated tests compare speed and uncertainty with the previous arithmetic, including zero elapsed time and extreme timestamp, calibration and pulse values.

## Non-overlap proof partitions

The three-forward-section fixture contains both registered trains and both symbolic head positions in every partition. One pair of harnesses checks the following and leading train for each of four wayside conditions: missing, Clear, Unknown and Present. Both downstream verdicts have the same condition in each pair; arbitrary mixed verdicts are outside this bounded fixture.

The following train must end on section 1000. The leading train must end on 1002 when the downstream section is Clear, and on 1001 otherwise. On the linear fixture these bounds imply disjoint authority sections. All eight partitions are required to close this declared non-overlap evidence. Passing one half is insufficient. The earlier fixture expected extension into 1002 without providing a Clear verdict; that expectation contradicted fail-restrictive operation. Ordinary tests now exercise clearance and occupancy independently.

## Execution budgets

The controlled runner defaults to 600 seconds per harness. Push and pull-request jobs gate the 39 declarations that currently complete within that envelope. Manual workflow dispatch also runs the nine unresolved declarations as non-gating diagnostics and can select 1800 seconds for each of the 48 declared harnesses across eight packages. The default 4096 MiB per-process address-space limit can be raised to 8192 MiB in manual dispatch (or configured with `--memory-mib` locally); the limit is inherited by verifier children and recorded in the evidence. Non-gating means that an already-recorded resource limitation does not make every development merge red; it does not turn a failure into a pass. Memory exhaustion remains a failed proof, and core dumps are disabled. Timeouts fail the run and kill the verifier's entire process group, including solver children left behind by the driver. Every completed outcome retains its command, input hashes and log; interrupted runners may lack a complete artifact and must be rerun. Kani remains pinned to 0.67.0. Release export still demands successful evidence for all 48 declarations and fails while any of the nine open obligations is absent or unsuccessful.

# Current verification follow-through

ATP determinism and interlocking determinism passed on candidate `2bf8b7717`. Odometry still timed out with 1800 seconds in CI. All eight non-overlap partitions remain unresolved because the local model exhausted its recorded memory budget. See the execution register for full records, the interrupted CI interlocking job, reproduction instructions and source boundaries.

## Historical topology-migration verification

The complete local 300-second run executed all 41 declared properties with Kani 0.67.0: 37 passed and four timed out. The newly completed properties are odometry forward non-regression (`E4.4b`, 14.3 seconds), uncertainty monotonicity (`E4.4c`, 15.4 seconds), and GNSS conservatism (`E4.4e`, 52.9 seconds). The existing balise-reset proof also passes. Compared with the previous 34/41 result, input ranges, assertions and unwind limits are unchanged.

The machine-readable summary and complete log archive retain all 41 outcomes, eight execution manifests, input hashes, the source patch and regression-test logs. See the reproduction notes.

At that historical checkpoint, remaining timeouts were odometry determinism (`E4.4a`), ATP determinism (`E4.1a`), interlocking non-overlap (`E1.1a`) and interlocking determinism (`E3.1a`). All four also timed out in separate 900-second attempts on the shared development host. These are unresolved proof obligations, not demonstrated counterexamples. Alternative solver/cache experiments did not establish closure; Z3 also encountered an internal verifier error on ATP. The reviewed default solver remains unchanged.

The full Rust workspace tests, Clippy with warnings denied, and 27 evidence and release-packaging regression tests passed. These executions are local and unattested; exact-commit CI and independent acceptance remain separate.

## Remaining proof work

The remaining properties exercise substantially more than fixture construction. Odometry determinism compares complete states, including variable-time integer speed division. Non-overlap also replays two trains into derived occupancy and train maps. The compiled braking profile and map refactor closed the bounded ATP and interlocking determinism checks; they did not close these other obligations.

The next design step is to isolate these calculations and state-replay contracts with explicit input/output invariants, prove the contracts, then verify their composition. Any such partition must preserve every original input case and safety check. An assumed contract or a smaller input range cannot be counted as closure of an existing obligation. The existing full harnesses remain the reference checks while that work is developed.

# Subsystem lifecycle-control register

Repository source: `engineering/assurance/subsystem-control-register.md`

> Generated by `python3 engineering/subsystem_control_register.py`. Do not edit this file or its JSON partner by hand.

This register joins every controlled mechanical product and assembly, station variant, reusable civil type and Rust workspace crate to the same configuration, quality, competence, management and identity controls. It routes evidence; it does not claim fabrication, construction, software deployment or railway release.

## Coverage

| Domain | Controlled records |
|---|---|
| LM3 mechanical products and assemblies | 146 |
| Station variants | 7 |
| Reusable civil types | 19 |
| Rust crates | 60 |
| Total | 232 |

The common control system contains 11 role templates, 9 record templates, 6 workflow templates and 4 management cadences. There are 172 physical identity candidates. There are deliberately zero printable QR labels until a deployment binds real assets to an operator-controlled HTTPS resolver and checks the physical labels.

## Best-practice basis

| Basis | Authoritative source | Applied here as |
|---|---|---|
| `FTA-QMS-2019` | Quality Management System Guidelines | Configuration, document, inspection, test, calibration, nonconformance and closeout record controls. |
| `FTA-PCMG-2025` | Project and Construction Management Guidelines | Scope, schedule, cost, safety, quality and accountable project-review templates. |
| `ISO-55001-2024` | Asset management system requirements | Lifecycle decision, value, risk/opportunity, information, management-review and predictive-action fields. |
| `ISO-9001-2026` | Quality management systems — requirements | Quality culture, documented information, competence, operational control, performance evaluation and improvement records. |
| `NIST-SSDF-1.1` | Secure Software Development Framework | Rust release provenance, protected source, review, test, vulnerability and change records. |
| `BUILDINGSMART-IFC43-ASSET-ID` | IFC 4.3 AssetIdentifier semantic definition | Separate stable operator asset identity from database and IFC instance identifiers. |
| `GS1-DIGITAL-LINK-1.7` | GS1 Digital Link URI Syntax | Resolver-based QR design and optional licensed GIAI mapping for individual assets. |
| `FRAPPE-HR-TRAINING` | Training Event | Native Training Program, Event, attendance, result and certificate workflow mapping. |
| `ERPNEXT-QUALITY-INSPECTION` | Quality Inspection | Incoming, in-process and outgoing inspection-template mapping. |

These sources inform the templates; they do not certify OSR or replace the contract, applicable law, national standards, competent engineers, operators or independent assessors.

## Control model

- Mechanical and station records require configuration, inspection/test, calibration, nonconformance and asset-identity evidence.
- Civil records add survey/ground, temporary-works, concealed-work, as-built and handover evidence.
- Rust records require locked source/toolchain, peer review, all-feature tests and linting, vulnerability disposition, reproducible artifacts and an explicit deployment-authority boundary.
- The QR contract is lookup-only. It carries no personal data, credential, command, approval, isolation or movement authority.

The complete per-record controls, source paths, maturity states and evidence requirements are in subsystem-control-register.json. The editable governance source is `lifecycle-governance.json`.

# Distributed-control process reference

Repository source: `engineering/assurance/tacs/README.md`

RFC 0033 is the proposed development target. Existing `osr-consensus`, `osr-interlocking`, ATP, ATO and brake components supply the decisions; `osr-runtime` supplies thin hosts. The earlier separate `osr-tacs` engine is retired.

Four train processes (A/B for each of two trains), three static voters, one point interface and two station interfaces exchange authenticated messages through bounded asynchronous queues. Each decision/communications process has a filesystem journal. Two additional output processes each enforce two-out-of-two agreement and either-channel trip using `DualGuard`. A publishes proposals; B only evaluates. Each host has its own journal. Missing-A/B, disagreement, replay and feedback faults must activate while moving and trip within one 50 ms virtual step. The 100 ms deadline cannot be concealed by a late feed. Shared sensors/code/host/clock/keys/comparator remain common causes; autonomous real-clock outputs and hardware independence remain pending. The policy keeps point/crossing/door/charging/obstacle local pairs explicitly open. The harness provides synthetic local physics/proving inputs without supplying global truth to onboard authority. The physics fixture rejects unsupported geometry/formation/braking bundles before startup and checks moving footprints against retained protection. Positions use measured speed and non-zero bounded uncertainty. Platform locks remain owned at arrival. Process restart uses SIGKILL and the same journal.

```
cargo test -p osr-runtime -p osr-consensus -p osr-interlocking
python3 tools/automation/tacs_reference.py --output /tmp/reference.json
python3 tools/automation/redundancy_policy.py
python3 tools/automation/tacs_assurance.py --check
python3 tools/automation/tacs_assurance.py --verify-replay

# Explicit new development bundle and actual execution evidence
python3 tools/automation/tacs_assurance.py --generate-deployment --run-twin
python3 tools/automation/tacs_assurance.py --run-formal build/toolchain/tla/tla2tools-1.8.0.jar
python3 tools/automation/tacs_cost.py engineering/assurance/tacs/cost-model.json
```

report.md and raw execution records contain unreviewed software results. assurance.json uses the shared hierarchical FMEA and change-impact compiler. Source changes invalidate recorded execution and frozen configuration and failure-subject applicability; compilation does not rebase FMEA records or create passing run evidence or independent acceptance. Reference keys are publicly reproducible test keys. PIDs differ on replay; all semantic results and traces must match.

Designed, installed and approved configuration states are distinct. This bundle is synthetic and not installed; operational activation is rejected. Storage compaction retains the full Raft log. Torn storage inhibits startup; physical power loss/flash behavior remains to qualify. The formal resource model checks two trains, two resources and two epochs under qualified clearance/no-reentry assumptions; batching and filesystem/runtime refinement remain independent-review work. No complete safety proof is claimed.

HIL must establish independent safe outputs/deadlines, sensor/integrity/points, clock and radio bounds, per-car charging/doors/PSD/BMS/traction integration, real braking/adhesion and storage power-loss behavior. Closed-track recovery, independent assessment and named G0–G4/profile-release decisions follow. Depot, rescue, turnback, following trajectories, arbitrary topology and large fleets are protected/unimplemented service extensions, not passed operating cases.

cost-model.json records equipment and lifecycle inputs for equivalent service/availability. Missing values remain unknown; no equipment removal, percentage saving or city-cost reduction is approved.

# TACS prototype assurance

Repository source: `engineering/assurance/tacs/report.md`

Generated by `tools/automation/tacs_assurance.py`. Software results are unreviewed; physical and operational release remain blocked.

Software milestone passed: true.

TLC checked 282 distinct bounded states. Physical clearance/no-reentry is an explicit assumption; this is not an unbounded proof or Rust refinement.

| Case | Passed | Arrivals | Conflicting occupancy | Unsafe departure |
|---|---|---|---|---|
| None | True | 2 | 0 | 0 |

## Open release stages

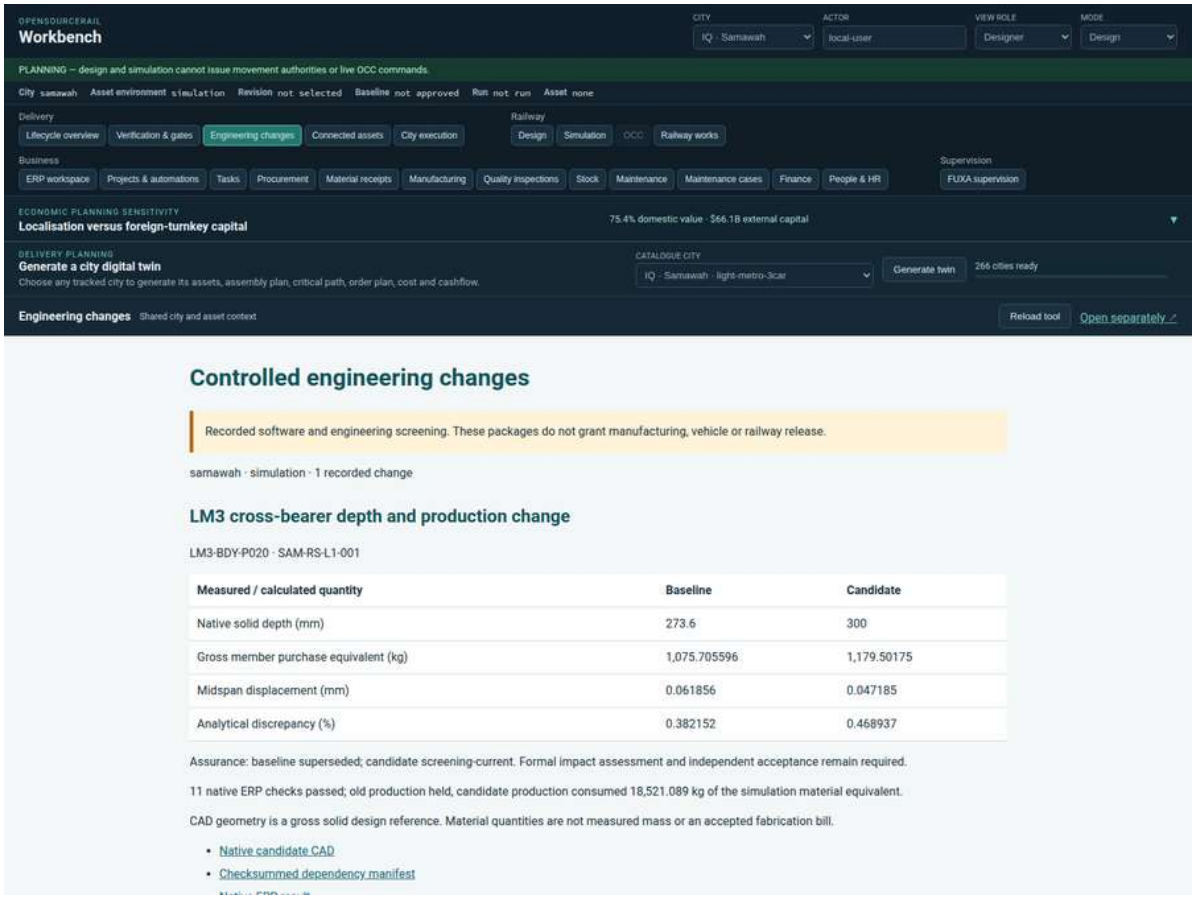
- Independent software/requirements review and Rust/formal refinement
- Hardware-in-the-loop with real output, clock, durable epoch, radio and proving interfaces
- Closed-track measured braking/integrity and recovery
- Independent assessment, approved operating/maintenance procedures and authenticated deployment release

Shared connected-engineering FMEA retains unknown occurrence evidence, unreviewed residual risks and blocked decisions. Source changes stale the execution evidence and traverse proofs, simulations, procedures and approval nodes.

# Controlled engineering changes

Repository source: `engineering/changes/README.md`

Workbench  Engineering changes connects retained native FreeCAD geometry, CalculiX screening, quantities, submitted ERPNext BOMs, production disposition, manufacturing transactions and superseded evidence. City and environment selection filter the recorded packages. Native document links are enabled only for the recorded ERP deployment; authentication still applies. Search links include each run's unique project/item identity so a fresh database at the same address cannot substitute reused sequential record IDs.



Workbench CAD-to-production evidence

## Executed Samawah example

The retained bundle changes one cross-bearer in tracked `LM3-BDY-P020.FCStd`, reopens the candidate, checks all other leaf solids remain unchanged, and executes three CalculiX meshes for each revision. The canonical CAD remains unchanged. FreeCAD 1.1.4 and CalculiX 2.23 executed this example; complete decks, solver output, native candidate and checksums are retained.

| Quantity | Baseline | Candidate |
|---|---|---|
| Native depth, mm | 273.6 | 300 |
| Gross member purchase equivalent, kg | 1,075.705596 | 1,179.501750 |
| Calculated midpoint displacement, mm | 0.06185623 | 0.04718545 |
| Analytical discrepancy | 0.382% | 0.469% |
| Final mesh displacement change | 0.192% | 0.237% |

The solver uses B32 quadratic beams, a 10 kN central point load and simply supported constraints. The analytical check includes rectangular-section shear deformation. It is a displacement benchmark, not a strength, fatigue, buckling, connection or complete vehicle analysis. See the CalculiX manual for the element formulation and FreeCAD's topology API for native shape operations.

The CAD uses gross solid design-reference geometry. Density times volume, including a configured 5% purchase allowance, is a simulation material equivalent; it is not measured mass or an accepted fabrication BOM. The ERP material valuation is a test value, not a procurement estimate.

The native ERP result retains eleven passing checks: two submitted child/parent BOM revisions and work orders; old nested production exposure; self-endorsement and premature outcome rejection; separate software-test reviewer endorsement;

actual old work-order stop and verification; unchanged original BOM/mapping; candidate production and material consumption. The candidate consumed 18,521.089 kg equivalent, within the native 0.0005 kg rounding tolerance of its exploded BOM. New records use an isolated project, warehouse and items in the example-city service. They remain inspectable.

The Mosul profile reuses the same workflow with a 250 mm candidate depth and its own city/asset/project. Its six solver runs produce 0.08071362 mm candidate displacement (0.302% analytical discrepancy), and the separate native ERP run passes the same eleven checks with reduced material quantities. Together the two profiles exercise both increasing and decreasing geometry through the production workflow. Neither is a city-specific structural design approval.

## Reproduce or configure another city

`config/generic.json` defines the shared screening assumptions. A versioned city profile overlays city, asset and any changed assumptions. This example supports an axis-aligned rectangular cross-bearer; other geometry needs a suitable analysis adapter. Reusing this method does not validate an arbitrary component.

```
# Requires FreeCADCmd and ccx, or the org.freecad.FreeCAD Flatpak with ccx.
# Use a new output folder so previous evidence is retained.
tools/automation/osr-python tools/automation/engineering-change.py prepare \
  --profile engineering/changes/config/samawah.json \
  --output build/engineering-change/samawah-new
tools/automation/osr-python tools/automation/engineering-change.py verify \
  build/engineering-change/samawah-new

# After ./osr example-city setup; use that setup's Samawah project ID.
# This creates and submits simulation records in the example ERP database.
tools/automation/osr-python tools/automation/engineering-change.py execute \
  build/engineering-change/samawah-new --reference-project PROJ-0001 \
  --report build/engineering-change/samawah-native.json
```

Use `--compose-project`, `--compose-file` and `--site` for another isolated ERP deployment. The reference project's city must match the profile. Execution refuses changed dependencies, missing/extra/altered bundle files or release claims. Reports must be new files outside the sealed bundle. Private execution diagnostics remain under `var/engineering-change/`; public reports contain record identifiers, checks and source hashes. Checkpoint evidence before removing example volumes.

To publish a new recorded example, retain its sealed bundle and native report and add a city/environment entry to `catalogue.json` with the matching ERP origin. The current receipts were rerun in a separate `osr-design-consistency` ERP site, reachable at `http://127.0.0.1:8284` when that local test site is running. Previous examples remain in Git history. Recorded results are historical observations; verification checks source currency, not the present state of mutable ERP records. CI exercises the retained bundle against a fresh example ERP and uploads its new report. Native CAD regeneration requires the tools above and is separately reproducible.

## Acceptance still required

The old evidence is retained as `superseded`; the new result is `screening-current`, bound to CAD, quantities and configuration hashes. Neither status grants engineering or physical release. Software-test identities verify role separation but do not constitute independent engineering reviewers. Formal impact assessment, supplier/material selection, fabrication drawings, connection/load/fatigue checks, measured mass, first-article evidence and independent acceptance remain explicit gates. This example closes the connected software journey for one design-reference member, not a complete released subassembly.

# Civil system exploration

Repository source: `engineering/civil_exploration/README.md`

This workbench investigates complete span–pier–foundation packages using the existing component catalogue and native OpenSeesPy. Its first campaign compares Pi20/Pi25 controls, a hollow deck, a hollow stepped tapered pier, and their combination over 100 m of double-track viaduct. Existing canonical designs, costs, production records and engineering release statuses remain separate.

From the repository root, using the normal engineering Python environment and native `ccx` installed for the existing reference replay:

```
tools/automation/osr-python tools/automation/civil-study.py run --deployment reference
tools/automation/osr-python tools/automation/civil-study.py verify \
  build/engineering/civil-studies/first-campaign
```

`run --deployment reference` freezes the input contract, copies governing source files, reproduces the existing native beam/drainage reference, verifies independent new benchmarks, executes isolated bounded workers and writes `comparison.md`, `comparison.csv` and `comparison.json`. The repository commit and source hashes identify the baseline even when the implementation has not yet been committed. Set `--output` to a fresh directory for each campaign.

Use `run --deployment reference --resume` to reuse only hash-verified results from the same study, code and native environment. `--retry-failed` creates another attempt while retaining the failed one. A terminated attempt's job/log files remain in its attempt directory. `verify --historical` checks retained artifact binding without claiming that old dependencies are current. A checksum is not a reviewer signature.

## Full investigation programme

```
tools/automation/osr-python tools/automation/civil-study.py programme \
  --deployment reference --search-evaluations 96 --output build/engineering/civil-studies/programme
```

This executes numerical component benchmarks, eight registered deck families, CAD/IFC quantity checks, commercial/equipment adapters, continuity/thermal cases, a coupled sprung/unsprung train diagnostic, three-seed constrained optimisation with an equal-budget random baseline, declared uncertainty scenarios, three actual-section solid meshes per detailed shortlist, physical-test protocols, artifact retrieval and a sealed promotion proposal. It also repeats the full reference transient campaign. `--quick` omits that last repeat.

`programme.json` and `programme.md` audit C01–C14 separately from engineering acceptance. Actual suppliers, measured materials/soil, physical tests and named independent acceptance are still required; the software cannot manufacture them.

## More realistic response models

The shared trainset–viaduct demonstrator adds one instance definition for family geometry, mass/inertia, joints, native Assembly placement, ERP inspection identity and coupled car/bogie/rail/multi-span response. It retains explicit synthetic inputs, source-bound change propagation and independent convergence/native equation checks. Supplier/physical release remains separate from the numerical demonstration.

The complete `system-study` workflow now compares ten beam, six pier and nine foundation layouts, GFRP/CFRP matrices, material/geometry variants, continuity and construction methods. It uses 300 m of double track and a distinctly labelled static Baghdad planning sensitivity, without a substituted axle array. It reruns component checks, searches cost/mass/working-time Pareto tradeoffs, retains failures/checkpoints, and confirms a diverse shortlist with three native solid meshes and three 3D frame meshes. The frame includes separate tracks, flexible transverse caps, finite bearing roll and coupled foundation stiffness; single-track and braking sensitivities are retained. Composite shear-slip diagnostics show dependence on still-unmeasured connection properties.

```
tools/automation/osr-python tools/automation/civil-study.py system-study \
  --output build/engineering/civil-studies/baghdad-complete-systems-v2
tools/automation/osr-python tools/automation/civil-study.py system-verify \
  build/engineering/civil-studies/baghdad-complete-systems-v2
```

This writes a self-contained `report.html`, CSV/Markdown comparisons, section and Pareto SVGs, candidate/input/source records, native fields, method-specific CPM schedules and complete cost rows. Actual Baghdad prices remain unknown. Three synthetic rate/productivity cases give conditional comparisons; their hypothetical crane tiers are not crane charts. Empty/segment shipping and lifting units differ from service mass. Precast pile production, delivery/splices and site concrete transport are included. Carbon totals remain unknown without controlled EPDs. Read the full workflow and remaining acceptance.

Use `--resume` only with matching frozen inputs/source/native hashes. `--skip-detail` supplies reduced evidence only and cannot create the retained confirmed review. `--evaluations-per-method`, `--seeds` and `--shortlist` bound pilots; the full default uses three seeds, equal random/evolution attempt budgets and 24 detailed packages. Numerical-library threads

are fixed at one; every CalculiX call has a 180-second limit and retains failures. Search wall/evaluation limits are in `config/system-options.json`.

Export a fully checked review, optionally updating the requested root README:

```
tools/automation/osr-python tools/automation/export-civil-system-review.py \
  build/engineering/civil-studies/baghdad-complete-systems-v2 --update-readme
```

All C01–C14 engineering acceptance gates remain open. The new workflow does not give material capacity, prestress, cyclic/fire/fatigue, surveyed ground or actual train dynamics an invented pass. The existing reference models below retain their original scope; their limitations should be read separately from the additional 3D and coupled-pile diagnostics.

- Actual disjoint section regions drive CAD, quantities, area, centroid and both bending inertias. Solid end diaphragm regions are counted once and have their own stiffness/mass. The hollow deck is a research box, not a qualified product.
- Native elastic Timoshenko elements include shear deformation, consistent mass and rotary inertia. Each span retains its own rotations and finite horizontal and vertical bearings. Shared piers, rigid cap offsets, pier self-weight and foundation-cap mass complete the 2D load path.
- Two explicitly uncalibrated ground stiffness scenarios provide finite axial, lateral and rotational compliance. Illustrative pile-group dimensions support equal-scope takeoff; they do not establish geotechnical resistance.
- The actual retained 12-axle LM3 AW2 planning pattern crosses both tracks synchronously. Static positions, Newmark moving-force histories at two speeds, modal shapes, acceleration and braking response are retained. The reference moving-force campaign does not include suspension feedback; the separate coupled-vehicle diagnostic does. Asymmetric loading and Baghdad six-car geometry need their actual supplier inputs. A mesh-independent 2 m triangular rail-distribution footprint avoids an instantaneous axle-load jump at model entry. The footprint is an explicit unverified track assumption; load and moment conservation are independently checked and its physical applicability needs validation.
- Handling models use the fabricated beam's nonuniform mass and overhanging supports at 20/80% span, rather than the service bearing arrangement. The complete suspended study mass includes a separate rigging allowance.

Three static/handling meshes and independent dynamic mesh/time refinements check response sensitivity. Failure of a declared convergence tolerance remains a failed numerical screen. Research lift limits are separate provisional constraints. Null railway limits and quotations remain unresolved. Elastic fibre stress is a gross-section response, not prestressed capacity or fatigue evidence.

Independent benchmarks cover Timoshenko UDL deflection/reactions, point loading with support settlement, a flexible-base pier, Rayleigh-limit modal frequencies, and moving-force histories against analytical modal superposition. See `benchmarks`. These verify equations and implementation; they provide no physical validation.

## Contracts, history and resource limits

`config/reference.json` owns the initial input values. `schemas` publish strict study and candidate contracts. Unknown keys, wrong unit field names, booleans as measurements, nonfinite values, duplicate JSON keys, incompatible geometry and stale input hashes fail closed.

Design IDs bind configuration and geometry. Evaluation IDs additionally bind the complete study, scenario, analysis implementation and native library bytes. Results and review state are separate records. Each attempt retains its job, compressed native response fields, modal shapes, governing conditions, convergence checks, logs, failures and output hashes. The append-only ledger is also hash-bound.

Modify a design by creating a definition containing only `deck` and `pier`, then:

```
tools/automation/osr-python tools/automation/civil-study.py derive \
  --parent build/engineering/civil-studies/first-campaign/candidates/CANDIDATE_ID.json \
  --definition my-revised-definition.json --output build/engineering/civil-studies/child.json \
  --reason 'Investigate a thicker bottom flange'
```

The child retains its parent ID and change reason; the parent is untouched. Put the child definition, `parents` and `modification_reason` in a new campaign's candidate row and the complete parent records in `lineage_records`. Ancestors are validated and retained; missing parents and lineage cycles are rejected. Result histories can be inspected independently; native fields remain scratch artifacts under `build/engineering/`. Compact intentional review evidence may be retained under the repository artifact policy.

Workers run sequentially, use one numerical-library thread, have a 4 GiB address space limit and a registered timeout. Candidate count is checked against the campaign budget before outputs are created. Resume does not bypass source or native-environment checks. An execution failure is not structural infeasibility.

# Remaining model and evidence work

The reference system is linear and planar. The programme additionally runs nonlinear Concrete02/steel fibre sections, native PySimple1/TzSimple1/QzSimple1 piles, P-delta columns, Coulomb friction bearings, orthotropic coupons and actual C3D20R solid sections. These have explicit, limited verification domains. It does not qualify prestress losses, cracking, shear/torsional resistance, connections, transverse cap bending, cyclic pier response, nonlinear pile/soil behaviour, uplift, scour, fire, fatigue, track irregularity or actual lift stability. Rayleigh damping and finite-domain entry/exit effects require further study. Actual train supplier records, material tests, soil data, quotes and independent review remain inputs to later phases.

Controlled evidence can be supplied through `evidence_refs`. A measured, supplier-verified or site-calibrated flag requires its role's source and checksum; those raw records are copied into the sealed study. Source currency is checked again after execution. Such a flag does not itself grant engineering acceptance.

# Baghdad deployment inputs

Baghdad is the active qualification target. The commands `run` and `programme` default to this target, report missing evidence and exit with code 2 before any solver runs. Existing LM3 software verification requires explicit `--deployment reference`. Missing quotations remain open with unknown costs.

```
tools/automation/osr-python tools/automation/civil-study.py qualification \
  --output build/engineering/civil-studies/baghdad-qualification
```

This writes source-bound JSON and a readiness table with owners. The retained profile is six cars, 24 axles and 111 m long, with planning masses of 204 t tare, 258 t AW2 and 276 t AW3. The 384 t infrastructure allowance is an envelope; it does not define axle forces. All 54 city lines select this train family. The desktop ground inventory has 30 missing profiles and is not site calibration.

A supplier can provide a retained repository JSON record conforming to `schemas/supplier-train.json`. It must bind an original drawing/load document by relative path and SHA-256, list all 24 sorted axle positions from a leading-end datum increasing towards the trailing end, and provide positive case-specific axle forces balanced against loaded mass. Tests use synthetic records only to verify this contract; no synthetic record is installed as Baghdad input.

```
tools/automation/osr-python tools/automation/civil-study.py run \
  --train-record path/to/retained-supplier-record.json \
  --output build/engineering/civil-studies/baghdad-moving-force
```

With valid inputs this creates a six-car moving-force research profile and runs the selected geometry/ground cases. Use `--config` for a different study contract; the Baghdad pattern replaces that contract's train. `--resume` and `--retry-failed` preserve the existing attempt history and source checks. Verify the resulting `evaluation/` directory with the normal `verify` command.

The complete Baghdad `programme` remains blocked even after this record is supplied: its coupled diagnostic needs actual per-axle suspension, bogie and contact data and an appropriate adapter. Project load combinations, lateral/3D response, material/ground calibration, costs, physical validation and acceptance also remain open. Reference models are never relabelled as Baghdad qualification. See Baghdad qualification.

See the implementation and acceptance backlog. The compact retained campaign review keeps numerical summaries and exact provenance available without committing high-volume fields. The constrained optimiser uses verified reduced models within a declared hollow-deck/pier domain. It retains each mutation, failure, cache hit and source identity. Different random seeds and equal evaluation budgets remain visible; no global optimum or validated cost saving is asserted. No candidate belongs to a qualified feasible Pareto set and no result triggers catalogue, procurement or ERP release.

The native formulations follow the official OpenSees documentation for Timoshenko elements and transient analysis.

# Individual tools

| Command | Purpose |
|---|---|
| `prepare` / `generate` | Strict study/candidate contracts and source snapshots |
| `benchmark` | Concrete/steel, nonlinear pile, P-delta, friction and orthotropic/coupled-vehicle verification |
| `optimise` | Multi-seed Pareto evolution and equal-budget random comparison |
| `detail` | Actual-section CalculiX solids at three mesh sizes |
| `cost` | Complete quantities, controlled rate sources, crane/transport and lifecycle scenarios |
| `export-ifc` | Full span–pier–foundation solids and stable IFC product/quantity IDs |
| `archive` / `restore` | Immutable multipart checksummed storage and safe retrieval |
| `validate-data` | Separate calibration/holdout specimens and measurement uncertainty |
| `test-plan` | Candidate-specific laboratory/field protocols and unresolved owners/limits |
| `promotion-check` | Sealed impact proposal; existing structural release inspection when supplied |

Use `--help` for each command. Search `--resume` verifies its checkpoint and replays the deterministic trajectory using saved results; modified inputs/code or tampered files cannot silently reuse it. Reference retries consume the registered attempt budget. Commercial totals remain null unless every scope item and currency conversion is priced; quoted sources are hash-checked.

Actual-section solids are linear elastic, with explicitly idealised supports and a bulk steel mass allowance. Nonlinear sections, pile response and friction are separate diagnostics; they do not confer full-system nonlinear or physical qualification. Unmeasured material matrices and range scenarios are labelled research inputs. Hybrid bond/slip, calibrated cyclic degradation, scour and 3D vehicle lateral interaction need project data and model selection.

The service-envelope workflow adds full represented-pair passage coverage, individual body histories and unweighted ride diagnostics. It distinguishes executed cases from plans and keeps full-family, ISO comfort and physical acceptance open. Earlier published reviews retain their producing source commit and can be checked with `tools/automation/verify-shared-review-history.py`.

# Retained civil campaign review

Repository source: `engineering/civil_exploration/examples/README.md`

`first-campaign.json` is the compact intentional review output of `tools/automation/civil-study.py run --deployment reference`, exported with:

```
tools/automation/osr-python tools/automation/export-civil-study-review.py \
  build/engineering/civil-studies/first-campaign
```

Its named consumer is `engineering/analysis/tests/test_civil_exploration_review.py`. It retains the frozen inputs, exact dependency/native identities, independent benchmarks, quantity/response summaries, convergence, failures and native output checksums. Full native fields remain under `build/engineering/civil-studies/`; regenerate them with the workbench. These are research results with unresolved engineering feasibility and no physical or operating release.

Run the exporter with `--check` against the same sealed bundle to verify this compact derivative. Historical review inputs stay explicit; future material, train or model changes require a new campaign and intentional fixture refresh.

`programme-review.json` and `programme-review.md` retain the expanded C01–C14 software audit, component benchmarks, multi-seed search, range sensitivity, native solid/nonlinear shortlist checks, commercial unknowns, safe retrieval and the blocked promotion proposal. Generate them with:

```
tools/automation/osr-python tools/automation/export-civil-programme-review.py \
  build/engineering/civil-studies/completed-software-programme
```

The named consumer is `engineering/analysis/tests/test_civil_exploration_programme_review.py`. Every external acceptance item remains visible; actual physical measurements, supplier commitments and authority signatures are not supplied by these records.

`baghdad-qualification/qualification.json` and `.md` retain the user-selected deployment readiness and source hashes. They are input-gap records, with no solver results or release claim. Their generator is `civil-study.py qualification` and their named consumer is `engineering/analysis/tests/test_civil_qualification.py`. Regenerate into a fresh scratch directory, compare to the retained pair, and refresh intentionally if the controlled inputs change.

`complete-system-review.json` and `.md` retain the expanded whole-package search, source/native identities, conditional cost/mass/time leaders, failed/provisional outcomes, diverse 3D/solid confirmations and all external gates. `system-choices.svg` shows canonical sections/footprints; `pareto.svg` shows synthetic scenario tradeoffs. Actual prices remain null and no qualified/global optimum is claimed. The named consumer is `engineering/analysis/tests/test_civil_system_choices.py`; the generator is:

```
tools/automation/osr-python tools/automation/export-civil-system-review.py \
  build/engineering/civil-studies/baghdad-complete-systems-v2 --update-readme
```

# Baghdad civil qualification input readiness

Repository source: `engineering/civil_exploration/examples/baghdad-qualification/qualification.md`

Target: Baghdad, six cars, 24 axles, 111 m retained planning length. Planning masses: 204 t tare, 258 t AW2 and 276 t AW3.

Supplier axle positions and loaded distribution are required before a Baghdad moving-load run. LM3 axle spacing is never repeated or relabelled.

Status: `blocked-missing-supplier-axle-inputs`. Physical release and engineering qualification remain false.

| Input | Owner | Status | Required evidence |
|---|---|---|---|
| TRAIN-AXLE-POSITIONS | rolling-stock supplier | open | six-car supplier drawing with all 24 axle positions |
| TRAIN-LOADED-DISTRIBUTION | rolling-stock supplier/structural lead | open | case-specific loaded axle forces and balanced loaded mass |
| TRAIN-SUSPENSION | rolling-stock supplier | open | per-axle sprung/unsprung masses, suspension, contact and bogie/articulation relationships |
| TRAIN-OTHER-CASES | supplier/structural lead | open | AW3, infrastructure, braking/rescue/maintenance, lateral and dynamic combinations |
| GROUND-CALIBRATION | geotechnical lead | open | support-zone boreholes, calibrated axial/lateral/group/settlement parameters and pile tests |
| MATERIAL-AND-TENDONS | materials/structural lead | open | actual concrete/composite batches, reinforcement, tendons, anchorage and losses |
| CODES-AND-LIMITS | engineers of record | open | adopted Iraqi/project standards, load combinations and accepted limits |
| SURVEY-AND-ERECTION | survey/construction leads | open | accepted alignment/support locations, temporary stages, actual rigging/routes and equipment charts |
| QUOTATIONS | cost/manufacturing owner | open | Baghdad-local supplier quotations, productivity and maintenance/replacement inputs |
| PHYSICAL-AND-INDEPENDENT | independent checker/authority | open | instrumented validation, independent review and existing controlled authority acceptance |

The 100 m double-track comparison segment is separate from the complete city inventory. Desktop soil screens are not calibrated site resistance. Existing LM3 studies remain software verification references. The coupled programme requires supplier suspension/bogie data and a suitable per-axle adapter.

# Complete viaduct system exploration

Repository source: `engineering/civil_exploration/examples/complete-system-review.md`

Baghdad target. Common scope: 300 m, double track. 731 distinct packages, 779 evaluation attempts, 175 provisional screening passes.

Actual supplier costs are unknown. No engineering-qualified cheapest design or global optimum is claimed. The static load is the retained infrastructure full-train allowance spread over the retained train length. It is not an actual axle pattern or dynamic envelope.

Winner basis: converged native shortlist and all shared provisional constraints. Price and productivity scenarios are synthetic assumptions; masses follow canonical material regions and full package quantities. Material strength/prestress/fatigue capacity remains unresolved. Gross stresses are retained without an invented material-independent acceptance limit.

| Scenario | Objective | Beam / pier / foundation / method | Installed cost USD | Installed mass t | Working days | Largest lift t |
|---|---|---|---|---|---|---|
| concrete-first | cheapest | U-girder 20 m / lightweight / hollow-tapered / CFA-six / in-situ / link-slab | 1,774,796 | 6,504.4 | 120 | 0.0 |
| concrete-first | lightest | hybrid-shell 20 m / high-performance + GFRP / hollow-prismatic / square-driven-six / precast-full / link-slab | 7,374,804 | 5,499.2 | 154.625 | 43.3 |
| concrete-first | fastest | uhpc-ribbed 20 m / high-performance / hollow-prismatic / CFA-six / precast-full / simple-span | 2,640,915 | 7,609.1 | 63 | 64.9 |
| lightweight-industrial | cheapest | U-girder 20 m / lightweight / hollow-tapered / CFA-six / in-situ / link-slab | 1,723,577 | 6,504.4 | 120 | 0.0 |
| lightweight-industrial | lightest | hybrid-shell 20 m / high-performance + GFRP / hollow-prismatic / square-driven-six / precast-full / link-slab | 4,034,997 | 5,499.2 | 137.5 | 43.3 |
| lightweight-industrial | fastest | uhpc-ribbed 20 m / high-performance / hollow-prismatic / CFA-six / precast-full / simple-span | 2,320,060 | 7,609.1 | 63 | 64.9 |
| resource-constrained | cheapest | conventional-I 25 m / lightweight / hollow-tapered / CFA-six / precast-full / continuous | 2,061,077 | 8,033.3 | 92.375 | 64.5 |
| resource-constrained | lightest | hybrid-shell 20 m / high-performance + GFRP / hollow-prismatic / square-driven-six / precast-full / link-slab | 7,977,508 | 5,499.2 | 214.25 | 43.3 |
| resource-constrained | fastest | uhpc-ribbed 20 m / high-performance / hollow-prismatic / CFA-six / precast-full / simple-span | 2,853,243 | 7,609.1 | 78.125 | 64.9 |

## Family coverage

| Beam family | Native completed packages | Model / evidence maturity |
|---|---|---|
| pi | 105 | Research; gross elastic properties, actual supplier details and physical validation open |
| hollow-box | 78 | Research; gross elastic properties, actual supplier details and physical validation open |
| conventional-I | 77 | Research; gross elastic properties, actual supplier details and physical validation open |
| U-girder | 114 | Research; gross elastic properties, actual supplier details and physical validation open |
| ribbed-deck | 42 | Research; gross elastic properties, actual supplier details and physical validation open |
| uhpc-ribbed | 130 | Research; gross elastic properties, actual supplier details and physical validation open |
| hybrid-shell | 41 | Research; gross elastic properties, actual supplier details and physical validation open |
| segmental-box | 41 | Research; gross elastic properties, actual supplier details and physical validation open |
| steel-composite-I | 66 | Research; gross elastic properties, actual supplier details and physical validation open |
| frp-composite-I | 37 | Research; gross elastic properties, actual supplier details and physical validation open |

## Detailed confirmation

24 shortlisted packages; 24 completed converged three-mesh solids and 3D frame checks. 3D models include two separate tracks, flexible transverse hollow caps, finite bearing translations/roll and coupled foundation translation/rotation. Both-track and single-track uniform loading are retained at three deck meshes for both soil scenarios. Composite connector sensitivity compares noncomposite, partial interaction and strong-connector behaviour; connector values are unmeasured assumptions. These checks do not supply bond failure or cyclic/fire evidence.

## Document work packages and remaining acceptance

| Package | Implemented software / retained output | External acceptance still required |
|---|---|---|
| C01 | source-bound Baghdad planning inputs and explicit qualification blockers | project inputs, applicable domain and responsible independent engineering acceptance |
| C02 | strict candidate inputs, package/candidate IDs, immutable results and modification events | project inputs, applicable domain and responsible independent engineering acceptance |
| C03 | ten beam, six pier, nine foundation options, material compatibility and bounded search | project inputs, applicable domain and responsible independent engineering acceptance |
| C04 | shared disjoint CAD/IFC solids, net material quantities, shipping/lift unit centres | project inputs, applicable domain and responsible independent engineering acceptance |
| C05 | analytical/native component checks, foundation reciprocity/energy and three-level refinement | actual instrumented tests, laboratories, independent reviewer and acceptance |
| C06 | native CalculiX nodal/stress parsers and complete 3D force/displacement fields | project inputs, applicable domain and responsible independent engineering acceptance |
| C07 | native nonlinear component benchmarks and coupled geometry-specific elastic pile groups | project inputs, applicable domain and responsible independent engineering acceptance |
| C08 | uniform planning sensitivity, separate 3D tracks/caps, method/stage schedules and construction units | project inputs, applicable domain and responsible independent engineering acceptance |
| C09 | complete material/plant/labour/overhead/maintenance/replacement bills and three conditional scenarios | project inputs, applicable domain and responsible independent engineering acceptance |
| C10 | bounded seeded runs, checked checkpoints, sealed raw data, multipart archive and verified restore | project inputs, applicable domain and responsible independent engineering acceptance |
| C11 | equal-budget random/evolution search, Pareto sets, scenario reversals and a diverse shortlist | project inputs, applicable domain and responsible independent engineering acceptance |
| C12 | three-mesh actual-section solids, orthotropic materials and connector-slip/torsion diagnostics | project inputs, applicable domain and responsible independent engineering acceptance |
| C13 | candidate-specific instrumented physical-test protocols and existing calibration/holdout workflow | actual instrumented tests, laboratories, independent reviewer and acceptance |
| C14 | sealed change proposal and pointers to the existing controlled change/structural release process | actual instrumented tests, laboratories, independent reviewer and acceptance |

## Open qualification inputs

- TRAIN-AXLE-POSITIONS (rolling-stock supplier): six-car supplier drawing with all 24 axle positions — open.
- TRAIN-LOADED-DISTRIBUTION (rolling-stock supplier/structural lead): case-specific loaded axle forces and balanced loaded mass — open.

- TRAIN-SUSPENSION (rolling-stock supplier): per-axle sprung/unsprung masses, suspension, contact and bogie/articulation relationships — open.
- TRAIN-OTHER-CASES (supplier/structural lead): AW3, infrastructure, braking/rescue/maintenance, lateral and dynamic combinations — open.
- GROUND-CALIBRATION (geotechnical lead): support-zone boreholes, calibrated axial/lateral/group/settlement parameters and pile tests — open.
- MATERIAL-AND-TENDONS (materials/structural lead): actual concrete/composite batches, reinforcement, tendons, anchorage and losses — open.
- CODES-AND-LIMITS (engineers of record): adopted Iraqi/project standards, load combinations and accepted limits — open.
- SURVEY-AND-ERECTION (survey/construction leads): accepted alignment/support locations, temporary stages, actual rigging/routes and equipment charts — open.
- QUOTATIONS (cost/manufacturing owner): Baghdad-local supplier quotations, productivity and maintenance/replacement inputs — open.
- PHYSICAL-AND-INDEPENDENT (independent checker/authority): instrumented validation, independent review and existing controlled authority acceptance — open.

## Further model domains

- moving/coupled Baghdad train requires supplier records.
- nonlinear 3D cyclic/seismic and scour/group calibration.
- reinforcement/prestress/joint/contact capacity and stage locking.
- physical fire/durability/fatigue and independent acceptance.
- V-piers/Y-caps: inclined/multiple-leg 3D cyclic and cap-joint qualification; requires-purpose-specific-adapter-and-data.
- ground-improvement-shallow: site treatment trial/calibration and inclusion-platform load-transfer model; requires-purpose-specific-adapter-and-data.
- recycled-primary-members: qualified material fatigue/durability datasets; secondary nonstructural use remains separate; requires-purpose-specific-adapter-and-data.
- haunched-variable-section: supplier section/tendon/diaphragm detailing and stage qualification; requires-purpose-specific-adapter-and-data.

Actual soil, supplier train records, material/connection details, quotations, physical tests and independent acceptance determine whether any shortlisted package is adoptable. Physical and operating release remain false.

# C01–C14 executed software and remaining acceptance

Repository source: `engineering/civil_exploration/examples/programme-review.md`

This audit records the executed research software. It does not close physical or engineering acceptance.

| ID | Software evidence | Remaining acceptance |
|---|---|---|
| C01 — project requirements and actual loads | implemented research workflow | adopted project codes/limits; actual train/ground/material inputs; named acceptance owners |
| C02 — contracts and lineage | implemented research workflow | independent contract/configuration review |
| C03 — family compatibility/material matrices | implemented research workflow | supplier sections, material properties and connection qualifications |
| C04 — CAD/IFC and quantities | implemented research workflow | accepted reinforcement/tendon/fabrication drawings |
| C05 — numerical benchmark domains | implemented research workflow | measured model applicability and blind physical validation |
| C06 — native result exchanges | implemented research workflow | accepted project output specifications and limits |
| C07 — nonlinear pier/soil components | implemented research workflow | site calibration, nonlinear group/scour/liquefaction/seismic selection |
| C08 — moving/thermal/continuity/construction cases | implemented research workflow | supplier suspension/axle records and site-specific 3D/erection cases |
| C09 — complete package pricing/equipment/lifecycle | implemented research workflow | actual charts, routes, productivity, quotations and maintenance/replacement costs |
| C10 — runner/CI/artifact retrieval | implemented research workflow | project custody/retention and independent environment replay |
| C11 — multi-seed constrained search and random baseline | implemented research workflow | accepted constraints, costs and candidate-specific qualification |
| C12 — native solids/material/joint refinements | implemented research workflow | calibrated interface/anchorage/cyclic/deterioration models and independent checks |
| C13 — physical datasets/tests and independent validation | implemented test/data workflow | laboratories, specimens, procurement and actual instrumented tests |
| C14 — sealed proposal and existing release gate | implemented research workflow | candidate-specific physical evidence, independent review and authority acceptance |

Native reference attempts: 10; component checks: 10; unique native search designs: 540.

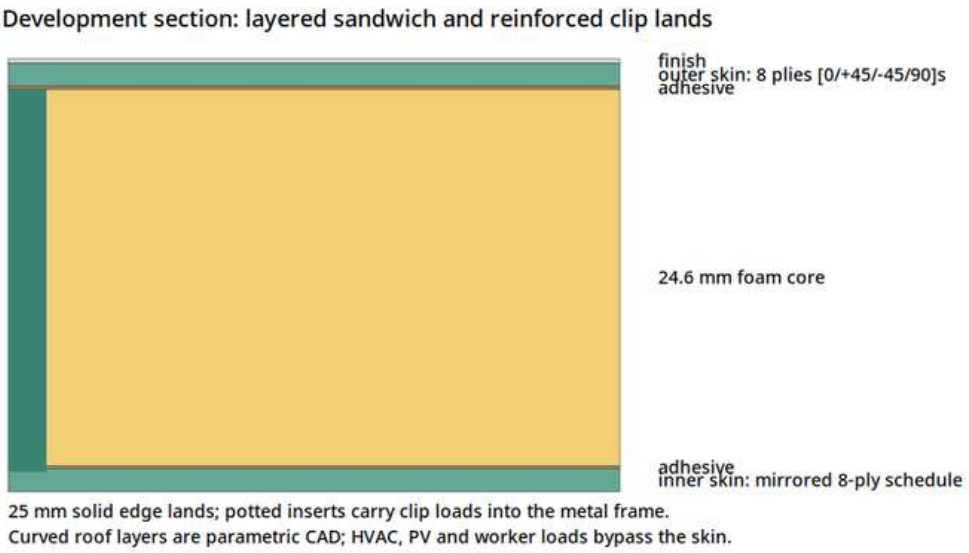
Actual physical results received: zero. The sealed promotion proposal remains blocked.

The companion `programme-review.json` retains exact source and native identities, evidence hashes, constraints, failure/domain states and conditional numerical results.

# Hybrid GFRP exterior-panel development

Repository source: `engineering/composite_panels/reference/README.md`

2592 conditional panel/support combinations; no candidate is released or changes the train mass/BOM.



Layered development section

Interactive comparison · Complete-scope RFQ prepared for review.

The metal frame remains the main structural load path. HVAC, PV, lifting and personnel loads pass into its dedicated supports. The reference section has two 1.5 mm eight-ply skins, two 0.2 mm bonds, 24.6 mm core and a separate 0.3 mm finish. Material values, pressure, ageing factors and roof crown are explicit development assumptions.

Complete comparison varies skin, core depth/density, module width, clip/support span, roof crown and hat-rib depth. Rib mass is counted; rib stiffness and bond benefits await evidence. Mass includes solid edge lands, potting, inserts, clips, retention, seals and finish. Curvature earns no stiffness credit. Classical laminate ABD and one-way pressure-strip bending plus core shear are numerical screens, not plate/clip fatigue or debonding qualification. Density selects a coupled supplier-grade property record at 23 C. Every support pitch generates steel rails, brackets and fasteners with installed mass; grade-specific hot/wet, fire and attachment qualification remains open. An 85 C roof exceeds the selected grades at their 70 C continuous-temperature datum and cannot pass thermal selection.

Reference panels · Actual aperture-based 144-module inventory · Steel/aluminium comparisons · All candidates · Shared support geometry. Shared-joint seal quantities remain a gross allowance; the cutout clip map and final roof crown remain unreleased. Bare 2 mm metal sheets are unequal-performance comparators. Separate metal plate assemblies are thickness-sized to the same pressure/support/deflection surrogate and include common attachment, finish and insulation allowances. This is not an optimum metal stiffener design or demonstrated equivalent rail behaviour. No whole-train saving is claimed.

Prototype/quotation status derives from the editable evidence register. Record candidate ID, dry/hot-wet condition, metre-valued measured deflection, uncertainty and original-file SHA-256 for correlation. Tests must reproduce the candidate pressure/support/material configuration. Quotations require the complete named scope. Empty records stay unknown; the $11,000 B6/B7 allowance is a comparator, not a quote.

Coupon tests precede a clipped side module and an equipment-adjacent roof bay. The register covers aged stiffness/bond/pull-out, pressure, clip loss, vibration/fatigue, impact, heat beneath PV, ingress, UV/sand/wash, bonding and measured replacement. Fire requirement set/hazard level and the exact complete stack remain unfrozen.

Regenerate: `.venv/bin/python tools/automation/composite-panel-study.py`; use `--check` for source/output drift. Native layered side and curved roof CAD validates nonoverlapping solids and independent volumes; curved roof insert lands remain separate development. Native CAD export/volume verification uses `tools/automation/verify-composite-panel-cad.py` in FreeCAD. Native exports do not establish physical performance.

Supplier and standards references: DIAB coupled core grades, May 2026, BSI EN 45545-2:2020+A1:2023, Sicomin SR1124, its datasheet, AIREX T90, Mat4Rail results. Supplier resin Tg and core thermal stability are separate from allowable panel service temperature.

# Persistent engineering design runner

Repository source: `engineering/continuous_design/README.md`

The runner executes mechanical, civil, software and integration work continuously under a durable SQLite queue. A user service keeps it independent of the chat, resumes interrupted work and restarts after process failure. Read the operating guide.

The development plan maps the next six work packages to implemented research pilots and remaining engineering evidence. The `process-aware-multidiscipline-search` capability adds three source-bound task families only after its independent/adverse benchmark receipt and exact-source review are registered. Unsupported topology optimisers, material systems, circuits and CFD models remain missing capabilities, not executable AI proposals.

The roof cassette varies explicit ply schedules, skin/core thickness, complete core-grade records and crown. It calculates laminate A/B/D and strip/hot-wet screens from those same plies. The current core cards fail the fixed 85°C roof context; the runner records the required compatible high-temperature material system and stops repeating that blocked family. Full curved-shell, contact, resin/cure and complete-stack fire qualification remain open.

The equipment demonstration compiles existing battery/HVAC alternatives and compares a real RHS ladder with a folded-pan material-region model, an optional rib and welded/bolted cover. Duct dimensions change both modeled sheet mass and pressure/fan demand. A two-zone heat/moisture model includes declared ventilation, door, solar and internal-load hypotheses, failed-module cases and time refinement. Auxiliary capacity and cooling-loss battery duty can reject thermal improvements. These are reference planning hypotheses, not measured Baghdad climate, passenger ventilation requirements or supplier performance maps. The minimum usable-energy hypothesis stays at the fixed reference pack; a smaller battery cannot win by silently reducing required function. Known battery installation-bay failures complete as rejected studies with the compiler constraint retained. They generate smaller-layout trials and never request native confirmation of an absent physical model. Unrelated compiler errors remain execution failures; earlier failed attempts stay in history.

The civil study connects the existing ten deck families and six pier families with their compatible material/foundation records and bounded dimensions. Comparison scope remains the existing 100m reference: five 20m two-track bays. Native material solids and a 2D elastic moving-load static model are evaluated; defined source research limits are enforced, while unset response limits stay explicitly unresolved and prevent any claim of engineering feasibility. Synthetic materials, perfect-bond assumptions, final reinforcement, manufacturing unit grouping, temporary works and actual Baghdad ground remain unqualified.

The `civil-kit-study` family compares a complete 20m two-track reference cell with two full supports, retaining that boundary for every alternative. Its large-span Pi, segmental-box and lighter ribbed examples include piles and prefabricated cages, foundation caps, piers, pier caps, bearings, track-support modules, walkways/parapets and separate power/data/drainage provisions. Registered choices include bored versus conditionally driven foundation bundles, split foundation/pier caps, six pier forms, segmented columns and service-module length. Station platform, independent footing/frame, canopy and stair packages use a separate comparison context so omitting a station can never appear as a saving. Stair supporting detail, complete services and actual station/railway acceptance remain open. The reference train is the retained source axle pattern, not an adopted Baghdad six-car load case.

Manufactured-unit IDs group exact CAD regions and explicit mass allowances. Those IDs survive native FCStd reopening and are reused in the RFQ CSV, joints, construction stages and QA templates. A cap-seat geometry revision is accounted in the material ledger; original reinforcement/prestress and track allowances are retained, with new kit additions accounted separately. Unknown cable, connection and reinforcement detail is never represented as qualified hardware.

Construction checks include demoulding, transport and lifting gross-beam demands, capacity at the declared crane radius, mat pressure, tolerance/engagement and stage precedence. Bores precede cages; segment assembly precedes post-tensioning; temporary support cannot be removed before connection and test completion. Early-age strength, stability, connections and ground still require their own qualified evidence. The event scheduler holds moulds through cure without charging passive curing as labour, holds loaded trailers until crane placement, reserves site waiting spaces, and accounts for bulk mixers, excavation, crews and QA. Capacity perturbations identify bottlenecks under the declared scheduling policy; this is a conditional heuristic schedule, not a proven minimum delivery time.

Required joint retention and inspection coverage are constraints. Inspection count is diagnostic; inspection effort can only be compared with matching required coverage. QA records require exact unit revision, serial identity and interface context; changed definitions request retests. Template hold points are unexecuted, and record consistency never authenticates a supplier or grants release. The civil-kit primary policy minimises scenario onsite work, then delivery time, lift and mass. Complementary leaders remain visible and can earn confirmation through non-mass improvements, including heavier alternatives. Small final improvements are still confirmed when a context becomes idle or stagnates.

Reproduce the three complete-scope planning examples in a new output folder:

```
tools/automation/osr-python tools/automation/design-civil-kit.py --output /tmp/osr-civil-kit-comparison
```

Outputs include manufactured-unit RFQ tables, material/allowance ledgers, handling demands, factory/delivery/erection schedules, capacity sensitivities, QA travellers and identical train/ground/durability/criteria fingerprints. Default productivity and crane/transport values are declared uncalibrated hypotheses, not supplier ratings or an erection instruction. Costs stay null until every unit revision and installation/temporary-work/disruption scope has input quotations. Factory work included in unit supply is not charged twice. The comparison does not establish a cheapest accepted railway design.

Fresh site concrete has explicit batching, travel, waiting, discharge and mixer return events. The pump and crew are reserved before batching; mixer occupancy continues through unloading and return. Dispatch offsets aim for continuous placement, but actual batch-to-discharge-end age and gaps between discharges are independently checked. The reference four-hour age and quarter-hour gap bounds are unqualified mix/temperature scenario inputs, not universal limits, supplier claims or Baghdad placement acceptance. Tightening them or reducing the mixer fleet can reject the delivery scenario. Reserved crew waiting time counts as labour. Batch tickets, weather, admixtures, tests and real continuity/strength criteria still need qualified records.

Driven piles include pitching, rig occupancy, driving per declared segment, splicing when declared, installation records and acceptance operations before the foundation can progress. Registered examples are full-length precast piles; splice scenarios do not create qualified splice geometry or resistance. The ground-applicability hold remains mandatory. Falsework tokens are held from mobilisation through final removal, including partial erection and connection completion. Temporary units have the same transport, crane-radius, rigging and ground-pressure screens as permanent units. Their envelope/mass assumptions are not a detailed temporary-works design.

QA events use content-derived immutable identities and explicit sequence and interface bindings. Exact replay is idempotent and record ordering cannot clear a failure. Each failure requires an applicable later passing retest and a documented later disposition referencing both event identities. Superseding a test record alone cannot clear a failure; legacy/unidentified records cannot establish passed-record coverage. These are consistency checks on submitted history, not an authenticated append-only evidence store or physical acceptance.

The progress table presents modelled mass, largest lift, conditional onsite labour/delivery, resource-capacity sensitivity and outstanding evidence, linked to receipt-verified study results. Further development remains necessary for a single component/connection definition spanning every evaluator; changing-support and early-age structural analysis beyond the gross beam screens; receipt-bound train-to-kit integration; shared-support/multi-front corridor optimisation; qualified lightweight/hybrid kit bundles; and complete train harness/duct cassettes with mating, locking and bench-to-installed test continuity. The synthetic two-bay falsework regression checks resource ownership, not a corridor design or throughput prediction.

Every physical family has an applicable process profile. The new pilots assign every represented part/material region to one, execute operation prerequisites, fixture hypotheses, inspection hold points and conservative removal envelopes, and pack rectangular blanks with gauge separation and kerf. Missing tool sweeps, clamping, weld distortion, cure, actual inspection and supplier procedures remain unknown. A simulated inspection point is never human acceptance. Folded-pan geometry uses sharp-corner regions and conservative blank allowance; bend material is carried as an unresolved mass allowance without stiffness credit. Springback and finished corner geometry still need qualification.

Weld/bond operation counts include declared destructive joins; equipment and removable covers use their selected fastening route. These graphs still describe represented regions, with final manufacturing-unit grouping unresolved.

Pareto comparison retains mass alongside available scrap, operation, setup, fixture, inspection and repair counts. These are scoped geometric/count proxies, not measured labour time, supplier quotations or complete installed mass. Selected exact revisions receive native FCStd/STEP checks and the explicitly named discipline numerical confirmations; later failures use the same eligibility veto and holds as the original frame/Pi-beam pipeline.

```
tools/automation/osr-python tools/automation/design-continuous.py init --with-ai
tools/automation/osr-python tools/automation/design-continuous.py install
tools/automation/osr-python tools/automation/design-continuous.py status
tools/automation/osr-python tools/automation/design-continuous.py dashboard
tools/automation/osr-python tools/automation/design-continuous.py verify
```

The default workspace is `~/.local/state/opensourcerail/continuous-design`. `status.json` is atomically replaced with the current heartbeat, active workers and resource state. `queue.sqlite` retains jobs, attempts, results, events and missing adapter/evidence needs. Every attempt has its own immutable directory. Completion and follow-up outbox capture are one transaction. Dispatch and AI imports replay idempotently after a crash; legacy completed results are backfilled.

Computational workers are fixed tools. One optional, sequential AI proposer uses the installed CLI, saved login and a read-only sandbox to return typed data. `config.json` controls its model/executable, cadence and call budget. A blank `provider_model` inherits the CLI model; an explicit value affects only this runner. The controller rejects unknown variables, changed limits and executable code in proposals. Software generation uses a restricted Boolean expression language or separately benchmarked bounded receiver templates. Proposer turns use persisted least-recently-served order; prompts contain bounded representative history with paginated lookup and separate input/log/response budgets.

Mechanical and civil failure-directed candidates are generated by existing numerical adapters even when the AI service is unavailable. Passing detail designs generate nearby material-saving trials, each subject to the same checks. The documented incompatible LM3 constant-EI family records an alternative structural-adapter need instead of repeatedly sampling its unchanged envelope. Integration uses receipt-bound mechanical, civil and software children from the same baseline and train configuration. Automatic couplings use passing children; actual coupled civil failures generate repair trials. Unknown physical/manufacturing acceptance stays open.

Research eligibility also incorporates every applicable confirmation for the exact candidate revision. A mandatory native/numerical failure excludes the candidate from current champions, Pareto selection and integration admission. Unavailable tools, incomplete measurements and interrupted execution hold it; these are distinct from a deterministic design failure. A first confirmation still pending permits explicitly provisional analytical exploration. Physical acceptance remains separate in every case.

`integration_dispositions` marks dependent queued, running and completed studies as held or superseded. Original analytical results, integration results and champion history stay immutable. Current summaries exclude ineligible studies and select the next eligible alternative, including a previously dominated one. Admission, dispatch and worker execution recheck live evidence. Automatically generated integrations bind an evidence revision, so subsequent receipt changes can produce a fresh re-evaluation of the same physical candidate combination.

Work is deduplicated by engineering inputs. Software is also deduplicated by its complete Boolean truth table. A rejected design remains an evaluated experiment; execution failures get at most two attempts. AI errors have backoff and at most three attempts for unchanged context. Exhausted queues leave the service watching for new work instead of repeating identical calculations.

There is no lifetime experiment-count cap. Each lane admits up to 64 queued or running jobs; further distinct recipes remain durable `deferred` records and are promoted as capacity returns. The workspace/disk and AI-call limits still apply. AI feedback includes failed predicates, check details and a context-balanced child catalogue that prioritizes passing results over recent failed experiments.

Source changes invalidate the active baseline. Dirty edits wait; once the source change is committed, the service restarts with fresh Python imports and a new source-bound epoch. Prior attempts remain historical. New baseline evaluations do not borrow acceptance from old runs. Verified historical passing recipes and the closest failed detail recipes nominate input values for fresh evaluation; `historical-inputs.json` records provenance. Previous integration child keys and results are never reused as current acceptance.

New results name their verification level. Selected detailed children receive native FCStd/STEP geometry checks and an independent mesh/refinement/benchmark confirmation of their equivalent one-dimensional elastic beam model. Full connection, shell/solid strength, soil, dynamic and physical qualification stay open. `verify` checks source/runtime/artifact applicability and integrity; it explicitly reports that it does not rerun physics.

Confirmation independently measures section area, centroid, inertia and volumes from reopened B-rep solids, using two prismatic stations and an independent box control. The equivalent beam solver uses this recovered stiffness, while keeping the existing material, loading, support and compatibility hypotheses explicit. Mechanical mass covers the modeled solids. Civil represented mass recovers gross concrete and strand length; metallic strand area remains a declared material input, and analytically estimated links remain an unrepresented mass allowance. Neither full reinforcement geometry nor complete assembled mass is inferred. After a context becomes idle or its best candidate stagnates for 15 minutes, the exact best unconfirmed revision is nominated even below the usual five-percent improvement threshold, subject to the existing pending-confirmation resource cap.

`integration-protocol` adds a fourth exact child, the registered receiver, through the experimental `osr-precharge-link/1` interface. It executes the retained generated receiver and controller together: corrupt/stale/duplicate packets, sequence wrap, independent local vetoes, a normal voltage ramp and stopped/moving reset paths propagate to modeled closure permission. Independent event-sequence controls and a deliberately broken bridge test the composition. This remains an offline interface model, with physical network, target timing and SIL/HIL open.

SQLite observations retain Pareto alternatives, constraint margins and versioned research champions. Cost and assembly time stay unknown without evidence. Runtime identity binds numerical package bytes, solver binaries, linked libraries and FreeCAD runtime commits. The dashboard reports useful improvements and separate evidence counts, including unsuccessful calls and waiting work.

Missing capabilities can be developed through `capability-prepare`, `capability-check` and `capability-register` in an isolated Git worktree. Passing independent/adverse benchmarks and a review of the exact receipt must match the installed bytes. Ordinary proposals cannot register arbitrary new code.

```
tools/automation/osr-python tools/automation/design-continuous.py history \
  --lane mechanical --after 0 --limit 20

systemctl --user status osr-continuous-design.service
journalctl --user -u osr-continuous-design.service -f
```

```
systemctl --user stop osr-continuous-design.service
systemctl --user start osr-continuous-design.service
```

`verify --historical` checks retained identity/artifact integrity without asserting current source applicability. Neither verification mode provides engineering acceptance or physical release.

Hourly progress pictures are available through a separate, read-only reporter:

```
tools/automation/osr-python tools/automation/design-progress.py snapshot --notify
tools/automation/osr-python tools/automation/design-progress.py install
systemctl --user list-timers osr-design-progress.timer
```

Open `~/.local/state/opensourcerail/continuous-design/progress/latest.html` for the latest report; it refreshes every minute while the hourly timer generates new snapshots. Reports show all four lanes, research rejections separately from execution errors, evidence counts, changes since the previous snapshot in the same epoch, and changes to research candidates within the same context. Counts are experiments, not completed railway components. Epoch changes reset comparisons.

Pictures tessellate retained, receipt-checked FreeCAD solids, with candidate IDs, contexts and exact proportions. Confirmed passing examples are selected ahead of unconfirmed analytical candidates; geometry gaps and rendering failures remain visible. No CAD is regenerated or saved, and no acceptance is inferred from a picture. Native input hashes and image hashes are retained in each snapshot. The numerical evidence remains scoped to equivalent 1D elastic bending.

The timer runs independently of the engineering service, catches up after missed hours and uses bounded CPU, memory and execution time. It retains at most 48 presentation snapshots within a 256 MiB budget (always preserving the newest); original experiments and native evidence are untouched. `--notify` requests a local desktop notification with a geometry icon and report link through the session notification service. When logged out or notifications are unavailable, the report still updates and `progress/notification.json` records delivery state. This local timer does not post messages into the chat. Disable it with `systemctl --user disable --now osr-design-progress.timer`.

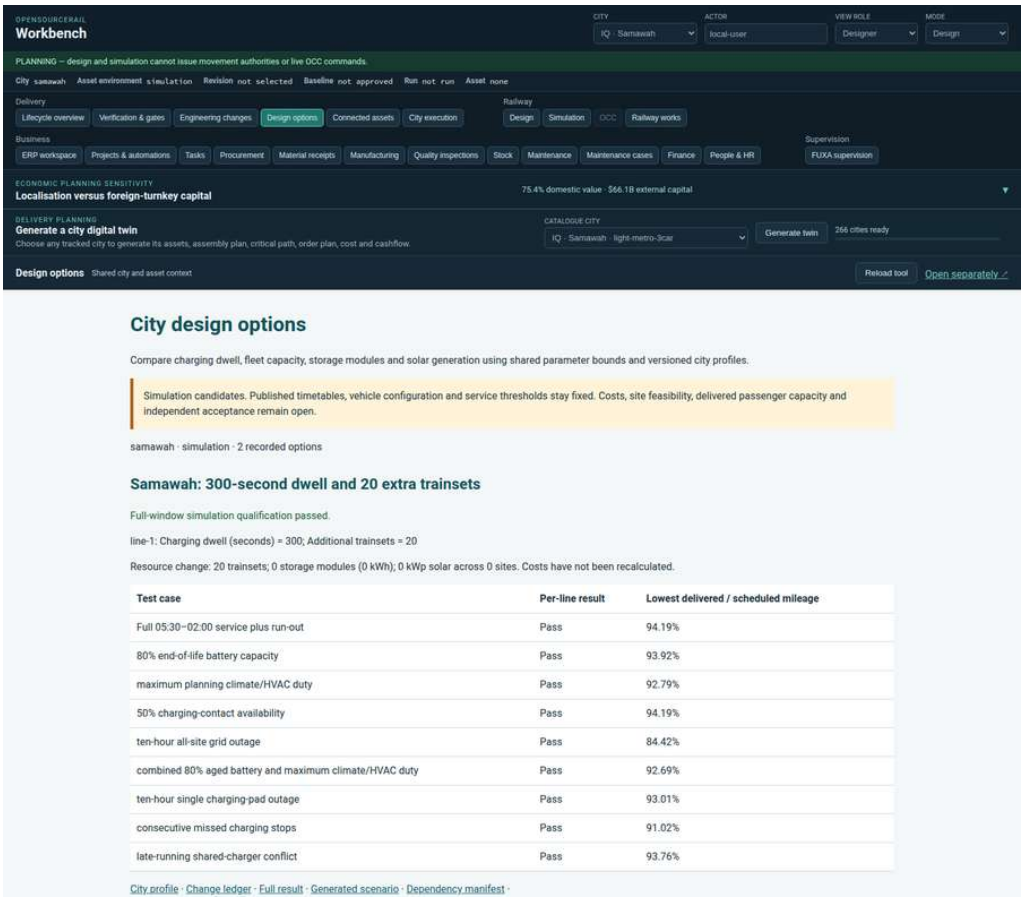
Tests:

```
tools/automation/osr-python -m pytest \
  engineering/analysis/tests/test_continuous_design.py \
  engineering/analysis/tests/test_continuous_planning.py \
  engineering/analysis/tests/test_continuous_reliability.py \
  engineering/analysis/tests/test_continuous_verification.py \
  engineering/analysis/tests/test_continuous_eligibility.py \
  engineering/analysis/tests/test_protocol_receiver.py \
  engineering/analysis/tests/test_protocol_system.py \
  tools/automation/tests/test_design_progress.py -q
```

# City design options

Repository source: `engineering/design-options/README.md`

Workbench  Design options compares recorded, city-scoped simulation candidates. A shared parameter policy supplies defaults and bounds; small city profiles select changes by line. The same workflow works with any catalogue city supported by the scenario generator. Canonical city packages remain controlled baselines until their separate promotion requirements are satisfied.



Workbench city design options

## Adjustable design

| Setting | Effect | Review consequence |
|---|---|---|
| `charging_dwell_seconds` | Charging dwell at powered stops on the selected line | Longer journeys, station occupation, timetable and fleet circulation |
| `additional_trainsets` | Adds service-rotation trainsets to that line's fleet | Purchase, stabling, maintenance, staffing and energy demand |
| `additional_storage_modules` | Adds whole modules at every energy site on that line, using each site's own module size | Battery footprint, fire protection, lifecycle and purchase costs |
| `additional_pv_kw` | Adds solar nameplate capacity at every energy site on that line | Land/roof area, grid connection and calibrated solar resource |

The bounds are software exploration limits, not approved hardware ratings. Shared charger/discharge power limits remain effective: extra kWh increases endurance, not charger power. Every site is retained when explicit overrides are generated; other lines' settings remain unchanged. Duplicate depot planning quantities stay consistent with their site. Unsupported keys, unknown lines, non-finite values, fractional modules and ignored settings are rejected.

Published timetable windows/headways, vehicle configuration, reserve policy and qualification thresholds remain fixed. Additional trains cannot reduce scheduled mileage in the denominator. Nominal and seven degraded cases retain the 90% floor; the ten-hour all-site grid outage retains its existing 60% floor. The existing 0.2 percentage-point numerical tolerance is unchanged. Full-window per-line mileage is still not a measured peak-headway or passenger-capacity guarantee.

## Reproduce a candidate

Requires the normal OSR Python and Rust simulation toolchains; no additional service or Python package is needed. Run from the repository root:

```
tools/automation/osr-python tools/automation/design-option.py prepare \
  --profile engineering/design-options/config/mosul-energy.json \
  --output build/design-options/my-mosul-energy
OSR_RESILIENCE_JOBS=4 tools/automation/osr-python \
  tools/automation/design-option.py qualify build/design-options/my-mosul-energy
tools/automation/osr-python tools/automation/design-option.py verify \
  build/design-options/my-mosul-energy
```

Qualification runs 90,000 simulated seconds for nominal service and each of the eight degraded cases. It returns exit 1 for a failed qualification and preserves the result. Use a new output folder for each experiment; existing evidence is not overwritten. Runtime depends on city size and available CPU resources.

To configure another city, copy a profile, set its catalogue slug and option ID, and specify only the required line overrides. `"lines": {}` is a generator-baseline control. An omitted setting uses the generic default (existing dwell or zero added resources). `prepare` resolves and checks the actual generated scenario before writing its bundle. Generated inline TOML is a complete machine-readable snapshot; the JSON profile is the human-editable source.

Each bundle contains its profile, generic policy, resolved settings, change ledger, generator baseline, candidate design/scenario and dependency manifest. Qualification binds the report to these files, Rust/generator/template dependencies and the native simulator hash. `verify` checks current source currency; `verify --historical` checks retained artifact/result binding without asserting current source currency. Checksums detect changes; they are not independent signatures or engineering approval.

To retain a result, copy its complete bundle to `examples/<option-id>` and add a city/environment entry to `catalogue.json`. Workbench verifies artifact/report hashes and scope before displaying it. It shows failure results as failures and hides other cities and physical environments. Baseline differences from the current generator are explicitly flagged. Resource deltas are recorded; canonical cost figures are not recalculated or accepted for the candidate.

## Recorded experiments

See results and design tradeoffs for executed trials and resource impacts. Passing candidates are simulation evidence, not canonical promotion.

## Closing the remaining programme tasks

| Remaining task | Design or execution route | Closure evidence |
|---|---|---|
| City service shortfalls | Versioned dwell, fleet and energy options, followed by the unchanged full qualification | Per-line nominal/degraded results, then observed headways and calibrated demand |
| FUXA/full-city concurrency | Existing configurable city polling, batching and bounded workers; measure gateway, FUXA and ERP together | Simultaneous native full-city load meeting the stated latency/loss targets |
| Recovery/cutover | Existing isolated coordinated restore plus deployment-specific recovery objectives | Fresh-volume recovery, then accepted production cutover and measured recovery times |
| Remaining formal-proof timeouts | Simplify equivalent implementation/harness paths or partition properties with complete coverage | Every declared property proved with original scope, unwinding checks and exact source evidence |
| CAD-to-production acceptance | Portable native CAD/solver adapters, controlled BOM revisions and production disposition | Supplier/material choices, full load cases, inspections and independent engineering review |
| Vehicle, station and civil packages | Reusable package structure with city/site-specific loads, interfaces and configuration | Controlled drawings, qualified analyses, physical evidence and authorized acceptance |

Configuration makes alternatives repeatable. It cannot substitute for proof results, site measurements, actual recovery execution or an independent acceptance decision.

# Design option results — 18 September 2026

Repository source: `engineering/design-options/results.md`

These experiments address per-line mileage failures. They do not establish peak-headway delivery, passenger capacity, multi-day energy sustainability or engineering/operating acceptance. All service thresholds and timetable windows remain unchanged. The generator baselines match the checked-in scenarios.

The original runs qualify their recorded source hashes. After the topology-adapter change, both successful options were fully requalified against the new Rust source; see the fresh bundles below. Earlier bundles remain historical evidence.

## Baseline and unsuccessful charging-only trials

The retained Samawah baseline passes nominal service but fails four degraded cases on line 1. Its 270-second charging dwell is increased in two exploratory trials:

| Line 1 dwell | Hot climate | Aged battery + heat | Missed charging stops | Overall |
|---|---|---|---|---|
| 270 seconds (baseline) | 87.26% | 87.54% | 88.34% | Failed; pad outage also fails |
| 300 seconds | 88.82% | 86.83% | 87.69% | Failed |
| 330 seconds | 87.64% | 86.65% | 87.53% | Failed |

Values are delivered/scheduled line mileage. Longer stops do not monotonically improve service: charging time competes with circulation and station occupation. The charging-only trials pass the pad-outage case but leave three failures. Their 300-second and 330-second reports retain full input snapshots and validator hashes. They predate the sealed option runner; they are exploratory evidence, not promoted candidates.

## Controlled fleet and energy options

The city-scoped Workbench view loads the sealed bundles listed in catalogue.json, including unsuccessful options. Each bundle records generic/city settings, effective input changes, resource deltas, exact source dependencies and the full nominal/eight-case qualification.

### Samawah: fleet capacity as well as charging time

| Option on line 1 | Nominal | Hot climate | Aged + heat | Missed charging | Degraded cases passed |
|---|---|---|---|---|---|
| 300 seconds + 12 trainsets | 93.01% | 89.25% | 89.58% | 89.95% | 6/8 |
| 300 seconds + 20 trainsets | 94.19% | 92.79% | 92.69% | 91.02% | 8/8 |

The 12-train option fails both heat cases. The 20-train option passes the complete nominal and eight-case suite across all three lines. Its line-1 fleet increases from 53 to 73; the whole city increases from 108 to 128. Each powered line-1 stop gains 30 seconds of charging dwell. The grid-outage line-1 result is 84.42%, above its separate 60% requirement. These are demonstrated alternatives, not proof that 20 trains is the minimum addition or the least-cost solution.

### Mosul: outage endurance

The controlled energy option adds three storage modules and 300 kWp solar at each of nine line-2 sites: 27 modules, 13,500 kWh storage and 2,700 kWp solar in total. Existing charge/discharge rates, charger power, fleet and timetable remain unchanged. Line 2's ten-hour all-site outage delivery rises from 51.81% to 88.78%. All six lines pass nominal service and all eight degraded cases; the lowest outage result is line 4 at 62.97%, above the existing 60% emergency floor. The separate exploratory energy run also passed before the sealed workflow rerun.

Across both cities, the original six candidate suites contain 54 runs of 90,000 simulated seconds: three exploratory and three controlled. The controlled 12-train Samawah option fails; the controlled 20-train Samawah and Mosul energy options pass. Two subsequent full requalifications add 18 runs, bringing the total to eight suites and 72 runs. This remains a targeted design comparison, not an exhaustive parameter sweep, calibrated demand study or least-cost optimization.

### Requalification after the topology refactor

Both successful options pass nominal service and all eight degraded cases on the new source. Every detailed nominal/degraded outcome field matches its preceding run, including service, energy, incidents and subsystem checks. Passenger-capacity configuration, timetable windows and trainset contracts also match. The fresh bundles bind the changed Rust dependencies and simulator binary, and both pass current-source `design-option.py verify`.

Workbench now points to these fresh bundles. The original Samawah and Mosul bundles remain retained for comparison. This provides whole-city regression evidence for the storage change; physical deployment and canonical promotion still require their separate gates.

Resource counts are planning deltas, not approved purchase orders. Added trainsets also add initially charged onboard energy; a 25-hour run does not establish a repeatable multi-day charging/stabling cycle. Added solar generation requires real area and calibrated weather assumptions. Extra storage remains constrained by the existing site discharge and charger power limits. Cost, maintenance, supplier, site and independent operator reviews are still required.

# Shared engineering definitions and demonstrators

Repository source: `engineering/design_consistency/README.md`

These research packages link proposed manufacturing geometry, analytical reductions and civil coordination by physical part identity, revision and geometry hash. FreeCAD is the native geometry authority; IFC carries the civil arrangement and an explicitly scoped analytical deck model. They are not issued manufacturing designs or qualified infrastructure.

| Demonstrator | Implemented package | Evidence still required |
|---|---|---|
| Clipped side bay | Trimmed ply/bond/core/solid-land regions, bored potted inserts, drilled rails, clips, brackets, fasteners and aperture frame | Local pressure/contact/peel response, joint stiffness, trim details, retention, complete-stack fire and prototype correlation |
| Curved roof bay | Exact circular layered solids, oriented support rails, brackets, clips and fasteners | Curved contact lands and insert arrangement; 85°C roof case fails the selected foam grades' 70°C continuous-temperature datum |
| Bogie–underframe interface | Hollow manufactured sills/carriers, drilled plates, dimensional bolt shanks/heads/nuts, preload/slip/separation screen, actual assembly mass/CG/inertia and reduced modes | Threads/fits, local contact/prying/weld fatigue, supplier suspension laws, equipment/fluids and measured modes; this is not a whole-train modal basis |
| Viaduct bay and construction front | Deck, longitudinal reinforcement, two pier/cap/bearing sets, eight piles with explicit embedded bars, tendon reservations, full LM3 twelve-axle two-track elastic sweep, lifting/jacking cases and one-mould resource calendar | Transverse cages, anchorage, prestress history/losses, cracking/shear/torsion/cyclic resistance, calibrated ground layers, lifting/local stability, crane charts and quoted costs |

Generated definitions and correspondence bind SI dimensions and material regions to each representation. Native audits independently integrate occupied solids for mass, CG and inertia, reject material overlaps, reopen each FCStd, check inspection projections and reimport STEP exports. Inspection drawings remain unissued. IFC exports exact civil extrusions, verifies tessellated volumes against material quantities and defines a deck member, pin/roller connections and a dead-load activity. Its deck idealisation excludes the uncalibrated pier/bearing/ground compliance.

Actual CalculiX/Gmsh section benchmarks compare B32R BOX hollow-beam bending with independently meshed C3D10 solids at two resolutions. The outer dimensions and walls drive both models. Thin-wall torsion is labelled separately from the polar area moment; this bending benchmark does not qualify torsion or a joint. The legacy static FEA generator now also emits explicit hollow study geometry and matching BOX sections, using proposed 8 mm research walls. Historical solid-envelope results are retained in Git history; they are not evidence for the revised sections.

Interface modes transfer each physical part's mass, CG and inertia into a kinetic matrix. A rigid-motion check independently reconciles total assembly mass/inertia, and exported modes are mass normalised. Gross-section stiffness, plate reductions, rigid equipment mounts and suspension springs are explicit assumptions. No complete vehicle basis is adopted.

Joint screen calculates bolt/member elastic stiffness, retained clamping, slip resistance, separating load and a fatigue stress range. Assumed friction and prying cannot establish bolt, weld or fatigue qualification. Civil stages retain failed deflection checks and unknown detailed resistance. Construction front counts installed deck reinforcement/tendon mass, checks transport/lift limits and rejects conflicting resource assignments. The 20 m arrangement exceeds the declared truck payload; its calendar is blocked and its quoted installed cost is unknown.

Mixed search uses real core depths, integer support counts, categorical supplier grades and binary roof geometry. Installed mass and attachment-count complexity are separate objectives. Three seeds each receive an equal-budget random benchmark and a 3.5 kPa holdout. Failed mandatory checks exclude a candidate; unknown fire, fatigue, joint, manufacturing and batch data remain unknown. The conditional frontier is not a verified frontier or a global optimum. Quoted cost, lifecycle cost, repair time and controlled carbon stay unresolved.

Foam grades select coupled density, compressive modulus, shear modulus/strength, conductivity and temperature records from the DIAB May 2026 datasheet. Public nominal/minimum values do not substitute for project batches, hot/wet ageing, fire tests or supplier quotes. Normal and shear properties are independent; an isotropic constitutive fit is not implied. Roof processing-temperature limits are not continuous service allowables.

Regenerate the Python/IFC/search/solver package:

```
.venv/bin/python tools/automation/design-consistency-study.py --ifc --search --solvers
flatpak run --filesystem="$PWD" --command=FreeCADCmd org.freecad.FreeCAD tools/automation/verify-design-consistency-cad.
py
.venv/bin/python tools/automation/design-consistency-study.py --check
.venv/bin/python -m pytest -q engineering/analysis/tests/test_design_consistency.py
```

Install the isolated analysis dependencies from requirements.txt. Native verification requires FreeCAD with Part and TechDraw; solver benchmarks require CalculiX. The recorded tool versions describe executed research evidence, not approved toolchains. The IFC model uses IfcOpenShell's structural API; search uses pymoo's mixed-variable support. Code_Aster, MBDyn and topology optimisation remain follow-on integrations and are not reported as executed.

The clipped-panel response refinement now adds a trimmed plate, discrete attachments, actual rail bending, all single-clip-loss locations and combined pressure/fault checks, with five native manufactured arrangements. The first delivery establishes shared definitions and bounded numerical/native checks. Remaining engineering work is deliberately

concentrated in these arrangements: mesh/contact response for the trimmed laminate, calibrated joints and equipment inventory, an assembled full-vehicle modal/contact/service envelope, detailed reinforced/prestressed civil resistance and construction stability, then measured prototype correlation. Every physical-release field remains false.

# Linked research demonstrators

Repository source: `engineering/design_consistency/examples/README.md`

Manifest binds the generated physical contracts and reduced responses to their sources. Correspondence reconciles dimensions/material mass, CG and inertia; detailed local stiffness and physical qualification remain open.

- Side bay and roof bay: layered parts and support hardware; the roof thermal condition fails.
- Interface, joint screen and modes: proposed geometry and bounded mechanical response.
- Viaduct, IFC, IFC audit, civil stages and construction front: coordinated research geometry, explicit deck analysis identity and unresolved ground/resistance/construction gates.
- Mixed search: three seeds, random benchmarks and independent pressure holdouts; no verified Pareto candidates.
- Native CAD and executed solvers: independent numerical geometry/response checks, without physical release.

Reproduce using the commands in the parent README. Historical civil/service campaigns retain their original bindings.

# Native manufacturing research geometry

Repository source: `engineering/design_consistency/examples/cad/README.md`

Verification records per-part mass/CG/inertia agreement, nonoverlapping occupied material, reopened native documents, unissued inspection projections and reimported STEP volumes.

| Assembly | Native FreeCAD | STEP |
|---|---|---|
| Trimmed side bay | side.FCStd | side.step |
| Curved roof bay | roof.FCStd | roof.step |
| Underframe interface | interface.FCStd | interface.step |
| Viaduct bay | viaduct.FCStd | viaduct.step |

Part identities and dimensions come from the shared definitions. Clearances, local contact/weld/anchor details and material acceptance require further engineering. These drawings and solids do not authorize manufacture or construction.

# Executed hollow-section benchmarks

Repository source: `engineering/design_consistency/examples/solver/README.md`

Receipt binds two Gmsh/CalculiX executions and their source/input/output hashes. A clamped hollow cantilever receives the same 1 kN tip force in the B32R BOX and C3D10 solid reductions.

Coarse and refined meshes compare bending response and mesh refinement. This establishes a numerical consistency screen for that load case; torsion, local contact, fatigue and physical correlation remain open.

# Hollow cantilever bending execution

Repository source: `engineering/design_consistency/examples/solver/coarse/README.md`

Benchmark records actual beam and solid responses, the hollow section and mesh size. Beam input, beam output and beam solver log retain the B32R BOX run. Solid input, solid output and solid solver log retain the C3D10 run.

The source-bound parent receipt also checks refinement. Results are numerical research evidence with no physical/manufacturing release.

# Hollow cantilever bending execution

Repository source: `engineering/design_consistency/examples/solver/refined/README.md`

Benchmark records actual beam and solid responses, the hollow section and mesh size. Beam input, beam output and beam solver log retain the B32R BOX run. Solid input, solid output and solid solver log retain the C3D10 run.

The source-bound parent receipt also checks refinement. Results are numerical research evidence with no physical/manufacturing release.

# Continuous design delivery

Repository source: `engineering/design_delivery/README.md`

This pipeline turns eligible, confirmed runner revisions into a portable review package at `docs/design-engine/continuous-delivery`. It does not infer complete engineering designs from experiment counts. The completion ledger retains every authoritative component, work package, required detail section and acceptance gate; unresolved and unallocated requirements stay open.

The publication includes exact child/confirmation receipts and their files in a bounded compressed archive; source/runtime and test receipts; editable native FreeCAD and compressed STEP; selected simulation, manufacturing and QA records; generated controller/receiver implementations; images; and eight-second H.264 assembly or construction sequence illustrations. Underframes without an evaluated assembly graph receive a labelled camera inspection tour. Videos reveal retained solids at final positions using evaluated operation or schedule events; they do not prove crane motion, insertion paths, collision freedom, temporary restraint or connection resistance. Physical tests, accepted loads, full train-to-kit dynamics and independent authority acceptance remain open.

```
tools/automation/osr-python tools/automation/design-publish.py qualify --output /absolute/new/qualification
tools/automation/osr-python tools/automation/design-publish.py build --qualification /absolute/new/qualification/
qualification.json --output /absolute/new/package
tools/automation/osr-python tools/automation/design-publish.py verify --package /absolute/new/package --media
tools/automation/osr-python tools/automation/design-publish.py cycle --qualification /absolute/new/qualification/
qualification.json --push
tools/automation/osr-python tools/automation/design-publish.py install --qualification /absolute/new/qualification/
qualification.json
```

Qualification executes the publication adverse/native tests, civil handling and delivery controls, process adapters, failed-confirmation veto/recovery, protocol tests and reporter regressions. Input code and data are hashed before/after. Changed code requires fresh qualification. Exporting rechecks current source, runtime, receipt integrity, eligibility and exact child/confirmation links. Offline verification needs no private runner workspace and does not rerun physics; `--media` also decodes the videos with ffmpeg.

The daily publisher creates a package only when selected confirmed revisions or their evidence/source identities change, caps each package at 64 MiB (256 MiB uncompressed raw evidence), and retains two prior local publication generations. It refuses a dirty checkout, a stale source/test epoch, changed Git head, unrelated staged changes, bad receipts, unavailable native tooling or oversized outputs. It commits only the owned publication directory to `main` and uses a normal non-force push. Existing worker evidence is never pruned. Git retains history, so daily deduplication and the byte cap reduce growth but do not make repository history size constant. Failed cycles leave existing publications unchanged; the package is explicitly a dated snapshot, not continuing acceptance.

A separate 15-minute task-family coverage timer gives one waiting case per starved family a slot, including whole civil kits and integration. It preserves the 64-job lane limit, existing jobs and receipts, and records every priority change. It does not bypass worker checks or solve missing evaluator capabilities. The design runner's disk/output and physical evidence limits remain in force.

Services: `osr-design-publication.timer` (daily compact Git publication) and `osr-design-coverage.timer` (15-minute family coverage), alongside the existing continuous design service and hourly local geometry reports.

Publication uses the optimiser's delivery policy, rather than a separate mass ranking. For each civil architecture/function it also retains eligible mass, lift and onsite-work leaders sharing the primary's context and comparison-basis identity. Extra leaders carry their selection roles and exact candidate keys; all remain subject to the same native/confirmation vetoes and archive budgets (at most 64 dependency jobs).

Offline verification compares exported results, metrics, verification claims, open evidence, implementations, manufacturing tables and compressed schedules/QA records directly with the archived originals. It regenerates summaries and report text from those inputs. The requirement inventory is bound to the source epoch, and the maturity ledger is recomputed from archived unit definitions, exact native confirmations and individual handling/numerical checks. Five explicit civil catalogue allocations currently link requirements to representative unit revisions, joints and evidence paths/hashes. Similar names create no allocation. Geometry and research screens remain separate from manufacturing qualification, authenticated acceptance and complete design.

The publisher persists built, committed and pushed transaction phases outside Git. Recovery precedes selection deduplication and the daily binary budget. An interrupted installation or commit is reconciled using the exact parent, owned-path diff and manifest bytes. Failed pushes retain the committed revision and retry that exact commit with a non-force refspec, including when selected designs have not changed. A 15-minute timer check retries transactions while the one-generation-per-day budget still controls new binary publications. Failed scratch builds are removed before any journal/Git mutation; journalled evidence remains until push succeeds.

# Design Engine Licensing

Repository source: `engineering/design_engine/LICENSE.md`

Executable Python and browser code in this package is licensed under Apache-2.0. Original documentation is CC-BY-SA-4.0. Generated original physical definitions, CAD and drawing artifacts follow CERN-OHL-S-2.0. The complete texts and repository rules are in LICENSES.

Manufacturer facts and source links remain attributed to their publishers. Third-party datasheets, models and product rights are not relicensed by this package, and a potential component is not an OSR-qualified purchase or a grant of manufacturing rights.

# Shared Design Engine

Repository source: `engineering/design_engine/README.md`

`./osr design campaign` adds a multi-agent manufacturing scenario over the existing common jobs: whole-inventory allocation, civil/mechanical feedback variations, bed-force coupling, native finite part domains and an explicit open work queue. It preserves these charters and their acceptance limits.

The Pi-beam demand extension adds exact moving-moment events, a continuous sagging peak, sampled service fibres and handling overhang/rigging demands to `factory-precast`. Three-car diagnostic loading remains distinct from unknown six-car loading; adverse checks and configuration-specific British equipment enquiries stay visible.

The factory development handover includes a 376-object complete nominal bed and 112-member spatial frame with finite six-axis bases. Native confirmation charges two actual OpenSees cases alongside FreeCAD; first-order equilibrium does not clear the separate second-order, local resistance, ground or physical qualification checks.

The common engine connects existing physical definitions and solvers through one scoped problem, candidate, job, verification matrix and review package. Legacy studies retain their formats and record ownership. Computation is local; GitHub Actions remains disabled.

The factory integration adds controlled fixture and precast problems, coupled handling/restraint/resource comparisons, partial per-instance inventories and native CAD confirmation through the same jobs and exports. `factory-native` requires fresh FreeCAD execution of nine retained models and both adapters; structural and production gates stay open. The support and scheduling extension adds tension-only anchors, compression-only grout and a finite resource calendar. Common native exports include a static review packet; the published snapshot is verified against its retained files and can also be checked for current sources. The staged-load extension adds controlled stressing/unloading orders, rail gravity, signed ideal end-pin demands and 145 static states per 48-strand case. Previous snapshots retain historical integrity; new results require their own source-bound common jobs.

```
./osr design problems
./osr design run --problem clipped-side-bay --city samawah
./osr design refine --problem clipped-side-bay --city samawah --evaluations 256
./osr design jobs --city samawah

./osr design iterate --problem civil-steel-beam --city samawah --finite-exhaustive --proposals 12 --confirmations 6 --
evaluations 64 --wall-seconds 1800
./osr design export <job-id> --output build/review/generated-part --native
```

The mechanical family varies plate thickness and a lightening hole in a drilled steel cleat. The civil family varies wall thickness and RHS/I-section topology on a fixed beam envelope. Each has six declared combinations, fixed material assumptions, loads, supports and provisional displacement limits. These are actual subtractive solids, not a complete bolted connection or railway structure.

The installed FreeCAD command-line tool produces a native document, BRep, STEP and inspection SVG. Gmsh meshes that BRep with quadratic tetrahedra. CalculiX solves two mesh sizes; separate checks compare CAD mass/CG/inertia with signed primitive integrals, integrate end-face loading, balance support forces/moments, compare displacement and mesh volume, and solve an independent simple-beam control. Raw decks, meshes, reactions, stresses, logs and failures remain in the attempt. Export retains these original files; it does not rerun the search.

The recursive controller uses native outcomes to choose subsequent neighbours. It fixes variable ordering, tie breaking and real-variable quantisation, records the complete request, source hashes and actual tool versions/binaries, and keeps immutable progress frames before long evaluations. Identical completed inputs and tools produce the same decision trace; this is not a claim that every CAD archive or timing byte is reproducible. A source/tool change invalidates current applicability. Resume appends a fresh attempt; it does not silently reuse partial solver output or promise continuation from an interrupted native solve.

`--proposals` bounds policy proposals and confirmations; `--confirmations` bounds native confirmations. `--rounds` bounds controller iterations. The common `--evaluations` budget separately charges compilations and actual solver cases, including benchmarks. Wall, memory and artifact limits also apply. Invalid geometry, failed constraints, unavailable tools, cancellation and exhausted budgets stay visible. Finite exhaustive mode visits every declared combination within its budget. Otherwise the report states the tested coverage and stop reason; a local stall is not evidence of a global optimum.

“Best verified in the tested domain” requires complete native numerical checks and known requested objectives across the finite domain. The general global optimum flag remains false. Unknown prices cannot become zero-cost winners. Material strength, fatigue, nonlinear buckling/contact, actual joint behaviour, site conditions, physical correlation and independent acceptance remain open; numerical serviceability checks grant no production or physical release.

The same controlled feedback policy can call the existing panel, roof, viaduct and foundation confirmation adapters. Other adapters report their unsupported native-iteration preset instead of inventing a solver pass. The guided UI provides recursive controls, lineage and native artifacts. See the review of twelve design systems and primary sources for the ideas used here and optional frameworks that are not integrated.

Every mandatory check participates in the recommendation veto. A `failed` or `outside-domain` result excludes the candidate from both screening and verified frontiers, including failures in material, thermal or physical qualification. Unknown physical qualification permits only a conditional numerical comparison. Civil iteration requires geometry, mass/inertia and service screening before native refinement; unresolved interfaces and degraded-service qualification stay visible. The current fixed deck fails its service limit and remains excluded.

Run required installed-tool acceptance with `./osr validate run --profile native-design`. Missing prerequisites, skipped mandatory tests or incomplete native artifacts fail this profile. See the local validation instructions for receipt verification and the separate software release requirements.

The 15 October native execution record retains source/tool identities, all candidate check states and repeated decision hashes. Four complete jobs made 72 actual CalculiX calls (candidate meshes and independent controls). Each six-choice domain was tested twice with identical decision traces; failing serviceability cases remain in the record.

| Bounded research selection | Starting mass | Selected mass | Native displacement | Retained design |
|---|---|---|---|---|
| 12 mm lightened drilled cleat | 0.936673 kg | 0.917733 kg | 0.92145 mm / provisional 1 mm limit | STEP, FreeCAD, inspection |
| 8 mm I-section civil beam | 32.2164 kg | 30.5208 kg | 6.66285 mm / provisional 8 mm limit | STEP, FreeCAD, inspection |

These files are unissued research outputs. Reproduce the actual four-job native validation with `tools/automation/osr-python tools/automation/validate-generated-parts.py --output build/generative-design/a-fresh-native-replay`. All raw attempts and two verified offline review exports remain local. This record does not replace historical physical studies or the full software release gate.

Candidate JSON is a list of complete variable maps supplied with `--candidates`. Function, units, variable domains, load cases, model limits and mandatory checks are declared before execution. Side and roof bays are separate problems; a smaller roof cannot win a side-panel comparison. Missing complete installed mass, prices, lifecycle scope, carbon and calibration stay unknown.

Jobs use an indexed local store at `var/design-engine`. Each attempt retains its request, outputs, failures and manifest. Resume requires unchanged source and solver environment and appends an attempt. Cancellation never erases the original attempt. Native input, evaluation, time and memory budgets remain separate from the engineering checks.

Screening and detailed confirmation have separate rankings and evidence. The panel adapter calls the existing mapped plate/rail solver, mesh comparison, all individual clip-loss cases and combined pressure/fault holdouts. It retains adverse results. Curved geometry cannot use that flat plate model. Assembly adapters preserve unresolved supplier inventories, site calibration, full passage/contact domains and independent decisions.

Review exports preserve exact source and attempt bytes, quantities, mandatory checks, RFQ scopes and licensing for offline review. They prepare drafts; they cannot overwrite adopted finance, production or railway baselines. Local hashes do not authenticate an executor, establish physical correlation or appoint an independent assessor. See licensing.

For the fixed-function side-panel pilot, pass `--candidates engineering/design_engine/data/panel-pilot.json --shortlist 4` to `refine`. Add `--native` to `export` for bounded shortlist CAD/STEP/unissued drawings and available IFC. The UI downloads hashed review chunks and original attempt logs, including failed runs.

Future record verification uses independently authenticated Ops Core accounts (existing `approver` or `admin` roles), rather than the appointed-role text. Cost scope completeness and finite-resource schedules are available in the common UI. See the acceptance status for incomplete engineering packages.

Current physical candidates accept scoped manufacturing/site/prestress input drafts in the inspector. Original definitions remain immutable; failed geometry, clearance and conditional stress checks are retained. Public converter/PV candidates are

previews with no installed credit. Searches retain charged finite sensitivity; vehicle confirmation conserves separate equipment/modal mass and checks actual whole-assembly coverage. Independent numerical benchmarks include `electrical-balance`, `prestress-reference` and `vehicle-conservation` through `tools/automation/design-benchmark.py`.

The CLI accepts `--project`, `--revision`, `--baseline-sha256`, `--run-id`, `--asset-id` and `--part-id` to preserve a complete identity. A baseline omitted from the request stays unknown and cannot support a reviewed-input revision.

The guided Workbench flow retains independently reviewed manufacturing, site, prestress and foundation inputs, then creates a new immutable child job. Every ancestor's proposal, review and document bytes are checked and included in private offline exports. Independent review permits research use; it grants no physical release or baseline adoption.

`civil-system-alternatives` and `vehicle-assembly` connect existing broader families with fixed functional scope. Optional `--interactions <file.json>` accepts `{"factors":{"support_span_m":[1.0,0.5],"core_m":[0.02,0.0246]},"evaluations":4}` for a panel study. All corners use the actual compiler/screen and common budget; missing economic/carbon inputs remain unknown.

Full-train confirmation divides the remaining declared job wall budget among outstanding native cases and retains each allocation. The older hardcoded 45-second diagnostic budget is no longer imposed by a common worker. A longer budget can execute a full passage, but time/deck/rail/modal convergence and the contact domain must still pass separately.

# Mechanical, civil and factory development examples

Repository source: `engineering/factory_examples/README.md`

The common engine's railway and handling continuation compares Pi20/Pi25 diagnostic demands and lift geometry, with a British-manufactured spreader enquiry. Three-car diagnostic failures remain visible and six-car loading and physical qualification remain open.

The development handover records delivered stages 1–5 and remaining engineering/qualification work. The common adapter now includes a 376-object complete nominal bed and an independently checked gross spatial frame. These original nine model files and reports remain unchanged.

Develop representative Baghdad production tooling, pi-beam manufacturing and factory coordination from versioned inputs and dated UK supplier information. Start with the visual review, generated design notes and staged plan.

The first iteration contains four native FreeCAD/STEP models: a datum fixture, a Pi25 mould/stressing-bed concept, a six-car component/assembly hall and a four-position pilot precast yard. Equipment solids are sourced external envelopes or explicitly labelled bespoke space reservations, rather than manufacturer CAD.

The second iteration adds fixture workholding, three full-span prestress alternatives, a bed-restraint stiffness and imperfection study, and a dedicated crane-runway bay. The package retains seven native models and a standalone engineering figure. The development inputs keep proposed loads, layouts and unknown material/site/supplier limits separate.

The fabrication iteration adds a perforated strongback end and retained locator-button coupon, taking the package to nine native models. It retains failed grip/plate fits, individual-strand stressing stages, nominal section/contact demands, restraint-compliance budgets and UK subcontract routes. Edit connection inputs and fabrication supplier facts for that work.

Edit design assumptions and the supplier register, then regenerate locally:

```
.venv/bin/python -m engineering.factory_examples.build --output build/factory-examples-new --native
.venv/bin/python -m engineering.factory_examples.build --check
.venv/bin/python -m pytest engineering/analysis/tests/test_factory_examples.py engineering/analysis/tests/
test_factory_development.py engineering/analysis/tests/test_factory_connections.py -q
```

`models.py` owns geometry and demand screens. `build.py` owns deterministic reports, SVG plans, BOM/cutting plans, process routes, utility gaps and unsent RFQ registers. `native.py` executes installed FreeCAD, checks actual solid volume, bounds and fixture interference, and reopens FCStd and STEP. Native logs and bootstrap scripts remain under ignored `build/factory-examples-native/`.

`development.py` owns the new contact, full-span prestress, beam-column restraint and runway interface calculations. Its buckling and imperfection solvers have independent Euler and sinusoidal-bow controls; proposed ground stiffness and clamp preload remain unmeasured. Numerical dependencies use the existing local engineering Python toolchain, with versions recorded in the development output.

`connections.py` owns grip/plate clearances, aligned-return-axis and individual stressing sequences, nominal strongback demands and the locator's fit/retention concept. Native export checks actual drilled/stepped solids and positive-volume interference for the declared steel subsets. Grip, screw and thread envelopes remain distinct from the solids checked for fabrication correspondence.

The common-engine integration registers `factory-fixture` and `factory-precast` problems for shared jobs, budgets, comparison views, per-instance inventories and source-bound native exports. Run `./osr validate run --profile factory-native` for mandatory fresh execution of all nine original models and both common adapters. Impact selection includes this profile for factory inputs, code and retained evidence.

The common support/scheduling continuation extends that adapter to 93 native objects and resource-calendar comparisons. Its inputs and review belong to the common engine; these nine original model files and reports remain retained unchanged.

`--check` now checks retained byte integrity separately from numerical recomputation using declared SI tolerances. Original reports and CAD remain unchanged; reproduction.json distinguishes their producer identity from the current verifier. Matplotlib paths are views of the checked JSON, not portable numerical evidence. Explicit `--seal-retained` re-verifies unchanged originals after verifier changes; it refuses altered original files. Generate changed engineering examples into a fresh directory.

No supplier quote, contact, physical qualification, adopted city CAPEX or railway release is created. British manufacture, Northern Ireland manufacture and a UK-supplied imported saw are distinguished. Factory completeness, civil resistance and exact process compatibility remain visible review gates in the output.

# Baghdad mechanical, civil and factory development examples

Repository source: `engineering/factory_examples/examples/README.md`

Generated from versioned SI inputs and official supplier information checked on 16 October 2026. These are review models; all physical release gates remain open.

Open the offline visual review, the engineering report, the equipment/RFQ register, utility gaps or process/inspection routes.

## What is built

The second development iteration adds three native models and full-span prestress alternatives, explicit bed-restraint stiffness/imperfection cases, fixture workholding and crane-runway interface demands. The original four models below remain baseline examples.

The fixture has a nominal model mass of 149.01 kg, a 500 kg payload hypothesis and a 1.5 load multiplier. Its six locators have independent kinematic rank. The payload-only elastic deflection bound is 0.742 mm against a provisional 1 mm review limit. This does not establish weld, pin, clamp, wall or anchor resistance.

Fixture drawing, native FreeCAD, cut list/BOM, stock cutting plan. Datum plates are welded mounts with bored locator interfaces; locator retention, shims and clamps need detailed design. Inspect the assembled fixture by a separate survey: it does not fit the Axiom CMM.

The canonical pi section is 1.1990 m², centroid 0.7748 m above soffit and gross inertia 0.142999 m⁴. New solid end-diaphragm fill is a separate hypothesis with nonoverlapping solids, not a canonical accepted detail.

| Span | Bare mass | With hypothetical solid end diaphragms | Lifting demand incl 2 t rigging and 1.25 multiplier | Bare dead-load deflection |
|---|---|---|---|---|
| 20 m | 59.95 t | 65.86 t | 84.83 t | 12.24 mm |
| 25 m | 74.94 t | 80.85 t | 103.56 t | 29.87 mm |

The bare-section Pi20 transfer hypothesis gives top-fibre stress -0.202 MPa with compression positive, so it predicts slight top tension. Concrete tensile/transfer limits are unknown. This needs a revised or qualified prestress/transfer design; a numerical stress result supplies no acceptance.

Pi25 mould/bed drawing and native FreeCAD show concrete, conceptual mould faces, side boxes, ties, strongback reservations and 40 tendon axes. These overlap across manufacturing states by design; this is not a finished mould or stressing-bed fabrication package.

The proposed 40-strand research scenario starts at 6.16 MN. Ideal pinned Euler screening of two 500 × 300 × 16 mm bed boxes gives demand/Euler = 2.48 over an unbraced 25 m, so that unsupported configuration fails even the ideal screen. The alternative 3 m brace assumption needs real brace/connection/foundation design. No railway live-load result or resistance acceptance is supplied.

## Factory examples

Vehicle hall plan and native model: 144 × 60 m; one canonical 135 × 6.5 m six-car assembly lane, component machining/welding, conditioned metrology and separated pilot composites reservations. Roof grid 12 × 30 m, 10 m concept columns and a 250 mm slab are coordination hypotheses. Roof-only gravity takeoff does not include wind, seismic or crane loads. Ground bearing capacity and foundation sizes remain unknown. Crane runways require separate supports/design. The two canonical 2 km test tracks require additional land and alignment.

Pilot precast yard plan and native model: 160 × 100 m with four casting positions, reinforcing/stressing, batching/washwater reservations, heavy transport routes and four storage positions. A complete concrete batching plant, rebar/strand preparation line, heavy trailers and laboratory remain unselected; the named mixer/grips do not supply those systems.

At 2 working days per full bed cycle, 85% availability and 95% accepted yield, four positions give 1.615 accepted beams/working day. The earlier 54/day programme target needs at least 134 positions at the same assumptions, before other bottlenecks. This pilot has no qualified production rate.

# Named equipment candidates

| Supplier/model | Origin basis | Specification source |
|---|---|---|
| Brauer — H350/2BLC flanged-base positive-locking clamp | Designed/manufactured at Milton Keynes, England, supplier statement; offered unit confirmation pending | Official source |
| Prosaw (UK supplier), BOMAR (Czech OEM) — Workline 510.350 DG manual bandsaw | Imported alternative via UK supplier; Czech OEM, no British-manufacture credit; offered unit origin certificate pending | Official source |
| Esprit Automation — Photon 5G, 3 x 1.5 m, 4 kW option | Britain manufacture published; offered configuration certificate pending | Official source |
| Yamazaki Mazak — CV5-500 | Built in Worcester, Britain, explicitly published for CV5 family | Official source |
| Aberlink — Axiom 900, honeycomb table | British manufacture published; model-specific origin declaration pending | Official source |
| Oxford Welders — MULTIMIG 333 2Pulse Synergic wheeled power unit | Manufactured in York, Britain, supplier statement | Official source |
| Composite Integration — CIJECT 1, resin-specific variant to select | UK design/integration at Saltash; offered unit manufacturing origin to confirm | Official source |
| Airflow Group — Bespoke composite curing oven enquiry | UK manufactured ovens published, Sheffield; offered unit origin pending | Official source |
| Street Crane — ZX8 10 t variable-gauge trolley, bespoke bridge | UK hoist manufacture published; bridge fabrication and exact origin to confirm | Official source |
| Rapid International — Planetary precast mixer; 1 m3 output enquiry | Northern Ireland, United Kingdom, design/manufacture published; prioritised UK alternative | Official source |
| Matravers Engineering — Bespoke OSR Pi20/Pi25 steel mould enquiry | British steel mould manufacture published; bespoke offer pending | Official source |
| CCL Precast — SLA 15 mm spring-loaded grip 604073 | CCL core prestress products UK manufactured, Ossett; exact offered grip origin to confirm | Official source |
| Street Crane — Configured 125 t open-winch crane enquiry | UK manufacturer family; offered hoist/bridge fabrication origin to confirm | Official source |
| Tata Steel UK — Celsius hot-finished RHS, nominal 100 x 50 x 5 mm candidate | UK producer lead; offered size, mill and origin certificate to confirm | Official source |

Supplier dimensions and numerical fields are in the versioned register, with document/page pointers. Published dimensions, historical specifications and OSR reservations are separate. Machine solids are external envelope proxies, not manufacturer CAD. UK supply/integration does not prove British manufacture. Rapid's Northern Ireland manufacture is identified separately.

The laser's 4 kW output is not its electrical input: the historical 4 kW-option sheet lists 40.2–58.9 kVA. The Mazak's 18.5 kW figure is spindle output at 10% ED. Total site power remains unknown. Axiom plus CIJECT publish 700 L/min combined air demand at their respective conditions; reference-flow bases and diversity are unconfirmed, so no compressor rating is adopted. Baghdad heat, dust, process cooling, extraction, fire and metrology HVAC require design.

The 80 t crane screen fails for the developed Pi25 lifting scenario. A 125 t Street open-winch configuration is an enquiry within its published 80–250 t family, not a quoted catalogue model or accepted lifting design. The 10 t ZX8 is for component handling. Bridge span is distinct from trolley gauge.

Installed CAPEX is unknown. The £2,640 ex-VAT Oxford UK retail reference is dated and excludes an agreed Iraq package; it is not a factory estimate. No supplier has been contacted and no delivery, service, performance or origin has been accepted.

# Build and inspect

```
.venv/bin/python -m engineering.factory_examples.build --native
.venv/bin/python -m engineering.factory_examples.build --check
.venv/bin/python -m pytest engineering/analysis/tests/test_factory_examples.py -q
```

FCStd documents are retained in Git; neutral STEP exports are generated beside them and remain ignored under repository policy. Each native receipt records toolchain, exact input/exporter hashes, per-part volumes/bounds, file hashes and actual FCStd/STEP reopen checks. `--check` verifies tracked CAD and reproducible text; it verifies STEP hashes when local exports exist. Deleted STEP files can be regenerated with `--native`.

Follow the staged plan. Next gates are supplier technical returns, site/ground design, detailed fabrication/structural checks, measured first articles and accepted factory trials; all remain open.

# Factory fabrication interfaces — iteration 3

Repository source: `engineering/factory_examples/examples/connections.md`

This extends the mechanical and civil examples together. Original models and failed cases remain available. Two additional native models develop a perforated/diaphragm-stiffened strongback end and a retained locator-button coupon. These are preliminary fabrication concepts, with no physical release.

## Grip spacing and strongback layout

The baseline 45 mm strand pitch clashes with the candidate 50 mm grip bodies by 5.0 mm. The 60 mm-pitch candidate gives 10.0 mm body clearance against a 5 mm research allowance. Side cover to the 15.2 mm clearance envelope is 52.4 mm. This does not qualify concrete cover, the exact strand/grip combination or jack-nose access.

The new end box is 4 m across, 900 mm deep in the stressing direction and 1.3 m high, with 40 mm outer plates, 20 mm internal diaphragms and 48 aligned 22 mm clearance holes in each stressing face. Return-rail stubs are raised to the initial tendon centroid. Strongback plate holes are actual native boolean cuts; the grip cylinders remain external envelopes.

The initial 1.2 m-height aligned box also leaves an upper grip body overhanging the plate by 8.3 mm. The 1.3 m-height candidate provides 41.7 mm minimum body-to-plate-edge clearance. This is a geometric seat screen, not local plate resistance or a qualified bearing seat.

The aligned return axis is z=1.2667 m. Its final initial-force vertical couple is zero in the stated symmetric model; temporary stressing stages still matter. The lower-first sequence reaches 1.363 MNm, while the proposed balanced-pair ordering reaches 0.133 MNm. Both individual-strand half-steps are retained, so simultaneous stressing is not assumed. Release needs its own accepted sequence.

Gross in-plane bending demand is 82.2 MPa. The nominal combined bending/average shear/closed-box torsion demand over the balanced stages is 127.6 MPa. Nominal grip annular bearing is 97.3 MPa. These omit local plate bending, openings/seat effects, weld resistance, buckling, distortional behaviour and fatigue; no stress allowable is adopted.

Strongback end CAD · 48-step proposed stressing sequence

## Ground-restraint load path

The raised return-rail support uses a nominal 250 × 250 × 12.5 mm post concept of 1.0167 m height. Its ideal fixed-base lateral stiffness is 67.1 MN/m. Steel-post, base rotation, connection and ground translation compliance act in series. Actual effective restraint remains unknown.

If every other interface were rigid, the ground-translation stiffness alone would need at least 1.015 MN/m to retain the proposed 1 MN/m spring. Alternatively, with all other interfaces rigid, the base rotational stiffness alone needs 1.049 MNm/rad. These individual limiting budgets cannot be combined as if they jointly met the requirement. Both-plane restraint, column/base/anchor resistance and geotechnical design remain open.

## Retained mechanical locator

The cartridge preserves the z=0.840 m datum with a 32 mm contact head and a 19.990 mm nominal stem in a 20.000 mm bore. Declared ±2 micrometre size hypotheses give a 6–14 micrometre diametral clearance range; heat treatment, temperature, finish and actual machining capability are not qualified.

A proposed M8 × 20 retaining screw passes through the RHS top-wall clearance hole; a 22 mm underside access opening permits assembly. A stepped pin solid contains a blind tap-drill, while the screw is a nominal thread envelope. Helical threads and their intended engagement interference are not modelled. Mount retention is not a rated lifting connection.

The button's nominal mass is 0.171 kg, top contact demand is 5.78 MPa and nominal screw engagement is 13.0 mm. Thread stripping, screw grade/preload/locking, local tube-wall/access-hole effects, pin heat treatment and repeatability remain open.

Locator cartridge CAD · concept fabrication BOM

## British manufacture and subcontract machining cases

These are published capabilities and unsent enquiries, not supplier offers. Pro-Mil's listed Starcut 260 travel is 6 × 4.35 × 2.15 m; its 50 t shop crane does not establish machine payload. Responsive lists a 10 × 3 × 1.5 m horizontal CNC capability. Boneham publishes UK custom cylindrical-component manufacture. Asquith Butler's current site focuses on service, spares and retrofit, so no new-build machine offer is inferred.

| Part with OSR setup allowance | Pro-Mil Starcut travel screen | Responsive advertised-range screen |
|---|---|---|
| runway-baseplate, [1.2, 1.2, 0.25] m | within | within |
| strongback-box, [4.3, 1.2, 1.5] m | within | within |
| strongback-end-steel, [4.9, 4.3, 2.117] m | within | outside |
| runway-girder, [6.3, 0.75, 1.4] m | outside | within |

The 6 m girder plus 300 mm setup length exceeds the 6 m Starcut X travel. Axis orientation, usable simultaneous envelope, workholding, table payload, tool/head clearance and fabrication inspection need actual supplier returns for every case. UK work, raw-stock origin and installed Iraqi costs remain separate unknowns.

Unsent fabrication RFQs · Full staged calculations

- Boneham & Turner: official source 1; official source 2
- Pro-Mil Engineering: official source 1
- Responsive Engineering: official source 1; official source 2
- Asquith Butler: official source 1

# Joint mechanical and civil development — iteration 2

Repository source: `engineering/factory_examples/examples/development.md`

The baseline four-model package remains available. These three additional CAD models develop workholding, prestress/bed restraint and crane-runway interfaces. Every physical release remains open. Engineering comparison figure.

## Fixture workholding

Three British-made Brauer H350/2BLC positive-locking clamp candidates each have a published nominal holding force of 350 daN (3,500 N). The requested 500 N clamping preload is a separate unverified input. Mounting plates are OSR concepts; equipment boxes reserve operation clearance rather than reproduce the supplier's geometry.

The declared payload/CG/tool cases leave a minimum vertical locator reaction of 993.0 N. That checks contact compression in those scenarios only. The conservative shear-only crossrail weld demand is 5.48 MPa; weld resistance, local wall/plate bending and connection eccentricity remain unknown.

Workholding CAD · detailed numerical inputs/results

## Prestress alternatives along both spans

The first iteration showed a Pi20 midspan tension warning. The full-force prismatic extension to the beam ends exposes a larger baseline warning. Actual pretension force develops over a transmission length that remains unknown, so the endpoint extension is diagnostic. This model includes end-diaphragm gravity patches and known strand displacement mass, while retaining gross prismatic stiffness. Conventional reinforcement and railway/track loads remain unquantified.

| Layout | Strands | Span | Minimum transfer compression | Minimum after-loss dead-load compression | Zero-tension research screen |
|---|---|---|---|---|---|
| low-40 | 40 | 20 m | -3.964 MPa | -3.171 MPa | outside |
| low-40 | 40 | 25 m | -3.964 MPa | -3.171 MPa | outside |
| balanced-40 | 40 | 20 m | 1.116 MPa | 0.893 MPa | within |
| balanced-40 | 40 | 25 m | 0.850 MPa | -1.842 MPa | outside |
| balanced-48 | 48 | 20 m | 0.362 MPa | 0.290 MPa | within |
| balanced-48 | 48 | 25 m | 0.362 MPa | 0.290 MPa | within |

The balanced-48 candidate increases initial bed force to 7.392 MN. Its known concrete-plus-strand Pi25 handling equivalent is at least 104.69 t including the stated rigging and multiplier; unquantified reinforcement and attachments can increase it. A zero-tension screen does not establish compression strength, transfer/bond/end-zone performance, deflection, shear, fatigue or railway capacity.

Revised beam/bed CAD

## Stressing-bed restraint

Pinned beam-column finite elements check the nominal side boxes over the 26 m return path between assumed inner strongback faces x=-0.5 and +25.5 m, with ground restraints at the CAD's x=3,6,...,24 m stations. Pin-connected cross ties alone do not establish a 3 m effective length: a common sway mode remains. End rotational restraint and a real restraint path in both buckling planes must be designed, including foundations and anchorages.

| Spring per restraint | Critical force per side | Elastic load factor at candidate force | Second-order brace force maximum |
|---|---|---|---|
| 0 MN/m | 1.148 MN | 0.310 | unstable elastic tangent |
| 0.1 MN/m | 3.428 MN | 0.927 | unstable elastic tangent |
| 1 MN/m | 10.264 MN | 2.777 | 1.82 kN |
| 10 MN/m | 32.080 MN | 8.680 | 1.63 kN |

The proposed 1 MN/m spring is a requirement scenario, not measured ground stiffness. Second-order reactions use an assumed sinusoidal 10 mm stress-free bow and springs initially unstressed in that crooked shape. The revised CAD adds interface stools/pad reservations, with no demonstrated foundation stiffness or capacity. Strongback load distribution, vertical eccentricity, local plates/welds, staged release and anchorage design remain open.

The candidate adds 4.186 MNm in-plane strongback moment and a 5.667 MNm end couple from the tendon/return-box height offset. These are unresolved load-path demands; the large strongback solids remain reservations, not designed steel sections or concrete abutments.

## Dedicated crane-runway bay

A separate 6 m runway bay develops a proposed 30 m-span, 125 t rated crane interface. Assumed crab/bridge masses, lift factor, two wheels per rail and approach yield near/far wheel actions 771.5/123.4 kN. These are OSR scenarios requiring Street's actual configuration/reaction return. Street describes wheel loads and duty as configuration-dependent.

The fabricated 1.2 m-deep runway girder has gross elastic bending demand 48.9 MPa and sampled deflection envelope 1.17 mm for the stated loads. Local wheel/web bearing, stability, fatigue, torsion, clips, connections and column resistance remain open. The conservative two-adjacent-bay column scenario is 2.127 MN. A 2.5 × 2.5 m pad reservation gives 369.7 kPa average gravity pressure; ground capacity, eccentric bearing and uplift are unknown, so no footing acceptance is given.

Runway bay CAD. Runway supports remain separate from the vehicle hall's roof-only frame. Runway rail/clip/stiffener dead weights and final project load combinations remain unknown.

The 900 × 900 × 50 mm runway baseplate blank is about 318 kg. It exceeds both the CV5-500's published part diameter and mass limits, while the 6 m girders also need a separate fabrication route. Outsourced plate machining/long-girder fabrication or additional machinery must be selected before this pilot factory can manufacture those structures. Sheet-plan fit alone does not establish 50 mm laser-cut capacity.

## Next evidence and ownership

Mechanical engineering: clamp GA/preload trials, pin retention and mount/weld/bolt details. Prestress/civil engineering: project concrete/strand limits, transmission/end-zone and railway loading, strongbacks, both-plane restraint and geotechnical design. Crane supplier/structural engineering: exact duty/configuration, wheel actions, rails/stops, runway/column/foundation design. Procurement: technical returns, certificates, Baghdad support and itemised installed prices. No contacts have been sent and no appointments invented.

# Multi-agent generative engineering campaign

Repository source: `engineering/generative_design/README.md`

## Federated engineering twins

`./osr design twin` joins the controlled 63-package inventory, source-qualified component specifications, existing physical-study model, and executable mechanical, civil, software and factory alternatives. Specialist AI agents developed the lanes and then rotated into independent criticism. The retained runner executes deterministic engineering adapters; it does not invoke an LLM or browse for new ideas at runtime.

```
./osr design twin plan
./osr design twin run --output build/design-twin/new-campaign --concurrency 3
./osr design twin verify --output build/design-twin/new-campaign --replay
```

The Baghdad development record links the component/variant browser, complete retained model packets and open detail/evidence requests. Parts and variants have distinct revision-bound identities. Mechanical changes trigger explicit gross-added-mass civil sensitivities with bounded failure-directed repair; removed structure and omitted accessories receive no invented mass credit. The original reference model stays configuration-distinct.

Numerical caches are reset at campaign start. Input and executable-source bytes are captured before execution and checked afterwards; code changes require a new Python process. Output hashes and the exact member set are verified. `--replay` recomputes the same packet in the recorded Python/NumPy environment; `--historical` checks retained byte integrity without current applicability.

Observation replay is read-only and binds asset, configuration, units, scenario, model endpoint time and observation provenance. It rejects incompatible or out-of-order records and retains residuals. Matching synthetic or unverified field records never confer physical validation. Use `./osr design twin observe --help` for the intake command. Actual supplier internal BOMs, unresolved part dimensions/tolerances, site data, material/process qualification, physical calibration and issued manufacturing information remain explicit open work.

The architecture feedback propagates actual LM3 source axle identities plus proposed gap/member changes, keeps the six-car mass sensitivities separate, and investigates whole-module platforms and British equipment limits. All acceptance gates remain open.

```
./osr design campaign architecture --output build/architecture-feedback/my-run --native
./osr design campaign verify-architecture --output build/architecture-feedback/my-run
./osr design campaign publish-architecture --output build/architecture-feedback/my-run \
  --destination docs/design-engine/my-architecture-review
./osr design campaign verify-architecture-snapshot \
  --destination docs/design-engine/my-architecture-review
```

Use fresh output directories. `verify-architecture --historical` and `verify-architecture-snapshot --historical` check retained integrity using frozen case records, without asserting applicability to current source inputs.

The queued-systems continuation executes 63 package-specific preliminary studies, records actual production/inspection requirements and propagates provisional six-car feedback into civil/factory demands. It retains source-changing mechanical proposals separately from source-compatible choices. Full discipline qualification and manufacturing release remain open.

```
./osr design campaign queue --output build/queued-design/my-run --native
./osr design campaign verify-queue --output build/queued-design/my-run
./osr design campaign publish-queue --output build/queued-design/my-run \
  --destination docs/design-engine/my-queued-review
./osr design campaign verify-queue-snapshot \
  --destination docs/design-engine/my-queued-review
```

Queue commands require fresh execution/publication directories. Verification binds actual drawing JSON, referenced artifact bytes, CAD inputs, evaluator sources, toolchain and the inherited snapshot. `--historical` checks integrity without current source applicability. Publication retains CSV/SVG/JSON/HTML/FCStd; native STEP and execution logs remain in the sealed local run. Inherited civil evaluations require unchanged numerical dependencies; the new six-car response study is calculated during each queue run. A failed attempt remains on disk.

This campaign allocates every inventoried civil, vehicle and factory item to an agent work package, executes bounded variations, and retains the open manufacturing/design gates. Read the scenario and scope manifest. The actual team used civil and mechanical design workers plus a scope worker; that worker then reviewed the proposals and integration code independently of their authors. The local runner executes controlled engineering evaluators, rather than creating simulated AI approvals.

```
./osr design campaign plan
./osr design campaign run --output build/generative-design/my-campaign \
  --civil-budget 2048 --mechanical-budget 4096 --native --common native
./osr design campaign verify --output build/generative-design/my-campaign
./osr design campaign publish --output build/generative-design/my-campaign \
  --destination docs/design-engine/my-campaign
./osr design campaign verify-snapshot --destination docs/design-engine/my-campaign
```

All execution/publication directories must be fresh. Runtime outputs remain under ignored `build/`; compact published evidence belongs in `docs/design-engine/`. `verify --historical` and `verify-snapshot --historical` check retained integrity without claiming current source applicability. Full common native artifacts remain in their sealed parent stores and are checked by campaign verification; the portable review explicitly retains a compact projection.

The scope audit reads actual source collection IDs and hashes. It requires coverage of 120 vehicle products, 26 assemblies, 50 station products, 19 civil types, all 31 factory release packages, 62 production-data products, 12 mechanical interfaces and 14 equipment cases. It also checks dependencies and exact unique ledger IDs. Inventory assignment does not establish engineering coverage.

The civil lane varies paired Pi20/Pi25 section depth, stem width, strand count, strand distribution and lift stations. Failed checks drive bounded neighbouring proposals. It retains transfer, three-car service and handling fibre demands, geometry/cover/grip screens, mass and prestressing force. Six-car loading, accepted compression limits, reinforcement/end zones and actual mould/lift qualification stay unknown. The continuous moving-moment method is inherited from the beam study; fibre stresses remain sampled. Candidate selection is local research screening.

The mechanical lane repairs locator fit, bolt/bore and rail access, stock size, plate stiffness and machine-envelope failures. Its continuous assessor also supports independent analytical tests; generated search proposals are restricted to the declared finite choices. An exhausted feedback frontier does not imply exhaustive coverage of every Cartesian combination. Actual material resistance, loads, fastener preload, retention, machine sweep and measured process capability remain open. The equipment basis prioritises the Worcester-made Mazak CV5; origin and configuration of an offered machine require supplier evidence. No supplier is contacted.

The bed coupling propagates each selected beam's changed prestressing force to two return rails. It varies 16/20/25 mm walls and three hypothetical ground-spring values using the existing elastic eigenvalue solver. These gross axial sensitivities do not qualify the new head pattern, staged eccentric loads, splices, local connections, foundations or a measured stiffness.

`--native` exports selected physical primitives through installed FreeCAD and reopens FCStd and STEP, checking identity, volumes and bounds. The tooling steel subset is checked for interference. Concrete and strand-envelope overlap is intentional and gives no interference acceptance or reinforcement detail. The original nine factory examples and earlier snapshots remain unchanged.

`--common native` executes the existing recursive CAD Gmsh CalculiX loop for all six declared alternatives in each of `mechanical-cleat` and `civil-steel-beam`. Their loads, supports, numerical limits and material assumptions remain fixed synthetic functions. Other mapped common problems receive at most four one-coordinate screening alternatives, or their sole fixed reference. They do not inherit native verification from the two small part families.

`--common screen` runs those bounded screens without recursive native work; `--common none` limits execution to the new lanes and coupling. The optional `--common-store` and repeated `--import-job` arguments reuse terminal sealed jobs only when city/project/environment/revision, controlled charter, current source hashes and actual toolchain match. Every failed and unknown check stays in its candidate. Missing objectives remain unknown.

The closure ledger and work queue retain every package and its prerequisites. Unsupported systems need a validated discipline adapter and controlled inputs before further automated design. Representative search passes cannot issue manufacturing drawings, prove process capability or close an entire system. New accepted input/model revisions require new campaigns and review of affected descendants. The current partial evaluators deliberately produce no manufacturing or physical release.

## Unified review and immutable evidence

The campaign review filters configuration-specific screening results, detailed unknowns and next actions, and compares two records without inventing unknown mass or cost. Generate it with `tools/automation/campaign-review.py --architecture <packet>`. The consolidation record explains historical applicability and acceptance limits.

Published JSON may now be an immutable-store reference. Use `engineering.generative_design.evidence_store.read_json(path)` or `read_bytes(path)` to read it, rather than decoding the reference file directly. `verify_projection(folder)` verifies the exact original member set and hashes. `materialized(folder)` is a context manager yielding a temporary reconstruction of the original packet; legacy snapshot verifiers use it automatically. The original seals are preserved byte for byte. `source_closure(path)` includes only reachable objects, so adding unrelated evidence does not stale an older source binding. Publication deduplicates repeated JSON subtrees in the shared store; CAD and review assets remain available at their ordinary paths.

Run `tools/automation/migrate-design-evidence.py verify` to check the three migrated historical packets. `prune` reports unreferenced objects without deleting them; the explicit `prune --delete-unreferenced` maintenance command removes only objects outside every projection and pinned original source map. Run integrity checks before and after maintenance. Never edit stored objects or replace historical seals to make current-source checks pass.

`./osr validate run --profile factory-native` now requires a fresh architecture campaign in addition to the original factory examples and common adapters. `python -m engineering.generative_design.native_acceptance run --output <newdir>` executes and independently checks the two mandatory current architecture models; `verify --output <dir>` rechecks its receipt. Failures remain in the output directory and fail the profile. This establishes numerical/native correspondence for the declared geometry, with engineering and manufacturing release explicitly false.

## Feedback-directed detailed design team

The detailed scenario adds `design_scenario.plan()` with exact component/artifact/inspection allocation, `mechanical_detail` and `civil_detail` adapters, and `design_iteration` orchestration. Run `./osr design campaign iterate --output <fresh-dir> --native --budget 256`. The default executes existing preliminary studies for every package; `--no-baseline` limits execution to the new detailed adapters. The standalone `tools/automation/design-iteration.py` CLI exposes the same functions.

Every attempt is checkpointed and retains parent/repair reasons. Failed checks generate bounded changes, with full geometry/self-weight/demand recomputation. Mechanical gross mass feeds separately identified civil sensitivity contexts; net replacement mass remains unknown. `--resume <prior-dir>` continues retained frontiers only for unchanged sources and contexts. Budget is a total per context, not an additional evaluation count. Changes require new controlled campaigns.

`verify-iteration --require-native` replays the numerical feedback sequence, checks exact source/component/evidence joins and independently derives required native context membership. `factory-native` now also executes this detailed campaign and verifies all required assembly exports; old receipts are incomplete. Historical integrity cannot satisfy fresh native acceptance. Local survivors remain research proposals until all package and integrated acceptance gates close.

## Hierarchical experiments and recovery

The hierarchical pilot uses common-store jobs, bounded isolated worktrees and independent fixtures to evaluate proposals and reject adverse parent effects. `tools/automation/hierarchical-design.py` plans, runs, verifies and publishes these experiments. `hierarchical-design` is a required local validation profile for affected sources.

Detailed runs default to `--mode repair`; `--mode optimization` continues past the first known-check pass and retains sourced conditional Pareto alternatives. Resume accepts an interrupted `execution-state.json` without a final receipt, preserving completed attempts and the frontier in a fresh output directory. Original mode/source/context/environment bindings remain mandatory. Historical evidence is checked against Git-index/tree publication membership as well as its immutable seals.

# Coordinated industrialisation programme

Repository source: `engineering/industrialisation/README.md`

Status: proposed programme; products, rights, commercial terms and physical acceptance remain open. Vehicle platform, bogie localisation and the viaduct system share one configuration and evidence chain. HÜBNER and CRRC are proposed discussion partners; no exact product or manufacturing-transfer agreement is selected. Controlled programme.

## Vehicle configuration and civil demand

Vehicle-to-civil trace preserves the current three-car, six-bogie/twelve-axle reference. Its 78,750 kg tare is an unclosed planning control. Equal car loading, midpoint CG and equal bogie axle sharing are explicitly assumed. Bogie locations follow the existing CAD rule. The shared-bogie alternative has an explicit four-support graph with unknown redesign masses. Buying an articulation creates no bogie-count, mass, energy or cost reduction. Exact joint/bogie selection, low-floor clearances, yaw/pitch/roll, stiffness/damping, fatigue/crash and maintenance/recovery require a joint interface freeze.

The same axle pattern feeds sampled static Pi20/Pi25 live-load demand. Dynamic augmentation, permanent capacity, prestress, bearings and launcher loads need independent design. Identified Baghdad spans remain the quantity authority. No vehicle/civil loading baseline is overwritten.

## Bogie localisation and first articles

First article  repeat assembly with qualified bought-in subcomponents  released frame cutting/forming/welding/machining/NDT/coating  further component localisation where economics justify qualification. Initially buy precision articulation assemblies and make approved surrounding adapters locally. Assess existing Iraqi fabrication and machining processes. Prioritise fixtures, metrology, weld quality, inspection and test equipment. Transfer rights, fees, tooling, qualification, imported components, labour, rejects, warranty and repeat prices have separate scopes.

## Civil catalogue and urban delivery

Two single-track full-span beams share a pier: 25 m primary, 20 m secondary, and separately engineered exceptional crossings. Standardise column/cap connections, bearing/jacking/lifting seats, direct-fixation datums, removable walkway/service cassettes and island-station transitions. Ground zones, depth, capacity, utility clearances and working platforms remain site-specific.

Support packets and urban controls keep foundation mobilisation and launcher support acceptance distinct. Compare precast columns/caps with reusable-form in-situ columns/precast caps by measured accepted supports/week and complete installed cost. Require inspectable connections, temporary stability, grout and verified release strength. Maintain shop/pedestrian/emergency access, appointment-based deliveries/spoil, booked lifting exclusions and prompt reinstatement. Lane-hours, access interruptions and occupation days are unioned by resource and bound to accepted completed bays; absent observations stay unknown.

## Production chain and 18-launcher scenario

Production balance treats one accepted double-track bay as the planning unit. Eighteen active independent fronts at 1/1.5/2 bays per working day give 18/27/36 bays, 36/54/72 beams and 450/675/900 m under the illustrative all-25 m assumption. Actual 20/25 m mixes and special spans retain identified quantities. At 54 beams/day, 48-hour occupation needs 108 casting positions before availability/reject allowances; a long-line bed can hold several positions. A five-working-day buffer needs 270 beams. None is a production commitment.

Released foundations  accepted piers  accepted serialized beams  transport  erection  completed-bay acceptance limit output together. Casting alone cannot release a bay. Mobilise only against a sufficiently long released run, qualified supply, access, authorised crew and compatible inspected machinery. Coordinate existing Iraqi precast facilities and expertise; allocate qualified products/slots and add only demonstrated necessary tooling/capacity.

## Work, training, programme gates and finance

Linked work packages and ERP handoffs connect the existing supplier, civil and execution structures. The first 30 and 30–90 day windows are proposed planning targets, followed by accepted pilot trials, controlled ramp-up and up-to-18-machine deployment. Responsible roles are named; appointments, funded recruitment and dated rosters remain open. Training attendance is separate from assessed equipment-specific work authority. Future reviewed reservations must undergo the same live machinery/worker exclusivity checks.

Installed costs and delivered-service finance separates priced scopes and missing amounts. The Baghdad delivery/finance bridge joins each line's conditional running-span date, retained finance opening month/fleet deadline, controlled required fleet and energy/service diagnostics. A common financial-close anchor, supplier vehicle deliveries and accepted station/special/system handovers are still missing. Dispatch completion does not automatically scale paid journeys. Running-bay completion is not railway revenue opening. Unique paid journeys/collection and operating acceptance are required before revised receipts can be considered. Transfers do not multiply paid journeys. Further elevation comparisons expose marginal civil reference allowances for explicit scope sensitivities, with complete installed costs, disruption values, financing and net benefit unknown. No additional alignment, beam order, price or accelerated saving is adopted.

## Possible component and equipment vendors

Official manufacturer product and reference pages; narrow published scope only. Historic references are not current quotations. No supplier was contacted. Related group brands are not independent offers. Product-family listings establish neither OSR fit nor regional availability, rights, prices, capacity or acceptance. Gangways are not automatically structural joints; segmental gantries are not whole-beam launchers. Machine-readable candidates · RFQ comparison CSV.

| Possible vendor | Scope | Official product/reference source |
|---|---|---|
| HÜBNER | structural-articulation | FXpro, FXcore and vehicle-specific adapters |
| HEMSCHEIDT Engineering | upper-articulation | HEUAS upper articulation systems |
| CRRC Zhuzhou | bogie-transfer | Vehicle and localisation engineering discussion |
| Siemens Mobility | complete-bogie | MoComp bogies and rail components |
| Alstom | complete-bogie | Flexx Urban / Flexx bogie portfolio |
| Lucchini RS | wheelset | Rail wheelsets, wheels and axles |
| GHH-BONATRANS | wheelset | Complete wheelsets and wheel/axle components |
| SKF | bearing-axlebox | Axlebox bearings, bearing units and monitoring |
| Continental | suspension | Rail secondary air springs |
| Knorr-Bremse | braking | Metro bogie brakes, controls and air supply |
| Wabtec / Faiveley | braking | Transit bogie brakes |
| ABB | traction-power | AMXM rail traction motors |
| Ingeteam | traction-power | INGETRAC traction converters |
| Voith | gearbox-coupling | Rail gear units and drive couplings |
| Dellner | gangway-coupler | Gangways, automatic and semi-permanent couplers |
| Forsee Power | traction-battery | PULSE PLUS RAIL high-power LTO battery |
| Schunk Transit Systems | charging-contacts | Rail contact/grounding and charging technology |
| Merak | hvac | Rail heating ventilation and air conditioning |
| Liebherr | hvac | Passenger and cab rail HVAC |
| IFE | doors | Rail entrance systems |
| duagon | control-electronics | Embedded computing, gateways and safe control systems |
| Kontron | control-electronics | Railway embedded computing / KBox R-101 |
| HARTING | connectors-harness | Rail power and data connectors and cables |
| Moxa | networking | ToughNet TN-4500A rail Ethernet switches |
| DEAL | whole-beam-erection | Launching girders for full-span erection |
| DLT Engineering | whole-beam-erection | Bespoke full-span erection gantry engineering |
| Cimolai Technology | special-segmental-erection | Segment launching gantry |
| Freyssinet | prestressing-bearings | Prestressing, bearing and connection systems |
| mageba | bearings-joints | RESTON-SPHERICAL structural bearings |
| MAURER | bearings-joints | Structural bearings and expansion joints |
| Elematic | precast-tooling | Frame line for precast columns and beams |
| BAUER Maschinen | foundation-equipment | BG drilling-rig family |

## Regeneration

Run `.venv/bin/python tools/automation/industrialisation-study.py`; add `--check` for source/output drift. Manifest records exact inputs and output bytes. Missing supplier or engineering evidence never becomes acceptance.

# engineering/integration_programme/data/contact/LICENSE.md

Repository source: `engineering/integration_programme/data/contact/LICENSE.md`

Version 2.0, January 2004
<http://www.apache.org/licenses/>

## Terms and Conditions for use, reproduction, and distribution

### 1. Definitions

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

### 2. Grant of Copyright License

Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

### 3. Grant of Patent License

Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

## 4. Redistribution

You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

- (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
- (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
- (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
- (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

## 5. Submission of Contributions

Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

## 6. Trademarks

This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

## 7. Disclaimer of Warranty

Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

## 8. Limitation of Liability

In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

## 9. Accepting Warranty or Additional Liability

While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

## APPENDIX: How to apply the Apache License to your work

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets [ ] replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

# Topography redesign, BIM and mechanical detail register

Repository source: `engineering/models/bim/design-detail-register.md`

This generated register says what the new terrain/water evidence changes, what remains provisional, and what information must be closed before design or fabrication release.

> Design-reference coordination data only. Open DEM and water data are screening evidence, not survey, geotechnical, hydraulic or navigation evidence. Candidate dimensions, loads and tolerances are not fabrication or construction release values until their stated closure evidence is accepted by the competent design authority.

## Redesign decision

Changed now: alignment/civil disposition; bridge/viaduct need; station siting/configuration; route compatibility evidence; BIM information requirements.

Not automatically changed: LM3 three-car architecture; car length/width concept; battery/traction topology; bogie and articulation concept.

A vehicle parameter changes only after a route-compatibility gate fails and a controlled whole-system trade study accepts that change.

## Delivery plan and completed implementation

1. Classify terrain/water evidence and trace each trigger to affected design domains.
2. Define BIM objects, information, relations and acceptance checks for each asset type.
3. Establish the LM3 datum hierarchy, mechanical ICDs, load cases and route gates.
4. Publish the register into IFC property sets and the model-coverage report.
5. Enforce ID integrity, source traceability, deterministic output and IFC round-trip tests.

All five steps are implemented in the repository; engineering evidence remains open where the status below says supplier, survey, calculation, test or authority acceptance is required.

## Design impacts

| ID | Disposition | Trigger | Domains |
|---|---|---|---|
| `OSR-IMP-TOPO-001` | `redesign-required` | terrain elevation or slope changes the feasible vertical alignment | alignment, earthworks, drainage, structures, traction-energy |
| `OSR-IMP-WATER-002` | `bridge-or-reroute-required` | route intersects mapped water or its hydraulic/flood influence zone | alignment, bridge, hydrology, environment, operations |
| `OSR-IMP-STRUCT-003` | `asset-family-and-site-design-required` | planner selects viaduct, bridge, retained or transition civil class | substructure, superstructure, track, egress, maintenance |
| `OSR-IMP-STN-004` | `station-configuration-redesign-required` | terrain, water, structure or access evidence moves or elevates a station | platform, accessibility, fire-life-safety, MEP, urban-interface |
| `OSR-IMP-LM3-005` | `compatibility-requalification-before-vehicle-redesign` | released route profile, structures or platforms differ from the vehicle design basis | rolling-stock, wheel-rail, traction, braking, energy, evacuation |
| `OSR-IMP-DEPOT-006` | `site-layout-revalidation-required` | topography or alignment changes depot access, stabling or recovery routes | depot, maintenance, logistics, energy, recovery |

## BIM information requirements

### corridor-and-alignment

- Objects: alignment, profile, terrain, water, civil-class segment, exclusion volume
- Information: CRS and vertical datum, chainage, source/license/date/resolution, confidence, civil disposition, design status
- Relations: segment-to-source-cell, segment-to-structure, station-to-exclusion, alignment-to-revision
- Acceptance: georeference round-trip; no station intersects exclusion volume; every route segment has exactly one civil disposition

### bridge-and-viaduct

- Objects: foundation, pier/abutment, bearing, deck/span, trackform, walkway, parapet, drainage, movement joint
- Information: span/skew/curvature, datum and reactions, load model, movement range, exposure, inspection zone, calculation/evidence IDs
- Relations: foundation-to-ground-model, bearing-to-movement-unit, track-to-deck, asset-to-work-package
- Acceptance: reaction and movement closure; kinematic/egress clash check; constructability and access review

### station

- Objects: platform edge, track, access route, lift/stair, canopy, MEP/fire/charging equipment, drainage, foundation
- Information: platform gap/step basis, accessible route, occupancy/egress, asset tags, maintainer, inspection and replacement clearances
- Relations: platform-to-track, equipment-to-system, space-to-egress route, station-to-catchment
- Acceptance: gap/step analysis; inclusive-access and flow check; MEP/structure clash review; no unresolved terrain/water exclusion

### rolling-stock

- Objects: carbody, bogie, wheelset, door, articulation, coupler, battery, traction, brake, HVAC, service/removal envelope
- Information: product ID, configuration, mass/CG status, datum, interface/load/tolerance status, material/process, verification evidence
- Relations: product-to-parent assembly, product-to-interface, interface-to-datum, product-to-analysis/evidence
- Acceptance: complete controlled product graph; interface and datum coverage; route compatibility closure; configuration-specific release boundary

### manufacturing-resource

- Objects: fixture, gauge, mould, tool, work centre, inspection zone
- Information: tool ID, controlled product/interface, calibration, capacity, revision, release status
- Relations: tool-to-process, gauge-to-datum/interface, process-to-product, record-to-built serial
- Acceptance: tooling coverage; calibration evidence; first-article correlation; as-built record linkage

## LM3 datum hierarchy

| ID | Datum | Parent | Origin and axes |
|---|---|---|---|
| `LM3-DAT-000` | trainset track datum | `ROOT` | lead-end car centreline at top-of-rail reference plane; +X forward, +Y left, +Z up |
| `LM3-DAT-100` | carbody primary datum | `LM3-DAT-000` | car longitudinal centre at nominal low-floor structural plane; parallel to trainset axes |
| `LM3-DAT-110` | body-to-bogie interface datum | `LM3-DAT-100` | secondary-suspension centre at nominal ride height; X longitudinal, Y axle direction, Z suspension reaction |
| `LM3-DAT-120` | door and platform datum | `LM3-DAT-100` | door opening centre at finished threshold; X along car, Y outboard, Z up |
| `LM3-DAT-130` | roof equipment rail datum | `LM3-DAT-100` | roof rail grid intersection at car centre; X rail pitch, Y cross-car, Z mounting normal |
| `LM3-DAT-140` | under-seat battery cassette datum | `LM3-DAT-100` | battery tray locating-pin centre; X withdrawal, Y cassette row, Z support reaction |
| `LM3-DAT-200` | wheelset and rail datum | `LM3-DAT-110` | axle centre at nominal wheel/rail contact geometry; X travel, Y axle, Z radial/up |
| `LM3-DAT-300` | articulation interface datum | `LM3-DAT-100` | articulation yaw-axis centre at nominal ride height; X connection chord, Y left, Z yaw axis |
| `LM3-DAT-400` | train-end and coupler datum | `LM3-DAT-100` | coupler centreline at nominal ride height; X coupling axis, Y left, Z up |

## Mechanical interface control

### LM3-ICD-001 — wheel to rail and route geometry

- Datums: `LM3-DAT-000` `LM3-DAT-200`

- Products: `LM3-BOG-SA611`, `LM3-BOG-SA621`, `LM3-BOG-P040`, `LM3-BOG-P041`
- Geometry: 1435 mm standard-gauge planning basis; profile, back-to-back, wear and contact tolerances require supplier and track-system freeze
- Loads: static/dynamic axle, curving, traction, braking and derailment cases from accepted vehicle/track dynamics
- Services: none
- Verification: wheelset dimensional report; gauging and dynamics analysis; instrumented route acceptance
- Route gate: gradient, curvature, cant, vertical curve, rail profile or track tolerance changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-002 — carbody to powered bogie

- Datums: `LM3-DAT-100 LM3-DAT-110`
- Products: `LM3-BDY-P030`, `LM3-BOG-SA610`, `LM3-BOG-P046`
- Geometry: pivot, air-spring, yaw-link and damper datums controlled as one replaceable interface set
- Loads: AW0/AW2/AW3 vertical, lateral, yaw, traction, braking, anti-lift and jacking cases
- Services: pneumatic suspension, height sensing, earth bond
- Verification: datum survey; load calculation; ride-height and full-motion test
- Route gate: curve/cant/gradient, axle-load, crosswind or structure-deflection envelope changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-003 — carbody to trailer bogie

- Datums: `LM3-DAT-100 LM3-DAT-110`
- Products: `LM3-BDY-P030`, `LM3-BOG-SA620`, `LM3-BOG-P061`
- Geometry: common body connection with configuration-controlled trailer-bogie adapter details
- Loads: AW0/AW2/AW3 vertical, lateral, yaw, braking, anti-lift and jacking cases
- Services: pneumatic suspension, height sensing, earth bond
- Verification: A/B interchange gauge; load calculation; ride-height and full-motion test
- Route gate: curve/cant/gradient, axle-load, crosswind or structure-deflection envelope changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-004 — door cassette, body portal and platform

- Datums: `LM3-DAT-100 LM3-DAT-120`
- Products: `LM3-DOOR-SA310`, `LM3-BDY-P100`, `LM3-DOOR-P010`, `LM3-EXT-P010`
- Geometry: 1500 x 2050 mm design-reference carrier gauge; final aperture, threshold, seal compression, leaf sweep and platform gap/step by frozen door and route ICD
- Loads: door equipment, passenger crowd, abuse, aerodynamic pressure and emergency-operation cases
- Services: LV power, safety loop, communications, drainage
- Verification: carrier proof; gap/step analysis; obstruction/closed-and-locked/water/replacement tests
- Route gate: platform offset/height, cant, curvature or suspension-deflection changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-005 — articulation structure and passenger gangway

- Datums: `LM3-DAT-100 LM3-DAT-300`

- Products: `LM3-ART-SA800`, `LM3-ART-SA810`, `LM3-ART-SA820`, `LM3-ART-SA830`
- Geometry: yaw/pitch/roll axes, anti-lift path, bellows, bridge, turntable and pinch keep-outs controlled through full motion
- Loads: buff/draft, vertical shear, torsion, curving, emergency braking, derailment and recovery cases
- Services: HV trainline, LV/data, pneumatic, earth bond, drainage
- Verification: structural proof; full-motion sweep; gap/pinch gauge; water and passenger bridge load tests
- Route gate: minimum curve, reverse curve, vertical curve, cant transition or recovery regime changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-006 — train end, coupler and rescue vehicle

- Datums: `LM3-DAT-100 LM3-DAT-400`
- Products: `LM3-END-SA700`, `LM3-EIF-SA650`, `LM3-END-P050`, `LM3-END-P060`
- Geometry: coupler axis, anti-climber, energy absorber, carrier ring and rescue adapter share a surveyed end datum
- Loads: buff/draft, coupling impact, crash, rescue tow, lifting and asymmetric recovery cases
- Services: pneumatic brake, LV/data jumper, earth bond
- Verification: end survey; coupler/adapter proof; rescue compatibility and recovery trial
- Route gate: maximum gradient, minimum curve, disabled-train mass or rescue fleet changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-007 — battery cassette, tray and carbody

- Datums: `LM3-DAT-100 LM3-DAT-140`
- Products: `LM3-HV-SA510`, `LM3-BDY-P050`, `LM3-HV-P010`
- Geometry: locating pins, retention, withdrawal path, lid/gasket, vent, drain and fire barrier controlled as a replaceable cassette
- Loads: mass/CG, longitudinal/lateral acceleration, shock/vibration, crash, thermal-runaway pressure and lifting cases
- Services: traction HV, HVIL, LV/data, cooling/fire connection, vent/drain
- Verification: tray proof; retention and withdrawal tests; isolation/HVIL; thermal propagation and drainage tests
- Route gate: route energy, gradient, ambient/flood exposure or duty-cycle changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-008 — traction motor, gearbox, axle and bogie frame

- Datums: `LM3-DAT-110 LM3-DAT-200`
- Products: `LM3-TRC-SA615`, `LM3-TRC-P010`, `LM3-TRC-P020`, `LM3-BOG-P050`
- Geometry: shaft, foot, torque-link, coupling, oil-port and removal envelopes frozen by supplier RFQ and bogie ICD
- Loads: peak/continuous torque, gear mesh, axle motion, torque reaction, shock, thermal and overspeed cases
- Services: traction HV, temperature/speed sensing, earth bond, lubricant service
- Verification: alignment and runout; mount/torque-link proof; thermal map; rotation and removal trial
- Route gate: gradient, adhesion, braking blend, speed or thermal duty changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-009 — roof HVAC and equipment rail

- Datums: `LM3-DAT-100 LM3-DAT-130`

- Products: `LM3-ROOF-SA410`, `LM3-ROOF-P010`, `LM3-HV-P020`, `LM3-EXT-P040`
- Geometry: rail pitch, curb flatness, drop duct, condensate, keep-out and removal lift envelope controlled together
- Loads: equipment mass/CG, acceleration, crosswind, roof snow/maintenance, lifting and fatigue cases
- Services: HV/LV power, controls/data, supply/return air, condensate drain, earth bond
- Verification: rail/curb survey; attachment proof; air/leak/drain tests; removal trial
- Route gate: crosswind, ambient temperature, dust/rain or tunnel/structure clearance changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-010 — brake, WSP and wheelset

- Datums: `LM3-DAT-110 LM3-DAT-200`
- Products: `LM3-BOG-SA611`, `LM3-BOG-SA621`, `LM3-BOG-P060`, `LM3-BOG-P061`
- Geometry: disc/caliper, sensor target, cable sweep and wear/removal clearances controlled over suspension travel
- Loads: service/emergency/parking braking, low adhesion, thermal fade, wheel-slide and failed-channel cases
- Services: pneumatic brake, LV power, WSP/speed data, earth bond
- Verification: static brake/WSP test; thermal capacity; stopping-distance and low-adhesion route tests
- Route gate: gradient, line speed, adhesion, station spacing or stopping-margin changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-011 — vehicle envelope to structure and evacuation walkway

- Datums: `LM3-DAT-000 LM3-DAT-100`
- Products: `LM3-TRAINSET-A000`, `LM3-CAR-A900`, `LM3-SHELL-A200`
- Geometry: 2850 mm body-width concept envelope plus dynamic movement, throw, wear, construction and maintenance allowances; released swept envelope is open
- Loads: crosswind, cant deficiency, suspension failure, passenger load and structure movement combinations
- Services: emergency lighting/communications interaction
- Verification: static/dynamic gauging; BIM swept-volume clash; evacuation and detraining demonstration
- Route gate: all alignment, platform, parapet, tunnel, bridge movement or crosswind changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

## LM3-ICD-012 — lifting, jacking and field rerailing

- Datums: `LM3-DAT-000 LM3-DAT-100`
- Products: `LM3-CAR-A900`, `LM3-BDY-P010`, `LM3-END-P050`
- Geometry: four-point lifting/jacking, transverse bridge and equipment keep-outs tied to measured car mass/CG
- Loads: normal/asymmetric lift, one-point pressure loss, rerailing side load, tiedown and damaged-vehicle cases
- Services: hydraulic/mechanical equipment, bonding and communications
- Verification: point survey; structural calculation; proof load; trained-crew recovery demonstration
- Route gate: route access, viaduct parapet/walkway, depot equipment or final mass/CG changes
- Status: `design-reference-definition-complete; release-evidence-open`; tolerance `allocation-open-until-stack-and-supplier-freeze`.

# Load cases

| ID | Case | Closure status |
|---|---|---|
| LM3-LC-001 | AW0/AW2/AW3 static mass, axle load and CG | measured-mass-and-loading-definition-required |
| LM3-LC-002 | traction, service/emergency braking and low adhesion | released-route-and-brake-supplier-model-required |
| LM3-LC-003 | curve, cant, vertical curve and full suspension motion | vehicle-dynamics-model-and-route-profile-required |
| LM3-LC-004 | crosswind, aerodynamic pressure and exposed structures | site-wind-and-vehicle-aerodynamic-evidence-required |
| LM3-LC-005 | buff/draft, coupling, rescue tow and crash energy | structural-and-crash-authority-definition-required |
| LM3-LC-006 | fatigue and vibration duty spectrum | route-spectrum-and-joint-classification-required |
| LM3-LC-007 | battery/HV thermal, fault, fire and environmental exposure | supplier-data-and-hazard-analysis-required |
| LM3-LC-008 | lifting, jacking, rerailing and damaged-vehicle recovery | measured-mass-cg-and-recovery-method-required |
| LM3-LC-009 | passenger, accessibility, door and evacuation operation | loading-and-operational-rules-required |
| LM3-LC-010 | thermal, dust, rain, flood splash and water ingress | route-environment-and-ingress-classification-required |

# Route compatibility gates

## LM3-RCG-001

Does the released static/dynamic swept envelope clear track, platforms and structures?

Decision rule: redesign geometry only if gauging cannot be closed by infrastructure tolerance or operational control.

Evidence: surveyed alignment; structure/platform as-built model; vehicle gauging model.

## LM3-RCG-002

Do gradient, curvature, cant and vertical curves remain within vehicle capability?

Decision rule: change route first where reasonable; otherwise requalify bogie, articulation, traction or braking.

Evidence: released profile; vehicle dynamics; traction/braking results.

## LM3-RCG-003

Does the timetable duty fit usable battery energy and thermal limits with reserve?

Decision rule: adjust timetable/charging before changing battery capacity; redesign only after whole-life comparison.

Evidence: route simulation; supplier battery/motor/inverter/HVAC maps; degraded-mode cases.

## LM3-RCG-004

Are axle/load spectra accepted by track, bridge and viaduct designs?

Decision rule: iterate vehicle mass and civil structures through one controlled load model.

Evidence: measured mass/CG; dynamic augmentation; structural calculations.

## LM3-RCG-005

Are crosswind and exposed-water/viaduct operations acceptable?

Decision rule: define wind monitoring/operating limits or vehicle aerodynamic changes through hazard assessment.

Evidence: site wind study; vehicle characteristic wind curve; operating rules.

## LM3-RCG-006

Can passengers evacuate and responders recover a failed train everywhere?

Decision rule: coordinate walkway, detraining and access provision; change vehicle emergency interfaces only where necessary.

Evidence: evacuation model/drill; BIM access review; recovery demonstration.

## LM3-RCG-007

Do station platform gap, step and door-zone flows meet the accessibility basis?

Decision rule: coordinate platform and suspension control; modify threshold/door system only after system trade study.

Evidence: platform survey; suspension cases; gap/step and passenger-flow assessment.

# Verification matrix

The complete machine-readable record is `design-detail-register.json`.

# Civil and LM3 BIM Reference Package

Repository source: `engineering/models/bim/reference/README.md`

This is the tracked, deterministic public-review federation. It lets GitHub users inspect the current IFC4.3 model and its requirements/evidence without installing the complete engineering toolchain.

48-second civil IFC construction sequence

| Substructure | Superstructure | Track and station interfaces |
|---|---|---|
| |  |  |
| IFC substructure construction milestone | IFC superstructure erection milestone | IFC track and station milestone |

| File | Purpose |
|---|---|
| `civil-coordination.ifc` | IFC4.3 rail/civil/station/rolling-stock coordination model |
| `civil-coordination.index.json` | Stable IDs, classifications, source revisions, quantities and relationships |
| `civil-coordination.validation.json` | IFC schema and project validation summary |
| `civil-information-requirements.ids` | Machine-checkable information requirements |
| `civil-information-requirements.report.json` | Complete IDS result report |
| `civil-coordination-issues.bcf` | Open coordination issues in BCF 3.0 form |
| `civil-coordination-issues.index.json` | Reviewable BCF issue index |
| `civil-construction-sequence.json` | Deterministic construction stages and object assignments |
| `civil-coordination.blend` | Native Bonsai/Blender review scene with assigned IFC assets, task IDs and construction keyframes |
| `civil-construction-sequence.mp4` | Full 48-second H.264 4D construction review |
| `civil-construction-sequence.gif` | Complete GitHub-viewable preview of the same sequence |
| `lm3-manufacturing-reference.ifc` | IFC4.3 LM3 product hierarchy, semantic doors/windows/fixtures/motors, manufacturing methods, sequenced tasks and 30 tooling families |
| `lm3-manufacturing-reference.index.json` | IFC counts, source hashes, semantic classes and deterministic validation summary |
| `lm3-information-requirements.ids` | Machine-checkable LM3 provenance, product graph, assembly and mechanical-interface requirements |
| `lm3-information-requirements.report.json` | Complete passing IDS result for the federated LM3 reference model |
| `lm3-parts/` | 120 separate geometric IFC4.3 product files, including round running-gear meshes and semantic doors, windows, lights, furniture and motor classes |
| `lm3-assemblies/` | 26 hierarchy-preserving IFC4.3 subassembly/car/train files; the final trainset contains every active descendant product |

| File | Purpose |
| --- | --- |
| lm3-product-library.index.json | Exact split-library file hashes, representation coverage and final-assembly reachability test |
| stations/ | Seven geometric station IFC4.3 assemblies covering every controlled product in the halt, standard, major, interchange, elevated-interchange, terminal and depot-terminal variants; IDs are cross-checked by the station reconciliation register |
| ../../model-coverage.md | Generated LM3/station fidelity, source, analysis and release-evidence register |
| ../design-detail-register.md | Terrain/water redesign impacts, BIM information requirements, LM3 datums, mechanical ICDs, load cases, route gates and verification matrix |

Regenerate it from the authoritative component geometry and engineering interchange code:

```
tools/automation/bonsai-civil.sh --animate \
  --out-dir engineering/models/bim/reference \
  --revision-id repository-reference
python3 engineering/design_detail_register.py
python3 engineering/interchange/trainset_manufacturing_ifc.py
python3 engineering/interchange/lm3_product_ifc_library.py
python3 engineering/interchange/station_ifc.py --all-variants \
  --output-dir engineering/models/bim/reference/stations
python3 engineering/model_coverage.py
```

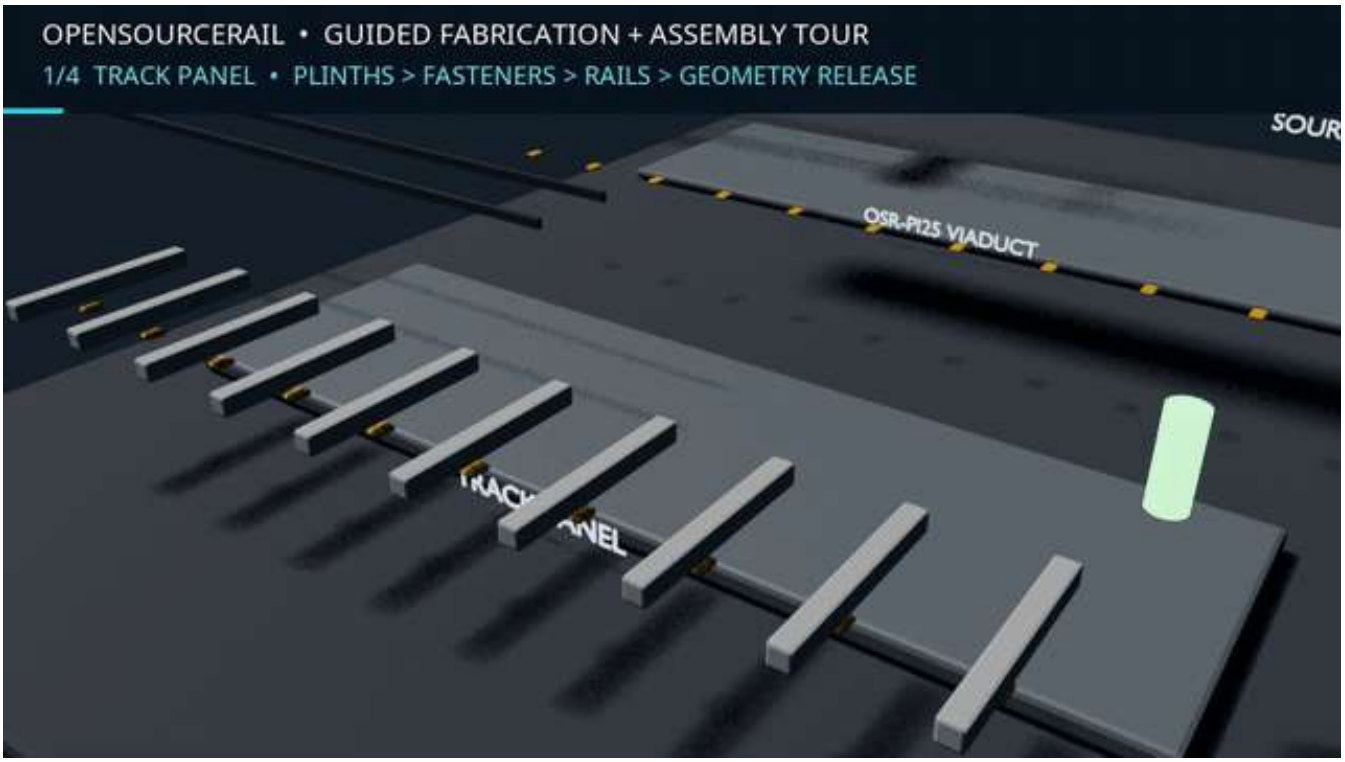
The 4D review moves the assigned IFC objects themselves: substructure rises, bearings and roofs descend, beams arrive from the erection side, and track feeds longitudinally according to the checked task assignments. It is a deterministic construction-state simulation, not crane physics, temporary-works verification, clash-free path planning or an approved method statement.

These models are coordination, product-structure and manufacturing-method evidence, not a construction release. The LM3 and station files expose their complete current product graphs and inspectable design-reference geometry. The federated LM3 IFC is checked against its IDS, and the split LM3 part/assembly IFCs carry the same design-detail source hash plus applicable datum/interface controls. These checks do not substitute for supplier-frozen interfaces, installed-coordinate/tolerance analyses, released shop drawings, qualified weld/laminate processes or NC surfaces. Repeated City Studio jobs and render intermediates remain under `build/`; this named review set is retained in Git.

# Fabrication and assembly digital twin

Repository source: `engineering/models/digital-twins/fabrication-assembly/README.md`

This source-linked planning twin follows four representative products from material release through fabrication, assembly, quality hold points, and handover: a 6 m track panel, a standard twin-platform station, an OSR-Pi25 twin-track viaduct bay, and a 49.5 m three-car LM3 trainset.



Animated fabrication and assembly digital twin

| Product rows staged | Controlled subassemblies | Complete LM3 node |
|---|---|---|
|  |  |  |
| LM3 product rows in deterministic staging | LM3 subassemblies following the product dependency graph | LM3 complete assembly state |

The animation is an 88-second guided assembly tour. The LM3 chapter instantiates all 120 controlled product rows and all 26 assembly nodes from subassembly to final trainset; each object is separately selectable and carries its ID, parent/children, quantity, route and dependency timing. Components move from deterministic staging positions only after their inputs are available, then the tour finishes with a completed-products overview. The chapters cover track, station, viaduct and LM3 assembly separately so small fixtures and installation order remain visible. The MP4 is the primary review artifact; the lower-frame-rate GIF is an inline preview of the same sequence.

The 146 LM3 nodes are coordination representations, not invented supplier shop geometry: repeated physical occurrences stay explicit as quantity metadata and the adjacent train geometry supplies the recognisable installed context. The tour is explanatory rather than a project schedule. The JSON retains the actual concurrent planning basis, durations, 25 stages, predecessors, work centres, inputs, outputs, hold points, evidence, cross-stream interfaces, and hashes of the controlled source documents.

The viaduct route now includes tested foundation construction, recorded pier column delivery, erection and seat survey of the compact hollow cap, two sub-75 t decked-beam lifts by portal/strand-jack launcher, an actual-load-chart fallback gate, a maturity-controlled link-slab/diaphragm connection stage, and separate walkway/containment cassettes.

| Artifact | Purpose |
|---|---|
| `fabrication-assembly-digital-twin.json` | Machine-readable production route, complete 146-node LM3 DAG/timing, live-state snapshots, relationships, source hashes, and validation checks |

| Artifact | Purpose |
| --- | --- |
| `fabrication-assembly-digital-twin.blend` | Native Blender scene with separately selectable staged components and animation |
| `fabrication-assembly-digital-twin.mp4` | Full-resolution 88-second H.264 guided assembly tour |
| `fabrication-assembly-digital-twin.gif` | Complete 88-second inline preview below the 20 MB repository limit |

Regenerate all outputs with:

```
design/component-catalogue/scripts/blender_fabrication_assembly_twin.sh
```

This is a fabrication-planning and first-article control twin, not released shop drawings or an approved construction method. Numeric weld procedures, fastener torques, lift studies, temporary works, supplier instructions, and signed travelers remain mandatory release inputs.

# CAD and IFC model coverage

Repository source: `engineering/models/model-coverage.md`

This generated register is the concise fidelity view for the LM3 and station models. Product maturity, geometry fidelity and release approval are separate states; no row is a construction release merely because geometry exists.

## Summary

- LM3 product models: 120
- Unique station product models: 50
- Complete station variant assemblies: 7
- LM3 objects with datum/interface control: 39 (20 products + 19 assemblies)
- Controlled mechanical interfaces: 12
- LM3 IDS checks: 945 across 4 specifications
- Geometry levels: `coordination-envelope`=92, `design-reference-detail`=23, `interface-detailed`=55

## Meaning

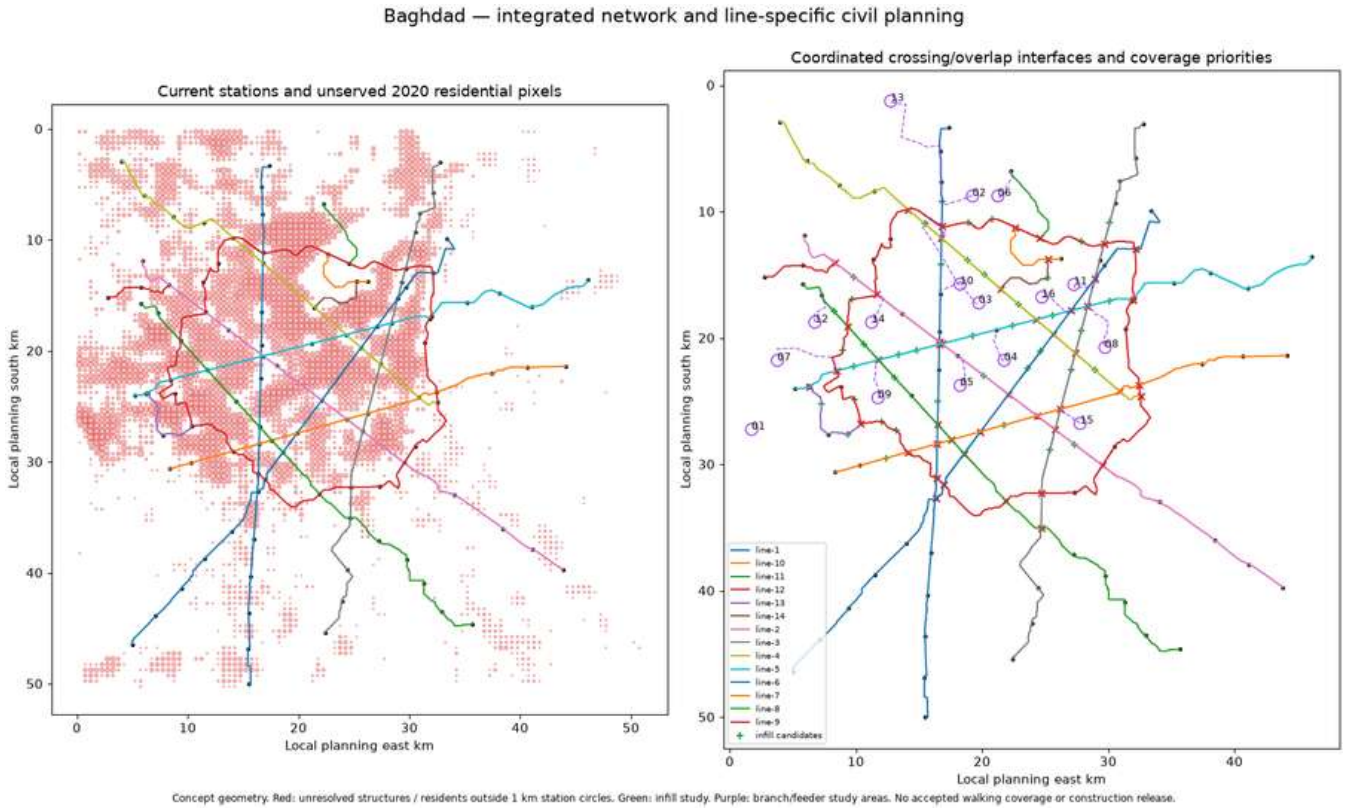
`coordination-envelope` controls space and interfaces for sourced equipment; `manufacturing-envelope` adds OSR manufacturing intent; `design-reference-detail` adds inspectable subcomponents; `interface-detailed` models repeatable datums, connections or service routes. `fabrication-detailed` and `released` require controlled drawings, tolerances and accepted evidence. Datum/interface coverage means the object is linked to the design-detail register; it does not mean that open tolerances, calculations or physical evidence are accepted.

The complete machine-readable per-product mapping, analysis IDs, evidence gates and FreeCAD/IFC/neutral-output paths are in `model-coverage.json`.

# Baghdad integrated network, foundations and assembly plan

Repository source: `engineering/network-planning/baghdad/README.md`

Coordinated design-development concept; field construction and operating adoption remain open.



Network interfaces and residential gaps

Interactive line / support / junction viewer lets reviewers zoom, select a line and inspect individual support packets and interface records offline.

One source-bound asset graph connects each line, actual span, shared support, beam, launcher front, junction interface, station complex and residential intervention. The current native timetable/finance remains a comparator; this package does not claim new operating service or accepted structural profiles.

The plan assigns 10,985 support-specific foundation packets, 9,973 catalogue bay assemblies, 404 specials and 28 workfronts sharing 18 configured launchers. 10 fronts have preceding asset assignments; a front record creates no additional machine. Support packets have coordinates, chainage, adjacent spans, desktop-soil investigation references and required loads/tests. Pile type/count/depth, groundwater and bearing capacity remain unselected until field design.

| Line | Foundation packets | Catalogue bay assemblies | Special packages | Candidate infill |
|---|---|---|---|---|
| line-1 | 918 | 770 | 32 | 3 |
| line-2 | 1165 | 988 | 76 | 3 |
| line-3 | 932 | 863 | 29 | 4 |
| line-4 | 1040 | 943 | 44 | 5 |
| line-5 | 952 | 874 | 35 | 7 |
| line-6 | 974 | 846 | 60 | 2 |
| line-7 | 867 | 813 | 21 | 2 |
| line-8 | 915 | 811 | 39 | 3 |
| line-9 | 2423 | 2280 | 61 | 8 |
| line-10 | 242 | 238 | 2 | 0 |
| line-11 | 155 | 153 | 1 | 0 |
| line-12 | 48 | 46 | 1 | 0 |
| line-13 | 127 | 123 | 2 | 2 |
| line-14 | 227 | 225 | 1 | 1 |

## Junction and overlap coordination

46 crossing/shared-corridor/self-crossing interfaces need explicit structural treatment. 0 original interchange groups exceed the 600 m full-diameter screen. The new bounded grouping prevents transitive long-distance complexes and preserves platform coordinates. It does not create a track switch, measured walking path or accepted vertical profile.

Integrated geometry and complex register · GIS junction/residential layer · Foundation coordinate conflicts.

## Residential coverage and expansion

Retained 2020 population within 1 km station circles is 27.7%. 40 population-ranked infill candidates give a conditional radial sensitivity of 45.7%. 2,173,888 currently unserved retained residents are also over 1 km from sampled existing corridors; infill cannot close those gaps. 16 named/located priority areas therefore require branch/extension or funded feeder/access studies. Area circles can overlap and are never summed as unique residents.

These are native population-count and distance screens, not current census, surveyed walksheds, ridership or funded service. Candidate sites need water/footprint/property/access, station structure, timetable, fleet, energy and full installed cost review.

Expansion corridor plans provide 15 source-bound routes along the retained arterial graph, tied to existing station connections, with access gaps and proposed stopping sites. Compare rail branches with frequent feeders; traffic direction, bridge grades/loads, railway curvature and walk routes are unverified. The combined infill/feeder 500 m stop-circle sensitivity is 51.4%; the rail 1 km sensitivity is 58.8%. Shared corridor edges count overlapping candidate road segments once. No corridor is adopted or funded.

## Foundation and assembly execution

Foundation register has one row per unique proposed support. Span assembly register has identified component pairs and both foundation parents, actual line/run, unique front assignment, sequence and predecessor. Launcher fronts preserve disconnected runs and relocation gates. Stage library defines foundation/column/cap/bearing, factory/delivery, first/second beam securing, advance and handover dependencies. Specials and junctions use their own design/erection chains.

Decode compressed CSV using `python -c "import gzip; print(gzip.open('foundation-register.csv.gz','rt').read())"`. Coordinates are interpolated from the retained planning route; desktop soil does not select a foundation, and no pile depth or allowable bearing value is invented.

Complete per-line summary · Wider catalogue audit · Catalogue findings and provenance.

Companion data archive contains this planning package and new controlled inputs. The original Baghdad proposal archive retains the baseline city/engineering input evidence. Use both for the full planning review; the companion does not imply physical release.

Run `python tools/automation/integrated-network-plan.py`; `--check` validates source/output hashes. `--retain-context` creates the immutable retained OSM road/name input from the cached extraction. Native route and financial assumptions change only through a subsequent fully regenerated, validated adoption revision.

# line-1 — foundation and assembly construction plan

Repository source: `engineering/network-planning/baghdad/line-1-construction-plan.md`

Line-specific design-development package; survey, ground, supplier and staged-load releases are still required.

Route length 49.068 km. 918 unique proposed support packets; 770 identified catalogue bay assemblies and 32 special packages. Each ordinary bay has two named beam components and both foundation parents. The 25 m average is a sizing basis; actual Pi20/Pi25/closure geometry controls installation.

| Front | Launcher | Previous asset assignment | Direction | Initial assembly chainage m | Bay assemblies |
|---|---|---|---|---|---|
| line-1-front-1 | launcher-01 | initial mobilisation | 1 | 408.3 | 385 |
| line-1-front-2 | launcher-02 | initial mobilisation | -1 | 44150.1 | 385 |

## Foundation workface plan

Filter the foundation register by `line-1`. For every support, verify the proposed coordinate/chainage, rights, utilities and the referenced desktop sample; commission field ground, groundwater, durability and load investigations. Review shallow footing, bored shaft, driven bent and pile-group alternatives against actual ground, axial/lateral/settlement/scour and construction loads. Desktop topsoil does not select a pile depth, count or allowable bearing pressure.

Release trial and working-platform design (F1), install the selected foundation with actual geometry/material/installation records (F2), then verify integrity/load/settlement/dimensions and close the foundation packet (F3). Construct/erect column and cap with independently checked connections/temporary restraint (P0). Survey and inspect bearings, strength and the next launcher/beam/delivery stage before support release (B0). Keep 10–15 consecutive bays of accepted supports and beam stock ahead only where the run and storage permit.

## Directed assembly and logistics sequence

Before mobilisation, release the predecessor asset assignment and its dismantle/transport/recommission package. The positive front installs toward increasing chainage; the negative front starts at its high-chainage end and installs backward. Factory/dispatch plans must follow this directed sequence, not the ascending raw span register. A foundation used by two bays is one packet; it is not built or priced twice.

For each front, identify the first complete run, permitted delivery/assembly site, temporary support/ground platform, configured plant and authorised shift/crew. Reserve both beam travellers, transport/receiving equipment, an operator, required riggers, lift supervision and inspection. Verify source strength, complete mass/CG, lifting points, rigging, bearings, weather limits and contingency landing/recovery before any lift.

Both support B0 packets and beam receiving H1 records precede E0. Place and restrain beam 1 (E1); then place/securing beam 2 (E2). Survey and accept connection/strength/bearings/NCRs (E3), release advance loads and the next supports before moving the launcher (E4), then complete walkways/barriers/waterproofing/drainage/track interface and following-trade handover (E5). The next bay depends on the preceding advance release. Following trades may overlap only with protected, agreed load/access boundaries.

Run boundaries, stations and specials require a passage or dismantle/transport/reassembly/recommission package. No discontinuity becomes an assumed launchable gap. Junction-affected orders remain on a design hold until J2 freezes the profile, clearance, support/cap geometry and staged-load/utility/access design. A physical crossing does not create a rail switch.

The compressed span register provides the full sequence, individual beam IDs, predecessors and junction holds. Stage library supplies the method dependencies. Front package lists every assigned span and actual disconnected working interval.

# Junctions, stations and residential interfaces

Coordinated structural interface IDs on this line: crossing-4761735b935e, crossing-596aa3d726d4, crossing-9090e87568d6, crossing-92b255c18da1, crossing-d02bcca1ecd2, crossing-e1b0b7941672, crossing-efa108fc0f05, shared-corridor-ea625bfc9e95.

Evaluate grade-separated crossings, shared four-track civil footprints or separate deck levels, and bounded platform/concourse/access complexes with the station authority. Freeze actual vertical profiles and gradients before selecting supports and ordinary spans. Preserve rail/PSD/egress/waterproofing/earthing interfaces. Proposed residential infill sites on this line require station/approach structures and revised service, fleet, power and full installed prices; they are not existing paid journeys.

Candidate infill IDs: infill-line-1-037500, infill-line-1-042500, infill-line-1-026500.

# Inspection, handover and programme

Use the foundation/production/lift/connection/concealed-work hold points from the master ITP. Capture installed component IDs, geometry, tests, personnel/equipment authority, NCR disposition and signed stage release. Update actual shift cycles, losses, stocks and resource reservations; do not infer an opening date from bay throughput. Station/special/track/energy/depot/fleet/testing/approval releases close the whole line. Unknown ground quantities, installed costs and dates stay unknown.

Integrated master package · Interactive support/junction inspection.

# line-10 — foundation and assembly construction plan

Repository source: `engineering/network-planning/baghdad/line-10-construction-plan.md`

Line-specific design-development package; survey, ground, supplier and staged-load releases are still required.

Route length 6.804 km. 242 unique proposed support packets; 238 identified catalogue bay assemblies and 2 special packages. Each ordinary bay has two named beam components and both foundation parents. The 25 m average is a sizing basis; actual Pi20/Pi25/closure geometry controls installation.

| Front | Launcher | Previous asset assignment | Direction | Initial assembly chainage m | Bay assemblies |
|---|---|---|---|---|---|
| line-10-front-1 | launcher-01 | line-1-front-1 | 1 | 210.5 | 119 |
| line-10-front-2 | launcher-02 | line-1-front-2 | -1 | 6572.7 | 119 |

## Foundation workface plan

Filter the foundation register by `line-10`. For every support, verify the proposed coordinate/chainage, rights, utilities and the referenced desktop sample; commission field ground, groundwater, durability and load investigations. Review shallow footing, bored shaft, driven bent and pile-group alternatives against actual ground, axial/lateral/settlement/scour and construction loads. Desktop topsoil does not select a pile depth, count or allowable bearing pressure.

Release trial and working-platform design (F1), install the selected foundation with actual geometry/material/installation records (F2), then verify integrity/load/settlement/dimensions and close the foundation packet (F3). Construct/erect column and cap with independently checked connections/temporary restraint (P0). Survey and inspect bearings, strength and the next launcher/beam/delivery stage before support release (B0). Keep 10–15 consecutive bays of accepted supports and beam stock ahead only where the run and storage permit.

## Directed assembly and logistics sequence

Before mobilisation, release the predecessor asset assignment and its dismantle/transport/recommission package. The positive front installs toward increasing chainage; the negative front starts at its high-chainage end and installs backward. Factory/dispatch plans must follow this directed sequence, not the ascending raw span register. A foundation used by two bays is one packet; it is not built or priced twice.

For each front, identify the first complete run, permitted delivery/assembly site, temporary support/ground platform, configured plant and authorised shift/crew. Reserve both beam travellers, transport/receiving equipment, an operator, required riggers, lift supervision and inspection. Verify source strength, complete mass/CG, lifting points, rigging, bearings, weather limits and contingency landing/recovery before any lift.

Both support B0 packets and beam receiving H1 records precede E0. Place and restrain beam 1 (E1); then place/securing beam 2 (E2). Survey and accept connection/strength/bearings/NCRs (E3), release advance loads and the next supports before moving the launcher (E4), then complete walkways/barriers/waterproofing/drainage/track interface and following-trade handover (E5). The next bay depends on the preceding advance release. Following trades may overlap only with protected, agreed load/access boundaries.

Run boundaries, stations and specials require a passage or dismantle/transport/reassembly/recommission package. No discontinuity becomes an assumed launchable gap. Junction-affected orders remain on a design hold until J2 freezes the profile, clearance, support/cap geometry and staged-load/utility/access design. A physical crossing does not create a rail switch.

# line-11 — foundation and assembly construction plan

Repository source: `engineering/network-planning/baghdad/line-11-construction-plan.md`

Line-specific design-development package; survey, ground, supplier and staged-load releases are still required.

Route length 6.884 km. 155 unique proposed support packets; 153 identified catalogue bay assemblies and 1 special packages. Each ordinary bay has two named beam components and both foundation parents. The 25 m average is a sizing basis; actual Pi20/Pi25/closure geometry controls installation.

| Front | Launcher | Previous asset assignment | Direction | Initial assembly chainage m | Bay assemblies |
|---|---|---|---|---|---|
| line-11-front-1 | launcher-03 | line-2-front-1 | 1 | 210.5 | 76 |
| line-11-front-2 | launcher-04 | line-2-front-2 | -1 | 4035.5 | 77 |

## Foundation workface plan

Filter the foundation register by `line-11`. For every support, verify the proposed coordinate/chainage, rights, utilities and the referenced desktop sample; commission field ground, groundwater, durability and load investigations. Review shallow footing, bored shaft, driven bent and pile-group alternatives against actual ground, axial/lateral/settlement/scour and construction loads. Desktop topsoil does not select a pile depth, count or allowable bearing pressure.

Release trial and working-platform design (F1), install the selected foundation with actual geometry/material/installation records (F2), then verify integrity/load/settlement/dimensions and close the foundation packet (F3). Construct/erect column and cap with independently checked connections/temporary restraint (P0). Survey and inspect bearings, strength and the next launcher/beam/delivery stage before support release (B0). Keep 10–15 consecutive bays of accepted supports and beam stock ahead only where the run and storage permit.

## Directed assembly and logistics sequence

Before mobilisation, release the predecessor asset assignment and its dismantle/transport/recommission package. The positive front installs toward increasing chainage; the negative front starts at its high-chainage end and installs backward. Factory/dispatch plans must follow this directed sequence, not the ascending raw span register. A foundation used by two bays is one packet; it is not built or priced twice.

For each front, identify the first complete run, permitted delivery/assembly site, temporary support/ground platform, configured plant and authorised shift/crew. Reserve both beam travellers, transport/receiving equipment, an operator, required riggers, lift supervision and inspection. Verify source strength, complete mass/CG, lifting points, rigging, bearings, weather limits and contingency landing/recovery before any lift.

Both support B0 packets and beam receiving H1 records precede E0. Place and restrain beam 1 (E1); then place/securing beam 2 (E2). Survey and accept connection/strength/bearings/NCRs (E3), release advance loads and the next supports before moving the launcher (E4), then complete walkways/barriers/waterproofing/drainage/track interface and following-trade handover (E5). The next bay depends on the preceding advance release. Following trades may overlap only with protected, agreed load/access boundaries.

Run boundaries, stations and specials require a passage or dismantle/transport/reassembly/recommission package. No discontinuity becomes an assumed launchable gap. Junction-affected orders remain on a design hold until J2 freezes the profile, clearance, support/cap geometry and staged-load/utility/access design. A physical crossing does not create a rail switch.

Update actual shift cycles, losses, stocks and resource reservations; do not infer an opening date from bay throughput.
Station/special/track/energy/depot/fleet/testing/approval releases close the whole line. Unknown ground quantities, installed costs and dates stay unknown.

Integrated master package · Interactive support/junction inspection.

# line-12 — foundation and assembly construction plan

Repository source: `engineering/network-planning/baghdad/line-12-construction-plan.md`

Line-specific design-development package; survey, ground, supplier and staged-load releases are still required.

Route length 6.586 km. 48 unique proposed support packets; 46 identified catalogue bay assemblies and 1 special packages. Each ordinary bay has two named beam components and both foundation parents. The 25 m average is a sizing basis; actual Pi20/Pi25/closure geometry controls installation.

| Front | Launcher | Previous asset assignment | Direction | Initial assembly chainage m | Bay assemblies |
|---|---|---|---|---|---|
| line-12-front-1 | launcher-05 | line-3-front-1 | 1 | 210.5 | 23 |
| line-12-front-2 | launcher-06 | line-3-front-2 | -1 | 1355.5 | 23 |

## Foundation workface plan

Filter the foundation register by `line-12`. For every support, verify the proposed coordinate/chainage, rights, utilities and the referenced desktop sample; commission field ground, groundwater, durability and load investigations. Review shallow footing, bored shaft, driven bent and pile-group alternatives against actual ground, axial/lateral/settlement/scour and construction loads. Desktop topsoil does not select a pile depth, count or allowable bearing pressure.

Release trial and working-platform design (F1), install the selected foundation with actual geometry/material/installation records (F2), then verify integrity/load/settlement/dimensions and close the foundation packet (F3). Construct/erect column and cap with independently checked connections/temporary restraint (P0). Survey and inspect bearings, strength and the next launcher/beam/delivery stage before support release (B0). Keep 10–15 consecutive bays of accepted supports and beam stock ahead only where the run and storage permit.

## Directed assembly and logistics sequence

Before mobilisation, release the predecessor asset assignment and its dismantle/transport/recommission package. The positive front installs toward increasing chainage; the negative front starts at its high-chainage end and installs backward. Factory/dispatch plans must follow this directed sequence, not the ascending raw span register. A foundation used by two bays is one packet; it is not built or priced twice.

For each front, identify the first complete run, permitted delivery/assembly site, temporary support/ground platform, configured plant and authorised shift/crew. Reserve both beam travellers, transport/receiving equipment, an operator, required riggers, lift supervision and inspection. Verify source strength, complete mass/CG, lifting points, rigging, bearings, weather limits and contingency landing/recovery before any lift.

Both support B0 packets and beam receiving H1 records precede E0. Place and restrain beam 1 (E1); then place/securing beam 2 (E2). Survey and accept connection/strength/bearings/NCRs (E3), release advance loads and the next supports before moving the launcher (E4), then complete walkways/barriers/waterproofing/drainage/track interface and following-trade handover (E5). The next bay depends on the preceding advance release. Following trades may overlap only with protected, agreed load/access boundaries.

Run boundaries, stations and specials require a passage or dismantle/transport/reassembly/recommission package. No discontinuity becomes an assumed launchable gap. Junction-affected orders remain on a design hold until J2 freezes the profile, clearance, support/cap geometry and staged-load/utility/access design. A physical crossing does not create a rail switch.

The compressed span register provides the full sequence, individual beam IDs, predecessors and junction holds. Stage library supplies the method dependencies. Front package lists every assigned span and actual disconnected working interval.

# Junctions, stations and residential interfaces

Coordinated structural interface IDs on this line: crossing-5564106417eb.

Evaluate grade-separated crossings, shared four-track civil footprints or separate deck levels, and bounded platform/concourse/access complexes with the station authority. Freeze actual vertical profiles and gradients before selecting supports and ordinary spans. Preserve rail/PSD/egress/waterproofing/earthing interfaces. Proposed residential infill sites on this line require station/approach structures and revised service, fleet, power and full installed prices; they are not existing paid journeys.

Candidate infill IDs: no qualifying candidate under this screen.

# Inspection, handover and programme

Use the foundation/production/lift/connection/concealed-work hold points from the master ITP. Capture installed component IDs, geometry, tests, personnel/equipment authority, NCR disposition and signed stage release. Update actual shift cycles, losses, stocks and resource reservations; do not infer an opening date from bay throughput.
Station/special/track/energy/depot/fleet/testing/approval releases close the whole line. Unknown ground quantities, installed costs and dates stay unknown.

Integrated master package · Interactive support/junction inspection.

# line-13 — foundation and assembly construction plan

Repository source: `engineering/network-planning/baghdad/line-13-construction-plan.md`

Line-specific design-development package; survey, ground, supplier and staged-load releases are still required.

Route length 8.042 km. 127 unique proposed support packets; 123 identified catalogue bay assemblies and 2 special packages. Each ordinary bay has two named beam components and both foundation parents. The 25 m average is a sizing basis; actual Pi20/Pi25/closure geometry controls installation.

| Front | Launcher | Previous asset assignment | Direction | Initial assembly chainage m | Bay assemblies |
|---|---|---|---|---|---|
| line-13-front-1 | launcher-07 | line-4-front-1 | 1 | 210.5 | 61 |
| line-13-front-2 | launcher-08 | line-4-front-2 | -1 | 3719.0 | 62 |

## Foundation workface plan

Filter the foundation register by `line-13`. For every support, verify the proposed coordinate/chainage, rights, utilities and the referenced desktop sample; commission field ground, groundwater, durability and load investigations. Review shallow footing, bored shaft, driven bent and pile-group alternatives against actual ground, axial/lateral/settlement/scour and construction loads. Desktop topsoil does not select a pile depth, count or allowable bearing pressure.

Release trial and working-platform design (F1), install the selected foundation with actual geometry/material/installation records (F2), then verify integrity/load/settlement/dimensions and close the foundation packet (F3). Construct/erect column and cap with independently checked connections/temporary restraint (P0). Survey and inspect bearings, strength and the next launcher/beam/delivery stage before support release (B0). Keep 10–15 consecutive bays of accepted supports and beam stock ahead only where the run and storage permit.

## Directed assembly and logistics sequence

Before mobilisation, release the predecessor asset assignment and its dismantle/transport/recommission package. The positive front installs toward increasing chainage; the negative front starts at its high-chainage end and installs backward. Factory/dispatch plans must follow this directed sequence, not the ascending raw span register. A foundation used by two bays is one packet; it is not built or priced twice.

For each front, identify the first complete run, permitted delivery/assembly site, temporary support/ground platform, configured plant and authorised shift/crew. Reserve both beam travellers, transport/receiving equipment, an operator, required riggers, lift supervision and inspection. Verify source strength, complete mass/CG, lifting points, rigging, bearings, weather limits and contingency landing/recovery before any lift.

Both support B0 packets and beam receiving H1 records precede E0. Place and restrain beam 1 (E1); then place/securing beam 2 (E2). Survey and accept connection/strength/bearings/NCRs (E3), release advance loads and the next supports before moving the launcher (E4), then complete walkways/barriers/waterproofing/drainage/track interface and following-trade handover (E5). The next bay depends on the preceding advance release. Following trades may overlap only with protected, agreed load/access boundaries.

Run boundaries, stations and specials require a passage or dismantle/transport/reassembly/recommission package. No discontinuity becomes an assumed launchable gap. Junction-affected orders remain on a design hold until J2 freezes the profile, clearance, support/cap geometry and staged-load/utility/access design. A physical crossing does not create a rail switch.

# line-2 — foundation and assembly construction plan

Repository source: `engineering/network-planning/baghdad/line-2-construction-plan.md`

Line-specific design-development package; survey, ground, supplier and staged-load releases are still required.

Route length 52.851 km. 1,165 unique proposed support packets; 988 identified catalogue bay assemblies and 76 special packages. Each ordinary bay has two named beam components and both foundation parents. The 25 m average is a sizing basis; actual Pi20/Pi25/closure geometry controls installation.

| Front | Launcher | Previous asset assignment | Direction | Initial assembly chainage m | Bay assemblies |
|---|---|---|---|---|---|
| line-2-front-1 | launcher-03 | initial mobilisation | 1 | 2228.8 | 494 |
| line-2-front-2 | launcher-04 | initial mobilisation | -1 | 51689.8 | 494 |

## Foundation workface plan

Filter the foundation register by `line-2`. For every support, verify the proposed coordinate/chainage, rights, utilities and the referenced desktop sample; commission field ground, groundwater, durability and load investigations. Review shallow footing, bored shaft, driven bent and pile-group alternatives against actual ground, axial/lateral/settlement/scour and construction loads. Desktop topsoil does not select a pile depth, count or allowable bearing pressure.

Release trial and working-platform design (F1), install the selected foundation with actual geometry/material/installation records (F2), then verify integrity/load/settlement/dimensions and close the foundation packet (F3). Construct/erect column and cap with independently checked connections/temporary restraint (P0). Survey and inspect bearings, strength and the next launcher/beam/delivery stage before support release (B0). Keep 10–15 consecutive bays of accepted supports and beam stock ahead only where the run and storage permit.

## Directed assembly and logistics sequence

Before mobilisation, release the predecessor asset assignment and its dismantle/transport/recommission package. The positive front installs toward increasing chainage; the negative front starts at its high-chainage end and installs backward. Factory/dispatch plans must follow this directed sequence, not the ascending raw span register. A foundation used by two bays is one packet; it is not built or priced twice.

For each front, identify the first complete run, permitted delivery/assembly site, temporary support/ground platform, configured plant and authorised shift/crew. Reserve both beam travellers, transport/receiving equipment, an operator, required riggers, lift supervision and inspection. Verify source strength, complete mass/CG, lifting points, rigging, bearings, weather limits and contingency landing/recovery before any lift.

Both support B0 packets and beam receiving H1 records precede E0. Place and restrain beam 1 (E1); then place/securing beam 2 (E2). Survey and accept connection/strength/bearings/NCRs (E3), release advance loads and the next supports before moving the launcher (E4), then complete walkways/barriers/waterproofing/drainage/track interface and following-trade handover (E5). The next bay depends on the preceding advance release. Following trades may overlap only with protected, agreed load/access boundaries.

Run boundaries, stations and specials require a passage or dismantle/transport/reassembly/recommission package. No discontinuity becomes an assumed launchable gap. Junction-affected orders remain on a design hold until J2 freezes the profile, clearance, support/cap geometry and staged-load/utility/access design. A physical crossing does not create a rail switch.

The compressed span register provides the full sequence, individual beam IDs, predecessors and junction holds. Stage library supplies the method dependencies. Front package lists every assigned span and actual disconnected working interval.

# Junctions, stations and residential interfaces

Coordinated structural interface IDs on this line: crossing-1c3badfbb529, crossing-5564106417eb, crossing-6644faf065db, crossing-778f06209d30, crossing-868cd72fc737, crossing-9eea764fde61, crossing-c9cacdc51c5b, shared-corridor-ea625bfc9e95.

Evaluate grade-separated crossings, shared four-track civil footprints or separate deck levels, and bounded platform/concourse/access complexes with the station authority. Freeze actual vertical profiles and gradients before selecting supports and ordinary spans. Preserve rail/PSD/egress/waterproofing/earthing interfaces. Proposed residential infill sites on this line require station/approach structures and revised service, fleet, power and full installed prices; they are not existing paid journeys.

Candidate infill IDs: infill-line-2-022000, infill-line-2-032000, infill-line-2-046500.

# Inspection, handover and programme

Use the foundation/production/lift/connection/concealed-work hold points from the master ITP. Capture installed component IDs, geometry, tests, personnel/equipment authority, NCR disposition and signed stage release. Update actual shift cycles, losses, stocks and resource reservations; do not infer an opening date from bay throughput. Station/special/track/energy/depot/fleet/testing/approval releases close the whole line. Unknown ground quantities, installed costs and dates stay unknown.

Integrated master package · Interactive support/junction inspection.

# line-3 — foundation and assembly construction plan

Repository source: `engineering/network-planning/baghdad/line-3-construction-plan.md`

Line-specific design-development package; survey, ground, supplier and staged-load releases are still required.

Route length 49.496 km. 932 unique proposed support packets; 863 identified catalogue bay assemblies and 29 special packages. Each ordinary bay has two named beam components and both foundation parents. The 25 m average is a sizing basis; actual Pi20/Pi25/closure geometry controls installation.

| Front | Launcher | Previous asset assignment | Direction | Initial assembly chainage m | Bay assemblies |
|---|---|---|---|---|---|
| line-3-front-1 | launcher-05 | initial mobilisation | 1 | 3436.5 | 431 |
| line-3-front-2 | launcher-06 | initial mobilisation | -1 | 48187.4 | 432 |

## Foundation workface plan

Filter the foundation register by `line-3`. For every support, verify the proposed coordinate/chainage, rights, utilities and the referenced desktop sample; commission field ground, groundwater, durability and load investigations. Review shallow footing, bored shaft, driven bent and pile-group alternatives against actual ground, axial/lateral/settlement/scour and construction loads. Desktop topsoil does not select a pile depth, count or allowable bearing pressure.

Release trial and working-platform design (F1), install the selected foundation with actual geometry/material/installation records (F2), then verify integrity/load/settlement/dimensions and close the foundation packet (F3). Construct/erect column and cap with independently checked connections/temporary restraint (P0). Survey and inspect bearings, strength and the next launcher/beam/delivery stage before support release (B0). Keep 10–15 consecutive bays of accepted supports and beam stock ahead only where the run and storage permit.

## Directed assembly and logistics sequence

Before mobilisation, release the predecessor asset assignment and its dismantle/transport/recommission package. The positive front installs toward increasing chainage; the negative front starts at its high-chainage end and installs backward. Factory/dispatch plans must follow this directed sequence, not the ascending raw span register. A foundation used by two bays is one packet; it is not built or priced twice.

For each front, identify the first complete run, permitted delivery/assembly site, temporary support/ground platform, configured plant and authorised shift/crew. Reserve both beam travellers, transport/receiving equipment, an operator, required riggers, lift supervision and inspection. Verify source strength, complete mass/CG, lifting points, rigging, bearings, weather limits and contingency landing/recovery before any lift.

Both support B0 packets and beam receiving H1 records precede E0. Place and restrain beam 1 (E1); then place/securing beam 2 (E2). Survey and accept connection/strength/bearings/NCRs (E3), release advance loads and the next supports before moving the launcher (E4), then complete walkways/barriers/waterproofing/drainage/track interface and following-trade handover (E5). The next bay depends on the preceding advance release. Following trades may overlap only with protected, agreed load/access boundaries.

Run boundaries, stations and specials require a passage or dismantle/transport/reassembly/recommission package. No discontinuity becomes an assumed launchable gap. Junction-affected orders remain on a design hold until J2 freezes the profile, clearance, support/cap geometry and staged-load/utility/access design. A physical crossing does not create a rail switch.

# line-5 — foundation and assembly construction plan

Repository source: `engineering/network-planning/baghdad/line-5-construction-plan.md`

Line-specific design-development package; survey, ground, supplier and staged-load releases are still required.

Route length 47.345 km. 952 unique proposed support packets; 874 identified catalogue bay assemblies and 35 special packages. Each ordinary bay has two named beam components and both foundation parents. The 25 m average is a sizing basis; actual Pi20/Pi25/closure geometry controls installation.

| Front | Launcher | Previous asset assignment | Direction | Initial assembly chainage m | Bay assemblies |
|---|---|---|---|---|---|
| line-5-front-1 | launcher-09 | initial mobilisation | 1 | 656.6 | 437 |
| line-5-front-2 | launcher-10 | initial mobilisation | -1 | 46242.5 | 437 |

## Foundation workface plan

Filter the foundation register by `line-5`. For every support, verify the proposed coordinate/chainage, rights, utilities and the referenced desktop sample; commission field ground, groundwater, durability and load investigations. Review shallow footing, bored shaft, driven bent and pile-group alternatives against actual ground, axial/lateral/settlement/scour and construction loads. Desktop topsoil does not select a pile depth, count or allowable bearing pressure.

Release trial and working-platform design (F1), install the selected foundation with actual geometry/material/installation records (F2), then verify integrity/load/settlement/dimensions and close the foundation packet (F3). Construct/erect column and cap with independently checked connections/temporary restraint (P0). Survey and inspect bearings, strength and the next launcher/beam/delivery stage before support release (B0). Keep 10–15 consecutive bays of accepted supports and beam stock ahead only where the run and storage permit.

## Directed assembly and logistics sequence

Before mobilisation, release the predecessor asset assignment and its dismantle/transport/recommission package. The positive front installs toward increasing chainage; the negative front starts at its high-chainage end and installs backward. Factory/dispatch plans must follow this directed sequence, not the ascending raw span register. A foundation used by two bays is one packet; it is not built or priced twice.

For each front, identify the first complete run, permitted delivery/assembly site, temporary support/ground platform, configured plant and authorised shift/crew. Reserve both beam travellers, transport/receiving equipment, an operator, required riggers, lift supervision and inspection. Verify source strength, complete mass/CG, lifting points, rigging, bearings, weather limits and contingency landing/recovery before any lift.

Both support B0 packets and beam receiving H1 records precede E0. Place and restrain beam 1 (E1); then place/securing beam 2 (E2). Survey and accept connection/strength/bearings/NCRs (E3), release advance loads and the next supports before moving the launcher (E4), then complete walkways/barriers/waterproofing/drainage/track interface and following-trade handover (E5). The next bay depends on the preceding advance release. Following trades may overlap only with protected, agreed load/access boundaries.

Run boundaries, stations and specials require a passage or dismantle/transport/reassembly/recommission package. No discontinuity becomes an assumed launchable gap. Junction-affected orders remain on a design hold until J2 freezes the profile, clearance, support/cap geometry and staged-load/utility/access design. A physical crossing does not create a rail switch.

Freeze actual vertical profiles and gradients before selecting supports and ordinary spans. Preserve rail/PSD/egress/waterproofing/earthing interfaces. Proposed residential infill sites on this line require station/approach structures and revised service, fleet, power and full installed prices; they are not existing paid journeys.

Candidate infill IDs: infill-line-5-028000, infill-line-5-011000, infill-line-5-019500, infill-line-5-016000, infill-line-5-005500, infill-line-5-009500, infill-line-5-023000.

# Inspection, handover and programme

Use the foundation/production/lift/connection/concealed-work hold points from the master ITP. Capture installed component IDs, geometry, tests, personnel/equipment authority, NCR disposition and signed stage release. Update actual shift cycles, losses, stocks and resource reservations; do not infer an opening date from bay throughput. Station/special/track/energy/depot/fleet/testing/approval releases close the whole line. Unknown ground quantities, installed costs and dates stay unknown.

Integrated master package · Interactive support/junction inspection.

# line-6 — foundation and assembly construction plan

Repository source: `engineering/network-planning/baghdad/line-6-construction-plan.md`

Line-specific design-development package; survey, ground, supplier and staged-load releases are still required.

Route length 52.503 km. 974 unique proposed support packets; 846 identified catalogue bay assemblies and 60 special packages. Each ordinary bay has two named beam components and both foundation parents. The 25 m average is a sizing basis; actual Pi20/Pi25/closure geometry controls installation.

| Front | Launcher | Previous asset assignment | Direction | Initial assembly chainage m | Bay assemblies |
|---|---|---|---|---|---|
| line-6-front-1 | launcher-11 | initial mobilisation | 1 | 20.0 | 423 |
| line-6-front-2 | launcher-12 | initial mobilisation | -1 | 46777.2 | 423 |

## Foundation workface plan

Filter the foundation register by `line-6`. For every support, verify the proposed coordinate/chainage, rights, utilities and the referenced desktop sample; commission field ground, groundwater, durability and load investigations. Review shallow footing, bored shaft, driven bent and pile-group alternatives against actual ground, axial/lateral/settlement/scour and construction loads. Desktop topsoil does not select a pile depth, count or allowable bearing pressure.

Release trial and working-platform design (F1), install the selected foundation with actual geometry/material/installation records (F2), then verify integrity/load/settlement/dimensions and close the foundation packet (F3). Construct/erect column and cap with independently checked connections/temporary restraint (P0). Survey and inspect bearings, strength and the next launcher/beam/delivery stage before support release (B0). Keep 10–15 consecutive bays of accepted supports and beam stock ahead only where the run and storage permit.

## Directed assembly and logistics sequence

Before mobilisation, release the predecessor asset assignment and its dismantle/transport/recommission package. The positive front installs toward increasing chainage; the negative front starts at its high-chainage end and installs backward. Factory/dispatch plans must follow this directed sequence, not the ascending raw span register. A foundation used by two bays is one packet; it is not built or priced twice.

For each front, identify the first complete run, permitted delivery/assembly site, temporary support/ground platform, configured plant and authorised shift/crew. Reserve both beam travellers, transport/receiving equipment, an operator, required riggers, lift supervision and inspection. Verify source strength, complete mass/CG, lifting points, rigging, bearings, weather limits and contingency landing/recovery before any lift.

Both support B0 packets and beam receiving H1 records precede E0. Place and restrain beam 1 (E1); then place/securing beam 2 (E2). Survey and accept connection/strength/bearings/NCRs (E3), release advance loads and the next supports before moving the launcher (E4), then complete walkways/barriers/waterproofing/drainage/track interface and following-trade handover (E5). The next bay depends on the preceding advance release. Following trades may overlap only with protected, agreed load/access boundaries.

Run boundaries, stations and specials require a passage or dismantle/transport/reassembly/recommission package. No discontinuity becomes an assumed launchable gap. Junction-affected orders remain on a design hold until J2 freezes the profile, clearance, support/cap geometry and staged-load/utility/access design. A physical crossing does not create a rail switch.

# line-9 — foundation and assembly construction plan

Repository source: `engineering/network-planning/baghdad/line-9-construction-plan.md`

Line-specific design-development package; survey, ground, supplier and staged-load releases are still required.

Route length 97.684 km. 2,423 unique proposed support packets; 2,280 identified catalogue bay assemblies and 61 special packages. Each ordinary bay has two named beam components and both foundation parents. The 25 m average is a sizing basis; actual Pi20/Pi25/closure geometry controls installation.

| Front | Launcher | Previous asset assignment | Direction | Initial assembly chainage m | Bay assemblies |
|---|---|---|---|---|---|
| line-9-front-1 | launcher-17 | initial mobilisation | 1 | 0.0 | 1140 |
| line-9-front-2 | launcher-18 | initial mobilisation | -1 | 97660.1 | 1140 |

## Foundation workface plan

Filter the foundation register by `line-9`. For every support, verify the proposed coordinate/chainage, rights, utilities and the referenced desktop sample; commission field ground, groundwater, durability and load investigations. Review shallow footing, bored shaft, driven bent and pile-group alternatives against actual ground, axial/lateral/settlement/scour and construction loads. Desktop topsoil does not select a pile depth, count or allowable bearing pressure.

Release trial and working-platform design (F1), install the selected foundation with actual geometry/material/installation records (F2), then verify integrity/load/settlement/dimensions and close the foundation packet (F3). Construct/erect column and cap with independently checked connections/temporary restraint (P0). Survey and inspect bearings, strength and the next launcher/beam/delivery stage before support release (B0). Keep 10–15 consecutive bays of accepted supports and beam stock ahead only where the run and storage permit.

## Directed assembly and logistics sequence

Before mobilisation, release the predecessor asset assignment and its dismantle/transport/recommission package. The positive front installs toward increasing chainage; the negative front starts at its high-chainage end and installs backward. Factory/dispatch plans must follow this directed sequence, not the ascending raw span register. A foundation used by two bays is one packet; it is not built or priced twice.

For each front, identify the first complete run, permitted delivery/assembly site, temporary support/ground platform, configured plant and authorised shift/crew. Reserve both beam travellers, transport/receiving equipment, an operator, required riggers, lift supervision and inspection. Verify source strength, complete mass/CG, lifting points, rigging, bearings, weather limits and contingency landing/recovery before any lift.

Both support B0 packets and beam receiving H1 records precede E0. Place and restrain beam 1 (E1); then place/securing beam 2 (E2). Survey and accept connection/strength/bearings/NCRs (E3), release advance loads and the next supports before moving the launcher (E4), then complete walkways/barriers/waterproofing/drainage/track interface and following-trade handover (E5). The next bay depends on the preceding advance release. Following trades may overlap only with protected, agreed load/access boundaries.

Run boundaries, stations and specials require a passage or dismantle/transport/reassembly/recommission package. No discontinuity becomes an assumed launchable gap. Junction-affected orders remain on a design hold until J2 freezes the profile, clearance, support/cap geometry and staged-load/utility/access design. A physical crossing does not create a rail switch.

# Initial bay packages

| Front | Sequence | Span | Product | Foundation A | Foundation B | Prior span |
|---|---|---|---|---|---|---|
| line-9-front-1 | 1 | line-9-run-0001-span-0001 | OSR-Pi25 | FND:line-9-support-000000000000 | FND:line-9-support-000000025000 | mobilisation |

The compressed span register provides the full sequence, individual beam IDs, predecessors and junction holds. Stage library supplies the method dependencies. Front package lists every assigned span and actual disconnected working interval.

# Junctions, stations and residential interfaces

Coordinated structural interface IDs on this line: crossing-1c3badfbb529, crossing-1fc40bbf9e02, crossing-3ba74f14bd23, crossing-4e4707f7a13b, crossing-526dbc821706, crossing-532e0b6bb63c, crossing-6644faf065db, crossing-80b4593a8386, crossing-86eb625bd399, crossing-92b255c18da1, crossing-954a77cefa6e, crossing-a79096d48aef, crossing-c15126eb0d40, crossing-c4ea0b93414e, crossing-c6c859f1b2b3, crossing-c7d529a495dc, crossing-d02bcca1ecd2, shared-corridor-481ca8ac8acb, shared-corridor-5c1c3ab579e9.

Evaluate grade-separated crossings, shared four-track civil footprints or separate deck levels, and bounded platform/concourse/access complexes with the station authority. Freeze actual vertical profiles and gradients before selecting supports and ordinary spans. Preserve rail/PSD/egress/waterproofing/earthing interfaces. Proposed residential infill sites on this line require station/approach structures and revised service, fleet, power and full installed prices; they are not existing paid journeys.

Candidate infill IDs: infill-line-9-014500, infill-line-9-012000, infill-line-9-087500, infill-line-9-079000, infill-line-9-073500, infill-line-9-092000, infill-line-9-023000, infill-line-9-075000.

# Inspection, handover and programme

Use the foundation/production/lift/connection/concealed-work hold points from the master ITP. Capture installed component IDs, geometry, tests, personnel/equipment authority, NCR disposition and signed stage release. Update actual shift cycles, losses, stocks and resource reservations; do not infer an opening date from bay throughput. Station/special/track/energy/depot/fleet/testing/approval releases close the whole line. Unknown ground quantities, installed costs and dates stay unknown.

Integrated master package · Interactive support/junction inspection.

# Residential network additions across the catalogue

Repository source: `engineering/network-planning/catalogue/README.md`

Controlled planning inventories and actual emitted-station population accounting; field and operating release remain open.

All 266 city designs have a source-bound expansion/evaluation package. 234 inventories contain added lines. Native population evidence is available for 247 and unavailable for 19.

0 city inventories reach their 80% working station-circle target; every remaining gap is reported. The target is not declared met from proposed sites or a demand score.

The city register records original/current line counts, added route quantities and actual station-circle fractions. The country register counts city programmes and reports the median city fraction; it is not national resident coverage. Population is never summed across potentially overlapping city bboxes. Recorded jurisdiction/source conflicts retain their explicit review gates.

Use each city alignment directory for immutable original design bytes, priority cells, common corridor connections, controlled terminal changes, native site/geometry reviews and actual emitted coverage. Country wages, fleet, depot, production, energy and finance models remain local. No Baghdad financing mix is transferred to another country.

Construction quantities, finite machine queues and line-opening dependencies follow the changed inventory. Public money, land, utilities, ground design, profiles, accessible walking routes, suppliers, prices, qualified workers and independent acceptance remain separate releases. These retained 2020 circles are not current census, observed passengers, funded feeder service or safe walking catchments.

Regeneration method · Sources and complete city results

# Operations Management: Planning, Field Work And Exchange

Repository source: `engineering/operations/README.md`

This implements the six functions identified in the commercial/open-source review. The code runs in the existing authenticated integration gateway and is available through Workbench  Service & field work. Its outputs are management plans and execution evidence; railway command, work-start permission, inspection and handback remain with their existing authorities.

| Review item | Implemented behaviour | Important scope |
|---|---|---|
| 1. Network/resources/possessions | Explicit directed physical edges and paths; track, platform, junction, depot and charger capacities; occupation/headway sweeps; time-bounded possessions; departure and path choices | A passenger interchange does not create a physical crossover. Resources and route connectivity must be supplied and reviewed. |
| 2. Fleet and coordinated recovery | Revenue and positioning/deadhead legs, charger reservations and energy reserves, fixed inspection/maintenance windows and deadlines; combined track/train/charger/staff recovery | Bounded service/train search uses a declared positioning and charging policy. It reports exhaustion and does not claim unrestricted global fleet optimality. |
| 3. Staff roster optimisation | Weighted coverage, previous-assignment preference and workload balancing; explicit OCC, station, maintenance, depot, cleaning, emergency and optional driver roles; competence expiry/revocation, availability, travel, rest, duty-hour/shift-span and break limits | GoA4 services do not invent a driver duty. Results are proposed rosters; native employment, permissions and execution gates still apply. |
| 4. Offline field execution | Assigned, expiring work packs; embedded instructions and typed/unit-qualified readings; hashed PNG/JPEG photos; lookup QR/asset filtering; persistent IndexedDB queue and offline shell; idempotent gateway/ERP delivery | Reconnection checks planning/engineering revision, installed serial, assignment and revocation. Native ERP re-resolves Task, Employee, method and allocation state; receipts await independent inspection. |
| 5. Reliability and RUL | Controlled fault codes; kilometre/cycle exposure and approved resets; failure cohorts, MDBF/MTTR and period trends; linear degradation estimates, residual sensitivity and held-out validation | Missing exposure produces unknown MDBF. No failures produces observed failure-free exposure, not infinity. A forecast needs matching units/family and separately held-out assets; false-alert, missed-failure, error and lead-time gates precede maintenance-review recommendations. |
| 6. Operational exchange | Source-bound operational JSON import/export with topology, possessions, timetables, fleet and roster; GTFS timetable import/export; binary GTFS-Realtime trip updates/cancellations; configured reversible country/operator identity adapters | Imported passenger timetables require physical path mapping. Changed stop patterns require a reviewed replacement static feed. The existing railML geometry subset remains limited; this is not full railML timetable/signalling conformance. |

## Reproduce The Pilot

The package is an explicitly synthetic simulation fixture, not surveyed Samawah infrastructure, real staff or commissioned assets. The combined disruption closes the direct track, removes T2 and W1, and disables the first destination charger. The revised plan retains all three services, uses the connected alternative route and backup charger, and assigns replacement staff. Inspection remains in the fleet diagram.

```
python3 -m pip install -r engineering/operations/test-requirements.txt
python3 tools/automation/operations-pilot.py --check
python3 tools/automation/operations-pilot.py
python3 -m pytest -q tools/automation/tests/test_operations_management.py tools/automation/tests/
test_field_operations_native.py
node deployment/workbench/tests/verify-operations.mjs
```

The CLI writes normal/recovery plans, operational JSON, GTFS ZIP and trip-update protobuf to `build/operations-pilot/`. The browser test starts its own gateway and Workbench on separate ports, downloads a revised feed, records readings/photo offline, reloads offline, then reconnects the durable queue. Its report explicitly records that native ERP delivery is not exercised by that isolated browser test. Python intake tests exercise native orchestration with controlled record doubles; a real operator/site must verify the provisioned native workflow after migration.

For an isolated interactive workspace:

```
python3 tools/automation/operations-pilot.py --serve
```

Open http://127.0.0.1:8197/docs/operating/operations/ and use the appropriate role credential from the private `build/operations-pilot/credentials.json` file. This workspace uses its own SQLite database and does not alter an installed city stack. Its work pack is test evidence; no ERP worker runs in this isolated server.

## Controlled Inputs And API

The contracts validate `osr-operations/1`. All intervals are integer seconds relative to a timezone-qualified epoch, with a declared horizon of at most 14 days. The bounded contract permits up to 80 service requests, 100 trains and 200 workers; search has an explicit node budget of at most 100,000. These are bounded planning limits, not a demonstrated production scale or solve-time commitment.

Supply known nodes/coordinates and directed edges with durations, energy and physical resource IDs; connected path alternatives; service/departure choices; train location, charge/reserve, route compatibility and maintenance deadline; chargers

and fixed fleet jobs; assessed staff competencies, validity windows and local rest/travel/break policies. An inspection can explicitly extend the declared maintenance deadline. The input is an engineering snapshot, not a live permit.

The gateway endpoints are `/operations/<action>`; Workbench forwards the same allowlist at `/api/operations/<action>`. Every request requires an explicit bearer credential and authorised city/environment. Browser writes also require the Workbench origin. View-role selectors do not grant credentials or authority.

| Method / action | Caller / result |
|---|---|
| GET `baseline`, `plan`, `export` | Scoped reads; exports reject stale plans |
| POST `baseline` | Engineer; validated package and compare-and-swap `expected` hash |
| POST `plan` | Engineer/operator/maintainer; expected baseline plus optional possessions/unavailable trains/workers |
| POST `work`, `revoke` | Engineer; issue or revoke a reviewed work pack |
| GET `work`, `field-events` | Technician sees their own records; engineer/operator sees scoped records |
| POST `complete` | Assigned maintainer; typed event queues native evidence exactly once |
| POST `analytics`, `calibrate`, `forecast` | Scoped management analysis; source hashes and validation outcomes retained in gateway audit |
| POST `import`, `import-gtfs` | Engineer; review-only import without changing the baseline |
| POST `operator-exchange` | Provisioned, accepted adapter; unknown or ambiguous mappings rejected |

A work-pack issue supplies `id`, city/environment, `asset_id`, `assigned_to`, `method_revision`, `erp_task`, `erp_asset`, current `native_modified`, `expires_at`, `requires_photo`, and reading definitions. Each reading names a kind and required flag; numeric readings also name exact units and finite bounds. `instructions` can carry issued plain-text method instructions for offline use. Server-controlled baseline/revision/serial/hash fields are added at issue, not accepted from callers. A lookup QR is `osr://asset?city=<city>&environment=<environment>&id=<asset-id>`; it selects an existing assigned work pack and establishes no new physical binding.

Offline completion status is always `performed-awaiting-inspection`. A 409 conflict retains device evidence for review; it never overwrites a newer work pack. The ERP outbox retries transport/server failures; permission, scope and revision rejection is terminal and requires refreshed work. Lost replies return the original receipt.

# Native ERP And Operator Configuration

Normal app install/migration creates the immutable OSR Field Execution DocType. The adapter intake uses the existing private `osr_integration_users` scope policy and native document permissions. An administrator must provision `osr_field_technicians`, mapping each gateway subject to its actual native `user` and `employee`. The user must have an open native ToDo assignment to the already Working Task. Task/asset/method and engineering revision, employee/company, serial and current allocation gates must match. Intake stores private photo attachments and an immutable receipt without completing/submitting the Task or granting railway handback. Generic Desk/REST writes cannot forge or alter an intake receipt.

Gateway configuration may contain `operations_adapters`, keyed by adapter ID. Each `osr-operator-adapter/1` profile names country, operator, revision, accepted review record, authorised cities/environments and a one-to-one `identities` map. There are no fabricated PKP PLK, ARTC or other national-system endpoints. A real transport/schema adapter and national/operator acceptance remain deployment work.

A predictive-model study supplies measured/synthetic provenance in its own controlled input records, rising-degradation units/family, threshold, warning horizon and error/false-alert/lead-time limits. Training and held-out asset IDs must be disjoint; observed non-failure cohorts must cover the warning horizon. Validation can fail or return insufficient data. Even a passing research model is marked uncommissioned and cannot automatically issue a maintenance order. The residual sensitivity band is not a calibrated statistical confidence interval.

# Evidence And Remaining Deployment Work

The source-bound pilot review retains the actual combined recovery checks and hashes; regenerate it with `operations-pilot.py --review`. Code and negative tests cover all six management functions. The fixture is a software demonstration. Real topology/resources, calibrated running times and energy, approved labour policies, operator master data, issued methods/permits, measured condition histories, native-site acceptance, support and security configuration remain deployment inputs. The first adoptable product and existing operating acceptance retain their separate commissioning and railway-authority boundaries.

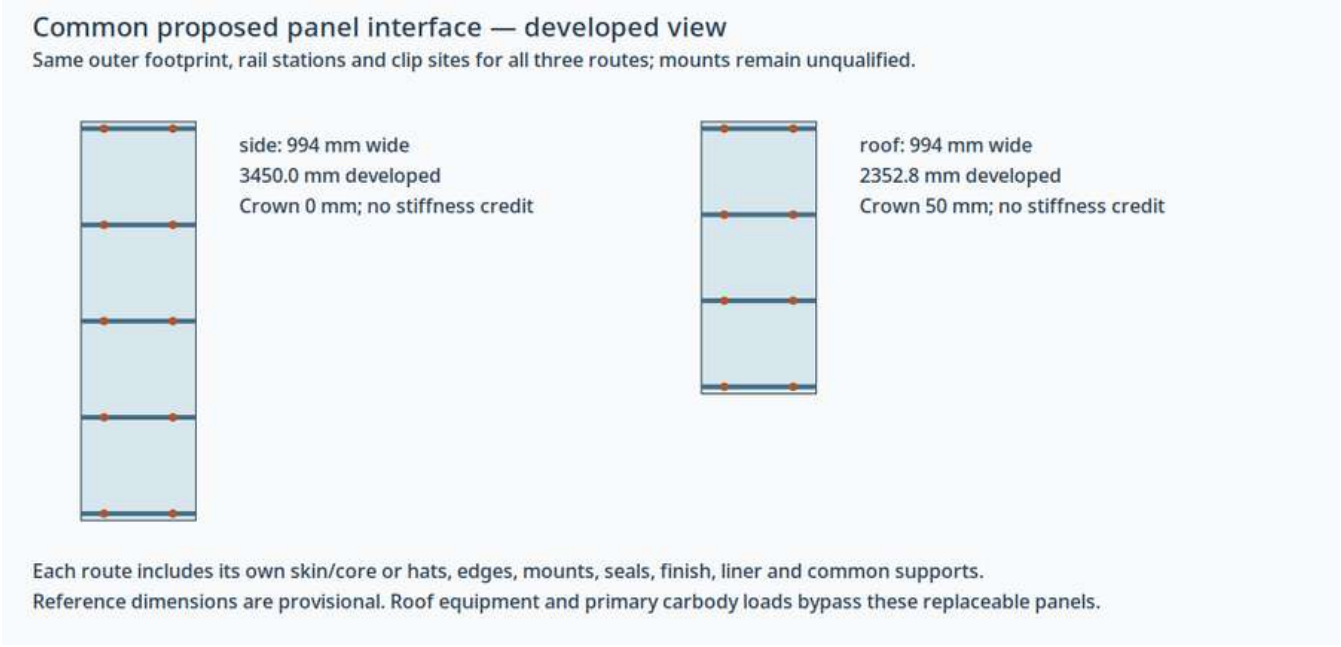
The passenger formats follow the primary GTFS schedule and GTFS-Realtime references; protobuf output is independently decoded with the official MobilityData bindings. Full railML timetable exchange remains a distinct extension rather than an implied capability of OSR's existing geometry export.

# Replaceable body-panel material benchmark

Repository source: `engineering/panel_materials/reference/README.md`

Aluminium is the reference hypothesis for straightforward removable panels. GFRP remains an alternative for curved ends, fairings and roofs. Primary carbody structure is a separate design decision.

172 generated side/roof hypotheses compare stiffened aluminium, aluminium sandwich and GFRP sandwich. No engineering-eligible or released design is selected. This standalone reproducible benchmark does not change the adopted train BOM, price, mass or the qualified background runner.



Proposed common panel interface

All candidate definitions/results · Comparison CSV · Common interface contexts · Summary · Prepared RFQ · Sources and British manufacturing shortlist

| Location | Route | Installed kg | Deflection mm | Conduction R m²K/W | Four provisional screens |
|---|---|---|---|---|---|
| side | stiffened-aluminium | 63.07 | 2.84 | 1.047 | Conditional pass |
| side | aluminium-sandwich | 80.46 | 0.76 | 1.044 | Conditional pass |
| side | gfrp-sandwich | 46.20 | 3.34 | 0.631 | Conditional pass |
| roof | stiffened-aluminium | 49.48 | 2.67 | 0.922 | Conditional pass |
| roof | aluminium-sandwich | 62.03 | 0.68 | 0.918 | Conditional pass |
| roof | gfrp-sandwich | 55.48 | 1.30 | 1.219 | Conditional pass |

For each location/route, the table shows minimum installed mass meeting the four provisional screens; if none does, it shows the lowest-deflection diagnostic. Candidate IDs and exact selection reasons are in summary.json. A failed diagnostic is never promoted.

All routes use the same developed footprint, proposed rails/clip sites, actual rail span, 2 kPa editable pressure and 5 mm deflection screen. These are research assumptions, not approved railway loads or acceptance limits. Roof curvature earns no membrane stiffness. Solid bays are screened; door/window cutouts and compound-curved ends need their own matched generators. The historical 144-module three-car inventory is not a six-car quantity or a new mass estimate.

Installed inventory includes skins, core/insulation, solid edge closures or returns, hats where used, potting/inserts or backing plates, clips, independent retention, seals, finish, a common provisional liner allowance and the same actual steel rails/brackets/fasteners. The parent structural frame and equipment are excluded equally. Folded returns use ideal mitered strip lengths; bend allowances and mount geometry need manufacturing CAD. Complete rail fire performance of the liner and entire stack remains unknown.

The folded-sheet screen adds local skin bending between hats to global face/hat strip bending. Full face effectiveness, perfect hat attachment and simple supports are ideal assumptions; fastener slip, shear deformation, local buckling, joints, strength and fatigue remain open. Sandwich screens assume perfect bonds; laminate ABD is retained for GFRP. Sensitivity factors are deliberately material-specific and uncalibrated, not measured hot/wet or temperature allowables.

Conduction is screened separately from bending against an editable 0.6 m²K/W review threshold. The original continuous-metal details retain their failed thermal screens. New aluminium variants add a continuous rear insulation layer

with explicit steel through-pin heat paths, mass and depth. These are proposed thermally broken constructions, not selected attachment systems. No cost or assembly-speed superiority follows from these results. The inherited H60/H80/H100 cores retain their 70°C datum against the 85°C roof hypothesis. Additional AIREX T90.100 variants use the manufacturer's100°C long-term thermal-stability datum and coupled grade properties. This is not a complete-stack service allowable: adhesive, skin/resin, liner, seal, attachment creep and fire applicability all remain held. The supplier explicitly makes sandwich fire performance dependent on the particular design.

British manufacture is prioritised case by case: Esprit Photon 5G for a quoted metal-cutting configuration; Blackman & White Genesis-Z/Genesis-V for fibre/core kit preparation. Their manufacturers state UK manufacture; that is not proof of every component origin, Iraqi support or process fitness. A brake/rolling machine, cure/infusion cell and trim/extraction cell remain unselected. Tiderock is a rail-composite technical partner enquiry, not a panel approval. The side bay exceeds a 3 m table before trim margins; confirm a larger bed or qualified indexed operation. No supplier has been contacted.

The RFQ requires identical issued interfaces/quantities and complete installed scope: material, labour, tooling, cure/energy, scrap/rework, fixtures, qualification, maintenance and replacement. Annual volume, good output per shift, local labour, tooling amortisation, price and replacement time are unknown and remain null. Use first-article coupons, joint/insert specimens and pressure/heat/fire/retention rigs to replace assumptions before any cost winner or installed release.

Run `.venv/bin/python tools/automation/panel-material-study.py`; use `--check` to reproduce source/output hashes. The assembly runner now executes a registered companion panel adapter, with native owned-section exhibits, geometry/manufacturing preflight and independent controls. Its subset geometry does not confirm complete mounts, curved formed roofs, manufacturing tolerances or complete installed assemblies. The exact-source qualification receipt is required before the updated runner executes. Existing GFRP plate/CAD evidence remains separate.

Primary technical sources: Hydro rail extrusions, Composites UK process selection, Tiderock rail, Esprit Photon 5G, Blackman & White manufacture, BSI railway fire scope. Core values come from the source-hashed supplier-grade records in the existing development config, with no project calibration claimed.

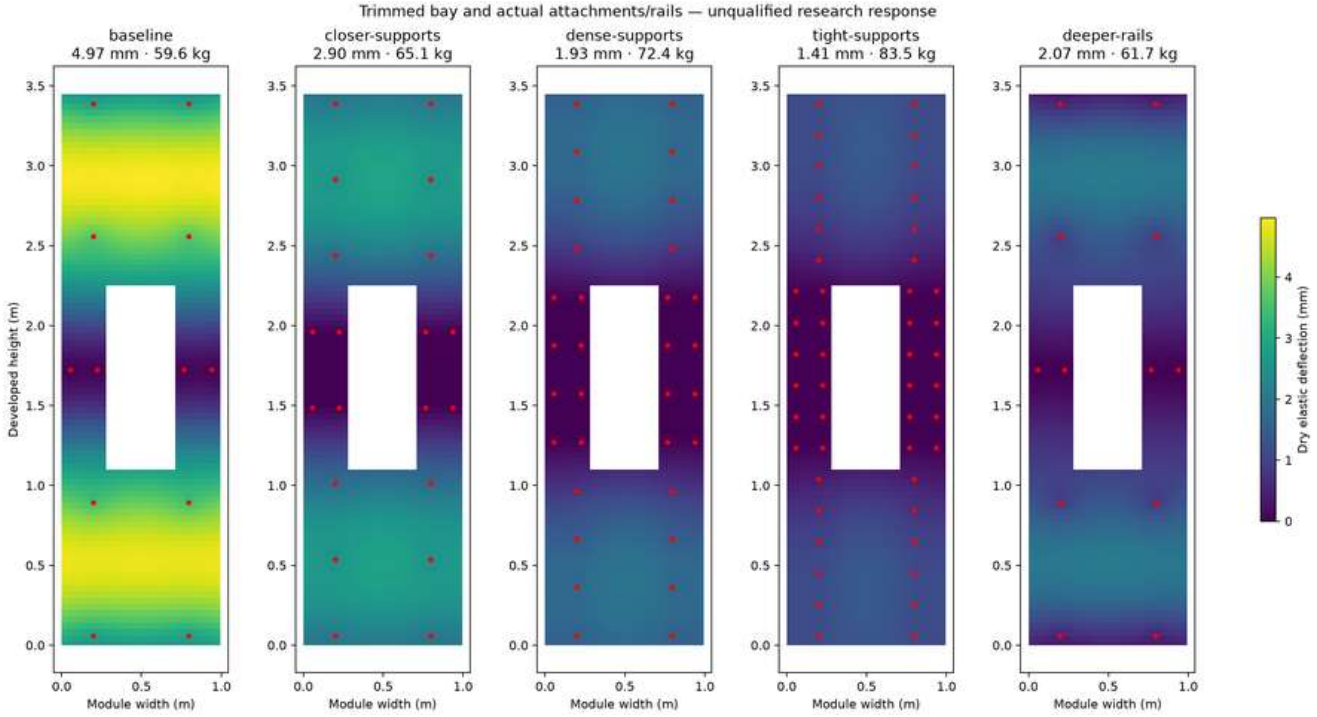
# Clipped panel response refinement

Repository source: `engineering/panel_response/README.md`

This study continues the shared engineering demonstrators with a trimmed flat plate, individual attachments and actual hollow support rails. It addresses global pressure deflection and load sharing. Local contact, pull-out, debonding, fatigue, fire, curved-roof response and measured correlation remain open; no design is released.

The plate reads each manufactured ply's angle, thickness and coordinates, solid edge/aperture lands, core and insert regions from the same contract used by native FreeCAD. A rectangular MITC4 formulation uses mixed edge shear interpolation, with a homogeneous cylindrical plate checked against both an analytical solution and an independently executed CalculiX S8R model. That check verifies the element formulation, not the project laminate or joint properties. The method follows Bathe and Dvorkin's plate formulation; the native solver uses the CalculiX element/input definitions.

Each clip connects to a real rail beam through provisional bolt/potting compliance. Rail bending uses its manufactured hollow-section inertia. Bracket ends are idealised as simply supported, including assumed aperture-frame anchorage. The joint springs are bilateral elastic seeds; actual gaps, friction, peel, pull-out and weld resistance are not established. Bond/finish extensional stiffness is uncredited. Circular insert/bore regions use quadrature within the rectangular mesh; local stresses at those boundaries are not qualified. Membrane-free ABD condensation is a local plate assumption, not a complete membrane/contact model. Material values are dry nominal development inputs at room temperature.



Refined panel deflections

Results compare nominal spacing of 1.0, 0.5, 0.33 and 0.2 m, plus a 40 mm rail-depth alternative at the baseline spacing. The deeper alternative keeps the clip contact plane and moves brackets and the aperture frame behind the new rail depth. Both the geometry and material quantities change. Defined mass excludes the still-unresolved seal/secondary-retention and final connection details.

A 0.35 m proposal was rejected before ranking because two potting regions lacked matching foam subtractions; the retained rejection binds that failure to its proposed geometry. Native volume/overlap checks remain mandatory after this analytical preflight.

Every accepted arrangement is solved at two mesh sizes, at 2 kPa, with softer joint springs, at a separate 3.5 kPa pressure, with every individual clip removed, and with higher pressure combined with the worst clip loss. Exact rank-one updates of the linear system evaluate all loss locations; a direct reassembly independently checks the worst case. Selecting only the most-loaded clip would miss the governing end-attachment loss.

The baseline's dry global deflection is near the 5 mm study limit, while individual clip loss and the pressure holdout expose failures. Closer supports improve deflection but add rails, brackets, fasteners, inserts and inspection work. Deeper rails improve nominal stiffness with a smaller mass increase, but do not resolve the end-attachment loss. The 0.2 m arrangement meets these specified elastic deflection cases with substantially more mass and attachments. This is a conditional research comparison, not a verified railway solution or an optimum. Strength, fatigue, fire, installation access, repair time, supplier pricing and physical tests remain mandatory and unresolved.

Native geometry evidence checks occupied-material volumes, overlap, restored part identities and STEP reimport for all five arrangements. Numerical evidence binds complete meshes, responses, attachment forces, rail reactions, formulation verification and the comparison figure to source hashes. The older train structural failures and roof thermal failure remain unchanged.

Reproduce:

```
.venv/bin/python tools/automation/panel-response-study.py
flatpak run --filesystem="$PWD" --command=FreeCADCmd org.freecad.FreeCAD tools/automation/verify-panel-response-cad.py
.venv/bin/python tools/automation/panel-response-study.py --check
.venv/bin/python -m pytest -q engineering/analysis/tests/test_panel_response.py
```

Use the existing research dependencies, plus Matplotlib for the standalone figure. FreeCAD and CalculiX are required for native evidence. The next refinement requires controlled constitutive/contact data and local joint/edge models before prototype correlation or any physical release.

# Retained panel response study

Repository source: `engineering/panel_response/examples/README.md`

Summary compares five physical arrangements. Manifest binds their definitions, complete meshes, pressure responses, all single-clip-loss envelopes, pressure holdouts, combined loss/pressure cases and softer-joint sensitivities.

Comparison figure displays nominal dry deflection and the actual attachment locations. Native CAD verifies all five arrangements; native formulation verification checks the numerical plate element independently.

The filename prefix identifies the arrangement: `baseline`, `closer-supports`, `dense-supports`, `tight-supports` or `deeper-rails`. The suffix identifies the scenario. Core properties, manufacturing definitions and every response remain unqualified research inputs/results. Follow the parent documentation to reproduce or interpret them.

Manufacturing rejection retains the invalid 0.35 m arrangement's contract. Its potting/core overlap prevents ranking or physical release.

# Native refined panel arrangements

Repository source: `engineering/panel_response/examples/cad/README.md`

Verification checks occupied material, nonoverlap, reopened native identities and STEP volumes against the shared contracts.

| Arrangement | FreeCAD | STEP |
|---|---|---|
| Baseline 1.0 m supports | baseline.FCStd | baseline.step |
| 0.5 m supports | closer-supports.FCStd | closer-supports.step |
| 0.33 m supports | dense-supports.FCStd | dense-supports.step |
| 0.2 m supports | tight-supports.FCStd | tight-supports.step |
| 40 mm deeper rails | deeper-rails.FCStd | deeper-rails.step |

Material/part identities and ply schedules are stored in each native document. All physical/manufacturing-release flags remain false. Proposed contact and frame/weld details require further engineering.

# Independent plate formulation verification

Repository source: `engineering/panel_response/examples/native-benchmark/README.md`

Verification compares the rectangular MITC4 strip against an analytical cylindrical-bending solution and actual CalculiX S8R results. Input, output and solver log retain the native execution.

This homogeneous benchmark validates a numerical formulation within its recorded tolerance; it does not validate the composite's constitutive properties, clips or physical service performance.

# Engineering Toolchain

Repository source: `engineering/toolchain/README.md`

This directory records reproducible inputs for the open-source design and simulation tools selected in `../../docs/engineering-design-simulation-plan.md`.

The installed environments are intentionally not stored in Git:

- FreeCAD, Blender/Bonsai, QGIS, CloudCompare, and SUMO are user Flatpaks;
- Python solvers and APIs use the repository `.venv`;
- EnergyPlus and FDS use versioned user-local directories beneath `${XDG_DATA_HOME:-$HOME/.local/share}/opensource-rail/native/`;
- generated checks and analysis scratch belong under `build/engineering/`.

`tool-manifest.toml` records the adopted releases, distribution channel, license identifier/source, Flatpak commit or binary checksum, and deliberately deferred tools.

RTKLIB is installed user-locally with the optional engineering applications, but remains unused until surveyed-pilot mobilisation because the public repository contains no raw observations. The deterministic `survey_control.py` gate validates controlled receipts and runs `rnx2rtkp` when the frozen deployment binary and real RINEX inputs are present; its automated quality result never records survey approval.

Use the root one-command setup and accept the optional engineering applications when prompted.

Run engineering workflows through the common launcher:

```
./osr engineering --check
./osr engineering --smoke
./osr engineering --baseline-assurance
./osr engineering --benchmarks
./osr engineering --station-ifc
./osr engineering --station-analysis
./osr engineering --flesh-out
./osr engineering --cities --city samawah,songea --jobs 2
./osr engineering --cities --all --generate-only --allow-input-gaps --jobs 8
./osr engineering --cities --all --allow-input-gaps --jobs 2 --resume
```

`python-requirements.txt` pins direct engineering packages and includes the smaller `ifc-python-requirements.txt` used by IFC CI and GUI jobs. The installer also writes a full transitive `pip-freeze.txt` manifest under `build/engineering/toolchain/` so evidence captures the exact environment that ran it.

The Flatpak applications remain independently versioned because they are GUI and desktop toolchains rather than Python library dependencies. The check command captures their installed commits and versions. The one-command installer selects these locations; users do not need to set paths or environment variables.

The smoke check performs calculations rather than import-only checks for IFC creation, an analytical axial bar in OpenSees, a two-bus pandapower load flow, pvlib plane-of-array irradiance, and a short PyBaMM single-particle battery model. It also runs a short SWMM rainfall/runoff fixture and rejects excessive continuity error. `--benchmarks` runs a deterministic JuPedSim normal/constrained station corridor, the all-variant station structure/flow/drainage screens, and a SUMO timetable directly from every Samawah line and station using the scenario's energy-derived dwell times.

`--baseline-assurance` is the fast, tracked regression layer. It executes seven independent analytical forms and verifies LandXML/OSR-ALN units and CRS, IFC source/index identity and finite envelopes, and a versioned duty-cycle projection into battery, grid and traffic rows. Reports are replaced atomically under `engineering/toolchain/`; planning or simulated duty remains explicitly ineligible as measured acceptance evidence. `--station-ifc` exports all seven positive-volume station product structures and checks that every BOM/traveler ID round-trips through IFC. The station analysis executes EnergyPlus and FDS when installed, preserving adverse results as open findings until project-specific climate/fire inputs and mitigations are independently reviewed.

`../analysis/analysis-register.toml` distinguishes planned, screening, calibrated, independently checked, and accepted analyses. Its validator requires review metadata at higher maturity and refuses image-only result artifacts.

## Catalogue-wide city packages

`../../tools/automation/generate-city-engineering.py` discovers `cities/catalogue/*/*/*/design.toml`; it does not maintain a second city list. For every selected city it writes:

- a depot energy inventory and initial-dispatch capacity reconciliation under `engineering/depot-scope/`, with source hashes, PV module area and equipment cost sensitivity; physical placement, installed cost and stabling gates remain open until controlled evidence exists;
- a distributed-station overnight allocation candidate under `engineering/stabling/`, with a local runnable scenario and explicit physical-capacity gates;
- a QGIS/GDAL GeoPackage plus GeoJSON review layers for corridors, stations, civil segments, energy sites, depots and input issues;
- a SUMO node, edge and route deck containing every declared line and station, with edge shapes taken from the canonical corridor GeoJSON;
- pandapower grid-only and coordinated-daylight networks and a pvlib PV-yield envelope, with overload, voltage and per-site import/export limit findings;
- a machine-readable result with source hash, tool version, service arrivals, per-line journey times and explicit input-quality findings;
- a station occurrence map resolving every city station to its shared station variant, product-item count, assembly count, open-release count and IFC template; and
- per-city logs plus an aggregate `batch-summary.json` under `build/engineering/cities/batch-summary.json`.

The generator creates and checks the seven shared station-archetype IFC files once per batch. It also runs the shared station systems package once; identical archetype models and results are referenced by city station occurrences rather than copied thousands of times.

`--generate-only` creates reviewable SUMO decks without launching SUMO; GIS generation and energy screening still run. Use `--skip-gis` or `--skip-energy` to omit those package families. Use `--allow-input-gaps` only for catalogue auditing: findings remain in the summary and `passed` remains false even though generation is allowed to continue. Omitting that flag makes input gaps fail the command. A full solver batch is selected by omitting `--generate-only`. Use `--resume` after an interrupted or partially successful solver batch; it reuses only summaries whose design, corridor, scenario and station-manifest hashes still match and whose simulation, GIS generation, energy design screen and station-product map passed, and the depot-scope source hashes remain current. Transient launcher failures are retried automatically at reduced concurrency.

Samawah and Mosul carry the full pilot evidence scope, with open electrical connection findings; Songea exercises the same code path as a portability check. The generator discovers all 266 canonical designs, and every one currently has the required `<slug>.corridor.geojson` and `<slug>.toml` companions. GIS layers use EPSG:4326. SUMO uses a city-local metric projection for visual geometry while retaining canonical chainage as edge length. Electrical results are planning screens. Transformer sizing uses the greater of installed rectifier input and declared import with 25% headroom; each site's solved HV import/export is independently checked against its declared limit, including transformer and converter losses. `solver_passed` records convergence; `passed` additionally requires no design findings. The screen reports exceedances without changing connection limits, charging demand or export controls. Feeder and utility capacity remain unmodelled. pvlib clear-sky output is an envelope rather than measured weather.

These are screening packages. Surveyed geometry, city demand and dwell calibration, connected interchange/junction topology, road interactions, local climate/fire inputs and competent review cannot be generated from the current catalogue and therefore remain explicitly pending.

The September 2026 provenance review also identifies 264 retained native simulation reports requiring scenario/validator and resilience refresh. Their full-package manifests list the stale sources. Strict README generation continues to reject stale evidence; `osr_scenario.network_readme --allow-stale-evidence` writes an explicitly unverified audit view without changing solver results or package acceptance.

Each checked-in city deliverable uses only two generated subfolders: `engineering/` contains alignment, solver results, simulation, screenshots, and finance validation; `operations/` contains asset, manufacturing, maintenance, QA, and acceptance evidence. Retry logs and scratch results stay under `build/engineering/`.

The same command runs EnergyPlus's `1ZoneUncontrolled` design-day example and the tracked FDS empty-box fixture, then requires each solver's explicit successful-completion marker.

Regenerate depot reconciliation alone with `.venv/bin/python tools/automation/generate-depot-scope.py --all` (or `--design path/to/design.toml`). A successful command means the reports were written; their `passed: false` preserves the unresolved physical/cost/stabling gates. The equipment sensitivity is not applied to city CAPEX.

The distributed station-stabling workflow generates a station/depot plan plus a separate station-only native benchmark. Plans assign two revenue trains per selected station where fleet permits and all remaining stock to storage on its own line. `hybrid_allocation` records inventory, depot stabling positions and usable lengths separately from workshop bays; `allocation_passed` covers inventory and morning direction coverage. The separate `native_hybrid_candidate` records a runnable home-return candidate only where the allocation and same-line depot access permit it. The connected `lib/examples/hybrid-stabling.toml` fixture exercises depot returns and restart through two service cycles; yard geometry and city operating acceptance remain open. Samawah's plan is 40 station trains plus 37/16/15 stored on Lines 1/2/3. Retained canonical scenarios remain source evidence for their existing operations. `generate-stabling-plan.py --all` refreshes the plans; `screen-stabling-plan.py --design path/to/design.toml` builds the native simulator and compares the retained and candidate 01:30–06:00 operations. The combined result now requires both operating behavior and the two-train station-capacity check to pass. Candidates retain the design's spare and cold-reserve counts as parked roles. The replay checks each planned line/station/direction at morning opening and rejects routine reserve departures. Plans compare train lengths and clearances with reference platform berths, leaving actual track availability unverified.

`screen-stabling-cycles.py --design path/to/design.toml --days 2` runs continuous service days without resetting trains or site storage. It checks each following morning by elapsed time, rejects trains outside selected stabling locations and compares observed night allocations with reference platform space. Samawah's two-day holding/restart behavior passes after the departure gate was extended to preserve energy through to the next selected charger. Queues of 18–19 trains fail the two-train capacity gate, so the combined replay fails. The optional `service-cycle-screen.json` is included in package failure and source-drift checks. Neither replay proves daytime headway delivery or outage resilience.

`study-stabling-redistribution.py --design path/to/design.toml` consumes the source-checked continuous replay and its local native CSV. It produces a counterfactual station allocation, explicit transfer routes and nominal charging/time requirements while preserving reserve locations and every planned revenue direction. Samawah's seven-train target remains above a two-train station provision. The optional `redistribution-study.json` remains failed for physical/movement release and is included in package/source checks. It can analyse a replay with passing behavior but failed capacity; this does not waive the capacity gate for either the observed or target allocation.

`screen-hybrid-stabling.py --design path/to/design.toml --days 2` runs the separate native hybrid candidate. It checks explicit homes, station/depot capacity, passenger-service closure and station launch directions. Empty `ReturnToStabling` movements are counted separately from passenger departures. The optional `hybrid-cycle-screen.json` participates in package and source checks. `--analyze-existing` reuses a run only after matching candidate, binary and raw-output hashes. No interline depot connection is assumed.

# Engineering Baseline Assurance

Repository source: `engineering/toolchain/baseline-assurance.md`

> Deterministic software/toolchain regression evidence only. This is not physical validation, design approval, certification, or authority acceptance.

- Overall result: PASS
- Analytical benchmarks: 7
- Interchange checks: 3

## Analytical Benchmarks

| ID | Case | Expected | Actual | Tolerance | Result |
|---|---|---|---|---|---|
| BENCH-STRUCT-001 | cantilever tip displacement | 0.0642857143 m | 0.0642857143 m | 1e-12 | PASS |
| BENCH-THERM-001 | thermal block midpoint | 40 degC | 40 degC | 1e-12 | PASS |
| BENCH-DRAIN-001 | simple drainage mass balance | 33.3333333 m3 | 33.3333333 m3 | 1e-12 | PASS |
| BENCH-ENERGY-001 | one-zone steady-state temperature | 45 degC | 45 degC | 1e-09 | PASS |
| BENCH-ELEC-001 | four-bus terminal voltage | 694.75 V | 694.75 V | 1e-09 | PASS |
| BENCH-EGRESS-001 | corridor evacuation clearance | 85.5384615 s | 85.5384615 s | 1e-09 | PASS |
| BENCH-TIME-001 | one-line timetable traversal | 1050 s | 1050 s | 1e-12 | PASS |

## Interchange Drift

| ID | Contract | Result |
|---|---|---|
| XCHG-ALN-001 | LandXML to OSR-ALN units/CRS/golden round trip | PASS |
| XCHG-IFC-001 | IFC asset identity and finite analysis envelope | PASS |
| XCHG-DUTY-001 | Duty-cycle battery/grid/traffic semantic projection | PASS |

The duty fixture is deliberately marked planning-only. Conversion cannot make it acceptance-eligible; measured data still requires controlled instrumentation and source evidence.

# Retained TLC assurance executable

Repository source: `engineering/toolchain/tla/README.md`

`tla2tools-1.8.0.jar` is the exact executable used by the retained TACS formal evidence and the bounded-model CI job. The filename records the upstream release asset, rather than inferring its internal version: its manifest records TLC 2.0, build 2026-10-04 and source revision `1813307068bbc5759a441df820f3f548948d6b7a`.

| Identity | Value |
|---|---|
| Bytes | 4,500,445 |
| SHA256 | `c2fe4e56e43bde19f213b4a7e441d037297fda733e503579623e859b79348239` |
| Published release SHA1 | `93d304f9c77595c8728c3ad939ed65b7a7149d1e` |

The upstream release published the matching SHA1. On 5 October 2026 its download asset was replaced: the replacement has SHA256 `411ab54221cf0c9fa7ae18f07a3e0ebbdf9e5ba6254b79017e7007f1feb44e89` and manifest revision `610da1d073754ea8e0dd3c2af3eae8011d20191a`. That replacement is not adopted.

CI copies this retained input to its build directory, verifies the original SHA256, then runs the assurance consumer. The verification constant and model remain unchanged. Tool upgrades require verified upstream provenance and a new actual model execution.

License.txt is extracted unchanged from this JAR. Its embedded third-party notices also remain intact. This executable is a reproducible assurance input, not a deployed railway component or physical-release evidence.

# CAD and BIM proposal execution

Repository source: `engineering/twin_workflow/README.md`

Use `tools/automation/twin-completion.py` through `tools/automation/osr-python`. Read the tool review and operating instructions for supported recipes, provider contract, resource budgets and the full completion programme.

The controller accepts data proposals from a configured provider or reviewed JSON files, reconstructs native CAD/BIM and retains actual failures and feedback. It does not itself invoke an LLM unless a provider command is configured. The nine explicit benchmark seeds do not constitute an LLM service.

`init`, `seed`, `submit`, `request`, `run`, `status` and `verify` all require `--workspace`. Initialisation requires a fresh directory. Repeating `run` resumes the queue; changed sources require a new baseline and workspace.

An optional provider is an operator-supplied argv array read from JSON. Its stdin is `osr-twin-agent-request/1`; stdout must be exactly `{"proposals":[...]}` and stderr is retained separately. This is a trusted command with timeout/output controls, not a sandbox. No command is accepted from the proposal itself.

Each `osr-twin-proposal/1` contains `id`, `baseline_sha256`, `kind`, `parameters`, `rationale`, `sources`, `expected_tests` and `schema`, with no extra fields. `submit` accepts an array; the provider response wraps the array in `proposals`. Inputs use strict JSON and supported recipes; source citations do not establish accepted numerical properties. The controller owns test implementation and limits.

`verify --historical` checks retained artifacts without requiring current source bytes. It does not make historical evidence applicable to a changed design.

The state and work orders deliberately have no engineering-approval or physical release setter. All 345 allocated source items and 1,219 inherited requests remain open. Full BOM decomposition, further solver families, target software/HIL, instrumented correlation and authenticated acceptance ingestion are required extensions, specified in the completion programme.

Regression checks:

```
tools/automation/osr-python -m pytest \
  engineering/analysis/tests/test_twin_completion_workflow.py -q
```

# Mechanical Design and Manufacturing

## Design Sources

Repository source: `design/README.md`

This domain contains reusable design logic, not individual city revisions or site-approved engineering.

| Area | Authority | Main outputs |
|---|---|---|
| `city-generation/` | GIS ingestion, demand/buildability rasters, route and station synthesis, scenario generation | Candidate city networks and simulator inputs |
| `component-catalogue/` | Parametric rolling-stock, track, station, depot and reusable civil components | CAD review models, product trees, BOMs and manufacturing templates |

Editable projects are under `../cities/workspaces/`. Published city results are under `../cities/catalogue/`. Federated BIM and engineering validation are under `../engineering/`.

# Parametric Component Catalogue

Repository source: `design/component-catalogue/README.md`

Reusable OpenSourceRail rolling-stock, track, station, and civil-kit components are expressed as parametric Python geometry. Deployment survey, railway alignment, ground conditions, structural release calculations, and the federated civil model have separate authorities.

## Design philosophy

The catalogue is biased toward prefabrication and maintainable mechanical connections. Design choices use three priorities:

1. Reduce bespoke site design. Reusable families and stated planning envelopes reduce repeated work. A competent deployment engineer must still select, adapt, analyse, detail, and release every site-specific application.
2. Minimise site welding and wet work. Bolted steel and precast elements are preferred where the released structural, durability, transport, and construction design supports them. Foundations, closures, reinforcement, grouting, rail welding, and temporary works remain deployment-specific.
3. Design for transport and assembly. Catalogue modules target practical road transport and repeatable erection, but actual vehicle limits, lifting studies, crane selection, temporary works, crew, and programme are released for each deployment.

## What's in scope

| Module | Components |
|---|---|
| `osr_mech.track` | Rail profile (54E1 / 60E1), precast mono-block sleeper, Pandrol-style fastener, assembled track panel |
| `osr_mech.civil` | OSR-Pi20/Pi25 decked beams, special U-girders, OSR-ST6/elevated direct-fixation trackforms, soil/access foundation catalogue, resource production plan, substructures and platform edges (RFC 0011) |
| `osr_mech.station` | Seven station families: precast platform/guideway, platform and auxiliary solar canopies, passenger/MEP/access/charging systems, terminal turnout and main-heavy depot interfaces |
| `osr_mech.rolling_stock` | Car body, bogies, trainsets, doors, batteries, traction/electronics, T-OBS, COTS fit-out and the common service-rail/fastener/fixture system |
| `osr_mech.cad_templates` | Fabrication templates plus supplier-neutral COTS fixture envelopes |

The CAD is an envelope and design-review package, not a homologated production drawing set. It now includes COTS-inspired fixture geometry, rolling-stock systems, and sheet-metal/chassis templates. Remaining production-detail work includes supplier-exact SKUs, weld maps, tolerance stacks, FEA-ready brackets, harness clamp locations, and controlled 2D manufacturing drawings.

Supplier-neutral fixture models intentionally remain generic until a procurement freeze. A selected SKU closes the CAD gap only when its datasheet envelope, mounting keep-outs, service-removal path, and revision are captured in the parametric source and matching drawing register.

The generated station/civil factory and deployment work packages cover all 45 stable product families with 18 controlled drawing/interface IDs. Their readiness register keeps every package open until reusable drawings, exact supplier configurations, site surveys/calculations, tools, tests and named approvals are recorded. The accompanying open-product reference defaults give all 29 unresolved families practical performance values and cost-conscious configurations without pretending that a supplier, site design or authority approval has been selected. Eighteen generated drawing-definition seeds then bind those product/default records to exact drawing ownership, views, source inputs, tools and verification tasks; every seed remains explicitly unissued.

The separate buildable civil catalogue reconciles all 19 deterministic federation types: nine civil-owned geometry types and ten controlled track, station, vehicle, or coordination interfaces. Its six release packages and nine drawing-definition briefs fail closed when an IFC type hash changes. They do not replace project survey, ground, reinforcement/prestress, structural, temporary-works, supplier, test, independent-check, or approval evidence. The civil fabrication and construction controls add repeatable workface sequences, crew/plant allowances, stop conditions and handback records beneath that unchanged release boundary.

## Parametric inputs

Every component takes its parameters from the RFC-level choices the operator has already made in `design.toml`:

- Rolling-stock family  platform length  canopy bay count.
- Track-geometry preset  rail profile + sleeper spacing.

- Station archetype  bay count + facility mast count.
- Civil class (at-grade / elevated / bridge)  ST6 or Pi20/Pi25 product, foundation zone and special-span interface
  - pier spacing or ballast depth.

`design.toml` supplies planning selections to both the Rust pipeline and the component catalogue. It is not the sole source for a deployment: accepted GIS and survey data, OSR-ALN alignment, released analysis and drawings, supplier records, and operational evidence retain their own controlled authorities.

## Canonical Source

The Python CAD source files under `src/osr_mech/` are the design basis. Tracked FreeCAD `.FCStd` files under `models/cad/` are the compact assembly-review artifacts. Neutral CAD exports are local-only scratch files when a supplier specifically asks for them.

The source geometry uses the local `osr_mech.cad` facade. Under `FreeCADCmd` that facade emits native FreeCAD `Part` shapes directly; in ordinary Python it keeps lightweight volume and bounding-box metadata so the unit tests can run without a local FreeCAD install.

For a component-and-system integration review in FreeCAD, run `scripts/freecad_civil_systems_example.sh`. It creates `models/cad/civil-systems-integration-test.FCStd` with reference viaduct, elevated-station, ground-station, turnout, and two complete three-car trainset assemblies plus executable bearing, track-support, platform-height, and clearance checks. Its paired `models/cad/civil-systems-integration-test.json` provides stable asset IDs, transforms, relationships, design-reference operational state, validation results, and a hash of the native model.

Key rolling-stock source entry points:

| Source | Scope |
|---|---|
| `src/osr_mech/rolling_stock/trainset.py` | Trainset family assembly and motorisation |
| `src/osr_mech/rolling_stock/car_body.py` | Concept-aligned layered car body: structure, exterior, interior, HVAC ducts, LV/data, HV/PV, thermal/fire routes |
| `src/osr_mech/rolling_stock/sensor_cowl.py` | Large glass end cowl and T-OBS nose envelope |
| `src/osr_mech/rolling_stock/systems.py` | Doors, batteries, couplers, electronics, charging, sensor packs |
| `src/osr_mech/rolling_stock/bogie/` | Powered and trailer bogie components |
| `src/osr_mech/cad_templates/rolling_stock.py` | Chassis/body sheet-metal templates |
| `src/osr_mech/design_definition.py` | Top-down design-space iteration, scoring, and candidate selection |
| `src/osr_mech/buildable_trainset.py` | Buildable product tree from parts through trainset assemblies |

## Buildable trainset handoff

The buildable trainset generator turns the optimized `light-metro-3car` baseline into a usable manufacturing handoff. It is still pre-release engineering data, but it is structured so a fabricator can start drawing, RFQ, routing, QA, and first-article planning without reverse-engineering the CAD tree.

Generated artifacts live in `catalog/buildable-trainset/`:

| Artifact | Purpose |
|---|---|
| `buildable-trainset-manifest.md` | Product tree: fabricated parts, external components, subassemblies, assemblies, trainset |
| `current-design-buildability-review.md` | Green/yellow/red buildability findings and next closure actions |
| `small-component-standard.md` | Four fastener families, common rail, keyed connectors, modular illumination and serviceable door/window boundaries |
| `exterior-finish-system.md` | Mandatory base protection, rail-use livery film zones, and trial-only CaCO3 radiative roof-coating qualification gates |
| `manufacturing-and-assembly-controls.md` | Ten reference work instructions for datums, steel, joints, bonding/glazing, GFRP, roof, interiors, lifting, finish and NCR handback |
| `manufacturing-control-record-template.json` | Blank per-work-order execution, inspection, stop/NCR and configuration-handback record |
| `first-article-inspection-plan.md` | All 16 factory packages expanded into 416 uniquely identified hold, witness and record-review characteristics |
| `production-data-release-register.md` | Per-product route and 472 fail-closed production-artifact slots across all 62 locally made rows, linked to drawings, tooling, controls and inspection IDs |
| `factory-release-work-packages.md` | Sixteen controlled chassis, body, bogie, door/window, fascia, roof, interior, finish, electrical and recovery drawing/interface work packages |
| `factory-release-readiness.md` | Package-level drawing, product revision, tooling, verification and approval readiness; all 16 remain open |
| `factory-drawings/` | Twenty-nine product-, tooling-, source- and package-bound drafting/checking briefs covering all 62 locally made rows; none is issued for manufacture |
| `mass-budget.md` | Nine-category optimizer subtotal, engineering reserve and controlled planning tare |

| Artifact | Purpose |
| --- | --- |
| mass-closure-ledger.md | Product-level mass responsibility, evidence state, lightweight design-space comparison and recovery-reaction link |
| critical-path.md and factory-plan.md | First-article sequence, labour, work centres, space and machinery planning |
| cots-candidates.md and supplier-anchors.md | Exact catalogue/RFQ candidates and controlled local-equivalent boundaries for all bought-in rows |
| first-article-execution-pack.md and first-article-evidence-status.md | Ordered execution route and fail-closed status for the 13 supplier, analysis, physical-test and mass-properties gates |
| definitions/index.md | Drawing/RFQ seed: JSON + Markdown definition for every product-tree node, including structured material and process specs |
| travelers/index.md | Shop traveler seed: material/process controls, operation routers, labor estimates, tooling IDs, QA gates, approval/signoff blocks |

The generated travelers are intentionally `unsigned-template` records. They are signable manufacturing forms, not already-approved build records; a real build cell must fill approvals, signatures, dates, inspection evidence, and NCR/deviation closure.

# Usage

```
# One-time: install the package in editable mode.
pip install -e .[test]

# From this design/component-catalogue directory, check FreeCAD / Flatpak
# availability and the tracked output locations.
../../tools/automation/freecad-generate.sh --check

# From this design/component-catalogue directory, regenerate every tracked FreeCAD
# review document, FEM screening model, and screenshot set.
../../tools/automation/freecad-generate.sh --all

# Render the two-scene civil/rolling-stock twin and encode the front-page GIF.
../../tools/automation/freecad-generate.sh --digital-twin-animation

# Render the source-linked track/station/viaduct/train production twin.
../../tools/automation/freecad-generate.sh --fabrication-twin

# From this design/component-catalogue directory, iterate the rolling-stock design
# space and then generate the buildable product tree, definitions, and
# unsigned shop travelers.
../../tools/automation/design-iterate.sh
../../tools/automation/buildable-trainset.sh

# Build a FreeCAD review assembly.
# The launcher uses native FreeCADCmd or the FreeCAD Flatpak and handles
# FreeCAD's script argument quirks.
scripts/freecad_trainset.sh --family light-metro-3car

# Build the single-car review assembly; both bogies use the shared
# wheelbase/chassis placement datum.
scripts/freecad_trainset.sh --family urban-shuttle-1car --out models/cad/single-car-assembly.FCStd

# Build chassis/bogie and full-body FreeCAD documents with assembled
# and disassembled/exploded review states, plus geometry-check markdown.
scripts/freecad_assembly_review.sh

# Build the native FreeCAD replacement catalogue for civil, track,
# station, depot, and rolling-stock fabrication-template parts, plus
# at-grade/elevated platform and station-canopy assemblies.
scripts/freecad_catalog.sh

# Run first-pass FreeCAD/CalculiX screening FEA beam models and
# solver-result PNGs for chassis, bogie, and body load cases.
scripts/freecad_fea.sh

# Capture FreeCAD GUI screenshots from the review/FEA documents.
# Uses Xvfb automatically when available and refreshes the stable
# docs/screenshots/freecad/ latest image set.
scripts/freecad_screenshots.sh

# Build and capture FreeCAD station, ballastless track, and rolling-stock
# scene renders for at-grade, elevated, and interchange configurations.
scripts/freecad_station_scenes.sh
```

# Testing

`pytest` validates volumes, masses, overall footprints, and solar-roof area against the published numbers in the RFCs. A geometry test that regresses mass outside ± 1 % fails — the RFC needs updating or the model needs fixing, but the two can't silently diverge.

The buildable-trainset tests also verify that every product-tree node has a definition and shop traveler, that all children/parents resolve, that material/process specs are present, and that traveler operations carry labor, tooling, approval, QA, and signoff fields.

The generated `mass-closure-ledger.json` maps all 120 LM3 product rows into the nine optimizer mass categories without treating simplified envelope geometry as a weighed production solid. It also keeps the lightest existing design-space candidate and its recovery reactions visible as an unpromoted study until production-CAD, supplier, calibrated weighing and weight/balance evidence close the design.

# Handoff to structural engineering

The tracked handoff package is the Python source, FreeCAD `.FCStd` review assemblies, screenshots, and design notes. A deployment partner can generate local neutral CAD exports from the same source if their toolchain requires them, but those exports are not committed because they are bulky and reproducible.

The component docstrings carry common screening cases for early comparison:

- EN 1991-2 rail loading (LM71 × α = 0.83 for light metro).
- Eurocode 8 seismic screening at PGA 0.3 g.
- Wind: 50 m/s basic wind speed (typhoon-class).
- Thermal: ΔT = 70 K for steel, 35 K for concrete.

These values do not establish site suitability or structural capacity. Every deployment must derive its applicable actions, combinations, material data, ground response, fatigue and durability requirements, then release the chosen or adapted family through project calculations and drawings.

# FreeCAD assembly bridge

## FreeCAD MCP bridge

The supported installer provides FreeCAD through Flatpak. An optional MIT-licensed FreeCAD MCP addon/server may be used for interactive local review; restart FreeCAD, switch to the MCP Addon workbench, and start its RPC server before starting an MCP client. The optional repository-local MCP client example is in `../../.mcp.json`; it expects `freecad-mcp` on PATH and uses localhost only with text feedback by default. Machine-specific installation paths belong in the user's local configuration.

The MCP server is an interaction layer, not the design authority. New designs should be added as reproducible FreeCAD source scripts under `src/osr_mech/`, with `.FCStd` files treated as generated review artifacts.

The repository-level entry point is `../../tools/automation/freecad-generate.sh`. It orchestrates the package launchers below so CI, maintainers, and deployment partners can regenerate the same artifacts from one command:

- `--models models/cad/trainset-light-metro-3car.FCStd`
- `--assemblies` assembled/exploded chassis-bogie and body review documents plus `assembly-geometry-review.md`
- `--fem` CalculiX `.inp` / `.dat` / `.frd` study folders, result PNGs, `screening-summary.{md,json}`, and `models/cad/fea-screening-models.FCStd`
- `--screenshots` and `--station-scenes` stable documentation images under `docs/screenshots/freecad/` and `docs/screenshots/stations/`
- `--samawah-line-twin` the full-line FreeCAD/JSON asset twin plus the Blender perspective S5 operations scene, MP4, and README GIF

`osr_mech.freecad_trainset` builds a structured FreeCAD document directly from the parametric source geometry. The resulting `.FCStd` file is a review and handoff assembly: parts are grouped as car bodies, bogies, onboard systems, couplers, platform interfaces, and clearance references, with placements and display colours applied for inspection.

The bridge deliberately does not make FreeCAD the source of truth. Authoritative geometry stays in the Python source; FreeCAD is the compact tracked review format for assembly inspection, drawing generation, and partner mark-up.

# Licence

Apache 2.0 for the Python code. Generated CAD review artifacts under `models/cad/` follow the same open-hardware intent as the rest of the `control-electronics/` tree.

# Generated Mechanical Review Artifacts

Repository source: `design/component-catalogue/catalog/README.md`

This directory contains generated mechanical review artifacts from `design/component-catalogue`. The authoritative designs are the parametric source files under `../src/osr_mech/`. Tracked artifacts are FreeCAD `.FCStd` review documents, FEA screening output, and screenshots referenced from the docs. Neutral CAD interchange exports are local-only scratch files and are ignored by git.

## Regenerate

FreeCAD review documents are regenerated with:

```
tools/automation/design-iterate.sh
tools/automation/buildable-trainset.sh
tools/automation/buildable-civil.sh
PYTHONPATH=design/component-catalogue/src design/component-catalogue/scripts/freecad_trainset.sh --family light-metro-
3car
PYTHONPATH=design/component-catalogue/src design/component-catalogue/scripts/freecad_assembly_review.sh
PYTHONPATH=design/component-catalogue/src design/component-catalogue/scripts/freecad_fea.sh
```

Supplier interchange exports, when needed, should be written outside the tracked tree or left ignored.

## Sections

| Folder | Scope |
|---|---|
| `design-system/` | Generated top-down / bottom-up design iteration scorecards and candidate shortlists |
| `buildable-trainset/` | Generated buildable product tree from parts through subassemblies, assemblies, and the trainset |
| `buildable-civil/` | Generated 19-type civil/IFC accountability register, six release packages, nine drawing briefs and empty authority record |
| `../models/cad/` | FreeCAD review assemblies, including trainset, assembled/exploded state documents, and FEA-screening model documents |
| `fea/` | FreeCAD/CalculiX first-pass beam-model screening inputs, solver outputs, and result summaries |

# Buildable Civil Release Catalogue

Repository source: `design/component-catalogue/catalog/buildable-civil/README.md`

This generated catalogue reconciles all 19 reusable IFC types (138 occurrences) into 6 bounded release packages and 9 drawing-definition briefs. It distinguishes the 9 civil-owned geometry types from 10 track, station, vehicle, and coordination interfaces.

Nothing here is issued for fabrication or construction. Site survey, geotechnics, per-span structural analysis, reinforcement/prestress, supplier certification, erection engineering, permits, independent check, and signed release remain open.

## Outputs

| File | Purpose |
|---|---|
| `reusable-type-release-register.md` | Exact one-to-one accountability for every deterministic IFC type |
| `factory-release-work-packages.md` | Outputs, tools/gauges, and open hold points for six release packages |
| `factory-drawings/index.md` | Nine controlled, non-issued drawing-definition briefs |
| `fabrication-and-construction-controls.md` | Ten practical moulding, survey, precast, transport, erection, track-interface and handback controls |
| `evidence/construction-control-record-template.json` | Blank workfront execution, hold-point, inspection and next-trade handback record |
| `inspection-and-test-plan.md` | Package-specific hold, witness and record-review characteristics covering all reusable IFC types |
| `evidence/civil-release-record-template.json` | Empty evidence record that project authorities must complete |
| `reusable-type-release-register.json` | Machine-readable register, packages, briefs, and validation flags |

## Regenerate

```
tools/automation/buildable-civil.sh
```

The generator deliberately fails if the reference IFC type hashes change without a corresponding ownership and release-path decision.

# Civil Fabrication and Construction Reference Controls

Repository source: `design/component-catalogue/catalog/buildable-civil/fabrication-and-construction-controls.md`

> Status: reference defaults — not issued for fabrication or construction.

This workface handbook fills repeatable moulding, inspection, handling, erection and handover gaps around the reusable civil kit. It deliberately leaves site actions, ground, reinforcement/prestress, temporary works and statutory release with the competent project organisations.

## Workface release rule

No work starts from coordination geometry alone: released drawings/method, accepted inputs, competent people/plant and open-hold-point authorization must all identify the same asset and revision.

Planning/RFQ definition only. Fabrication or construction release requires project survey, geotechnical model, checked calculations, reinforcement/prestress design, supplier data, temporary-works design and signed engineering acceptance.

## CIV-MFG-010 — Survey, Datums And Set-Out

Default sequence:

1. establish protected project control outside the work zone.
2. transfer primary control independently to factory bed or work front.
3. set mould, foundation, bearing and rail-seat datums from primary control.
4. record as-built coordinates before the work is concealed or loaded.

Planning default: Use one project grid and vertical datum; close each set-out from two independent control points. Survey all first-article interfaces and every foundation, bearing seat, rail seat, platform edge and movement joint.

Typical first-shift crew/plant: two-person survey crew, total station, digital level and traceable check artefact. This is a resource-planning allowance, not authorisation or a minimum safe crew.

Hold the work when: control closure fails, benchmark disturbed, design/survey revision mismatch, or required accuracy is absent from the released survey plan.

Required handback: accepted survey control report, set-out sheets and signed as-built survey.

## CIV-MFG-020 — Precast Mould, Reinforcement And Inserts

Default sequence:

1. clean and survey mould/bed datums.
2. apply release system and fit cages, ducts, drains, lifting anchors and inserts.
3. independently check cover, restraint and insert templates.
4. photograph and sign the pre-pour hold point.

Planning default: Use rigid reusable steel moulds with replaceable end boxes and positive insert templates. First mould and every repaired/reset mould receive a full dimensional survey; subsequent pours receive datum, closure and insert checks before each pour.

Typical first-shift crew/plant: mould/carpentry 2–3, reinforcement 4–6, one independent inspector, mould survey kit and cover/insert gauges. This is a resource-planning allowance, not authorisation or a minimum safe crew.

Hold the work when: unreleased reinforcement/prestress drawing, unidentified steel/insert, cover failure, dirty duct, loose insert, mould outside drawing tolerance, or unsigned pre-pour checklist.

Required handback: mould acceptance, material lots, cage/insert/cover report and signed pre-pour record.

## CIV-MFG-030 — Concrete Placement, Curing And Prestress Transfer

Default sequence:

1. accept batch and fresh-concrete tests.

2 place in the released sequence without displacing cages or ducts.

3 finish and cure with temperature/maturity records.

4 confirm specified release/transfer strength before demoulding or prestress transfer.

Planning default: Reject site water addition unless the approved mix procedure permits and records it. Concrete class, exposure, w/c ratio, workability window, test frequency, curing cycle, release strength and prestress sequence remain calculation/specification values—not catalogue defaults.

Typical first-shift crew/plant: placement 6–8 plus pump/crane operator, finishing 2–3, laboratory technician and independent inspector at hold points. This is a resource-planning allowance, not authorisation or a minimum safe crew.

Hold the work when: batch ticket mismatch, workability/temperature outside specification, interrupted placement beyond permitted joint time, curing excursion, failed strength result, or prestress anomaly.

Required handback: batch/test records, curing history, transfer/release strength, prestress elongation/force record and approved deviation/NCR closure.

## CIV-MFG-040 — Demould, Dimensional Acceptance And Storage

Default sequence:

1 confirm release strength and approved lifting arrangement.

2 demould without prying at unapproved points.

3 inspect surfaces, cracks, geometry, inserts, ducts and bearing/rail interfaces.

4 mark unique ID, orientation, mass and approved support points before storage.

Planning default: Inspect 100% of the first three units of each mould/type and every safety/interface feature thereafter. Routine non-interface dimensions may move to first/last plus 10% minimum three only through an approved control plan. Support units at the drawing-defined points on level, verified bearers.

Typical first-shift crew/plant: lift supervisor, certified crane operator, four riggers, two survey/inspection staff and rated lifting frame. This is a resource-planning allowance, not authorisation or a minimum safe crew.

Hold the work when: strength not accepted, crack/damage beyond acceptance limits, interface out of tolerance, blocked duct/drain, unidentified unit, or storage support not verified.

Required handback: dimensional/crack report, concrete and lift records, traceability mark and storage inspection.

## CIV-MFG-050 — Transport And Delivery Acceptance

Default sequence:

1 match unit, mass and centre of gravity to transport schedule.

2 inspect route, trailer, temporary supports and restraints.

3 load only from approved points and record restraint installation.

4 inspect and survey interfaces again after delivery.

Planning default: Use the approved transport orientation and support spacing; do not support on bearing seats, walkway edges, drains or rail plinths. The route survey, permits, dynamic allowances and temporary-state calculation are deployment-specific.

Typical first-shift crew/plant: transport supervisor, certified operator, four riggers, escort/traffic staff as permitted, inspected trailer and rated lifting equipment. This is a resource-planning allowance, not authorisation or a minimum safe crew.

Hold the work when: route/permit absent, actual unit mass exceeds schedule, support/restraint mismatch, weather beyond method limits, transport damage, or delivery survey failure.

Required handback: route/permit pack, checked transport calculation, pre/post condition records and delivery acceptance.

## CIV-MFG-060 — Foundation, Pier And Cap Construction

Default sequence:

1 verify utilities, ground horizon and formation.

2 construct/test foundation and survey starter interface.

3 erect or cast column with temporary stability maintained.

4 install cap, closure/grout and bearing-seat survey.

Planning default: Release one work front at a time from accepted survey, utility and geotechnical zone data. Never extrapolate a foundation selection across an uninvestigated ground boundary. Keep column/cap temporary stability independent of incomplete permanent connections.

Typical first-shift crew/plant: site engineer, supervisor, survey pair, foundation crew sized to selected method, 4–6 erection riggers and independent quality hold-point inspector. This is a resource-planning allowance, not authorisation or a minimum safe crew.

Hold the work when: unexpected ground/water/utility, foundation test failure, starter or bearing-seat survey failure, uncontrolled temporary state, grout/material mismatch, or open structural NCR.

Required handback: ground log, foundation tests, concrete/grout records, temporary-works inspection and pier/cap as-built survey.

## CIV-MFG-070 — Girder Erection, Bearings And Closures

Default sequence:

1 accept bearing seats, bearings, unit and erection plant.

2 set bearing orientation/temperature and install temporary restraints.

3 lift or launch to the released sequence and survey before de-rigging.

4 complete diaphragms/closures and remove temporary restraints only at the authorised stage.

Planning default: Plan one lift controller, one command channel and a controlled exclusion zone. Set each bearing by ID and orientation; protect movement surfaces and retain access for inspection/replacement. No person enters beneath a suspended or incompletely restrained unit.

Typical first-shift crew/plant: lift supervisor, crane/launcher operator(s), four riggers, survey pair, two closure/grout workers and safety lead; plant capacity follows the checked lift study. This is a resource-planning allowance, not authorisation or a minimum safe crew.

Hold the work when: seat/bearing/unit not accepted, wind or visibility beyond method limits, plant configuration mismatch, loss of communication, unplanned movement, survey failure, or incomplete restraint.

Required handback: checked erection/lift plan, plant and personnel certificates, bearing schedule, lift record, closure strength and final survey.

## CIV-MFG-080 — At-Grade Formation, Slab And Transition

Default sequence:

1 prove utilities, drainage outfall and formation level.

2 place and test ground treatment/subbase by lot.

3 set rail-seat/duct/drain templates and sign pre-pour hold.

4 cast/cure, survey and trial the first complete transition panel.

Planning default: Build a full-width trial panel including drainage, ducts and rail-seat fixings before repetitive work. Divide earthworks and pavement testing into traceable lots no larger than one shift or one material/source change; the project specification sets test values and lot size if smaller.

Typical first-shift crew/plant: site engineer, survey pair, earthworks 5–8 plus selected plant, concrete 6–8, laboratory technician and track-interface inspector. This is a resource-planning allowance, not authorisation or a minimum safe crew.

Hold the work when: soft spot or groundwater differs from model, drainage unavailable, compaction/plate test failure, template movement, concrete/cure failure, or transition survey outside released limits.

Required handback: formation lot tests, drainage proof, pre-pour record, concrete tests, trial-panel acceptance and as-built survey.

## CIV-MFG-090 — Track, Platform And Systems Interface Handover

Default sequence:

1. clean and survey rail-seat/plinth, platform and equipment interfaces.
2. install accepted fastening/rail/turnout products to supplier procedures.
3. measure gauge, alignment, cant, stepping, clearances, drainage and electrical continuity.
4. hand over an as-built interface model with all NCRs and temporary conditions visible.

Planning default: Use a common chainage and asset ID across survey, IFC, inspection and maintenance records. Perform 100% measurement at turnouts, movement joints, stations, transitions and first article; routine interval and acceptance values come from the released track/vehicle/interface plan.

Typical first-shift crew/plant: permanent-way supervisor, 6–10 track workers, survey pair, signalling/power representatives, calibrated track gauge and clearance gauge. This is a resource-planning allowance, not authorisation or a minimum safe crew.

Hold the work when: supplier revision mismatch, missing vehicle envelope, failed gauge/cant/stepping/continuity, obstructed drainage/access, or interface NCR not accepted by both owners.

Required handback: supplier installation records, track/clearance survey, signed civil-track-station-vehicle ICD and configuration handover.

## CIV-MFG-100 — Nonconformance, Repair And Work-Front Handback

Default sequence:

1. identify, contain and preserve the original evidence.
2. assess structural, durability, geometry and downstream interface effects.
3. obtain authorised use-as-is, rework, repair, return/scrap or design-change disposition.
4. perform repair and repeat every invalidated inspection before handback.

Planning default: No field cutting, drilling, heat straightening, reinforcement/strand exposure, concrete repair, bearing adjustment, grout substitution or tolerance concession without a written disposition by the accountable designer and checker where required.

Typical first-shift crew/plant: responsible construction engineer, quality lead, accountable designer and independent checker according to consequence; repair team only after disposition. This is a resource-planning allowance, not authorisation or a minimum safe crew.

Hold the work when: unapproved repair, repeat defect trend, hidden defect extent, missing retest, configuration mismatch, or any open safety/structural NCR.

Required handback: NCR, engineering assessment, approved repair method, repeat-test/survey result, as-built update and signed handback.

# Civil Factory/Release Work Packages

Repository source: `design/component-catalogue/catalog/buildable-civil/factory-release-work-packages.md`

> Status: definition seed — not issued.

These packages define the smallest reusable handoffs around the current civil kit. Hold points remain open until real project evidence is recorded.

## CIV-FRP-100 — precast superstructure and guideway edge

Lane: `reusable-product`

Drawing briefs: `CIV-SUP-100`
`CIV-SUP-110`
`CIV-EGR-120`

Tooling/gauges: `CIV-TOL-001`, `CIV-MLD-010`, `CIV-JIG-020`, `CIV-GGE-030`

Reference workface controls: `CIV-MFG-010`, `CIV-MFG-020`, `CIV-MFG-030`, `CIV-MFG-040`, `CIV-MFG-050`, `CIV-MFG-070`, `CIV-MFG-100`

Controlled outputs:

- checked product drawings
- mould and insert schedules
- inspection/test plan
- first-article dossier

Open hold points:

- [ ] project action set accepted
- [ ] independent check closed
- [ ] first mould and girder accepted

## CIV-FRP-110 — pier column and precast cap

Lane: `hybrid-project-product`

Drawing briefs: `CIV-SUB-200`
`CIV-SUB-210`

Tooling/gauges: `CIV-TPL-100`, `CIV-MLD-110`, `CIV-GGE-120`

Reference workface controls: `CIV-MFG-010`, `CIV-MFG-020`, `CIV-MFG-030`, `CIV-MFG-040`, `CIV-MFG-050`, `CIV-MFG-060`, `CIV-MFG-100`

Controlled outputs:

- pier/foundation schedule
- column and cap drawings
- reinforcement and lifting schedules
- survey/test dossier

Open hold points:

- [ ] survey/geotechnics accepted
- [ ] foundation and pier calculations signed
- [ ] first cap accepted

## CIV-FRP-120 — bearing, restraint and replacement interfaces

Lane: `supplier-configured`

Drawing briefs: `CIV-BRG-300`

Tooling/gauges: `CIV-TPL-200`, `CIV-JCK-210`, `CIV-GGE-220`

Reference workface controls: `CIV-MFG-010`, `CIV-MFG-060`, `CIV-MFG-070`, `CIV-MFG-100`

Controlled outputs:

- bearing and movement schedule
- supplier data/certificates
- seat and jacking details
- installed survey

Open hold points:

- [ ] movement/CWR model accepted
- [ ] supplier capacities approved
- [ ] trial jack/replacement method accepted

## CIV-FRP-130 — at-grade slab and transition

Lane: `deployment-led-product`

Drawing briefs: `CIV-ATG-400`

Tooling/gauges: `CIV-RIG-300`, `CIV-TPL-310`, `CIV-GGE-320`

Reference workface controls: `CIV-MFG-010`, `CIV-MFG-030`, `CIV-MFG-080`, `CIV-MFG-090`, `CIV-MFG-100`

Controlled outputs:

- formation and slab drawings
- ground-treatment schedule
- drainage/utility details
- track survey and test record

Open hold points:

- [ ] survey/ground/drainage inputs accepted
- [ ] formation and slab checks signed
- [ ] trial panel accepted

## CIV-INT-200 — track and station-deck interfaces

Lane: `coordination-interface`

Drawing briefs: `CIV-INT-500`

Tooling/gauges: `CIV-GGE-400`, `CIV-CHK-410`

Reference workface controls: `CIV-MFG-010`, `CIV-MFG-090`, `CIV-MFG-100`

Controlled outputs:

- supplier interface control document
- IFC/IDS issue
- clash and disposition report

Open hold points:

- [ ] rail/turnout data frozen
- [ ] station deck data frozen
- [ ] interdisciplinary review signed

# CIV-INT-210 — station and vehicle envelope interfaces

Lane: `coordination-interface`

Drawing briefs: `CIV-INT-510`

Tooling/gauges: `CIV-GGE-500`, `CIV-CHK-510`

Reference workface controls: `CIV-MFG-010`, `CIV-MFG-090`, `CIV-MFG-100`

Controlled outputs:

- platform/canopy/vehicle ICD
- IFC/IDS issue
- kinematic and access report

Open hold points:

- [ ] vehicle envelope accepted
- [ ] station interface data frozen
- [ ] interdisciplinary review signed

## Authority Boundary

Planning/RFQ definition only. Fabrication or construction release requires project survey, geotechnical model, checked calculations, reinforcement/prestress design, supplier data, temporary-works design and signed engineering acceptance.

# Civil Inspection and Test Plan

Repository source: `design/component-catalogue/catalog/buildable-civil/inspection-and-test-plan.md`

> Status: unfilled protocol — not fabrication, construction, inspection or test evidence.

This plan assigns unique characteristics to every civil package prerequisite, drawing, reusable IFC type, tool/gauge, workface control and handover output. Project-specific values and results remain blank until competent teams execute an authorised workfront.

Packages: 6 · Characteristics: 114.

Point types: H mandatory hold, W witness, R record review.

| Package | Lane | Characteristics | H | W | R | Status |
|---|---|---|---|---|---|---|
| `CIV-FRP-100` — precast superstructure and guideway edge | `reusable-product` | 24 | 10 | 7 | 7 | `open` |
| `CIV-FRP-110` — pier column and precast cap | `hybrid-project-product` | 21 | 8 | 7 | 6 | `open` |
| `CIV-FRP-120` — bearing, restraint and replacement interfaces | `supplier-configured` | 16 | 7 | 4 | 5 | `open` |
| `CIV-FRP-130` — at-grade slab and transition | `deployment-led-product` | 18 | 8 | 5 | 5 | `open` |
| `CIV-INT-200` — track and station-deck interfaces | `coordination-interface` | 16 | 9 | 3 | 4 | `open` |
| `CIV-INT-210` — station and vehicle envelope interfaces | `coordination-interface` | 19 | 12 | 3 | 4 | `open` |

## Execution Rules

- bind every result to project, asset/workfront, location, drawing/method revision, people, plant and date
- coordination IFC, an empty form or planned inspection is not performed evidence
- stop and contain affected work on failure; link the accepted NCR/RFI disposition and repeated inspection before release
- do not sample away survey control, foundations, lifting, bearings, movement joints, track geometry, platform stepping or other safety/interface characteristics
- handover requires accepted as-builts, tests, temporary-condition register, NCR status and receiving-party signature

Use `construction-control-record-template.json` for each asset/workfront and retain the ITP characteristic IDs when importing into a project QMS. All project release evidence remains governed by the deployment checklist.

# Reusable Civil Type Release Register

Repository source: `design/component-catalogue/catalog/buildable-civil/reusable-type-release-register.md`

> Status: definition seed — not issued for fabrication or construction.

This register reconciles every reusable type in the reference civil IFC with one accountable release lane. Planning/RFQ definition only. Fabrication or construction release requires project survey, geotechnical model, checked calculations, reinforcement/prestress design, supplier data, temporary-works design and signed engineering acceptance.

## Coverage

| Measure | Count |
|---|---|
| ifc reusable types | 19 |
| ifc occurrences | 138 |
| civil owned types | 9 |
| controlled interface types | 10 |
| release packages | 6 |
| drawing definition briefs | 9 |
| tooling and gauge families | 17 |

# Type Register

| IFC type | Asset class | Occurrences | Release lane | Package | Drawing brief | Disposition |

# Release Boundary

The hashes identify deterministic coordination geometry. They are not drawing revisions, certificates, approvals, or permission to build. A geometry change intentionally fails generation until its new type is classified.

# Buildable station kit catalogue

Repository source: `design/component-catalogue/catalog/buildable-stations/README.md`

Generated station EBOM/MBOM and unsigned assembly travelers for the six base station shells and the controlled elevated-interchange variant.

| Archetype | Platforms | Platform length m | Bays/platform | Product rows | Open product gaps | Auxiliary modules / installed m² | Definition | Traveler |
|---|---|---|---|---|---|---|---|---|
| `halt` | 1 | 55.5 | 10 | 26 | 11 | 1 / 187.0 | `md` | `md` |
| `standard` | 2 | 59.5 | 10 | 29 | 13 | 7 / 1309.0 | `md` | `md` |
| `major` | 1 | 59.5 | 10 | 30 | 14 | 9 / 1683.0 | `md` | `md` |
| `interchange` | 2 | 59.5 | 10 | 30 | 14 | 11 / 2057.0 | `md` | `md` |
| `interchange-elevated` | 2 | 59.5 | 10 | 35 | 20 | 12 / 2244.0 | `md` | `md` |
| `terminal` | 2 | 59.5 | 10 | 37 | 21 | 11 / 2057.0 | `md` | `md` |
| `depot-terminal` | 2 | 59.5 | 10 | 44 | 28 | 6 / 1122.0 | `md` | `md` |

Auxiliary area is quantised upward into repeatable 8.5 m × 22 m solar-roof modules rather than left as an unbuildable square-metre allowance. Site structural, foundation, drainage, egress, and electrical approvals remain gates. See the generated `open release gap register` for the supplier, site, utility, and component-design closures behind these counts. The `factory/release work packages` classify all 45 unique products as reusable-definition, supplier-configuration or deployment-specific scope. The intentionally open `readiness register` and evidence template prevent catalogue maturity from being mistaken for fabrication or construction release. The 18 individual `drawing-definition seeds` provide controlled drafting/checking briefs; none is issued. The `reference defaults` give all 29 open product families practical concept/RFQ values plus mandatory override triggers. The generated `station product reconciliation` checks the BOM, traveler, drawing, FreeCAD and IFC identities in both directions. The shared station systems screening runs OpenSees, JuPedSim and SWMM across the family. EnergyPlus/FDS execute the baseline and proposed depot thermal/fire cases; the baseline failures, screened mitigation and open deployment work packages remain evidence for detailed design, not construction release.

# Station open-product reference defaults

Repository source: `design/component-catalogue/catalog/buildable-stations/default-product-specifications.md`

Status: recommended concept/RFQ defaults; not a supplier selection or construction release.

These values close avoidable ambiguity in the open product rows with common, serviceable configurations. A default remains subordinate to every listed override trigger and the factory/release evidence gate.

Coverage: 34 defaults for 34 open product families; 13 source anchors.

## `STN-CNP-P030` — factory-bonded solar roof sandwich panel with MC4 leads

Default: commodity mono-PERC/TOPCon modules on insulated standing-seam roof

Use class: `rfq-default-not-selected`

Values:

- 6,000 x 4,200 x 55 mm bay cassette
- 200 W/m2 gross design yield; about 5.0 kWp/bay
- 20 kg/m2 maximum complete cassette mass
- 1,000 VDC-rated string components
- IEC 61215/61730-qualified module; 450 W class reference
- 40 mm insulated core; white underside; factory MC4-compatible leads

Affordability: Uses high-volume framed modules and a repeated dry-fixed roof cassette rather than a bespoke BIPV laminate.

Must override when:

- site wind/snow/hail loads exceed qualified module values
- fire or roof warranty disallows the selected bond/rail system
- local module price or availability favours a different certified format

Sources: `OSR-STATION`, `IEC-61215`, `TRINA-450`.

## `STN-CNP-P040` — platform-canopy PV string, combiner, isolation, bonding, and downlink kit

Default: one independently isolated PV string group per platform

Use class: `rfq-default-not-selected`

Values:

- 1,000 VDC equipment rating
- 6 mm2 UV-resistant copper PV cable baseline
- lockable DC isolator and Type 2 DC surge protection
- one monitored combiner/downlink per platform
- string voltage kept within selected inverter/MPPT window at local minimum temperature
- IEC 62446-1 inspection, polarity, insulation and handover record

Affordability: Standard string hardware and one downlink per platform minimize field joints and specialist site labour.

Must override when:

- cold-corrected open-circuit voltage exceeds equipment margin
- parallel-string current requires larger protection/cable
- lightning or utility study requires Type 1 protection

Sources: `OSR-STATION`, `IEC-62446`.

## STN-CNP-P050 — 8.5 m × 22 m factory-bonded auxiliary solar-roof bay module

Default: repeatable auxiliary PV roof bay

Use class: `rfq-default-not-selected`

Values:

- 8,500 x 22,000 mm module planning grid
- 187 m2 gross roof area
- 31.8 kWp nominal after 15% packing allowance
- 20 kg/m2 roof/PV cassette mass allowance
- 3,850 mm minimum clear height
- dry-bolted panel rails and replaceable commodity PV modules

Affordability: One repeated 187 m2 grid shares frames between bays and uses the same commodity PV family as platform canopies.

Must override when:

- site circulation or fire access cannot fit the module grid
- wind/snow/seismic calculation changes frame spacing
- local solar yield makes partial PV coverage preferable

Sources: OSR-STATION, IEC-61215, TRINA-450.

## STN-CNP-P060 — 22 m S355 transverse Warren-truss frame with two HSS 200 columns

Default: galvanised bolted/welded S355 auxiliary Warren truss

Use class: `preliminary-design-default-not-construction-release`

Values:

- 22,000 mm clear span planning envelope
- 2,000 mm truss depth
- S355 steel baseline
- HSS 200 mm column and HSS 150 mm chord planning envelopes
- 8,500 mm frame spacing
- hot-dip galvanised after fabrication; bolted site splices where transport requires

Affordability: Common structural hollow sections, repeated jigs and shared N+1 frames support local fabrication and low part variety.

Must override when:

- signed structural model changes any member
- transport envelope requires additional splices
- corrosivity category requires a duplex coating system

Sources: OSR-STATION.

## STN-CNP-P070 — auxiliary-canopy pad footing, reinforcement, base plate, and anchor-bolt kit

Default: reinforced-concrete pad with reusable anchor cage

Use class: `preliminary-design-default-not-construction-release`

Values:

- 2.0 x 2.0 x 0.65 m pad allowance for estimating only
- C30/37 concrete and B500 reinforcement baseline
- 100 kPa preliminary allowable bearing pressure
- four M24 cast-in anchors on removable steel template
- 75 mm nominal soil-face cover
- top of pedestal kept 150 mm above finished drainage level

Affordability: A simple square pad, common bar grades and reusable anchor template are normally cheaper than piles on competent ground.

Must override when:

- geotechnical report gives less than 100 kPa or settlement risk
- uplift/sliding/seismic calculation fails
- buried utilities, flood level or expansive/aggressive soil affects the location

Sources: OSR-STATION.

## STN-CNP-P080 — auxiliary-canopy PV string, combiner, isolation, bonding, and downlink kit

Default: modular auxiliary-canopy PV combiner groups

Use class: `rfq-default-not-selected`

Values:

- one independently isolated group per 10 or fewer roof modules
- 1,000 VDC equipment rating
- Type 2 DC surge protection baseline
- string current monitoring at combiner
- lockable local isolation plus remote inverter trip
- IEC 62446-1 commissioning dossier

Affordability: Repeating one protected group avoids a bespoke combiner for every station size and limits fault/maintenance isolation scope.

Must override when:

- selected module/inverter electrical window changes string length
- lightning study requires Type 1 SPD
- cable voltage-drop or fault study changes conductor size

Sources: OSR-STATION, IEC-62446.

## STN-CNP-P090 — auxiliary-canopy gutter, downpipe, lightning, maintenance-access, and edge-protection kit

Default: gravity drainage, LPS and guarded maintenance kit

Use class: `preliminary-design-default-not-construction-release`

Values:

- 200 mm minimum eaves gutter planning size
- DN150 downpipe at each low point and no more than one bay per outlet baseline
- 600 mm clear anti-slip maintenance route

- 1,100 mm guardrail where fall exposure remains
- LPS Class III planning basis with bonded metalwork
- removable debris baskets and rodding access at every outlet

Affordability: Gravity drainage, standard pipe sizes and permanent simple access reduce pumps, bespoke parts and recurring cleaning labour.

Must override when:

- local design storm exceeds hydraulic capacity
- roof geometry creates additional low points
- lightning risk assessment changes LPS class
- fall-risk assessment permits or requires a different access system

Sources: `OSR-STATION`.

## `STN-MEP-P020` — incoming switchboard, distribution board, metering, UPS, and earthing kit

Default: 400/230 V modular LV board with one-hour online UPS

Use class: `rfq-default-not-selected`

Values:

- 400/230 V 3-phase 4-wire 50 Hz default
- 25 kA minimum board short-circuit rating pending utility study
- 20% spare ways and 25% spare load capacity
- 10 kVA online double-conversion UPS starting point
- 60 minutes autonomy for life-safety/control loads only
- TN-S downstream earthing with monitored surge protection

Affordability: A standard modular IEC LV board and small centralized critical-load UPS avoid maintaining many proprietary batteries.

Must override when:

- utility voltage/frequency or fault level differs
- life-safety load schedule exceeds 8 kW
- local code requires a generator or different earthing arrangement

Sources: `OSR-STATION`.

## `STN-PAX-P030` — CCTV, PA loudspeaker, help-point, radio, and station-LAN kit

Default: PoE fixed-camera, 100 V PA and SIP help-point platform kit

Use class: `rfq-default-not-selected`

Values:

- four 2 MP H.265 fixed cameras per 60 m platform starting layout
- outdoor devices IP66 and IK10; -30 to +55 degC baseline
- IEEE 802.3at PoE with 20% switch power reserve
- two weatherproof loudspeakers plus one help point per platform baseline
- managed gigabit fibre uplink with physically separate life-safety VLANs
- coverage and speech-intelligibility model governs final quantity

Affordability: Fixed PoE cameras and standard IP networking are cheaper to buy, cable and replace than PTZ/proprietary field networks.

Must override when:

- coverage model finds blind spots
- facial/incident evidential requirements need higher resolution
- PA is part of voice evacuation and must use the approved EN 54 system

Sources: `OSR-STATION`, `AXIS-M11`.

## `STN-PAX-P040` — fare gate, accessible gate, and validator equipment kit

Default: compact bidirectional flap gate with one wide accessible lane

Use class: `rfq-default-not-selected`

Values:

- 600 mm clear standard lane
- 900 mm clear accessible lane minimum
- fail-safe open on loss of power or fire input
- contactless bank-card, account token and QR reader interfaces
- dry-contact/Ethernet controller interface
- indoor IP20 equipment only under weatherproof canopy; outdoor-rated gate otherwise

Affordability: Uses a conventional compact speed-gate envelope and open reader interfaces instead of custom mechanical gates.

Must override when:

- local accessibility rule requires a wider lane
- unpaid-area weather exposure requires outdoor equipment
- evacuation analysis prohibits barriers or demands more free-exit width

Sources: `OSR-STATION`, `PRM-TSI`, `GUNNEBO-FL`.

## `STN-PAX-P050` — ticket-vending machine equipment kit

Default: cashless outdoor ticket/validation terminal

Use class: `rfq-default-not-selected`

Values:

- 15 inch sunlight-readable capacitive display baseline
- contactless EMV/account token and QR issuance/reading
- no cash module by default; staffed/offline exception process
- IP54 and IK10 minimum enclosure target
- 230 VAC input with internal 15 minute orderly-shutdown reserve
- wheelchair reach and knee/toe clearance governed by local access code

Affordability: Omitting cash acceptors, printers where e-ticketing permits, and proprietary fare media lowers purchase and field-maintenance cost.

Must override when:

- cash acceptance is a legal or inclusion requirement
- fare policy requires a printed ticket
- solar gain, dust, rain or vandalism needs a higher enclosure rating

Sources: `OSR-STATION`, `PRM-TSI`.

## STN-CHG-P010 — station charging cabinet, protection, cable, and wayside connector kit

Default: shared 500 kW modular bidirectional DC charger

Use class: `rfq-default-not-selected`

Values:

- 500 kW continuous station cabinet
- 650-700 VDC normal train connection
- 825 A maximum equipment current
- 1,000 VDC insulation/equipment class
- two mechanically separate platform contacts interlocked so total cabinet power remains 500 kW
- IP55 outdoor cabinet; liquid-cooled power modules at high ambient

Affordability: One shared modular cabinet uses established DC power-stage building blocks and avoids duplicating 500 kW hardware per platform.

Must override when:

- timetable energy model needs simultaneous charging
- selected train voltage/current envelope changes
- utility/harmonic study or 50 degC duty requires derating/additional modules

Sources: OSR-STATION, ABB-TPSS.

## STN-CHG-P020 — traction power substation transformer/rectifier and protection interface

Default: prefabricated dry-type transformer/rectifier substation

Use class: `rfq-default-not-selected`

Values:

- 11 kV 3-phase 50 Hz incoming planning default
- 750 VDC nominal traction/energy bus
- 12-pulse diode rectifier baseline
- catalogue ratings 800/1,000/1,500/2,000 kVA by archetype
- metal-enclosed MV, dry transformer, DC switchgear, protection and SCADA in one e-house
- 20% physical spare feeder capacity; no installed redundant transformer unless RAM study requires it

Affordability: A factory-integrated e-house and passive diode rectifier are widely used, locally installable and simpler than a bespoke building or active front end.

Must override when:

- utility supply voltage/fault level differs
- regeneration/export study requires active conversion
- RAM, fire or load-flow study requires N+1 capacity

Sources: OSR-STATION, ABB-TPSS.

## STN-ACC-P020 — installed passenger lift

Default: machine-room-less through-car passenger lift core

Use class: `rfq-default-not-selected`

Values:

- 1,150 kg / 15-person nominal capacity
- 1.0 m/s nominal speed
- 1,100 mm minimum clear door target
- through-car doors preferred where they remove wheelchair turning
- two-way alarm, fire recall and automatic rescue/backup lowering
- external weatherproof shaft/enclosure where not inside a conditioned concourse

Affordability: A standard machine-room-less 1,150 kg catalogue lift avoids a plant room while supporting wheelchairs, attendants and luggage.

Must override when:

- local lift/access/fire code changes car or door dimensions
- travel or passenger demand needs higher speed/capacity
- flood, seismic or exposed climate conditions need a special package

Sources: OSR-STATION, KONE-MRL, PRM-TSI.

## STN-ACC-P040 — installed escalator

Default: escalator study

Use class: `preliminary-design-default-not-construction-release`

Values:

- equipment identity, served levels and envelope from shared station layout
- separate installed equipment and associated works

Affordability: Quantify actual equipment instead of a blanket accessibility kit.

Must override when:

- passenger-flow, one-lift-out, evacuation or structural assessment changes geometry

Sources: OSR-STATION.

## STN-ACC-P050 — installed staircase

Default: separated staircase study

Use class: `preliminary-design-default-not-construction-release`

Values:

- equipment identity, served levels and envelope from shared station layout
- separate installed equipment and associated works

Affordability: Quantify actual equipment instead of a blanket accessibility kit.

Must override when:

- passenger-flow, one-lift-out, evacuation or structural assessment changes geometry

Sources: OSR-STATION.

## STN-ACC-P060 — installed shaft

Default: lift shaft study

Use class: `preliminary-design-default-not-construction-release`

Values:

- equipment identity, served levels and envelope from shared station layout
- separate installed equipment and associated works

Affordability: Quantify actual equipment instead of a blanket accessibility kit.

Must override when:

- passenger-flow, one-lift-out, evacuation or structural assessment changes geometry

Sources: OSR-STATION.

## STN-CIV-P060 — station track-deck and running-rail interface

Default: station track-deck and rail interface study

Use class: `preliminary-design-default-not-construction-release`

Values:

- tracks and rail-head datums from shared layout
- station decks require separate support/foundation structural release

Affordability: Keep station track structures separate from running viaduct quantities.

Must override when:

- station or track-spreading geometry changes

Sources: OSR-STATION.

## STN-CIV-P050 — island centre deck infill between edge L-unit strips

Default: island centre deck infill study

Use class: `preliminary-design-default-not-construction-release`

Values:

- 420 mm structural envelope; reinforcement and reaction design unreleased
- width equals island width minus two 3 m edge strips

Affordability: Price wider island deck explicitly alongside access equipment.

Must override when:

- station support, launcher clearance or structural design changes

Sources: OSR-STATION.

## STN-ACC-P030 — pedestrian overbridge/concourse structural and enclosure kit

Default: simple weather-protected steel pedestrian bridge

Use class: `preliminary-design-default-not-construction-release`

Values:

- 4,000 mm clear walking width planning default
- 5,500 mm minimum rail clearance planning envelope pending infrastructure gauge
- 5.0 kPa crowd live-load starting case
- two simply supported transportable spans preferred
- anti-slip drained deck and 1,400 mm high non-climbable side enclosure
- lift/stair cores structurally independent where practical

Affordability: Straight repeated steel spans and independent vertical cores reduce bespoke geometry, erection possessions and future lift replacement risk.

Must override when:

- railway gauge/electrification requires more clearance
- crowd/egress analysis changes width
- span, wind, seismic, impact or foundation design changes the structural system

Sources: OSR-STATION, PRM-TSI.

## STN-TRK-P010 — 1:9 UIC60 stock-rail, machined switch-blade, and closure-rail kit

Default: 60E1 1:9 fixed-frog turnout rail kit

Use class: `preliminary-design-default-not-construction-release`

Values:

- 1,435 mm gauge
- 60E1 rail family
- 1:9 tangent; 27,000 mm overall planning length
- 190 m nominal diverging radius
- 7,800 mm switch blade and 4,200 mm crossing envelopes
- 40 km/h maximum reverse-route planning speed

Affordability: One standard-gauge 1:9 family covers terminal and depot low-speed moves with common spares and training.

Must override when:

- wheel/rail study selects another profile
- required diverging speed exceeds 40 km/h
- supplier system geometry or slab-track interface differs

Sources: OSR-STATION, VOESTALPINE-TURNOUT.

## STN-TRK-P020 — cast-manganese frog, check-rail, stretcher-bar, and mechanical-lock kit

Default: cast-manganese fixed crossing with external mechanical lock

Use class: `rfq-default-not-selected`

Values:

- fixed crossing for 40 km/h reverse-route duty
- cast manganese frog baseline
- adjustable check rails and replaceable wear components
- positive external blade lock independent of motor force
- one common stretcher/lock family across terminal and depot
- insulated joints omitted unless signalling design explicitly requires them

Affordability: A fixed frog and common mechanical lock are lower-cost and simpler to maintain than a movable-point crossing at this speed.

Must override when:

- RAM/wear analysis favours a different crossing
- axle load or wheel profile changes check-rail geometry
- signalling architecture requires insulated joints or another lock arrangement

Sources: OSR-STATION, VOESTALPINE-TURNOUT.

## STN-TRK-P030 — prestressed turnout sleeper, slide-chair, and elastic-fastener set

Default: 42-position prestressed turnout bearer set

Use class: `rfq-default-not-selected`

Values:

- 42 numbered sleeper/bearer positions per turnout
- prestressed concrete baseline with supplier-drilled inserts
- elastic rail fastening with replaceable pads/insulators
- galvanised slide chairs with low-friction replaceable plates
- deliver as sequenced packs matching erection plan
- same fastener family as plain line where technically compatible

Affordability: Supplier-numbered concrete bearers and shared elastic fasteners reduce site drilling, inventory and installation error.

Must override when:

- trackform requires steel or composite bearers
- supplier layout changes bearer count
- stray-current or vibration study changes pads/insulation

Sources: `OSR-STATION`, `VOESTALPINE-TURNOUT`.

## `STN-TRK-P040` — 6 kN nominal / 12 kN peak point-machine actuator, crank, and hand-wind kit

Default: compact electro-hydraulic point machine with external lock

Use class: `rfq-default-not-selected`

Values:

- 6 kN nominal and 12 kN peak operating-force requirement
- 18 kN ultimate proof requirement
- 3 second maximum normal throw
- integral hand-wind/manual release
- separate lock and dual end-position detection
- weatherproof low-profile assembly suitable for urban track

Affordability: A proven compact point-machine architecture fits multiple turnout types and reduces bespoke mechanisms and maintenance burden.

Must override when:

- measured switch force exceeds duty
- interlocking safety case requires another actuator/lock architecture
- flood, sand, temperature or tunnel envelope exceeds qualification

Sources: `OSR-STATION`, `VOESTALPINE-ECOSTAR`.

## `STN-TRK-P050` — dual position detector, W-SBC interface, junction, and turnout harness kit

Default: two-channel fail-safe end-position detection kit

Use class: `rfq-default-not-selected`

Values:

- two electrically independent detector channels
- normal, reverse and neither/unknown states

- 24 VDC field circuits with isolated safety inputs baseline
- IP67 junction box and halogen-free armoured home-run cable
- no software-only inference of blade position
- bench and installed route-lock proof for every turnout

Affordability: Simple hardwired independent detectors keep the safety boundary inspectable and avoid an unnecessary proprietary fieldbus.

Must override when:

- interlocking interface voltage differs
- safety integrity allocation requires a certified fieldbus
- cable distance/EMC study changes transmission or protection

Sources: `OSR-STATION`, `VOESTALPINE-ECOSTAR`.

## `STN-TRK-P060` — 3 kW points-heating strip, thermostat, IP67 cabinet, isolation, and cabling kit

Default: thermostatic resistance points-heating kit

Use class: `rfq-default-not-selected`

Values:

- 3 kW installed heat per turnout baseline
- two or more replaceable heater strips
- rail-temperature plus precipitation enable logic
- IP67 local isolation/control cabinet
- 30 mA personnel RCD only where permitted by railway earthing design; dedicated fault monitoring otherwise
- omit entirely in climates with no credible ice/snow case

Affordability: Basic resistance strips are widely serviceable; climate gating avoids buying and energising heaters where they provide no benefit.

Must override when:

- climate study removes the ice case
- thermal test needs more/less power
- railway earthing and protection rules prohibit the baseline RCD arrangement

Sources: `OSR-STATION`.

## `STN-TRK-P070` — terminal stop-block, passive end marker, foundation, and fixing kit

Default: energy-absorbing terminal buffer stop and passive marker

Use class: `rfq-default-not-selected`

Values:

- friction/hydraulic energy-absorbing stop selected to site approach case
- 10 km/h maximum design-impact starting case for restricted terminal track
- bright passive end marker with retroreflective face
- independent reinforced-concrete foundation allowance
- minimum 2,000 mm protected overrun/service zone behind stop for planning
- no reliance on buffer stop as normal stopping control

Affordability: A proprietary tested buffer stop is safer and usually cheaper than locally designing impact hardware; only its foundation is localized.

Must override when:

- signalling hazard analysis sets another impact speed
- train mass/coupler interface changes
- available overrun or foundation conditions change

Sources: `OSR-STATION`, `VOESTALPINE-TURNOUT`.

## `STN-DEP-P010` — main-heavy depot site formation, drainage, service-road, and secure-boundary kit

Default: compact main-heavy depot site shell

Use class: `preliminary-design-default-not-construction-release`

Values:

- 8,000 m2 reference footprint
- 1.0% minimum paved surface fall away from buildings
- separate clean stormwater and wash/contaminated drainage
- 6.0 m two-way service road planning width
- 2.4 m anti-climb perimeter fence with controlled vehicle/pedestrian gates
- 100-year local storm plus authority climate allowance for concept drainage

Affordability: A compact rectilinear site, gravity drainage and standard fencing minimize land, pumps and custom civil details.

Must override when:

- survey/ground/flood study changes levels or drainage
- fire access or swept-path study changes roads
- security or planning authority changes the boundary treatment

Sources: `OSR-STATION`.

## `STN-DEP-P020` — stabling, inspection, wash, and workshop track-panel/stop-block package

Default: four-road 400 track-m inspection/stabling package

Use class: `preliminary-design-default-not-construction-release`

Values:

- 400 track-m total across four reference roads
- 60E1 rail and common elastic fastener baseline
- minimum 80 m useful clear length per road
- one drained wash road and one inspection/lift road
- 1,200 mm minimum side walkway planning width
- low-speed 10 km/h depot operating limit

Affordability: Four repeated roads match the base maintenance concurrency and reuse the line rail/fastener family.

Must override when:

- fleet/concurrency plan requires more roads
- site geometry changes road length or throat
- maintenance equipment requires pits, embedded rail or different trackform

Sources: OSR-STATION, VOESTALPINE-TURNOUT.

## STN-DEP-P030 — 1:9 depot-throat turnout assembly replicated from the terminal turnout standard

Default: two common 1:9 depot-throat turnouts

Use class: `preliminary-design-default-not-construction-release`

Values:

- two turnout assemblies for four reference workshop roads
- same 60E1 1:9 geometry and spares as terminal
- shop-preassembled panels where transport permits
- 10 km/h depot operating limit
- independent lock/detection proof before route use
- manual hand-wind and clipped/scotched degraded mode

Affordability: Reusing the terminal turnout family avoids a depot-only geometry, spares stock and competence set.

Must override when:

- yard layout needs another turnout count/tangent
- transport prevents panel delivery
- signalling or degraded-operation rules differ

Sources: OSR-STATION, VOESTALPINE-TURNOUT.

## STN-DEP-P040 — outdoor/open-sided per-stall plug-in charger, isolation, suspended cable, and data-dock kit

Default: 150 kW outdoor plug-in charger per maintenance stall

Use class: `rfq-default-not-selected`

Values:

- four 150 kW charger/data docks in the reference depot
- 650-700 VDC operating range
- 250 A connector/cable continuous rating minimum
- IP55 charger and IP67 stowed connector target
- overhead retractable/suspended cable with mechanical strain relief
- Ethernet maintenance-data dock kept electrically isolated from HV

Affordability: One modest modular charger per active bay supports 12-minute turnaround/overnight work without installing a 500 kW unit at every stall.

Must override when:

- maintenance timetable needs faster simultaneous charging
- selected connector or train voltage differs
- ambient/solar load causes supplier derating

Sources: OSR-STATION, ABB-TPSS.

## STN-DEP-P050 — depot PV canopy, inverter, microgrid switchgear, and separated outdoor stationary-battery package

Default: 600 kWp PV plus four modular 500 kWh outdoor LFP blocks

Use class: `rfq-default-not-selected`

Values:

- 4,000 m2 PV canopy and 600 kWp nominal array
- 2,000 kWh gross stationary LFP storage
- four independently isolatable 500 kWh blocks
- 500 kW bidirectional PCS starting rating
- outdoor liquid-cooled containers/cabinets with off-gas detection and remote isolation
- 6 m preliminary separation zone from occupied/control buildings pending fire strategy

Affordability: Repeated outdoor LFP blocks can be procured competitively, phased and isolated individually; factory integration reduces site labour.

Must override when:

- energy simulation changes capacity/power
- cell-to-pack fire evidence or authority changes separation/containment
- utility export/protection rules change PCS architecture

Sources: `OSR-STATION`, `CATL-ENERONE`, `IEC-62446`.

## STN-DEP-P060 — main workshop, synchronized LM3 lift/bogie-change bay, overhaul/inspection bays, 40 t crane, wash plant, stores, and wheel-lathe package

Default: four-bay modular workshop with synchronized vehicle lift

Use class: `rfq-default-not-selected`

Values:

- 1,800 m2 workshop reference envelope
- four concurrent inspection/maintenance bays
- 40 t overhead crane
- 40 t synchronized four-column vehicle lift minimum system SWL
- 10 t minimum rated capacity per column with mechanical locks
- one bogie-change/extraction path, wheel lathe and recycling wash plant

Affordability: A repeatable portal building and commercial synchronized columns avoid a bespoke buried lifting table while retaining full-car/bogie change capability.

Must override when:

- weighed car/recovery load case exceeds lift allowance
- supplier column reactions change foundations
- fleet maintenance plan removes/adds heavy equipment
- crane runway or building calculation changes geometry

Sources: `OSR-STATION`.

## STN-DEP-P070 — depot cooled controls room, LV, compressed-air, fire, lighting, CCTV, LAN, access-control, and maintenance-data kit

Default: separate cooled controls room with N+1 packaged DX

Use class: `rfq-default-not-selected`

Values:

- two independent 30 kW nominal packaged DX units
- one unit carries the 30 kW design sensible duty
- automatic duty/standby rotation and high-temperature alarm
- 400/230 V modular LV, UPS, fire alarm, PoE CCTV/LAN and access control
- 8 bar oil-free compressed-air ring baseline
- no shared return air with workshop or battery/charger compound

Affordability: Two commodity packaged units provide maintainable N+1 cooling without a central chilled-water plant.

Must override when:

- room heat-load test exceeds 30 kW
- maximum ambient exceeds selected unit envelope
- fire strategy changes room separation/ventilation
- tool air demand changes compressor/ring size

Sources: `OSR-STATION`, `DAIKIN-ROOFTOP`, `AXIS-M11`.

Populate `factory-release-record-template.json` under document control. Reusable factory information may be released independently only where its package boundary permits; site work still requires the deployment survey, calculations, supplier configuration, permits and named approvals. Use the individual `factory-drawings/` seeds as drafting/checking briefs, never as issued fabrication or construction drawings.

Boundary: These packages define reusable drafting and deployment handoff scope. They are not approved fabrication/construction drawings, supplier selections, signed calculations, permits, surveys or performed acceptance records.

# Station and civil factory/release work packages

Repository source: `design/component-catalogue/catalog/buildable-stations/factory-release-work-packages.md`

These packages turn the 45 stable station product identities into bounded drawing, tooling, site-handoff and verification tasks. They deliberately separate reusable definitions from supplier configuration and deployment release.

- Packages: 9
- Unique product rows: 50
- Drawing/interface IDs: 18
- Tool/gauge families: 22
- Release paths: 18 reusable definition, 14 supplier configuration, 18 deployment-specific

`release-candidate` means the catalogue definition is mature enough to enter controlled detailing; it never means a part, structure or site is released.

## `STN-FRP-010` — precast platform, guideway edge, drainage and closure pack

Delivery lane: `hybrid-prefabrication-and-site`.

Drawings/interfaces: `STN-CIV-100`, `STN-CIV-110`. Tools/gauges: `STN-TOOL-PRECAST-MOULD`, `STN-TOOL-EDGE-GAUGE`, `STN-TOOL-LIFTING-GAUGE`.

### Controlled products

| Product | Route | Catalogue maturity | Release path | Default | Variants |
|---|---|---|---|---|---|
| `STN-CIV-P010` — 6 m ground-level station slab and depressed double-track guideway-channel panel | `MAKE` | `release-candidate` | `reusable-definition` | `not-required` | 7 |
| `STN-CIV-P020` — platform sub-base, levelling pad, grout, and closure-pour kit | `MAKE` | `release-candidate` | `reusable-definition` | `not-required` | 7 |
| `STN-CIV-P030` — platform and track drainage channel, pipe, catch-pit, and outlet kit | `MAKE` | `release-candidate` | `reusable-definition` | `not-required` | 7 |
| `STN-CIV-P040` — 3 m at-grade guideway-channel edge beam, coping/tactile carrier, and drained service trough | `MAKE` | `release-candidate` | `reusable-definition` | `not-required` | 6 |
| `STN-CIV-P050` — island centre deck infill between edge L-unit strips | `MAKE` | `study-only` | `deployment-specific` | `specified` | 1 |
| `STN-CIV-P060` — station track-deck and running-rail interface | `MAKE` | `study-only` | `deployment-specific` | `specified` | 7 |
| `STN-PLT-P010` — platform coping, tactile strip, warning line, and edge-marker kit | `SOURCE` | `release-candidate` | `reusable-definition` | `not-required` | 7 |

### Frozen inputs

- accepted survey control, track alignment and platform stepping/gap envelope
- site geotechnical, drainage/outfall and foundation design
- released concrete, reinforcement, tactile and joint/seal systems

### Controlled outputs

- repeatable precast mould, reinforcement, insert and lifting drawings
- site set-out, levelling, drainage and closure-pour schedule
- platform-edge datum, tolerance and interface-control plan

### Verification

- mould and first-article dimensional survey
- concrete, reinforcement and lifting-insert records
- installed track/platform gap-step and drainage survey

Boundary: The reusable mould and panel definition does not release site excavation, foundations, drainage falls or track/platform geometry.

## STN-FRP-020 — platform canopy steel, footing and solar-roof pack

Delivery lane: `hybrid-prefabrication-and-supplier`.

Drawings/interfaces: `STN-CNP-200`, `STN-CNP-210`. Tools/gauges: `STN-TOOL-PORTAL-FIXTURE`, `STN-TOOL-ANCHOR-TEMPLATE`, `STN-TOOL-ROOF-WATER-TEST`.

### Controlled products

| Product | Route | Catalogue maturity | Release path | Default | Variants |
|---|---|---|---|---|---|
| `STN-CNP-P010` — 6 m galvanised HEA portal-frame steel kit | `MAKE` | `release-candidate` | `reusable-definition` | `not-required` | 7 |
| `STN-CNP-P020` — canopy footing, reinforcement, base plate, and anchor-bolt kit | `MAKE` | `release-candidate` | `reusable-definition` | `not-required` | 7 |
| `STN-CNP-P030` — factory-bonded solar roof sandwich panel with MC4 leads | `BID` | `buildable-after-supplier-freeze` | `supplier-configuration` | `specified` | 7 |
| `STN-CNP-P040` — platform-canopy PV string, combiner, isolation, bonding, and downlink kit | `BID` | `buildable-after-supplier-freeze` | `supplier-configuration` | `specified` | 7 |

### Frozen inputs

- site wind, snow, seismic, thermal and maintenance load cases
- accepted steel, coating, roof-panel, PV and connector systems
- surveyed foundation, platform, electrical and drainage interfaces

### Controlled outputs

- portal cut/weld, baseplate, anchor-template and erection drawings
- roof-panel layout, joints, gutters, penetrations and edge details
- PV string, isolation, bonding and cable-route schedule

### Verification

- steel certificates, weld/NDT and frame survey
- anchor-template and erected-frame survey
- roof watertightness, PV insulation/polarity and bond-continuity tests

Boundary: Catalogue bay geometry is not a structural release; foundations and every site load case require the deployment design authority.

## STN-FRP-030 — auxiliary solar-canopy module, truss and site-interface pack

Delivery lane: `deployment-led-hybrid`.

Drawings/interfaces: `STN-CNP-220`, `STN-CNP-230`. Tools/gauges: `STN-TOOL-TRUSS-FIXTURE`, `STN-TOOL-AUX-ANCHOR-TEMPLATE`, `STN-TOOL-AUX-ROOF-GAUGE`.

## Controlled products

| Product | Route | Catalogue maturity | Release path | Default | Variants |
|---|---|---|---|---|---|
| STN-CNP-P050 — 8.5 m × 22 m factory-bonded auxiliary solar-roof bay module | BID | buildable-after-supplier-and-structural-release | supplier-configuration | specified | 7 |
| STN-CNP-P060 — 22 m S355 transverse Warren-truss frame with two HSS 200 columns | MAKE | buildable-after-structural-calculation-and-drawing-release | reusable-definition | specified | 7 |
| STN-CNP-P070 — auxiliary-canopy pad footing, reinforcement, base plate, and anchor-bolt kit | MAKE | buildable-after-site-structural-release | deployment-specific | specified | 7 |
| STN-CNP-P080 — auxiliary-canopy PV string, combiner, isolation, bonding, and downlink kit | BID | buildable-after-electrical-and-supplier-freeze | supplier-configuration | specified | 7 |
| STN-CNP-P090 — auxiliary-canopy gutter, downpipe, lightning, maintenance-access, and edge-protection kit | SOURCE | buildable-after-site-and-supplier-freeze | deployment-specific | specified | 7 |

## Frozen inputs

- released site layout, egress, fire, drainage and maintenance-access plan
- site-specific structural calculation and foundation reactions
- selected roof/PV/lightning/edge-protection supplier configurations

## Controlled outputs

- repeatable truss fabrication and roof-bay module drawings
- site footing, anchor, erection, gutter/downpipe and access drawings
- PV string, protection, bonding and commissioning schedule

## Verification

- truss weld/NDT and dimensional survey
- foundation pre-pour, anchor and erected-geometry surveys
- water, electrical, lightning and edge-protection acceptance tests

Boundary: The 8.5 m by 22 m catalogue module is an area-planning unit only until site structure, foundations, egress and electrical integration are signed.

# STN-FRP-040 — station services, passenger equipment and plinth integration pack

Delivery lane: supplier-interface.

Drawings/interfaces: STN-SYS-300, STN-SYS-310. Tools/gauges: STN-TOOL-CABINET-PLINTH-GAUGE, STN-TOOL-FARE-PLINTH-GAUGE, STN-TOOL-ACCESSIBILITY-GAUGE.

## Controlled products

| Product | Route | Catalogue maturity | Release path | Default | Variants |
|---|---|---|---|---|---|
| STN-MEP-P010 — weatherproof services cabinet, plinth, cooling, and maintenance-light kit | MAKE | release-candidate | reusable-definition | not-required | 7 |
| STN-MEP-P020 — incoming switchboard, distribution board, metering, UPS, and earthing kit | BID | buildable-after-supplier-freeze | supplier-configuration | specified | 7 |
| STN-MEP-P030 — platform and emergency LED luminaire, support, and cable kit | SOURCE | release-candidate | reusable-definition | not-required | 7 |
| STN-MEP-P040 — fire detection, alarm interface, extinguisher, and evacuation-sign kit | SOURCE | release-candidate | reusable-definition | not-required | 7 |
| STN-PAX-P010 — S-SBC station/depot host and rack enclosure | SOURCE | release-candidate | reusable-definition | not-required | 7 |
| STN-PAX-P020 — passenger-information display and route-strip kit | SOURCE | release-candidate | reusable-definition | not-required | 7 |
| STN-PAX-P030 — CCTV, PA loudspeaker, help-point, radio, and station-LAN kit | BID | buildable-after-supplier-freeze | supplier-configuration | specified | 7 |
| STN-PAX-P040 — fare gate, accessible gate, and validator equipment kit | BID | buildable-after-supplier-freeze | supplier-configuration | specified | 7 |
| STN-PAX-P050 — ticket-vending machine equipment kit | BID | buildable-after-supplier-freeze | supplier-configuration | specified | 6 |
| STN-PAX-P060 — seating, wheelchair-zone marking, wayfinding, and accessible-signage kit | SOURCE | release-candidate | reusable-definition | not-required | 7 |
| STN-PAX-P070 — anchored rolled-steel fare-lane / validator plinth with protected cable void | MAKE | release-candidate | reusable-definition | not-required | 7 |
| STN-PAX-P080 — anchored rolled-steel TVM plinth with protected power/data entry | MAKE | release-candidate | reusable-definition | not-required | 6 |

## Frozen inputs

- frozen operator equipment, communications, fare and cyber interfaces
- utility, UPS, cooling, earthing, fire and evacuation requirements
- released accessibility, sightline, coverage and maintainability zones

## Controlled outputs

- cabinet/plinth fabrication and coordinated equipment-layout drawings
- power, data, containment, earth and fire-interface schedules
- equipment anchorage, accessible reach and replacement-clearance map

## Verification

- plinth and anchorage dimensional/proof checks
- supplier FAT and station integrated functional tests
- accessibility, CCTV/PA coverage and power-loss survey

Boundary: Generic plinths may be prepared from controlled envelopes; holes, anchors and services may not be released against assumed supplier equipment.

# STN-FRP-050 — pedestrian approach, lift/stair core and overbridge interface pack

Delivery lane: deployment-led-hybrid.

Drawings/interfaces: STN-ACC-400, STN-ACC-410. Tools/gauges: STN-TOOL-ACCESSIBILITY-GAUGE, STN-TOOL-STAIR-RISER-GAUGE.

## Controlled products

| Product | Route | Catalogue maturity | Release path | Default | Variants |
|---|---|---|---|---|---|
| STN-ACC-P010 — direct/protected pedestrian approach, kerb, ramp, and boundary kit | MAKE | release-candidate | reusable-definition | not-required | 7 |
| STN-ACC-P020 — installed passenger lift | BID | buildable-after-site-and-supplier-freeze | deployment-specific | specified | 1 |
| STN-ACC-P030 — pedestrian overbridge/concourse structural and enclosure kit | BID | buildable-after-site-and-supplier-freeze | deployment-specific | specified | 1 |
| STN-ACC-P040 — installed escalator | BID | study-only | deployment-specific | specified | 1 |
| STN-ACC-P050 — installed staircase | BID | study-only | deployment-specific | specified | 1 |
| STN-ACC-P060 — installed shaft | BID | study-only | deployment-specific | specified | 1 |

## Frozen inputs

- topographical survey, land boundary, pedestrian demand and road interfaces
- site structural, geotechnical, fire/egress and accessibility approvals
- selected lift, enclosure and emergency-power configuration

## Controlled outputs

- approach, ramp, kerb, boundary and accessible-route drawings
- lift/stair/overbridge structure, enclosure and service-interface drawings
- evacuation, rescue, drainage and inspection-access plan

## Verification

- route gradient, crossfall, width, surface and obstacle survey
- structural, clearance and weatherproofing acceptance
- lift certification, fire recall, backup power and egress test

Boundary: No catalogue access arrangement substitutes for a site accessibility, egress, highway or structural approval.

# STN-FRP-060 — wayside charging and traction substation interface pack

Delivery lane: supplier-and-utility-interface.

Drawings/interfaces: STN-PWR-500, STN-PWR-510. Tools/gauges: STN-TOOL-CHARGER-ALIGNMENT, STN-TOOL-EARTH-BOND-TEST.

## Controlled products

| Product | Route | Catalogue maturity | Release path | Default | Variants |
|---|---|---|---|---|---|
| STN-CHG-P010 — station charging cabinet, protection, cable, and wayside connector kit | BID | buildable-after-supplier-freeze | supplier-configuration | specified | 6 |
| STN-CHG-P020 — traction power substation transformer/rectifier and protection interface | BID | buildable-after-utility-and-supplier-freeze | deployment-specific | specified | 5 |

## Frozen inputs

- utility fault level, capacity, metering and protection requirements
- selected charger and transformer/rectifier supplier data
- released vehicle docking envelope and operational charging duty

## Controlled outputs

- equipment arrangement, foundation reaction and maintainability drawings
- single-line, protection, earthing, isolation and cable schedules
- vehicle/wayside datum, alignment, interlock and abort interface control

## Verification

- supplier FAT and protection-coordination review
- earthing, insulation, isolation and utility witness tests
- vehicle alignment, charge, abort and emergency-isolation SAT

Boundary: Rated catalogue power is a requirement, not authority to connect; the utility and electrical design authority retain release.

# STN-FRP-070 — 1:9 turnout, actuation, detection, heating and track-end pack

Delivery lane: `hybrid-fabrication-and-supplier`.

Drawings/interfaces: `STN-TRK-600`, `STN-TRK-610`. Tools/gauges: `STN-TOOL-TURNOUT-BENCH`, `STN-TOOL-BLADE-PROFILE-GAUGE`, `STN-TOOL-TRACK-GEOMETRY`.

## Controlled products

| Product | Route | Catalogue maturity | Release path | Default | Variants |
|---|---|---|---|---|---|
| `STN-TRK-P010` — 1:9 UIC60 stock-rail, machined switch-blade, and closure-rail kit | `MAKE` | `buildable-after-controlled-drawing-release` | `reusable-definition` | `specified` | 2 |
| `STN-TRK-P020` — cast-manganese frog, check-rail, stretcher-bar, and mechanical-lock kit | `BID` | `buildable-after-supplier-freeze` | `supplier-configuration` | `specified` | 2 |
| `STN-TRK-P030` — prestressed turnout sleeper, slide-chair, and elastic-fastener set | `SOURCE` | `buildable-after-supplier-freeze` | `supplier-configuration` | `specified` | 2 |
| `STN-TRK-P040` — 6 kN nominal / 12 kN peak point-machine actuator, crank, and hand-wind kit | `BID` | `buildable-after-actuator-qualification` | `supplier-configuration` | `specified` | 2 |
| `STN-TRK-P050` — dual position detector, W-SBC interface, junction, and turnout harness kit | `SOURCE` | `buildable-after-hardware-freeze` | `supplier-configuration` | `specified` | 2 |
| `STN-TRK-P060` — 3 kW points-heating strip, thermostat, IP67 cabinet, isolation, and cabling kit | `SOURCE` | `buildable-after-climate-and-supplier-freeze` | `supplier-configuration` | `specified` | 2 |
| `STN-TRK-P070` — terminal stop-block, passive end marker, foundation, and fixing kit | `SOURCE` | `buildable-after-site-geometry-freeze` | `deployment-specific` | `specified` | 2 |

## Frozen inputs

- released wheel/rail interface, axle loads, route speed and climate envelope
- selected rail, frog, sleeper, actuator, detector and heater configurations
- site track alignment, signalling, drainage and track-end geometry

## Controlled outputs

- rail machining, switch/closure, gauge and weld drawings

- complete turnout assembly, harness, detection, heating and bench-test schedule
- site set-out, installation, stop-block and commissioning drawings

### Verification

- material, machining, weld/NDT and dimensional records
- bench throw, lock, detection, hand-wind and heating proof
- installed geometry, route/detection and stop-block acceptance

Boundary: The catalogue tangent and geometry do not release rail machining or site installation without controlled drawings and supplier qualifications.

## STN-FRP-080 — depot site, drainage, track and throat-turnout pack

Delivery lane: `deployment-specific`.

Drawings/interfaces: STN-DEP-700, STN-DEP-710. Tools/gauges: STN-TOOL-DEPOT-SET-OUT, STN-TOOL-TRACK-GEOMETRY, STN-TOOL-DRAINAGE-TEST.

### Controlled products

| Product | Route | Catalogue maturity | Release path | Default | Variants |
|---|---|---|---|---|---|
| STN-DEP-P010 — main-heavy depot site formation, drainage, service-road, and secure-boundary kit | MAKE | buildable-after-site-design-release | deployment-specific | specified | 1 |
| STN-DEP-P020 — stabling, inspection, wash, and workshop track-panel/stop-block package | MAKE | buildable-after-controlled-layout-release | deployment-specific | specified | 1 |
| STN-DEP-P030 — 1:9 depot-throat turnout assembly replicated from the terminal turnout standard | MAKE | buildable-after-turnout-design-and-site-freeze | deployment-specific | specified | 1 |

### Frozen inputs

- boundary/topographical/utility/geotechnical surveys and environmental approvals
- released fleet plan, movements, swept paths and maintenance concept
- controlled depot layout, gradients, drainage/outfall and track standards

### Controlled outputs

- earthworks, pavement, drainage, boundary and service-road drawings
- stabling, inspection, wash and workshop track-layout drawings
- turnout, stop-block, walkways, crossings and clearance-control schedule

### Verification

- formation, compaction, drainage and pavement records
- track geometry, clearance and stop-block proof
- route, detection and vehicle swept-path demonstration

Boundary: These are deployment drawings: the reference depot quantities do not authorize site works or fix a universal depot layout.

## STN-FRP-090 — depot charging, energy, workshop and services integration pack

Delivery lane: `deployment-and-supplier`.

Drawings/interfaces: STN-DEP-720, STN-DEP-730. Tools/gauges: STN-TOOL-VEHICLE-LIFT-GAUGE, STN-TOOL-CHARGER-ALIGNMENT, STN-TOOL-ENERGY-ISOLATION-TEST.

## Controlled products

| Product | Route | Catalogue maturity | Release path | Default | Variants |
|---|---|---|---|---|---|
| STN-DEP-P040 — outdoor/open-sided per-stall plug-in charger, isolation, suspended cable, and data-dock kit | BID | buildable-after-supplier-and-energy-freeze | deployment-specific | specified | 1 |
| STN-DEP-P050 — depot PV canopy, inverter, microgrid switchgear, and separated outdoor stationary-battery package | BID | buildable-after-energy-site-and-supplier-freeze | deployment-specific | specified | 1 |
| STN-DEP-P060 — main workshop, synchronized LM3 lift/bogie-change bay, overhaul/inspection bays, 40 t crane, wash plant, stores, and wheel-lathe package | BID | buildable-after-building-and-equipment-freeze | deployment-specific | specified | 1 |
| STN-DEP-P070 — depot cooled controls room, LV, compressed-air, fire, lighting, CCTV, LAN, access-control, and maintenance-data kit | BID | buildable-after-services-and-supplier-freeze | deployment-specific | specified | 1 |

## Frozen inputs

- selected equipment loads, heat rejection, utilities and maintenance envelopes
- site building, fire, structural, energy and environmental approvals
- released LM3 lift points, bogie extraction path and service requirements

## Controlled outputs

- equipment layouts, foundations, clearances and replacement paths
- power/microgrid/battery isolation, fire, cooling and controls drawings
- workshop lift, crane, pit, wash, stores and maintenance-data schedules

## Verification

- supplier FAT, certification and equipment foundation survey
- charging, energy, fire, cooling and emergency-isolation SAT
- synchronised lift, mechanical lock, bogie extraction and crane proof

Boundary: Reference duties and envelopes do not select suppliers or release a depot building, stationary battery compound, crane or lifting system.

Global boundary: These packages define reusable drafting and deployment handoff scope. They are not approved fabrication/construction drawings, supplier selections, signed calculations, permits, surveys or performed acceptance records.

# Station open release gap register

Repository source: `design/component-catalogue/catalog/buildable-stations/open-release-gaps.md`

Generated from the same product rows as the station EBOMs and assembly travelers. A row disappears only when its product maturity is promoted to `release-candidate`; acceptance evidence remains mandatory at build time.

| Engineering ID | Component | Route | Maturity / blocker | Variant quantities | Closure evidence |
|---|---|---|---|---|---|
| STN-ACC-P020 | installed passenger lift | BID | buildable-after-site-and-supplier-freeze | interchange-elevated=4 core | lift certification; fire recall test; backup-power test; accessibility survey |

| STN-TRK-P070 | terminal stop-block, passive end marker, foundation, and fixing kit | SOURCE | buildable-after-site-geometry-freeze | terminal=2 track-end kit; depot-terminal=2 track-end kit | track-end geometry release; foundation inspection; stop-block proof; marker visibility check |

# Package-level exclusions

These conditions are not product rows and therefore remain explicit package gates:

- platform screen doors are optional for light-metro-3car and are not included
- site survey, geotechnical design, utilities, permits, and stamped calculations remain deployment-specific
- auxiliary canopy requires deployment structural, foundation, drainage, egress, and electrical release

# Station product reconciliation

Repository source: `design/component-catalogue/catalog/buildable-stations/station-product-reconciliation.md`

Status: PASS

This generated register proves stable identities in both directions across the station manifest, BOM, traveler, compact variant definition/drawing register, native FreeCAD installed/exploded states and IFC4.3 handoff. It proves configuration consistency, not construction readiness.

| Variant | Products | Assemblies | Definition sheets | Connection controls | States | Result |
|---|---|---|---|---|---|---|
| `halt` | 26 | 8 | 26 | 8 | installed, exploded | PASS |
| `standard` | 29 | 8 | 29 | 10 | installed, exploded | PASS |
| `major` | 30 | 8 | 30 | 10 | installed, exploded | PASS |
| `interchange` | 30 | 8 | 30 | 10 | installed, exploded | PASS |
| `interchange-elevated` | 35 | 8 | 35 | 10 | installed, exploded | PASS |
| `terminal` | 37 | 9 | 37 | 13 | installed, exploded | PASS |
| `depot-terminal` | 44 | 10 | 44 | 14 | installed, exploded | PASS |

A definition-sheet or connection-control identifier is a required deployment deliverable keyed to its product row. It is not evidence that a signed fabrication drawing, supplier data or site approval already exists. Those gates remain in the open-release register and each assembly traveler.

# Generated buildable trainset artifacts

Repository source: `design/component-catalogue/catalog/buildable-trainset/README.md`

This folder is generated by:

```
tools/automation/buildable-trainset.sh
```

The manifest starts the buildable rolling-stock product structure: fabricated parts, external components, subassemblies, assemblies, and the final trainset. Generated definitions and travelers now carry structured material specs, process specs, evidence requirements, and inspection controls. The review calls out what is already solid in the current basic design and what must be closed before first steel cut.

# How to use this folder

| If you are… | Start with | Then use |
|---|---|---|
| Design authority | `current-design-buildability-review.md` | Close yellow/red findings before release |
| Configuration / release manager | `open-release-gaps.md` | Keep every supplier, drawing, analysis and approval gap visible against the controlled candidate |
| First-article lead | `first-article-baseline.json` | Hold `LM3-FA-001`, assign the 81 public work packages, and manage closure only through the controlled state file |
| Test / assurance lead | `first-article-evidence-status.md` | Separate current screening from the 13 still-open supplier, structural, physical, thermal, electrical, HIL, manufacturing and mass-properties release gates |
| Manufacturing engineer | `buildable-trainset-manifest.md` | Turn `MAKE` definitions into controlled drawings, fixtures, and NC/cut data |
| Drawing/interface lead | `factory-release-readiness.md` | Execute the 16 chassis, module, fascia, roof, interior, finish and recovery packages through issued drawings, released tooling and performed verification |
| Drafting/checking team | `factory-drawings/index.md` | Develop the 29 drawing-definition seeds covering all 62 locally made rows into checked production drawings without treating design envelopes as manufacturing dimensions |
| Train configuration engineer | `train-end-interface.md` | Select panoramic glass outer ends or the optional mid open train-to-train connection on the common end interface |
| Vehicle mechanical / interior engineer | `small-component-standard.md` | Freeze the common rail, four fastener families, adapters, keyed connectors, lighting modules, and door/window service boundaries |
| Exterior finish engineer | `exterior-finish-system.md` | Retain mandatory corrosion/fire/UV protection while using livery film and trial-only radiative roof coating only in permitted zones |
| Production planner | `critical-path.md` | Plan parallel part fabrication, subassembly release, final train assembly, space use, and rough labour |
| Factory planner | `factory-plan.md` | Size the pilot factory cells, enclosed area, yard, assembly-time rollups, machinery list, and rough equipment prices |
| Cost planner | `trainset-build-cost.md` | Review the recalculated 3-car trainset build cost with USD 10/h labour, 20% unexpected-cost premium, and included seats/floors/lighting/HVAC/windows/doors scope |
| Mass-properties engineer | `mass-closure-ledger.md` | Close all 117 active product responsibilities with production-CAD, supplier and calibrated weighed evidence; use `mass-budget.md` for the nine-category control total |
| Assembly engineer | `joint-control-schedule.md` | Close each joint with its named torque authority and interface drawing |
| Manufacturing / quality lead | `manufacturing-and-assembly-controls.md` | Adopt or replace the ten reference datum, steel, joint, bonding, moulding, roof, interior, lifting, finish and NCR controls |
| Build-record controller | `evidence/manufacturing-control-record-template.json` | Copy the blank ten-control execution record per work order; bind actual revisions, people, plant, lots, observations, NCRs and handback |
| Inspection lead | `first-article-inspection-plan.md` | Import the 416 package-specific hold, witness and record-review characteristics into the QMS without pre-claiming a result |
| Production-data controller | `production-data-release-register.md` | Issue and hash-bind the 472 drawing, material, cut/form/NC, mould, harness, finish and inspection artifacts required across all 62 locally made products |
| Buyer / supplier manager | `supplier-anchors.md` | Source all 56 bought-in rows from 27 real supplier/research families or qualify a controlled local equivalent, then issue the per-part RFQ/evidence definitions |
| Buyer preparing enquiries | `cots-candidates.md` | Use 41 manufacturer/research catalogue/RFQ candidates covering all 56 bought-in rows, while preserving the exact fit and evidence still required |
| Buyer needing a costable starting point | `default-product-specifications.md` | Start every 34 `BID` and 24 `SOURCE` product row from one controlled affordable reference, then override it when fit, duty, evidence or whole-life cost requires |
| First-article execution team | `first-article-execution-pack.md` | Follow one ordered procurement, rig, physical-test, mass-properties and independent-acceptance route across all 13 evidence gates |
| Shop lead | `travelers/index.md` | Assign work centers, fill approvals/signatures during a real build |
| QA / inspector | `travelers/index.md` | Use QA gates, hold points, signoff blocks, and NCR/deviation logs |
| Local factory/tooling team | `manufacturing-methods.md` | Review all 120 product links, 9 timed methods, 30 tooling families, joining parts, mould use, coating, seals, floor/fixture and motor/bogie steps |
| Factory supervisor | `../../../../deployment/supervision/README.md` | Generate the nine read-only method views on a real city plant, rehearse unavailable/quality-hold routing, and correlate only reviewed ERP Item/BOM mappings |

Open the 120 native FreeCAD parts and 26 assembly files, the selectable tooling in `../../models/cad/lm3-manufacturing-tooling.FCStd`, and the matching IFC4.3 product/assembly and method

federation.

## Generated manufacturing visuals

| View | Use |
|---|---|
| `trainset-factory-layout.png` | Pilot factory cell arrangement: 55 m final bay, chassis fixtures, moulding/trim, bogies, interiors/HVAC kits, corrosion/finish, stores/QA, yard, and test access |
| `trainset-assembly-method-flow.png` | Parallel first-article critical-path work streams and labour/day envelopes |
| `trainset-gfrp-moulding-method.png` | Reusable one-metre glass-fibre mould route, CNC trim, insert/seal fit, master-frame dry fit, and clip-on carbody installation |
| `trainset-bogie-marriage-method.png` | Final-bay bogie-to-carbody marriage with lifting columns, surveyed chassis datums, accepted bogies, and static-release hold points |
| `simplified-small-component-package.png` | Common service rails, plug-in lighting, fixture adapters, adjustable door carriers, and open window pressure frames |

The intended sequence is:

1. Hold the `LM3-FA-001` configuration in `first-article-baseline.json`, then read the buildability review for release blockers.
2. Use the manifest to understand the 120-product-row / 26-assembly tree, then use `default-product-specifications.md` as the costable starting configuration, `cots-candidates.md` for exact catalogue samples and vehicle-specific RFQs, and `supplier-anchors.md` for the broader local-equivalent boundary.
3. Use `train-end-interface.md` to confirm whether each end position is dressed as a panoramic glass front/end or an open mid-train train-to-train connection.
4. Use definitions as the drawing/RFQ/material/process source of truth.
5. Use the critical path to reserve the long final assembly track only for accepted subassemblies and keep steel, GFRP, bogie, HV, and interior kit work off-line where possible.
6. Use `factory-plan.md` to reserve about 3,515 m2 of enclosed pilot factory, 2,200 m2 of yard/test apron, and the rough machinery package before lease/building work or RFQs start.
7. Use `trainset-build-cost.md` for the current rough-order build cost: direct material/supplier modules plus explicit labour at USD 10/h, with a 20% unexpected-cost premium. Its direct-module bucket already includes seats, floors, grab rails, interior lighting, roof HVAC, windows, side doors, sill/emergency kits, and panoramic end glass.
8. Qualify the small-component rail/fastener samples and close each fixture, lighting, door and glazing release gate in `small-component-standard.md`.
9. Close every active product row in `mass-closure-ledger.md`, reconcile the nine-category mass budget, then close joint-control rows as supplier, production-CAD and calibrated weighed evidence becomes available.
10. Use travelers as the shop-routing, material/process-control, and QA template, applying `manufacturing-and-assembly-controls.md` wherever a released procedure has not yet superseded its reference control.
11. Run the ordered procurement and rig sequence in `first-article-execution-pack.md`; begin supplier and test records from the controlled templates under `evidence/`.
12. Attach real inspection evidence and signatures only during an authorised build.
13. Run `python3 tools/automation/validate-lm3-first-article-evidence.py` before claiming a release gate. It verifies accountable submissions, calibrated-equipment metadata, artifact existence and SHA-256 values.

The work-package register is generated from the product manifest plus `first-article-work-package-state.toml`. Use `python3 tools/automation/publish-lm3-work-packages.py` for a read-only publication plan; `--apply` idempotently reconciles open rows with GitHub issues after maintainer review.

`definitions/` is the generated definition pack. It contains JSON and Markdown files for every product-tree node:

- `parts/` — fabricated parts plus BID/SOURCE external components.
- `subassemblies/` — reusable build cells such as underframe, roof, HV, bogie, and interior subassemblies.
- `assemblies/` — complete car, end, articulation, and control assemblies.
- `trainsets/` — final trainset-level definition.

Use `definitions/index.md` as the drawing/RFQ worklist. These files are not stamped shop drawings; they are the traceable seed for the v2A drawing, supplier-freeze, material/process-control, and proof-evidence packages.

`travelers/` is the generated shop-traveler pack. It contains JSON and Markdown traveler templates for every product-tree node. Each traveler includes:

- document revision and pending approval blocks,
- material specifications, process specifications, and evidence requirements,
- estimated labor by operation,
- work centers and tooling IDs,
- QA gates linked to the component/assembly acceptance checks,
- operator, cell-lead, quality, and manufacturing-engineering signoff blocks,
- a nonconformance/deviation log.

These are signable manufacturing templates, not already-signed release records. A real build cell must fill the approval/signature fields and attach actual inspection evidence before first-article release.

# Buildable trainset manifest

Repository source: `design/component-catalogue/catalog/buildable-trainset/buildable-trainset-manifest.md`

Generated by `tools/automation/buildable-trainset.sh`. This is the first structured product breakdown for a buildable OpenSourceRail trainset: parts  subassemblies  assemblies  final trainset.

- Family: `light-metro-3car`
- Candidate: `light-metro-3car__16p5m__reference-body__reference-bogie__motor-350kw-hm47-class__battery-225kwh-lfp-800v__hvac-24kw-direct-hv-dc__pv12`
- Candidate score: `92.628`
- Candidate feasible: `true`
- Product item rows: `120`
- Assembly nodes: 26
- Open supplier/component rows: `81` (register)
- Bought-in product reference defaults: `58` (register)

## Candidate metrics

| Metric | Value |
|---|---|
| cars | 3.0 |
| trainset_length_m | 49.5 |
| platform_margin_m | 10.0 |
| mass_t | 75.308 |
| cost_usd | 682431.18 |
| axle_load_kg | 6275.63 |
| installed_continuous_kw | 1500.0 |
| traction_margin | 2.845 |
| battery_usable_kwh | 540.0 |
| offwire_range_km | 68.915 |
| hvac_margin | 1.2 |
| pv_peak_kw | 15.12 |
| manufacturing_complexity_index | 1.0 |

## Current CAD baseline vs optimizer target

| Parameter | Current CAD baseline | Optimizer target |
|---|---|---|
| car_length_m | 16.5 | 16.5 |
| motor | motor-350kw-hm47-class | motor-350kw-hm47-class |
| battery | battery-225kwh-lfp-800v | battery-225kwh-lfp-800v |
| hvac | hvac-24kw-direct-hv-dc | hvac-24kw-direct-hv-dc |
| pv_modules_per_car | 12.0 | 12.0 |

## Product item route summary

| Route | Quantity sum |
|---|---|
| MAKE | 396 |
| BID | 116 |
| SOURCE | 493 |

|---|---|---|---|---|---|---|---|
| LM3-BDY-P010 | B1 | fabricated-part | MAKE | 6 ea | LM3-BDY-SA110 | laser-cut side sill beam, LH/RH | heat traceability<br>dimensional check<br>weld VT/MT where classed |
| LM3-BDY-P020 | B1 | fabricated-part | MAKE | 3 kit | LM3-BDY-SA110 | underframe centre spine and longitudinal load-path kit | tube/plate certs<br>spine straightness survey<br>bogie-centre datum report |
| LM3-BDY-P021 | B1 | fabricated-part | MAKE | 3 car pack | LM3-BDY-SA110 | underframe cross-bearer, door-bay outrigger, and equipment-bracket pack | cut-list identity<br>cross-bearer profile gauge<br>station map<br>fixture tack survey |
| LM3-BDY-P030 | B2 | fabricated-part | MAKE | 6 set | LM3-BDY-SA110 | bolster box, air-spring pad, and centre-pivot insert set | line-bore report<br>air-spring datum survey<br>NDT report |
| LM3-BDY-P040 | B2 | fabricated-part | MAKE | 2 set | LM3-END-SA700 | coupler pocket, shear plate, and crash-can insert kit | coupler face datum<br>bolt-hole survey<br>crash-load drawing check |
| LM3-BDY-P050 | B2<br>T17 | fabricated-part | MAKE | 3 kit | LM3-HV-SA510 | battery tray rails, vent plenum, and service-lid gutter kit | battery gauge fit<br>vent-path inspection<br>gasket land check |
| LM3-BDY-P060 | B1<br>B12 | fabricated-part | MAKE | 3 set | LM3-BDY-SA120 | low-floor centre pan and removable service-floor support set | PRM floor height<br>egress aisle gauge<br>pan weld inspection |
| LM3-BDY-P061 | B1 | fabricated-part | MAKE | 3 car set | LM3-BDY-SA120 | raised bogie-end deck, transition ramp, and removable hatch-frame set | deck-height survey<br>PRM transition gauge<br>hatch fit/removal<br>deck weld inspection |
| LM3-BDY-P070 | B1 | fabricated-part | MAKE | 6 side | LM3-BDY-SA120 | side-wall post, door portal, waist rail, and cant rail kit | door cassette gauge<br>window cassette gauge<br>side-frame survey |
| LM3-BDY-P080 | B1 | fabricated-part | MAKE | 3 kit | LM3-ROOF-SA410 | roof bow, HVAC rail, PV rail, and cable-tray bracket kit | roof rail pitch<br>HVAC curb gauge<br>PV clamp pull test |
| LM3-BDY-P090 | B1 | fabricated-part | MAKE | 2 set | LM3-END-SA700 | end ring frame and anti-climber beam set | A/B interchange check<br>glass carrier land survey<br>anti-climber datum |
| LM3-END-P060 | B2 | fabricated-part | MAKE | 2 end position | LM3-EIF-SA650 | common reversible end-interface carrier ring, option bolt grid, and sealing datum kit | option bolt-grid survey<br>seal datum continuity<br>A/B interchange check<br>end-option fit gauge |
| LM3-END-P061 | B2 | fabricated-part | MAKE | 2 option kit | LM3-EIF-SA650 | panoramic-end option shim, cowl/glass carrier, and sensor datum closeout kit | panoramic option fit gauge<br>glass/cowl datum transfer<br>sensor datum check<br>water-ingress pre-test |
| LM3-END-P062 | B2 | fabricated-part | MAKE | 0 option kit | LM3-EIF-SA650 | mid open-connection option portal trim, bellows clamp, threshold bridge, and drain kit | open-portal gauge<br>bellows clamp fit<br>threshold/turntable level check<br>drain-path water test |
| LM3-BDY-P100 | B2<br>B25 | fabricated-part | MAKE | 12 opening kit | LM3-DOOR-SA310 | door portal reinforcement, threshold beam, and cassette shim kit | door aperture gauge<br>threshold height survey<br>cassette shim record<br>water-drain path check |
| LM3-BDY-P110 | B2 | fabricated-part | MAKE | 18 opening kit | LM3-WIN-SA320 | window carrier ring, bonded-gasket land, and replacement jack-point inserts | aperture gauge<br>bond-land surface check<br>water-ingress witness<br>replacement tool clearance |

|---|---|---|---|---|---|---|---|
| LM3-BDY-P120 | B26 | fabricated-part | MAKE | 3 car kit | LM3-BDY-SA110 | jacking pad, lifting eye, towing lug, and recovery-label kit | material traceability<br>weld/NDT record<br>proof load<br>four-point depot interface gauge<br>datum and label inspection |
| LM3-BDY-P130 | B6 | fabricated-part | MAKE | 48 module | LM3-SHELL-A200 | one-metre clip-on solid-side fiberglass body module | material/fire certificate<br>trim gauge<br>insert pull-out<br>master-frame dry fit |
| LM3-BDY-P131 | B6 | fabricated-part | MAKE | 24 module | LM3-SHELL-A200 | one-metre clip-on window-edge fiberglass side module | window trim nest<br>sealed-edge inspection<br>cassette removal sweep<br>master-frame dry fit |
| LM3-BDY-P132 | B6 | fabricated-part | MAKE | 24 module | LM3-SHELL-A200 | one-metre clip-on door-edge fiberglass side module | door trim nest<br>sealed-edge inspection<br>door motion/service sweep<br>master-frame dry fit |
| LM3-BDY-P133 | B7 | fabricated-part | MAKE | 48 module | LM3-SHELL-A200 | one-metre clip-on fiberglass roof skin and equipment-fairing module | roof mould/trim record<br>anti-lift proof<br>equipment keep-out gauge<br>water/debris-ingress test |
| LM3-BDY-P140 | B7 | fabricated-part | MAKE | 3 car kit | LM3-SHELL-A200 | keyed clip rail, captive retainer, anti-lift, and dry-seal car kit | clip proof load<br>anti-reversal gauge<br>retainer witness-mark check<br>water ingress test |
| LM3-ROOF-P010 | T14 | fabricated-part | MAKE | 3 kit | LM3-ROOF-SA410 | HVAC curb, drop-duct collar, condensate tray, and drain fitting kit | curb flatness<br>drop-duct gauge<br>condensate drain flow test<br>roof leak test |
| LM3-ROOF-P020 | T22 | fabricated-part | MAKE | 3 car kit | LM3-ROOF-SA410 | PV bonded-pad lands, raised rail kit, bonding jumpers, and roof isolation labels | rail pitch survey<br>bond pull coupon<br>earth continuity<br>module keep-out gauge |
| LM3-ROOF-P030 | B7<br>T14 | fabricated-part | MAKE | 3 car set | LM3-ROOF-SA410 | removable HVAC curb fairing, intake/exhaust skirt, and access-hatch moulding set | fairing trim gauge<br>HVAC airflow keep-out<br>hatch removal trial<br>roof leak test |
| LM3-ROOF-P040 | B7<br>T22 | fabricated-part | MAKE | 3 car set | LM3-ROOF-SA410 | PV junction plinth, cable-gland cover, antenna closeout, and walkway edge set | gland/closeout trim gauge<br>drain-path test<br>bonding access check<br>service-removal trial |
| LM3-CWL-P010 | B8 | fabricated-part | SOURCE | 2 kit | LM3-CWL-SA710 | end-cowl fiberglass laminate, insert, adhesive, and coupon material kit | material batch trace<br>fire/smoke certificate<br>coupon layup record<br>adhesive shelf-life check |
| LM3-CWL-P011 | B8 | fabricated-part | MAKE | 2 ea | LM3-CWL-SA710 | CWL-FRP-01 upper brow and roof-cap fiberglass cast | mould release record<br>laminate coupon<br>trim-line gauge<br>roof-flange fit |
| LM3-CWL-P012 | B8 | fabricated-part | MAKE | 2 ea | LM3-CWL-SA710 | CWL-FRP-02 left cheek fiberglass cast | mould release record<br>laminate coupon<br>insert pull-out<br>split-gap gauge |
| LM3-CWL-P013 | B8 | fabricated-part | MAKE | 2 ea | LM3-CWL-SA710 | CWL-FRP-03 right cheek fiberglass cast | mould release record<br>laminate coupon<br>insert pull-out<br>split-gap gauge |
| LM3-CWL-P014 | B8 | fabricated-part | MAKE | 2 ea | LM3-CWL-SA710 | CWL-FRP-04 lower apron and anti-climber cover fiberglass cast | mould release record<br>laminate coupon<br>lamp pocket gauge<br>drain-path water test |
| ID | BOM lines | Layer | Route | Qty/trainset | Parent | Title | Acceptance |
| LM3-CWL-P015 | B8 | fabricated-part | MAKE | 4 hatch | LM3-CWL-SA710 | CWL-FRP-05 lamp, washer, and | mould release record |

| ID | BOM lines | Layer | Route | Qty/trainset | Parent | Title | Acceptance |
|---|---|---|---|---|---|---|---|
| | | | | | | service-hatchfiberglass cast set | insert pull-out<br>gasket compression check<br>hatch removal trial |
| LM3-CWL-P016 | B8 | fabricated-part | MAKE | 8 flange section | LM3-CWL-SA710 | CWL-FRP-06 backing-ring flange fiberglass cast set | mould release record<br>glass-carrier land survey<br>bond-line witness<br>A/B interchange check |
| LM3-FAS-P010 | B8<br>B27 | fabricated-part | MAKE | 2 end set | LM3-CWL-SA710 | panoramic front-glass carrier ring, setting-block pockets, and secondary-retention frame | carrier datum survey<br>glass-edge clearance gauge<br>secondary-retention proof<br>pane removal trial |
| LM3-FAS-P020 | B8<br>B17 | fabricated-part | MAKE | 2 end set | LM3-CWL-SA710 | reversible front-lamp cassette tray, aiming adjusters, and retained service bracket | lamp datum gauge<br>aiming range/retention test<br>harness clearance<br>cassette removal trial |
| LM3-FAS-P030 | B8<br>B27 | fabricated-part | SOURCE | 2 end kit | LM3-CWL-SA710 | front glazing/lamp EPDM seal, drain rail, washer sleeve, and edge-closeout kit | seal batch/certificate<br>compression map<br>drain flow test<br>water-ingress test |
| LM3-ART-P010 | B2<br>B29 | fabricated-part | MAKE | 2 kit | LM3-ART-SA810 | articulation adapter frame, anti-lift keeper, and shim kit | motion envelope<br>bearing proof<br>shim pack record |
| LM3-BOG-P010 | G1<br>G18 | fabricated-part | MAKE | 3 ea | LM3-BOG-SA610 | powered bogie welded H-frame and motor-cradle weldment | bogie fixture survey<br>weld/NDT record<br>motor-cradle proof |
| LM3-BOG-P020 | G2 | fabricated-part | MAKE | 3 ea | LM3-BOG-SA620 | trailer bogie welded H-frame | bogie fixture survey<br>weld/NDT record<br>air-spring datum survey |
| LM3-BOG-P030 | G13<br>G20 | fabricated-part | MAKE | 3 kit | LM3-BOG-SA610 | powered-bogie guards, cable guides, WSP brackets, and inspection covers | service access check<br>harness clearance<br>fastener torque record |
| LM3-BOG-P031 | G13<br>G20 | fabricated-part | MAKE | 3 kit | LM3-BOG-SA620 | trailer-bogie guards, cable guides, WSP brackets, and inspection covers | service access check<br>harness clearance<br>fastener torque record |
| LM3-BOG-P050 | G18 | fabricated-part | MAKE | 3 bogie kit | LM3-TRC-SA615 | powered-bogie motor torque link, anti-rotation stop, and safety lanyard bracket kit | torque-link gauge<br>bracket NDT<br>motor removal clearance<br>fastener locking record |
| LM3-BOG-P060 | G14<br>G15<br>G17 | fabricated-part | MAKE | 3 bogie kit | LM3-BOG-SA610 | powered-bogie brake/WSP/speed-sensor harness and junction-bracket kit | continuity test<br>connector IP rating<br>wheelset clearance<br>dynamic cable sweep |
| LM3-BOG-P061 | G14<br>G15<br>G17 | fabricated-part | MAKE | 3 bogie kit | LM3-BOG-SA620 | trailer-bogie brake/WSP/speed-sensor harness and junction-bracket kit | continuity test<br>connector IP rating<br>wheelset clearance<br>dynamic cable sweep |
| LM3-EXT-P010 | B11<br>B25<br>E20 | external-component | BID | 12 ea | LM3-DOOR-SA310 | electric plug/sliding door cassette | EN 14752 evidence<br>obstruction test<br>closed-and-locked loop test |
| LM3-EXT-P020 | B10 | external-component | SOURCE | 18 ea | LM3-WIN-SA320 | side laminated glazing cassette | glazing certificate<br>water ingress test<br>replacement method |
| LM3-EXT-P030 | B27 | external-component | BID | 2 ea | LM3-END-SA700 | single panoramic heated end-glass assembly | glass certificate<br>heater test<br>bond/gasket procedure |
| LM3-EXT-P040 | T14 | external-component | BID | 3 ea | LM3-ROOF-SA410 | hvac-24kw-direct-hv-dc roof HVAC | +50 C capacity evidence<br>condensate drain test<br>EMC/vibration evidence |
| LM3-EXT-P050 | T21 | external-component | SOURCE | 36 module | LM3-ROOF-SA410 | roof PV module and edge-clamp kit | module datasheet<br>clamp pull test<br>isolation/bonding check |

| LM3-ART-P041 | B24 | external-component | SOURCE | 0 joint kit | LM3-TTART-SA850 | train-to-train jumper blanking, transition harness, isolation label, and dust-cover kit | pinout test<br>blanking cover ingress check<br>isolation label inspection<br>bend-radius sweep |

# LM3 off-the-shelf and RFQ candidate register

Repository source: `design/component-catalogue/catalog/buildable-trainset/cots-candidates.md`

Freeze real catalogue candidates and vehicle-specific RFQ baselines for every bought-in LM3 product row.

Release boundary: A catalogue candidate proves that a relevant product exists; it does not prove LM3 fit, safety acceptance, availability, price, or authority approval. Exact order codes and supplier-controlled drawings remain mandatory before purchase or release.

Manufacturer sources checked on 2026-08-31.

A complete system such as a door, bogie, HVAC unit or gangway is vehicle-specific even when its supplier uses a standard platform. Exact catalogue components are therefore separated from RFQ baselines and partial interface kits.

## Coverage

| Measure | Value |
|---|---|
| Bought-in LM3 rows with a sourcing candidate | 56 / 56 |
| Rows containing at least one exact catalogue component | 10 |
| Controlled candidates | 41 |

# Candidate components and systems

| Candidate | Model and primary source | State | LM3 rows | Publicly established boundary |
|---|---|---|---|---|
| OSR-COTS-DOOR-IFE | Knorr-Bremse IFE — IFE modular sliding-plug entrance system | rfq-baseline | LM3-EXT-P010 | rail entrance-system family; supplier engineering required for vehicle aperture and controls |
| OSR-COTS-GLASS-AGC | AGC Automotive — rail glazing with framing system | rfq-baseline | LM3-EXT-P020, LM3-EXT-P030 | laminated rail glazing family; supplier framing-system option |
| OSR-COTS-FINISH-3M-180MC | 3M — Controltac Graphic Film with Comply Adhesive 180mC family | sample-and-system-rfq | LM3-FIN-P010 | listed for rail-car graphic applications; 50 micrometre cast opaque film; pressure-activated removable adhesive; up to seven-year MCS warranty subject to selected construction and conditions |
| OSR-COTS-COOLROOF-PURDUE-CACO3 | Purdue University research team (reference only) — 2020 CaCO3-acrylic particle-matrix paint formulation | qualification-only | LM3-FIN-P020 | 95.5 percent initial solar reflectance reported; 0.94 normal emissivity in the atmospheric window reported; 60 percent particle concentration research formulation |
| OSR-COTS-GLAZING-SIKA268 | Sika — Sikaflex-268 PowerCure, 600 ml | sample-ready | LM3-EXT-P020, LM3-EXT-P030 | EN 45545-2 R1/R7 HL3; 4.5 MPa typical lap-shear strength; -50 to 90 deg C service range; 30 minute open time at stated reference conditions |
| OSR-COTS-HVAC-LONGERTEK | Longertek — direct-DC rail HVAC platform | rfq-baseline | LM3-EXT-P040, LM3-INT-P010 | direct high-voltage DC architecture; rail HVAC product platform |
| OSR-COTS-PV-SUNMAN | Sunman Energy — eArc lightweight PV module | sample-ready | LM3-EXT-P050 | lightweight flexible photovoltaic family |
| OSR-COTS-FLOOR-COMFLOOR | 3A Composites Mobility — COMFLOOR rail floor panel | rfq-baseline | LM3-EXT-P060 | lightweight sandwich floor-panel family; optional integrated heating; rail vehicle application |
| OSR-COTS-FLOOR-FORBO-6R3883 | Forbo Flooring Systems — Marmoleum Fresco FR2 6R3883 moonstone, 2.5 mm | sample-ready | LM3-EXT-P061 | 2.5 mm thickness; 2.9 kg/m2; EN 45545-2 HL2 stated for the published system; roll width 2 m |
| OSR-COTS-SEAT-FAINSA | Fainsa — metro and urban-rail seating family | rfq-baseline | LM3-EXT-P062, LM3-EXT-P063 | urban rail passenger seat family |
| OSR-COTS-PIS-LUMINATOR | Luminator Technology Group — RailKom passenger-information and communication platform | rfq-baseline | LM3-EXT-P064 | rail passenger information, audio and communication family |
| OSR-COTS-CAMERA-MOXA-P06HC | Moxa — VPort P06HC-1MP-M12-CAM36 | sample-ready | LM3-EXT-P065 | EN 50155 application statement; IEC 61373 shock/vibration; IP66; PoE and M12 Ethernet; 1280 x 800 up to 30 fps |
| OSR-COTS-LIGHT-TEKNOWARE | Teknoware — rolling-stock interior and emergency lighting platform | rfq-baseline | LM3-EXT-P066, LM3-LGT-P010, LM3-LGT-P020, LM3-END-P050 | rolling-stock LED emergency-lighting platform |
| OSR-COTS-FASTENER-RIVNUT | Boellhoff — RIVNUT metric M6/M8 steel or stainless blind rivet nuts | sample-ready | LM3-FIX-P020 | published M6/M8 thread and upset-strength data; one-sided installation |
| OSR-COTS-ANTENNA-HS-85137717 | HUBER+SUHNER — SENCITY Rail MIMO 5-port with GNSS/LNA, product 85137717 | orderable-candidate | LM3-EXT-P070, LM3-CTRL-P020 | 2x2 cellular and Wi-Fi MIMO; GNSS with integrated LNA; EN 50155; EN 45545-2 and NFPA 130; -40 to 85 deg C |
| OSR-COTS-COMPOSITE-GURIT-130FR | Gurit — SE 130FR / ST 130FR prepreg with SA130FR and SF130FR films | sample-ready | LM3-EXT-P080, LM3-EXT-P090 | EN 45545 HL2 stated for R1/R7/R17 monolithic laminates; 85 deg C low-temperature cure option; 45 minute cure option at 120 deg C; published reinforcement and film order codes |
| OSR-COTS-MOTOR-ABB-AMXE250 | ABB — AMXE250 configurable traction motor | rfq-baseline | LM3-TRC-P010 | up to 436 kW peak; up to 3353 Nm peak; up to 3500 rpm; configurable shaft and length |
| OSR-COTS-GEAR-VOITH-SE | Voith — SE single-stage axle-mounted metro gear unit | rfq-baseline | LM3-TRC-P020 | single-stage axle-mounted rail gear family |
| OSR-COTS-CONVERTER-ABB-CC400 | ABB — BORDLINE CC400 LRV compact converter | rfq-baseline | LM3-TRC-P030 | 600/750 VDC LRV platform; two independent propulsion converters; integrated auxiliary converter and battery charger; regenerative or resistor braking |
| OSR-COTS-BATTERY-HOPPECKE-LITRAC | HOPPECKE — LiTrac modular high-voltage LFP rail traction battery | rfq-baseline | LM3-TRC-P040 | modular/scalable traction system; published LFP option; UN 38.3 base-module statement; supplier rail safety engineering |
| OSR-COTS-RESISTOR-DANOTHERM | Danotherm Electric — custom traction brake resistor, 600-3000 VDC family | rfq-baseline | LM3-TRC-P050 | rail traction brake-resistor family; 600-3000 VDC published range; IEC 60322 and IEC 61373 product-family statements; roof/underframe installation options |

| Candidate | Model and primary source | State | LM3 rows | Publicly established boundary |
|---|---|---|---|---|
| OSR-COTS-CHARGER-SCHUNK | Schunk Carbon Technology — Smart Charging automated high-current collector platform | concept-alternative | LM3-TRC-P060 | automated conductive charging platform |
| OSR-COTS-HV-SCHALTBAU-C360 | Schaltbau — C360K/300 railway bidirectional DC contactor | sample-ready | LM3-TRC-P070 | IEC 60077-2 category B; 1000 V at pollution degree 3 / 1500 V at pollution degree 2; 300 A at 70 deg C; 3000 A one-second withstand; 24/36-48/72-110 VDC coil options |
| OSR-COTS-HV-TE-HVP800 | TE Connectivity — AMP+ HVP800 cable assembly 1-2286937-1 | sample-ready | LM3-TRC-P070, LM3-ART-P030 | 1000 VDC; 1 m 50 mm2 cable assembly; integrated HVIL family; -40 to 140 deg C; published CAD and product drawings |
| OSR-COTS-FIRE-LIIONTAMER-3 | Xtralis / Li-ion Tamer — Li-ion Tamer GEN 3 | sample-ready | LM3-SAF-P010 | electrolyte-vapour early detection; temperature and humidity at sensing nodes; relay and Modbus interfaces; calibration-free sensing claim |
| OSR-COTS-FIRE-FOGTEC | FOGTEC Rail Systems — rail high-pressure water-mist system | hazard-analysis-rfq | LM3-SAF-P010 | rail water-mist system family; small pipe diameters and configurable vehicle installation |
| OSR-COTS-WHEELSET-GHH | GHH-BONATRANS — urban-rail wheelset with axle-mounted disc interfaces | rfq-baseline | LM3-BOG-P040, LM3-BOG-P041 | urban-rail wheelset supplier family |
| OSR-COTS-BEARING-SKF-TBU | SKF — sensor-ready railway tapered roller bearing unit | calculation-then-rfq | LM3-BOG-P042, LM3-BOG-P043 | sealed and pre-lubricated ready-to-mount TBU family |
| OSR-COTS-SUSPENSION-CONTI | Continental — rail half-bellow air spring with integrated auxiliary spring | dynamics-then-rfq | LM3-BOG-P044, LM3-BOG-P045, LM3-BOG-P046, LM3-BOG-P047 | metro/local-transport air-spring family; integrated rubber-metal auxiliary spring option |
| OSR-COTS-BRAKE-KNORR-RZKT | Knorr-Bremse — WheelAct Compact RZKT with spring parking-brake option | brake-calculation-then-rfq | LM3-BOG-P048, LM3-BOG-P049 | 50 kN service pad force; 45 kN spring parking force; 68 kg; 305 mm width; plus/minus 25 mm lateral movement; 8-10 year stated overhaul interval |
| OSR-COTS-AIR-KNORR-VV120T | Knorr-Bremse — VV120-T 2.0 oil-free rail compressor / AirSupply Smart | air-demand-then-rfq | LM3-AUX-P010 | oil-free rail compressor family; variable-speed smart-control option; published low-noise operating mode |
| OSR-COTS-COUPLER-DELLNER430 | Dellner — automatic coupler Type 430 with pivot anchor | rfq-baseline | LM3-END-P010, LM3-END-P040 | light-rail/tram/monorail application; 600 kN buff and 500 kN draft; gas-hydraulic damper; remote uncoupling and foldable options |
| OSR-COTS-JOINT-SCHAEFFLER | Schaeffler — ELGES maintenance-free spherical plain bearing and rod-end family | calculation-then-order-code | LM3-ART-P020, LM3-ART-P021 | maintenance-free spherical plain-bearing family |
| OSR-COTS-GANGWAY-HUBNER | HUEBNER — modular metro double-wall corrugated gangway | kinematic-envelope-then-rfq | LM3-ART-P022, LM3-ART-P023, LM3-ART-P040 | single/double-wall corrugated-bellows options; bridge and elastic interior-panel options; metro/urban-rail application |
| OSR-COTS-TRAINLINE-IGUS-HARTING | igus / HARTING — rail e-chain carrier with Han HPR connector system | sample-and-cycle-test | LM3-ART-P024, LM3-ART-P030, LM3-ART-P041 | rail dynamic cable-carrier family; rail connector/fire variants available |
| OSR-COTS-CONTROL-DUAGON-MH50C | duagon — D-SC Controller with MH50C safe CPU and distributed safe I/O | safety-allocation-then-rfq | LM3-CTRL-P010 | applications up to SIL4 stated by supplier; three-CPU safe controller; safe I/O; EN 50155 rolling-stock environment; certification packages available |
| OSR-COTS-COMPUTE-MOXA-V2406C | Moxa — V2406C-WL1-T railway computer | application-compute-candidate | LM3-CTRL-P010 | EN 50155:2017 mandatory-test statement; EN 50121-4; IEC 61373; -40 to 70 deg C; 24 to 110 VDC isolated input family |
| OSR-COTS-ROUTER-WESTERMO-630-5G | Westermo — Ibex-RT-630-5G | orderable-candidate | LM3-CTRL-P020 | 3GPP Release 16 5G; 4x4 sub-6 GHz MIMO; 2x2 Wi-Fi; EN 50155 and EN 45545-2; M12 and IP66 |
| OSR-COTS-SAFETYRELAY-PILZ-751184 | Pilz — PNOZ s4, railway order 751184 | bench-safety-relay-candidate | LM3-CTRL-P030 | railway application note for order 751184; three safety contacts; redundant self-monitoring circuit |
| OSR-COTS-RECORDER-HASLER | HaslerRail — JRU/EVA event-recorder platform | requirements-then-rfq | LM3-CTRL-P050 | rail event-recording product family |
| OSR-COTS-LIDAR-OUSTER-OS1 | Ouster — OS1 industrial lidar sensor | development-sensor-candidate | LM3-END-P020 | industrial digital lidar family |

# Integration and closure actions

## OSR-COTS-DOOR-IFE — Knorr-Bremse IFE IFE modular sliding-plug entrance system

- Source class: vehicle-specific-rfq

- Local manufacture: Buy the first cassette and controller; manufacture portal, threshold, carrier, harness and service parts locally to the released interface.
- Before freeze:
  - freeze clear aperture, stroke, mass and four mounting datums
  - obtain EN 14752 evidence and emergency-release/cycle data
  - freeze keyed power, network and interlock interfaces

## `OSR-COTS-GLASS-AGC` — AGC Automotive rail glazing with framing system

- Source class: `vehicle-specific-rfq`
- Local manufacture: Retain the pressure-frame and dry-seal replacement concept; qualify regional laminators against the released cassette drawing.
- Before freeze:
  - freeze laminate stack, optical zones and curvature
  - freeze heated end-glass voltage and power
  - obtain impact, fire, weather and bond-system evidence

## `OSR-COTS-FINISH-3M-180MC` — 3M Controltac Graphic Film with Comply Adhesive 180mC family

- Source class: `catalogue-family-with-rail-application-guidance`
- Local manufacture: Plot, print, label and apply pre-cut one-metre-bay kits locally; accept another supplier only through complete-system equivalence rather than nominal film thickness.
- Before freeze:
  - select film colour/print, ink, overlaminate and edge system together
  - obtain project fire and hot-climate exposure evidence
  - run adhesion, wash, weather, repair and removal trials on the actual LM3 base finish

## `OSR-COTS-COOLROOF-PURDUE-CACO3` — Purdue University research team (reference only) 2020 CaCO3-acrylic particle-matrix paint formulation

- Source class: `research-formulation-not-orderable`
- Local manufacture: Local coupon preparation is encouraged, but fleet application remains prohibited until an orderable controlled formulation and signed rail qualification pack exist.
- Before freeze:
  - identify a controlled commercial binder/pigment/additive formulation
  - obtain rail fire, chemical and application evidence
  - pass GFRP adhesion/flexibility plus UV, abrasion, wash and soiling ageing
  - measure new/aged optical performance and complete a one-car thermal/maintenance trial

## `OSR-COTS-GLAZING-SIKA268` — Sika Sikaflex-268 PowerCure, 600 ml

- Source class: `exact-catalogue-product`
- Local manufacture: Use locally applied standard cartridges with supplier-approved pretreatment; retain a mechanical pressure frame so glass replacement is not adhesive-only.
- Before freeze:
  - Sika-approved substrate preparation for the actual glass/frame coatings
  - bondline calculation and physical coupon validation
  - lot and shelf-life control

## OSR-COTS-HVAC-LONGERTEK — Longertek direct-DC rail HVAC platform

- Source class: `vehicle-specific-rfq`
- Local manufacture: Buy the first roof unit and controller; localise ducts, diffusers, drains, filters and later coils after calorimeter testing.
- Before freeze:
  - confirm 24 kW LM3 duty at worst ambient
  - freeze roof envelope, mass, coolant/refrigerant and drain interfaces
  - obtain EN 50155/50121 and fire evidence for quoted configuration

## OSR-COTS-PV-SUNMAN — Sunman Energy eArc lightweight PV module

- Source class: `catalogue-family`
- Local manufacture: Use standard modules and make clamps, bonded carriers and replaceable roof harnesses locally.
- Before freeze:
  - freeze module size and electrical string
  - qualify roof retention, fire, isolation, impact and walk-zone separation
  - verify MPPT and safe isolation under all charging states

## OSR-COTS-FLOOR-COMFLOOR — 3A Composites Mobility COMFLOOR rail floor panel

- Source class: `configurable-catalogue-system`
- Local manufacture: Import first panel stock if needed; machine panels, edge closeouts, hatch frames and inserts locally from released cut files.
- Before freeze:
  - freeze panel layup, inserts, hatch edges and fire level
  - prove concentrated, wheelchair and seat-rail loads
  - validate wet-zone sealing and repair method

## OSR-COTS-FLOOR-FORBO-6R3883 — Forbo Flooring Systems Marmoleum Fresco FR2 6R3883 moonstone, 2.5 mm

- Source class: `exact-catalogue-product`
- Local manufacture: Use roll material initially; cut, cove, weld and repair locally with a controlled substrate/adhesive system.
- Before freeze:
  - obtain fire certificate for selected substrate/adhesive combination
  - freeze cove, weld-cord, nosing and hatch details
  - slip, cleaning and repair trials

## OSR-COTS-SEAT-FAINSA — Fainsa metro and urban-rail seating family

- Source class: `vehicle-specific-rfq`
- Local manufacture: Make the common seat rail, grab poles and adapters locally; localise shells and frames only after fire and abuse-load qualification.
- Before freeze:
  - select exact shell, frame and upholstery
  - freeze common-rail attachment loads and PRM geometry
  - obtain fire, abuse-load, corrosion and maintainability evidence

## OSR-COTS-PIS-LUMINATOR — Luminator Technology Group RailKom passenger-information and communication platform

- Source class: `configurable-catalogue-system`
- Local manufacture: Use local brackets, speaker grilles and wiring; permit display/amplifier substitution through open interfaces and regression tests.
- Before freeze:
  - freeze display, amplifier, speaker and software licences
  - require open Ethernet/IP data interfaces
  - obtain EMC, fire, accessibility and cybersecurity evidence

## OSR-COTS-CAMERA-MOXA-P06HC — Moxa VPort P06HC-1MP-M12-CAM36

- Source class: `exact-catalogue-model`
- Local manufacture: Use the camera as a replaceable Ethernet appliance with locally made anti-vandal mount and harness.
- Before freeze:
  - confirm lifecycle availability and cybersecurity baseline
  - freeze viewing zones and privacy policy
  - qualify cable, storage and passenger-intercom integration

## OSR-COTS-LIGHT-TEKNOWARE — Teknoware rolling-stock interior and emergency lighting platform

- Source class: `vehicle-specific-rfq`
- Local manufacture: Make the 1.2 m carrier, lens, brackets and harness locally around replaceable quoted LED modules.
- Before freeze:
  - freeze 24 V keyed cassette, optics and emergency duration
  - obtain rail fire, EMC, ingress and photometry evidence
  - separately select certified exterior head/tail lamps

## OSR-COTS-FASTENER-RIVNUT — Boellhoff RIVNUT metric M6/M8 steel or stainless blind rivet nuts

- Source class: `catalogue-family-with-sizing`
- Local manufacture: Source from regional distributors or qualify metric equivalents by joint family; do not substitute solely by thread size.
- Before freeze:
  - select body, head, grip range and coating per joint drawing
  - run substrate-specific setting and proof-load trials
  - freeze setting-tool force and inspection gauge

## OSR-COTS-ANTENNA-HS-85137717 — HUBER+SUHNER SENCITY Rail MIMO 5-port with GNSS/LNA, product 85137717

- Source class: `exact-catalogue-product`
- Local manufacture: Buy antenna assemblies; manufacture roof doublers, cable conduits and replaceable RF jumpers locally.
- Before freeze:
  - confirm city radio bands and cable losses

- freeze roof ground/bond and lightning path
- perform installed antenna and EMC tests

### `OSR-COTS-COMPOSITE-GURIT-130FR` — Gurit SE 130FR / ST 130FR prepreg with SA130FR and SF130FR films

- Source class: `exact-catalogue-family`
- Local manufacture: Use the catalogue prepreg as the first-article material; cut, vacuum-bag, cure, trim and repair locally with batch coupons.
- Before freeze:
  - select reinforcement/core/film stack per component
  - fire-test the actual sandwich laminate
  - run environmental, insert, impact and repair qualification

### `OSR-COTS-MOTOR-ABB-AMXE250` — ABB AMXE250 configurable traction motor

- Source class: `configurable-catalogue-machine`
- Local manufacture: Buy first motors; local rewind and bearing service may follow an ABB-approved service procedure before attempting local manufacture.
- Before freeze:
  - quote a rail-duty 800 V winding and cooling configuration
  - freeze shaft, foot, mass and torque-speed map
  - obtain rail environmental, insulation, overspeed and endurance evidence

### `OSR-COTS-GEAR-VOITH-SE` — Voith SE single-stage axle-mounted metro gear unit

- Source class: `vehicle-specific-rfq`
- Local manufacture: Buy first gear units; machine guards, torque link and mounting hardware locally.
- Before freeze:
  - freeze ratio, centre distance, torque and coupling
  - obtain bearing, lubrication, efficiency, noise, overspeed and endurance evidence
  - freeze reaction-link and wheelset interfaces

### `OSR-COTS-CONVERTER-ABB-CC400` — ABB BORDLINE CC400 LRV compact converter

- Source class: `configurable-rail-product`
- Local manufacture: Buy first converters; localise cabinet, coolant manifold, harness and diagnostics integration behind frozen interfaces.
- Before freeze:
  - confirm operation from the selected battery/DC-link range
  - freeze motor, cooling, MVB/Ethernet and protection interfaces
  - quote exact mass, envelope, losses, software and rail evidence

### `OSR-COTS-BATTERY-HOPPECKE-LITRAC` — HOPPECKE LiTrac modular high-voltage LFP rail traction battery

- Source class: `vehicle-specific-rfq`
- Local manufacture: Buy certified packs/BMS initially; make external trays, ducts, guards, coolant manifolds and service fixtures locally.
- Before freeze:

- confirm the frozen 225 kWh gross per-car target against the validated duty cycle or raise a controlled change request
- freeze voltage window, pack segmentation, mass and cooling
- obtain IEC 62928, propagation, fire, EMC and software evidence for the quote

### `OSR-COTS-RESISTOR-DANOTHERM` — Danotherm Electric custom traction brake resistor, 600-3000 VDC family

- Source class: `vehicle-specific-rfq`
- Local manufacture: Buy the element pack and insulators; manufacture roof carrier, shield, duct and service guard locally after the hot-zone model is frozen.
- Before freeze:
  - derive resistance, continuous/pulse energy and duty cycle from simulation
  - freeze enclosure, airflow, thermal switch and touch guards
  - run worst-case stopped-train thermal test

### `OSR-COTS-CHARGER-SCHUNK` — Schunk Carbon Technology Smart Charging automated high-current collector platform

- Source class: `interface-rfq-baseline`
- Local manufacture: Prefer a proven automated collector geometry if it reduces bespoke side-pin risk; make station frame, guards and alignment target locally.
- Before freeze:
  - compare roof/bottom collector against the LM3 side-pin concept
  - freeze current, voltage, touch safety, alignment and emergency release
  - qualify stationary and vehicle halves together

### `OSR-COTS-HV-SCHALTBAU-C360` — Schaltbau C360K/300 railway bidirectional DC contactor

- Source class: `exact-catalogue-model`
- Local manufacture: Buy contactors and qualified fuses; fabricate busbars, enclosure, precharge assembly and service-disconnect panel locally.
- Before freeze:
  - confirm breaking duty and prospective fault current
  - select coil, auxiliary contacts and mounting orientation
  - coordinate fuse, busbar, precharge and enclosure clearances

### `OSR-COTS-HV-TE-HVP800` — TE Connectivity AMP+ HVP800 cable assembly 1-2286937-1

- Source class: `exact-catalogue-part`
- Local manufacture: Buy terminals/connectors; cut and terminate qualified rail cable locally only with controlled tooling and 100 percent electrical test.
- Before freeze:
  - confirm current derating, fire and railway vibration for installed route
  - freeze coding and mating header
  - perform bend, ingress, HVIL and articulation-cycle tests

### `OSR-COTS-FIRE-LIIONTAMER-3` — Xtralis / Li-ion Tamer Li-ion Tamer GEN 3

- Source class: `exact-catalogue-system`

- Local manufacture: Buy sensing nodes/controller; make brackets, protected Ethernet/relay harness and test-gas service access locally.
- Before freeze:
  - verify sensor response in selected battery airflow and contaminants
  - define safe-state action and false-alarm handling
  - do not treat detection as suppression or a standalone safety system

### `OSR-COTS-FIRE-FOGTEC` — FOGTEC Rail Systems rail high-pressure water-mist system

- Source class: `vehicle-specific-rfq`
- Local manufacture: Buy validated nozzles/actuation/controller; localise approved pipework, brackets and refill/service tooling.
- Before freeze:
  - perform LM3 battery and passenger fire-hazard analysis
  - freeze nozzles, reservoir, gas/water cylinders, detection and drains
  - conduct representative full-scale fire and discharge tests

### `OSR-COTS-WHEELSET-GHH` — GHH-BONATRANS urban-rail wheelset with axle-mounted disc interfaces

- Source class: `vehicle-specific-rfq`
- Local manufacture: Buy certified wheelsets initially; local wheel/axle manufacture requires a separately qualified metallurgical and NDT route.
- Before freeze:
  - freeze wheel profile/diameter, axle journals and disc seats
  - issue load spectrum and duty
  - obtain material, forging, heat-treatment, NDT, press-fit and fatigue evidence

### `OSR-COTS-BEARING-SKF-TBU` — SKF sensor-ready railway tapered roller bearing unit

- Source class: `vehicle-specific-rfq`
- Local manufacture: Buy bearing units; machine housings, sensor guards and cable brackets locally to the supplier-controlled fits.
- Before freeze:
  - calculate bearing life from journal, load spectrum and speed
  - freeze exact designation, fit, seal, grease and grounding
  - freeze speed/temperature sensor and cable interface

### `OSR-COTS-SUSPENSION-CONTI` — Continental rail half-bellow air spring with integrated auxiliary spring

- Source class: `vehicle-specific-rfq`
- Local manufacture: Buy elastomer/spring/damper elements; fabricate spring seats, guides, centre pivot, yaw links and guards locally after calculation.
- Before freeze:
  - freeze load-deflection/damping curves from the vehicle dynamics model
  - select primary springs, air springs, dampers and bump stops as one system
  - obtain ageing, fatigue, fire and ride evidence

### `OSR-COTS-BRAKE-KNORR-RZKT` — Knorr-Bremse WheelAct Compact RZKT with spring parking-brake option

- Source class: `configurable-catalogue-model`
- Local manufacture: Buy first calipers/actuators; localise discs, hoses, brackets and overhaul parts only under brake-system approval.
- Before freeze:
  - confirm disc diameter/pad pair and required force from brake calculation
  - freeze actuator, parking, WSP and degraded-mode architecture
  - perform stopping, thermal, adhesion and endurance tests

### `OSR-COTS-AIR-KNORR-VV120T` — Knorr-Bremse VV120-T 2.0 oil-free rail compressor / AirSupply Smart

- Source class: `configurable-rail-product`
- Local manufacture: Buy compressor/dryer; fabricate reservoir, manifold, isolation, drains, mounts and acoustic enclosure locally to approved pressure codes.
- Before freeze:
  - size from suspension, brake and auxiliary air demand
  - freeze dryer, reservoir, relief, noise and mounting package
  - run duty, thermal, condensate and degraded-mode tests

### `OSR-COTS-COUPLER-DELLNER430` — Dellner automatic coupler Type 430 with pivot anchor

- Source class: `configurable-catalogue-model`
- Local manufacture: Buy coupler/head/absorber; make pocket, covers, brackets and harness locally to Dellner drawings.
- Before freeze:
  - freeze height, gathering range, fold, crash stroke and pocket loads
  - freeze electrical head and rescue jumper pinout
  - integrate into whole-vehicle crash-energy management

### `OSR-COTS-JOINT-SCHAEFFLER` — Schaeffler ELGES maintenance-free spherical plain bearing and rod-end family

- Source class: `catalogue-family-with-calculation`
- Local manufacture: Buy bearing liners/rod ends; machine housings, pins, links and retained fasteners locally from released drawings.
- Before freeze:
  - derive static/dynamic load, pin diameter, misalignment and life
  - freeze liner, seal, corrosion and temperature variant
  - proof and fatigue-test the complete local housing/pin/link joint

### `OSR-COTS-GANGWAY-HUBNER` — HUEBNER modular metro double-wall corrugated gangway

- Source class: `vehicle-specific-rfq`
- Local manufacture: Buy first bellows/bridge system; fabricate clamp frames, threshold, drains and service panels locally to released interfaces.
- Before freeze:

- issue full articulation sweep and end-frame geometry
- freeze bellows, bridge, turntable, clamp and drainage
- perform fire, fatigue, water, passenger-load and pinch-gap tests

### `OSR-COTS-TRAINLINE-IGUS-HARTING` — igus / HARTING rail e-chain carrier with Han HPR connector system

- Source class: `catalogue-family-with-sizing`
- Local manufacture: Buy carriers/connectors; cut rail cable and hose, make support arms, drains and protective sleeves locally with controlled termination.
- Before freeze:
  - select carrier from bend radius, fill, travel and torsion
  - freeze Han HPR inserts, housings, coding and breakaway
  - cycle-test complete HV/LV/coolant bundle through the articulation envelope

### `OSR-COTS-CONTROL-DUAGON-MH50C` — duagon D-SC Controller with MH50C safe CPU and distributed safe I/O

- Source class: `certified-configurable-platform`
- Local manufacture: Use duagon for the independent qualified channel; keep OSR application compute separate and portable. Build cabinet/harness locally.
- Before freeze:
  - allocate each LM3 safety function and required SIL
  - freeze CPU/I/O/BSP/application configuration
  - independently verify OSR integration and safe-state timing

### `OSR-COTS-COMPUTE-MOXA-V2406C` — Moxa V2406C-WL1-T railway computer

- Source class: `exact-catalogue-model`
- Local manufacture: Buy fanless computers; build the cabinet, isolated supply, M12 train network and replaceable storage locally.
- Before freeze:
  - not a safety controller
  - freeze memory/storage and supported Linux image
  - cybersecurity hardening, lifecycle and application-load tests

### `OSR-COTS-ROUTER-WESTERMO-630-5G` — Westermo Ibex-RT-630-5G

- Source class: `exact-catalogue-model`
- Local manufacture: Buy router; integrate local SIM service, cybersecurity configuration, roof cables and cabinet harness.
- Before freeze:
  - confirm local 5G bands/SIMs and cybersecurity lifecycle
  - freeze antenna/cable topology
  - prove handover, loss-of-comms and update behaviour

### `OSR-COTS-SAFETYRELAY-PILZ-751184` — Pilz PNOZ s4, railway order 751184

- Source class: `exact-catalogue-order`
- Local manufacture: Buy relays; fabricate labelled DIN cabinet, E-stop/pendant harness and replaceable terminal blocks locally.
- Before freeze:

- use only for an allocated compatible function
- observe supplier accessibility restriction for railway use
- verify contact load, diagnostics and safe-state integration

### `OSR-COTS-RECORDER-HASLER` — HaslerRail JRU/EVA event-recorder platform

- Source class: `vehicle-specific-rfq`
- Local manufacture: Buy protected recorder; use local commodity storage only for non-protected operational logs.
- Before freeze:
  - freeze jurisdictional data set, retention and clock
  - select protected memory and download interfaces
  - obtain crash, fire, environmental and chain-of-custody evidence

### `OSR-COTS-LIDAR-OUSTER-OS1` — Ouster OS1 industrial lidar sensor

- Source class: `catalogue-sensor`
- Local manufacture: Buy sensors; manufacture datum carrier, sacrificial heated window, washer, guard and service alignment fixture locally.
- Before freeze:
  - not a certified railway obstacle-detection function
  - freeze field of view, range, latency, heater/washer and protective window
  - validate sensing, diagnostics and failure response over route conditions

## Controlled inputs

- Candidate source: `lib/templates/trainset-cots-candidates.toml` (`0588d76029c2f426beadc09a5ba096848d2eb85a22fb4e1306c54d68931f3b94`)
- Product manifest: `design/component-catalogue/catalog/buildable-trainset/buildable-trainset-manifest.json` (`ca385a6d3c27ee343d7f4bc4c90b4f4e27058380ff82a0aa76ca573275149703`)

# LM3 fabrication and final-assembly critical path

Repository source: `design/component-catalogue/catalog/buildable-trainset/critical-path.md`

Generated by `tools/automation/buildable-trainset.sh`. This is a rough-order first-train manufacturing plan for parts, subassemblies, final train assembly, internal furnishings, and commissioning. It is intended for layout and takt planning; it is not a released shop baseline.

- Family: `light-metro-3car`
- Candidate: `light-metro-3car__16p5m__reference-body__reference-bogie__motor-350kw-hm47-class__battery-225kwh-lfp-800v__hvac-24kw-direct-hv-dc__pv12`
- Planning basis: one first-article three-car LM3 trainset after design release/material availability; one long final assembly track; off-line steel, composite, bogie, and interior benches run in parallel
- Rough elapsed duration: 35.0 working days
- Rough direct labour: 5,524 h
- Critical path: `CP-010` -> `CP-020` -> `CP-030` -> `CP-040` -> `CP-070` -> `CP-080` -> `CP-090` -> `CP-110` -> `CP-130` -> `CP-140` -> `CP-150`

# Critical-path table

| ID | Task | Level | Work center | Pred | Duration d | Labour h | Crew eq | ES | EF | Float | Critical |
|---|---|---|---|---|---|---|---|---|---|---|---|
| CP-010 | release traveler pack, work orders, QA gates, and material lots | program release | project controls / production planning | - | 2.0 | 72 | 4.5 | 0.0 | 2.0 | 0.0 | yes |
| CP-020 | cut, form, drill, and kit structural steel chassis/body parts | parts fabrication | steel prep cell | CP-010 | 3.0 | 288 | 12.0 | 2.0 | 5.0 | 0.0 | yes |
| CP-030 | weld three underframe datum weldments | subassembly | weld and fixture cell | CP-020 | 4.0 | 384 | 12.0 | 5.0 | 9.0 | 0.0 | yes |
| CP-040 | add side/roof spaceframes, floors, portals, roof rails, and chassis interfaces | subassembly | weld and fixture cell | CP-030 | 4.0 | 420 | 13.1 | 9.0 | 13.0 | 0.0 | yes |
| CP-050 | assemble powered/trailer bogies, wheelsets, suspension, brake, and bogie harness kits | subassembly | bogie assembly cell | CP-020 | 8.0 | 520 | 8.1 | 5.0 | 13.0 | 7.0 | |
| CP-060 | mould, cure, demould, trim, drill, and kit 144 GFRP exterior modules | parts fabrication | composite moulding and trim cell | CP-010 | 5.0 | 420 | 10.5 | 2.0 | 7.0 | 8.0 | |
| CP-065 | prebuild internal furnishings and cabin trim kits | parts fabrication | interior bench / supplier receiving | CP-010 | 5.0 | 360 | 9.0 | 2.0 | 7.0 | 12.0 | |
| CP-070 | blast, prime, topcoat, cavity-wax, and release painted carbody frames | subassembly | paint and corrosion cell | CP-040 | 2.0 | 192 | 12.0 | 13.0 | 15.0 | 0.0 | yes |
| CP-080 | install clip-on GFRP side/roof modules and complete water/rattle pre-test | assembly | clip-on body cell | CP-060, CP-070 | 1.0 | 96 | 12.0 | 15.0 | 16.0 | 0.0 | yes |
| CP-090 | install doors, windows, roof HVAC/PV hardware, and exterior service details | assembly | final assembly track with glazing/roof access | CP-080 | 3.0 | 360 | 15.0 | 16.0 | 19.0 | 0.0 | yes |
| CP-100 | install HV battery, traction, LV/control, safety loops, coolant, and fire interfaces | assembly | final assembly electrical/HV cell | CP-080 | 4.0 | 480 | 15.0 | 16.0 | 20.0 | 5.0 | |
| CP-110 | install internal furnishings, flooring, liners, seats, grab rails, PIS, CCTV, lighting, and signage | assembly | final assembly interior fit-out cell | CP-065, CP-090 | 3.0 | 420 | 17.5 | 19.0 | 22.0 | 0.0 | yes |
| CP-120 | marry bogies to carbodies and close brake/ride-height static checks | assembly | final assembly bogie marriage station | CP-050, CP-080 | 2.0 | 240 | 15.0 | 16.0 | 18.0 | 4.0 | |

| ID | Task | Level | Work center | Pred | Duration d | Labour h | Crew eq | ES | EF | Float | Critical |
|---|---|---|---|---|---|---|---|---|---|---|---|
| CP-130 | install articulation, gangways, end cowls, couplers, sensor packs, and trainlines | final trainset assembly | final assembly track | CP-110, CP-120 | 3.0 | 360 | 15.0 | 22.0 | 25.0 | 0.0 | yes |
| CP-140 | static commissioning, insulation, door/HVAC/brake tests, snag closeout, and QA release | commissioning | final assembly / static test cell | CP-100, CP-130 | 4.0 | 480 | 15.0 | 25.0 | 29.0 | 0.0 | yes |
| CP-150 | dynamic commissioning and trial-running release | commissioning | test track / depot | CP-140 | 6.0 | 432 | 9.0 | 29.0 | 35.0 | 0.0 | yes |

# Space and parallelism

| Area | Minimum planning allowance | Why it is enough |
|---|---|---|
| Long final assembly track | 1 x 55 m bay | Doors, roof systems, HV, interior, bogie marriage, articulation, and static test share one controlled train-length space. |
| Underframe fixtures | 2 fixtures | Two fixtures let three underframes move through without a third full-length weld bay. |
| Side/roof frame fixtures | 2 fixtures | Keeps side/roof spaceframe work ahead of paint without holding the final track. |
| Paint bay | 1 car-length bay | Frames enter only after dimensional acceptance, then leave for clip-on body installation. |
| Bogie stands | 3 stands | Bogies are assembled off-line while carbody welding is on the critical path. |
| Short GFRP moulds | 4 moulds | Repeated 1 m modules are produced without a full-car mould or final-bay cure hold. |
| Interior trim benches | 1 bench set | Furnishings are pre-kitted by car/door zone, then installed after leak-sensitive work closes. |

Key minimisation rule: keep the 55 m final assembly track for accepted subassemblies only. Steel parts, GFRP modules, bogies, HVAC/PV kits, doors/windows, cabin liners, seats, grab rails, lighting, PIS, CCTV, flooring, signage, and labels are all prepared off-line and enter the train only as released kits.

# Labour by work center

| Work center | Labour h |
|---|---|
| bogie assembly cell | 520 |
| clip-on body cell | 96 |
| composite moulding and trim cell | 420 |
| final assembly / static test cell | 480 |
| final assembly bogie marriage station | 240 |
| final assembly electrical/HV cell | 480 |
| final assembly interior fit-out cell | 420 |
| final assembly track | 360 |
| final assembly track with glazing/roof access | 360 |
| interior bench / supplier receiving | 360 |
| paint and corrosion cell | 192 |
| project controls / production planning | 72 |
| steel prep cell | 288 |
| test track / depot | 432 |
| weld and fixture cell | 804 |

# Float use

Composite module fabrication, bogie assembly, HV install, and interior pre-kitting have float in this rough network. Use that float to absorb first-article rework without expanding the final assembly track. Do not spend the float by letting incomplete kits enter the long bay; that trades cheap bench work for expensive train-length blockage.

# Current basic design buildability review

Repository source: `design/component-catalogue/catalog/buildable-trainset/current-design-buildability-review.md`

This review uses the generated design-system optimum and the current rolling-stock CAD/BOM/fabrication package to identify what is already buildable, what is only an envelope, and what must be closed before first steel cut.

## Summary

| Status | Meaning |
|---|---|
| green | current design is good enough to carry into v2A build package |
| yellow | concept is sound but supplier/CAD/BOM alignment must be closed |
| red | missing build-release evidence or shop-drawing detail |

# Findings

| ID | Status | Scope | Finding | Action |
|---|---|---|---|---|
| BDR-001 | green | architecture | The current design already uses repeated self-contained car modules with one powered and one trailer bogie per car. | Keep repeated-car architecture as the buildable baseline; it simplifies fixtures, spares, and training. |
| BDR-002 | green | COTS/fabricated delineation | The procurement BOM now carries a controlled many-to-many crosswalk from all 100 commercial lines to LM3 product or assembly IDs; definitions and travelers carry the reverse references. | Keep the generated crosswalk mandatory as component kits are split and supplier routes are frozen. |
| BDR-003 | green | candidate/CAD alignment | The promoted FreeCAD/product-tree baseline matches the optimizer target: 16.5 m cars, motor-350kw-hm47-class, battery-225kwh-lfp-800v, hvac-24kw-direct-hv-dc, and 12 PV modules per car. | Treat this as the v2A buildable seed: 250 kW continuous / 350 kW peak motors, 180 kWh usable / 225 kWh gross batteries per car, 24 kW/car HVAC, and supplier-freeze envelopes before drawings. |
| BDR-004 | yellow | supplier freeze | All 58 BID/SOURCE rows now have a generated affordable reference default tied to 41 controlled manufacturer/reference sources and the current CAD envelopes. Buildability still depends on supplier-frozen doors, HVAC, batteries, traction, wheelsets, brakes, couplers, and gangways. | Use the reference-default register to issue comparable RFQs, accept alternates only through fit/power/mass/evidence checks, then lock v2A supplier interfaces. |
| BDR-005 | yellow | definition package / shop travelers / shop drawings | Every product-tree node now has a generated definition and signable shop-traveler template with structured material specs, process specs, labor, tooling, QA gates, revision approvals, and signoff blocks; controlled cut lists, weld maps, tolerance stacks, flat patterns, and harness/plumbing drawings are still v2A drawing-package work. | Use the generated material/process definitions and travelers as the drawing/RFQ/traveler index, then promote each MAKE/BID/SOURCE node into controlled LM3-BDY/BOG/HV/ELC drawings before first steel cut. |
| BDR-006 | yellow | proof evidence | FEA screening exists and the previously coarse local bracket, coupler-pocket, battery-tray, door-portal, roof-equipment, and bogie-frame items now have generated definitions and assembly integration steps; local proof cases are still not complete. | Attach proof load cases to the generated component definitions and make FEM/static-test acceptance a release gate for each affected subassembly. |
| BDR-007 | yellow | mass properties | The generated mass budget reconciles the 75.308 t optimizer subtotal with the 78.75 t controlled planning tare through an explicit 3.442 t engineering reserve. A 120-row responsibility ledger now identifies the evidence route for every product and quantifies the lightest existing design-space option without claiming achieved mass; drawing-level and as-built closure remains open. | Close each active ledger row with supplier-frozen, production-CAD and/or calibrated weighed values, reconcile car/axle/centre-of-gravity results, and repeat affected substantiation before changing the controlled tare. |
| BDR-008 | yellow | joint and fastener control | Every assembly integration step now carries machine-readable join classes and torque authority. Interior small parts have been rationalised into four fastener families and one common datum rail instead of treating every attachment as a bespoke structural joint; numerical values remain open until the applicable standard, supplier instruction, or load calculation is released. | Close the generated joint-control schedule by joint ID, qualify the common rail/fastener samples, and reference accepted values from interface drawings and shop travelers. |
| BDR-009 | green | small components and serviceability | Door and glazing interfaces, passenger-fixture adapters, lighting cassettes, captive fasteners, seals, drain rails, keyed plugs, and emergency illumination are now explicit CAD/product-tree items rather than an opaque interior-kit allowance. | Keep the simplified interface families fixed while suppliers freeze detailed door, glass, luminaire, connector, and fastener parts; release safety-critical loads and tests through their stated gates. |

# Immediate build-package work

1. Treat the generated definition and shop-traveler packs as the product-tree index for parts, external components, subassemblies, assemblies, and trainsets.
2. Execute the generated factory drawing/interface work packages for chassis, modules, fascia, roof, interiors, bogies, trainlines, finishes and recovery; approve their frozen inputs, controlled outputs and verification ownership.
3. Convert every remaining `MAKE` definition into controlled drawings: cut list, flat pattern, weld class, datum scheme, tolerance, and inspection method.
4. Convert each `BID/SOURCE` definition into an RFQ envelope: mass, power, volume, mounting datum, service clearance, evidence pack, and alternate acceptance rule.
5. Close every active product in the generated mass-closure ledger, reconcile its nine mass-budget categories, and close joint-control rows as supplier, calculation, production-CAD, and calibrated weighing evidence becomes available.
6. Attach local proof cases to the structural subassemblies: underframe, bolsters, coupler pocket, door portals, battery tray, roof equipment, bogie frames, and articulation adapters.
7. Fill traveler approval/signoff blocks only during a real build; do not pre-sign generated templates.
8. Regenerate FreeCAD/FEM only after the promoted candidate parameters are reflected in the parametric source.

# LM3 bought-in product reference defaults

Repository source: `design/component-catalogue/catalog/buildable-trainset/default-product-specifications.md`

Provide a concrete, affordable starting configuration for every bought-in LM3 product row while preserving supplier competition and override gates.

- Status: `concept-and-rfq-defaults-not-procurement-or-engineering-release`
- Defaults: 58 (`BID` 34; `SOURCE` 24)
- Manufacturer/reference sources: 41
- Candidate sources checked: 2026-08-31

A default is the affordable first configuration to draw, cost and request in an RFQ. It is not a nominated supplier, order code, quotation, safety approval or permission to manufacture. CAD envelopes are fit constraints, not claimed supplier dimensions.

# Default index

| Product | Reference default | Use class | CAD envelope X × Y × Z (mm) | Sources |
|---|---|---|---|---|
| LM3-CWL-P010 end-cowl fiberglass laminate, insert, adhesive, and coupon material kit | Gurit — SE 130FR / ST 130FR prepreg with SA130FR and SF130FR films | sample-ready-reference-default-not-selected | 2900 × 2800 × 3050 | OSR-COTS-COMPOSITE-GURIT-130FR |
| LM3-FAS-P030 front glazing/lamp EPDM seal, drain rail, washer sleeve, and edge-closeout kit | AGC Automotive — rail glazing with framing system | rfq-baseline-reference-default-not-selected | 2500 × 420 × 1950 | OSR-COTS-GLASS-AGC OSR-COTS-GLAZING-SIKA268 |
| LM3-EXT-P010 electric plug/sliding door cassette | Knorr-Bremse IFE — IFE modular sliding-plug entrance system | rfq-baseline-reference-default-not-selected | 1350 × 260 × 2050 | OSR-COTS-DOOR-IFE |
| LM3-EXT-P020 side laminated glazing cassette | AGC Automotive — rail glazing with framing system | rfq-baseline-reference-default-not-selected | 1520 × 90 × 1100 | OSR-COTS-GLASS-AGC OSR-COTS-GLAZING-SIKA268 |
| LM3-EXT-P030 single panoramic heated end-glass assembly | AGC Automotive — rail glazing with framing system | rfq-baseline-reference-default-not-selected | 2300 × 110 × 1450 | OSR-COTS-GLASS-AGC OSR-COTS-GLAZING-SIKA268 |
| LM3-EXT-P040 hvac-24kw-direct-hv-dc roof HVAC | Longertek — direct-DC rail HVAC platform | rfq-baseline-reference-default-not-selected | 2600 × 1900 × 620 | OSR-COTS-HVAC-LONGERTEK |
| LM3-EXT-P050 roof PV module and edge-clamp kit | Sunman Energy — eArc lightweight PV module | sample-ready-reference-default-not-selected | 1700 × 1050 × 45 | OSR-COTS-PV-SUNMAN |
| LM3-EXT-P060 stepped floor-board and removable service-hatch system | 3A Composites Mobility — COMFLOOR rail floor panel | rfq-baseline-reference-default-not-selected | 1000 × 1300 × 35 | OSR-COTS-FLOOR-COMFLOOR |
| LM3-EXT-P061 welded resilient floor covering, cove, nosing, and adhesive system | Forbo Flooring Systems — Marmoleum Fresco FR2 6R3883 moonstone, 2.5 mm | sample-ready-reference-default-not-selected | 1000 × 1300 × 6 | OSR-COTS-FLOOR-FORBO-6R3883 |
| LM3-EXT-P062 longitudinal passenger and priority-seat modules | Fainsa — metro and urban-rail seating family | rfq-baseline-reference-default-not-selected | 1550 × 620 × 980 | OSR-COTS-SEAT-FAINSA |
| LM3-EXT-P063 stainless grab-pole, handrail, joint, and insulated adapter kit | Fainsa — metro and urban-rail seating family | rfq-baseline-reference-default-not-selected | 2300 × 2300 × 2050 | OSR-COTS-SEAT-FAINSA |
| LM3-EXT-P064 passenger-information display, speaker, amplifier, and mounting kit | Luminator Technology Group — RailKom passenger-information and communication platform | rfq-baseline-reference-default-not-selected | 1100 × 220 × 420 | OSR-COTS-PIS-LUMINATOR |
| LM3-EXT-P065 CCTV camera, passenger intercom, PoE/data, and mounting kit | Moxa — VPort P06HC-1MP-M12-CAM36 | sample-ready-reference-default-not-selected | 650 × 420 × 260 | OSR-COTS-CAMERA-MOXA-P06HC |
| LM3-EXT-P066 PRM, safety-signage, emergency-lighting, extinguisher, and first-aid kit | Teknoware — rolling-stock interior and emergency lighting platform | rfq-baseline-reference-default-not-selected | 1200 × 650 × 600 | OSR-COTS-LIGHT-TEKNOWARE |
| LM3-FIX-P020 four-family captive fastener, floating nut, isolator, and access-fastener kit | Boellhoff — RIVNUT metric M6/M8 steel or stainless blind rivet nuts | sample-ready-reference-default-not-selected | 520 × 360 × 160 | OSR-COTS-FASTENER-RIVNUT |
| LM3-LGT-P010 1.2 m plug-in main LED lighting cassette and captive mounting kit | Teknoware — rolling-stock interior and emergency lighting platform | rfq-baseline-reference-default-not-selected | 1200 × 95 × 45 | OSR-COTS-LIGHT-TEKNOWARE |
| LM3-LGT-P020 emergency and doorway lighting modules with independent keyed feeder kit | Teknoware — rolling-stock interior and emergency lighting platform | rfq-baseline-reference-default-not-selected | 900 × 360 × 120 | OSR-COTS-LIGHT-TEKNOWARE |
| LM3-EXT-P070 roof antennas, service walkway pads, lifting covers, and maintenance labels | HUBER+SUHNER — SENCITY Rail MIMO 5-port with GNSS/LNA, product 85137717 | orderable-candidate-reference-default-not-selected | 2400 × 1500 × 260 | OSR-COTS-ANTENNA-HS-85137717 |
| LM3-EXT-P080 fire-rated GFRP side-module laminate, core, gelcoat, and consumable kit | Gurit — SE 130FR / ST 130FR prepreg with SA130FR and SF130FR films | sample-ready-reference-default-not-selected | 1000 × 120 × 3050 | OSR-COTS-COMPOSITE-GURIT-130FR |
| LM3-EXT-P090 fire-rated GFRP roof-module, dry-seal, and removable skirt material kit | Gurit — SE 130FR / ST 130FR prepreg with SA130FR and SF130FR films | sample-ready-reference-default-not-selected | 1000 × 2700 × 180 | OSR-COTS-COMPOSITE-GURIT-130FR |
| LM3-FIN-P010 pre-cut exterior livery graphic film, edge-seal, datum-mark, and repair-patch kit | 3M — Controltac Graphic Film with Comply Adhesive 180mC family | sample-and-system-rfq-reference-default-not-selected | 16000 × 1400 × 8 | OSR-COTS-FINISH-3M-180MC |
| LM3-FIN-P020 calcium-carbonate radiative roof-coating qualification and exposed-roof application kit | qualified light-colour base roof finish; CaCO3 coating restricted to coupon and one-car trial | trial-only-reference-not-an-orderable-fleet-product | 16000 × 2700 × 8 | OSR-COTS-COOLROOF-PURDUE-CACO3 |
| LM3-INT-P010 HVAC diffusers, side return ducts, saloon grilles, and access panels | Longertek — direct-DC rail HVAC platform | rfq-baseline-reference-default-not-selected | 6000 × 2400 × 320 | OSR-COTS-HVAC-LONGERTEK |
| LM3-TRC-P010 motor-350kw-hm47-class axle traction motor | ABB — AMXE250 configurable traction motor | rfq-baseline-reference-default-not-selected | 1050 × 720 × 720 | OSR-COTS-MOTOR-ABB-AMXE250 |
| LM3-TRC-P020 single-stage reduction gearbox and flexible coupling | Voith — SE single-stage axle-mounted metro gear unit | rfq-baseline-reference-default-not-selected | 760 × 620 × 620 | OSR-COTS-GEAR-VOITH-SE |
| LM3-TRC-P030 two independent motor controllers, isolated LV DC/DC, MPPT, station protection, and cooling-loop kit | ABB — BORDLINE CC400 LRV compact converter | rfq-baseline-reference-default-not-selected | 2200 × 1200 × 620 | OSR-COTS-CONVERTER-ABB-CC400 |
| LM3-TRC-P040 battery-225kwh-lfp-800v saloon-isolated side traction battery pack | HOPPECKE — LiTrac modular high-voltage LFP rail traction battery | rfq-baseline-reference-default-not-selected | 5200 × 780 × 720 | OSR-COTS-BATTERY-HOPPECKE-LITRAC |

| Product | Reference default | Use class | CAD envelope X × Y × Z (mm) | Sources |
|---|---|---|---|---|
| LM3-TRC-P050 roof-mounted regen dump resistor and thermal shield kit | Danotherm Electric — custom traction brake resistor, 600-3000 VDC family | rfq-baseline-reference-default-not-selected | 1900 × 750 × 420 | OSR-COTS-RESISTOR-DANOTHERM |
| LM3-TRC-P060 station side-pin charging connector, actuator, shutter, and alignment target | supplier-neutral 650-700 VDC side-contact RFQ; automated collector retained only as a concept alternative | interface-rfq-default-not-selected | 1050 × 620 × 540 | OSR-COTS-CHARGER-SCHUNK |
| LM3-TRC-P070 HV contactor, fuse, pre-charge, service-disconnect, and current-sensor panel | Schaltbau — C360K/300 railway bidirectional DC contactor | sample-ready-reference-default-not-selected | 1500 × 420 × 1050 | OSR-COTS-HV-SCHALTBAU-C360<br>OSR-COTS-HV-TE-HVP800 |
| LM3-SAF-P010 battery temperature/off-gas detection, electrical-enclosure smoke detection, and localized mist kit | Xtralis / Li-ion Tamer — Li-ion Tamer GEN 3 | sample-ready-reference-default-not-selected | 1600 × 900 × 520 | OSR-COTS-FIRE-FOGTEC<br>OSR-COTS-FIRE-LIIONTAMER-3 |
| LM3-BOG-P040 powered-bogie wheelset with axle-mounted brake discs | GHH-BONATRANS — urban-rail wheelset with axle-mounted disc interfaces | rfq-baseline-reference-default-not-selected | 1850 × 2200 × 920 | OSR-COTS-WHEELSET-GHH |
| LM3-BOG-P041 trailer-bogie wheelset with axle-mounted brake discs | GHH-BONATRANS — urban-rail wheelset with axle-mounted disc interfaces | rfq-baseline-reference-default-not-selected | 1850 × 2200 × 920 | OSR-COTS-WHEELSET-GHH |
| LM3-BOG-P042 powered-wheelset axlebox, sealed bearing unit, speed and temperature sensor set | SKF — sensor-ready railway tapered roller bearing unit | calculation-then-rfq-reference-default-not-selected | 820 × 620 × 620 | OSR-COTS-BEARING-SKF-TBU |
| LM3-BOG-P043 trailer-wheelset axlebox, sealed bearing unit, speed and temperature sensor set | SKF — sensor-ready railway tapered roller bearing unit | calculation-then-rfq-reference-default-not-selected | 820 × 620 × 620 | OSR-COTS-BEARING-SKF-TBU |
| LM3-BOG-P044 powered-bogie primary suspension spring, guide and bump-stop set | Continental — rail half-bellow air spring with integrated auxiliary spring | dynamics-then-rfq-reference-default-not-selected | 1800 × 2100 × 520 | OSR-COTS-SUSPENSION-CONTI |
| LM3-BOG-P045 trailer-bogie primary suspension spring, guide and bump-stop set | Continental — rail half-bellow air spring with integrated auxiliary spring | dynamics-then-rfq-reference-default-not-selected | 1800 × 2100 × 520 | OSR-COTS-SUSPENSION-CONTI |
| LM3-BOG-P046 powered-bogie to carbody connection: air springs, emergency spring, centre pivot, yaw links and dampers | Continental — rail half-bellow air spring with integrated auxiliary spring | dynamics-then-rfq-reference-default-not-selected | 1900 × 2200 × 650 | OSR-COTS-SUSPENSION-CONTI |
| LM3-BOG-P047 trailer-bogie to carbody connection: air springs, emergency spring, centre pivot, yaw links and dampers | Continental — rail half-bellow air spring with integrated auxiliary spring | dynamics-then-rfq-reference-default-not-selected | 1900 × 2200 × 650 | OSR-COTS-SUSPENSION-CONTI |
| LM3-BOG-P048 powered-bogie brake calipers, parking actuators, pads and wheel-slide hardware | Knorr-Bremse — WheelAct Compact RZKT with spring parking-brake option | brake-calculation-then-rfq-reference-default-not-selected | 2100 × 2200 × 520 | OSR-COTS-BRAKE-KNORR-RZKT |
| LM3-BOG-P049 trailer-bogie brake calipers, parking actuators, pads and wheel-slide hardware | Knorr-Bremse — WheelAct Compact RZKT with spring parking-brake option | brake-calculation-then-rfq-reference-default-not-selected | 2100 × 2200 × 520 | OSR-COTS-BRAKE-KNORR-RZKT |
| LM3-AUX-P010 secondary-suspension compressor, dryer, reservoir, and isolation-manifold kit | Knorr-Bremse — VV120-T 2.0 oil-free rail compressor / AirSupply Smart | air-demand-then-rfq-reference-default-not-selected | 1300 × 850 × 720 | OSR-COTS-AIR-KNORR-VV120T |
| LM3-END-P010 automatic end coupler and crash-energy absorber | Dellner — automatic coupler Type 430 with pivot anchor | rfq-baseline-reference-default-not-selected | 1850 × 760 × 620 | OSR-COTS-COUPLER-DELLNER430 |
| LM3-ART-P020 articulation lower spherical pivot, bearing housing and pin set | Schaeffler — ELGES maintenance-free spherical plain bearing and rod-end family | calculation-then-order-code-reference-default-not-selected | 780 × 780 × 520 | OSR-COTS-JOINT-SCHAEFFLER |
| LM3-ART-P021 articulation upper lateral/yaw links, spherical joints and retained pins | Schaeffler — ELGES maintenance-free spherical plain bearing and rod-end family | calculation-then-order-code-reference-default-not-selected | 1200 × 1500 × 420 | OSR-COTS-JOINT-SCHAEFFLER |
| LM3-ART-P022 inter-car double-wall corrugated bellows and clamp-frame set | HUEBNER — modular metro double-wall corrugated gangway | kinematic-envelope-then-rfq-reference-default-not-selected | 1100 × 2100 × 2300 | OSR-COTS-GANGWAY-HUBNER |
| LM3-ART-P023 inter-car passenger bridge, turntable and flexible interior-panel set | HUEBNER — modular metro double-wall corrugated gangway | kinematic-envelope-then-rfq-reference-default-not-selected | 1250 × 1850 × 260 | OSR-COTS-GANGWAY-HUBNER |
| LM3-ART-P024 articulation trainline carrier, support arms, abrasion liners and drain path | igus / HARTING — rail e-chain carrier with Han HPR connector system | sample-and-cycle-test-reference-default-not-selected | 1300 × 1600 × 320 | OSR-COTS-TRAINLINE-IGUS-HARTING |
| LM3-CTRL-P010 T-ECU/S and T-ECU/A compute and safety-control cabinet kit | duagon — D-SC Controller with MH50C safe CPU and distributed safe I/O | safety-allocation-then-rfq-reference-default-not-selected | 1200 × 550 × 1350 | OSR-COTS-COMPUTE-MOXA-V2406C<br>OSR-COTS-CONTROL-DUAGON-MH50C |
| LM3-CTRL-P020 navigation, balise, 5G, LoRa, GNSS, IMU, and roof-antenna kit | Westermo — Ibex-RT-630-5G | orderable-candidate-reference-default-not-selected | 1500 × 1100 × 420 | OSR-COTS-ANTENNA-HS-85137717<br>OSR-COTS-ROUTER-WESTERMO-630-5G |
| LM3-CTRL-P030 maintenance HMI, depot pendant, emergency controls, and safety-relay kit | Pilz — PNOZ s4, railway order 751184 | bench-safety-relay-candidate-reference-default-not-selected | 1100 × 550 × 650 | OSR-COTS-SAFETYRELAY-PILZ-751184 |
| LM3-CTRL-P050 operational and crashworthy event-recorder storage kit | HaslerRail — JRU/EVA event-recorder platform | requirements-then-rfq-reference-default-not-selected | 520 × 420 × 280 | OSR-COTS-RECORDER-HASLER |

| Product | Reference default | Use class | CAD envelope X × Y × Z (mm) | Sources |
|---|---|---|---|---|
| LM3-END-P020 T-OBS nose sensor pack, heated window services, and washer kit | Ouster — OS1 industrial lidar sensor | development-sensor-candidate-reference-default-not-selected | 1050 × 1850 × 520 | OSR-COTS-LIDAR-OUSTER-OS1 |
| LM3-END-P040 e-coupler LV jumper, recovery trainline, and end harness breakaway kit | Dellner — automatic coupler Type 430 with pivot anchor | rfq-baseline-reference-default-not-selected | 1700 × 900 × 260 | OSR-COTS-COUPLER-DELLNER430 |
| LM3-END-P050 sealed headlight, tail/marker light, threshold-warning, and end-lamp harness kit | Teknoware — rolling-stock interior and emergency lighting platform | rfq-baseline-reference-default-not-selected | 1600 × 900 × 280 | OSR-COTS-LIGHT-TEKNOWARE |
| LM3-ART-P030 inter-car HV/LV jumper, coolant hose loop, energy chain, and drain sleeve kit | igus / HARTING — rail e-chain carrier with Han HPR connector system | sample-and-cycle-test-reference-default-not-selected | 1400 × 1600 × 360 | OSR-COTS-HV-TE-HVP800 OSR-COTS-TRAINLINE-IGUS-HARTING |
| LM3-ART-P040 train-to-train open-end articulation, gangway, drawbar, turntable, and service-jumper cassette | HUEBNER — modular metro double-wall corrugated gangway | kinematic-envelope-then-rfq-reference-default-not-selected | 1450 × 2250 × 2400 | OSR-COTS-GANGWAY-HUBNER |
| LM3-ART-P041 train-to-train jumper blanking, transition harness, isolation label, and dust-cover kit | igus / HARTING — rail e-chain carrier with Han HPR connector system | sample-and-cycle-test-reference-default-not-selected | 1200 × 850 × 260 | OSR-COTS-TRAINLINE-IGUS-HARTING |

# Product requirements and override gates

## LM3-CWL-P010 — end-cowl fiberglass laminate, insert, adhesive, and coupon material kit

Default: Gurit — SE 130FR / ST 130FR prepreg with SA130FR and SF130FR films.

Published reference facts:

- EN 45545 HL2 stated for R1/R7/R17 monolithic laminates
- 85 deg C low-temperature cure option
- 45 minute cure option at 120 deg C
- published reinforcement and film order codes

Affordability/localisation basis: Use the catalogue prepreg as the first-article material; cut, vacuum-bag, cure, trim and repair locally with batch coupons.

Close before supplier freeze:

- select reinforcement/core/film stack per component
- fire-test the actual sandwich laminate
- run environmental, insert, impact and repair qualification

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-FAS-P030 — front glazing/lamp EPDM seal, drain rail, washer sleeve, and edge-closeout kit

Default: AGC Automotive — rail glazing with framing system.

Published reference facts:

- laminated rail glazing family
- supplier framing-system option

Affordability/localisation basis: Retain the pressure-frame and dry-seal replacement concept; qualify regional laminators against the released cassette drawing.

Close before supplier freeze:

- freeze laminate stack, optical zones and curvature

- freeze heated end-glass voltage and power
- obtain impact, fire, weather and bond-system evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P010 — electric plug/sliding door cassette

Default: Knorr-Bremse IFE — IFE modular sliding-plug entrance system.

Published reference facts:

- rail entrance-system family
- supplier engineering required for vehicle aperture and controls

Affordability/localisation basis: Buy the first cassette and controller; manufacture portal, threshold, carrier, harness and service parts locally to the released interface.

Close before supplier freeze:

- freeze clear aperture, stroke, mass and four mounting datums
- obtain EN 14752 evidence and emergency-release/cycle data
- freeze keyed power, network and interlock interfaces

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P020 — side laminated glazing cassette

Default: AGC Automotive — rail glazing with framing system.

Published reference facts:

- laminated rail glazing family
- supplier framing-system option

Affordability/localisation basis: Retain the pressure-frame and dry-seal replacement concept; qualify regional laminators against the released cassette drawing.

Close before supplier freeze:

- freeze laminate stack, optical zones and curvature
- freeze heated end-glass voltage and power
- obtain impact, fire, weather and bond-system evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P030 — single panoramic heated end-glass assembly

Default: AGC Automotive — rail glazing with framing system.

Published reference facts:

- laminated rail glazing family
- supplier framing-system option

Affordability/localisation basis: Retain the pressure-frame and dry-seal replacement concept; qualify regional laminators against the released cassette drawing.

Close before supplier freeze:

- freeze laminate stack, optical zones and curvature
- freeze heated end-glass voltage and power
- obtain impact, fire, weather and bond-system evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-EXT-P040` — hvac-24kw-direct-hv-dc roof HVAC

Default: Longertek — direct-DC rail HVAC platform.

Published reference facts:

- direct high-voltage DC architecture
- rail HVAC product platform

Affordability/localisation basis: Buy the first roof unit and controller; localise ducts, diffusers, drains, filters and later coils after calorimeter testing.

Close before supplier freeze:

- confirm 24 kW LM3 duty at worst ambient
- freeze roof envelope, mass, coolant/refrigerant and drain interfaces
- obtain EN 50155/50121 and fire evidence for quoted configuration

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-EXT-P050` — roof PV module and edge-clamp kit

Default: Sunman Energy — eArc lightweight PV module.

Published reference facts:

- lightweight flexible photovoltaic family

Affordability/localisation basis: Use standard modules and make clamps, bonded carriers and replaceable roof harnesses locally.

Close before supplier freeze:

- freeze module size and electrical string
- qualify roof retention, fire, isolation, impact and walk-zone separation
- verify MPPT and safe isolation under all charging states

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P060 — stepped floor-board and removable service-hatch system

Default: 3A Composites Mobility — COMFLOOR rail floor panel.

Published reference facts:

- lightweight sandwich floor-panel family
- optional integrated heating
- rail vehicle application

Affordability/localisation basis: Import first panel stock if needed; machine panels, edge closeouts, hatch frames and inserts locally from released cut files.

Close before supplier freeze:

- freeze panel layup, inserts, hatch edges and fire level
- prove concentrated, wheelchair and seat-rail loads
- validate wet-zone sealing and repair method

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P061 — welded resilient floor covering, cove, nosing, and adhesive system

Default: Forbo Flooring Systems — Marmoleum Fresco FR2 6R3883 moonstone, 2.5 mm.

Published reference facts:

- 2.5 mm thickness
- 2.9 kg/m2
- EN 45545-2 HL2 stated for the published system
- roll width 2 m

Affordability/localisation basis: Use roll material initially; cut, cove, weld and repair locally with a controlled substrate/adhesive system.

Close before supplier freeze:

- obtain fire certificate for selected substrate/adhesive combination
- freeze cove, weld-cord, nosing and hatch details
- slip, cleaning and repair trials

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P062 — longitudinal passenger and priority-seat modules

Default: Fainsa — metro and urban-rail seating family.

Published reference facts:

- urban rail passenger seat family

Affordability/localisation basis: Make the common seat rail, grab poles and adapters locally; localise shells and frames only after fire and abuse-load qualification.

Close before supplier freeze:

- select exact shell, frame and upholstery
- freeze common-rail attachment loads and PRM geometry
- obtain fire, abuse-load, corrosion and maintainability evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-EXT-P063` — stainless grab-pole, handrail, joint, and insulated adapter kit

Default: Fainsa — metro and urban-rail seating family.

Published reference facts:

- urban rail passenger seat family

Affordability/localisation basis: Make the common seat rail, grab poles and adapters locally; localise shells and frames only after fire and abuse-load qualification.

Close before supplier freeze:

- select exact shell, frame and upholstery
- freeze common-rail attachment loads and PRM geometry
- obtain fire, abuse-load, corrosion and maintainability evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-EXT-P064` — passenger-information display, speaker, amplifier, and mounting kit

Default: Luminator Technology Group — RailKom passenger-information and communication platform.

Published reference facts:

- rail passenger information, audio and communication family

Affordability/localisation basis: Use local brackets, speaker grilles and wiring; permit display/amplifier substitution through open interfaces and regression tests.

Close before supplier freeze:

- freeze display, amplifier, speaker and software licences
- require open Ethernet/IP data interfaces
- obtain EMC, fire, accessibility and cybersecurity evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope

- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P065 — CCTV camera, passenger intercom, PoE/data, and mounting kit

Default: Moxa — VPort P06HC-1MP-M12-CAM36.

Published reference facts:

- EN 50155 application statement
- IEC 61373 shock/vibration
- IP66
- PoE and M12 Ethernet
- 1280 x 800 up to 30 fps

Affordability/localisation basis: Use the camera as a replaceable Ethernet appliance with locally made anti-vandal mount and harness.

Close before supplier freeze:

- confirm lifecycle availability and cybersecurity baseline
- freeze viewing zones and privacy policy
- qualify cable, storage and passenger-intercom integration

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P066 — PRM, safety-signage, emergency-lighting, extinguisher, and first-aid kit

Default: Teknoware — rolling-stock interior and emergency lighting platform.

Published reference facts:

- rolling-stock LED emergency-lighting platform

Affordability/localisation basis: Make the 1.2 m carrier, lens, brackets and harness locally around replaceable quoted LED modules.

Close before supplier freeze:

- freeze 24 V keyed cassette, optics and emergency duration
- obtain rail fire, EMC, ingress and photometry evidence
- separately select certified exterior head/tail lamps

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-FIX-P020 — four-family captive fastener, floating nut, isolator, and access-fastener kit

Default: Boellhoff — RIVNUT metric M6/M8 steel or stainless blind rivet nuts.

Published reference facts:

- published M6/M8 thread and upset-strength data
- one-sided installation

Affordability/localisation basis: Source from regional distributors or qualify metric equivalents by joint family; do not substitute solely by thread size.

Close before supplier freeze:

- select body, head, grip range and coating per joint drawing
- run substrate-specific setting and proof-load trials
- freeze setting-tool force and inspection gauge

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-LGT-P010` — 1.2 m plug-in main LED lighting cassette and captive mounting kit

Default: Teknoware — rolling-stock interior and emergency lighting platform.

Published reference facts:

- rolling-stock LED emergency-lighting platform

Affordability/localisation basis: Make the 1.2 m carrier, lens, brackets and harness locally around replaceable quoted LED modules.

Close before supplier freeze:

- freeze 24 V keyed cassette, optics and emergency duration
- obtain rail fire, EMC, ingress and photometry evidence
- separately select certified exterior head/tail lamps

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-LGT-P020` — emergency and doorway lighting modules with independent keyed feeder kit

Default: Teknoware — rolling-stock interior and emergency lighting platform.

Published reference facts:

- rolling-stock LED emergency-lighting platform

Affordability/localisation basis: Make the 1.2 m carrier, lens, brackets and harness locally around replaceable quoted LED modules.

Close before supplier freeze:

- freeze 24 V keyed cassette, optics and emergency duration
- obtain rail fire, EMC, ingress and photometry evidence
- separately select certified exterior head/tail lamps

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P070 — roof antennas, service walkway pads, lifting covers, and maintenance labels

Default: HUBER+SUHNER — SENCITY Rail MIMO 5-port with GNSS/LNA, product 85137717.

Published reference facts:

- 2x2 cellular and Wi-Fi MIMO
- GNSS with integrated LNA
- EN 50155
- EN 45545-2 and NFPA 130
- -40 to 85 deg C

Affordability/localisation basis: Buy antenna assemblies; manufacture roof doublers, cable conduits and replaceable RF jumpers locally.

Close before supplier freeze:

- confirm city radio bands and cable losses
- freeze roof ground/bond and lightning path
- perform installed antenna and EMC tests

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P080 — fire-rated GFRP side-module laminate, core, gelcoat, and consumable kit

Default: Gurit — SE 130FR / ST 130FR prepreg with SA130FR and SF130FR films.

Published reference facts:

- EN 45545 HL2 stated for R1/R7/R17 monolithic laminates
- 85 deg C low-temperature cure option
- 45 minute cure option at 120 deg C
- published reinforcement and film order codes

Affordability/localisation basis: Use the catalogue prepreg as the first-article material; cut, vacuum-bag, cure, trim and repair locally with batch coupons.

Close before supplier freeze:

- select reinforcement/core/film stack per component
- fire-test the actual sandwich laminate
- run environmental, insert, impact and repair qualification

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating

- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-EXT-P090 — fire-rated GFRP roof-module, dry-seal, and removable skirt material kit

Default: Gurit — SE 130FR / ST 130FR prepreg with SA130FR and SF130FR films.

Published reference facts:

- EN 45545 HL2 stated for R1/R7/R17 monolithic laminates
- 85 deg C low-temperature cure option
- 45 minute cure option at 120 deg C
- published reinforcement and film order codes

Affordability/localisation basis: Use the catalogue prepreg as the first-article material; cut, vacuum-bag, cure, trim and repair locally with batch coupons.

Close before supplier freeze:

- select reinforcement/core/film stack per component
- fire-test the actual sandwich laminate
- run environmental, insert, impact and repair qualification

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-FIN-P010 — pre-cut exterior livery graphic film, edge-seal, datum-mark, and repair-patch kit

Default: 3M — Controltac Graphic Film with Comply Adhesive 180mC family.

Published reference facts:

- listed for rail-car graphic applications
- 50 micrometre cast opaque film
- pressure-activated removable adhesive
- up to seven-year MCS warranty subject to selected construction and conditions

Affordability/localisation basis: Plot, print, label and apply pre-cut one-metre-bay kits locally; accept another supplier only through complete-system equivalence rather than nominal film thickness.

Close before supplier freeze:

- select film colour/print, ink, overlaminate and edge system together
- obtain project fire and hot-climate exposure evidence
- run adhesion, wash, weather, repair and removal trials on the actual LM3 base finish

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-FIN-P020 — calcium-carbonate radiative roof-coating qualification and exposed-roof application kit

Default: qualified light-colour base roof finish; CaCO3 coating restricted to coupon and one-car trial.

Published reference facts:

- 95.5 percent initial solar reflectance reported
- 0.94 normal emissivity in the atmospheric window reported
- 60 percent particle concentration research formulation

Affordability/localisation basis: Local coupon preparation is encouraged, but fleet application remains prohibited until an orderable controlled formulation and signed rail qualification pack exist.

Close before supplier freeze:

- identify a controlled commercial binder/pigment/additive formulation
- obtain rail fire, chemical and application evidence
- pass GFRP adhesion/flexibility plus UV, abrasion, wash and soiling ageing
- measure new/aged optical performance and complete a one-car thermal/maintenance trial

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-INT-P010 — HVAC diffusers, side return ducts, saloon grilles, and access panels

Default: Longertek — direct-DC rail HVAC platform.

Published reference facts:

- direct high-voltage DC architecture
- rail HVAC product platform

Affordability/localisation basis: Buy the first roof unit and controller; localise ducts, diffusers, drains, filters and later coils after calorimeter testing.

Close before supplier freeze:

- confirm 24 kW LM3 duty at worst ambient
- freeze roof envelope, mass, coolant/refrigerant and drain interfaces
- obtain EN 50155/50121 and fire evidence for quoted configuration

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-TRC-P010 — motor-350kw-hm47-class axle traction motor

Default: ABB — AMXE250 configurable traction motor.

Published reference facts:

- up to 436 kW peak
- up to 3353 Nm peak

- up to 3500 rpm
- configurable shaft and length

Affordability/localisation basis: Buy first motors; local rewind and bearing service may follow an ABB-approved service procedure before attempting local manufacture.

Close before supplier freeze:

- quote a rail-duty 800 V winding and cooling configuration
- freeze shaft, foot, mass and torque-speed map
- obtain rail environmental, insulation, overspeed and endurance evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-TRC-P020` — single-stage reduction gearbox and flexible coupling

Default: Voith — SE single-stage axle-mounted metro gear unit.

Published reference facts:

- single-stage axle-mounted rail gear family

Affordability/localisation basis: Buy first gear units; machine guards, torque link and mounting hardware locally.

Close before supplier freeze:

- freeze ratio, centre distance, torque and coupling
- obtain bearing, lubrication, efficiency, noise, overspeed and endurance evidence
- freeze reaction-link and wheelset interfaces

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-TRC-P030` — two independent motor controllers, isolated LV DC/DC, MPPT, station protection, and cooling-loop kit

Default: ABB — BORDLINE CC400 LRV compact converter.

Published reference facts:

- 600/750 VDC LRV platform
- two independent propulsion converters
- integrated auxiliary converter and battery charger
- regenerative or resistor braking

Affordability/localisation basis: Buy first converters; localise cabinet, coolant manifold, harness and diagnostics integration behind frozen interfaces.

Close before supplier freeze:

- confirm operation from the selected battery/DC-link range
- freeze motor, cooling, MVB/Ethernet and protection interfaces
- quote exact mass, envelope, losses, software and rail evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-TRC-P040 — battery-225kwh-lfp-800v saloon-isolated side traction battery pack

Default: HOPPECKE — LiTrac modular high-voltage LFP rail traction battery.

Published reference facts:

- modular/scalable traction system
- published LFP option
- UN 38.3 base-module statement
- supplier rail safety engineering

Affordability/localisation basis: Buy certified packs/BMS initially; make external trays, ducts, guards, coolant manifolds and service fixtures locally.

Close before supplier freeze:

- confirm the frozen 225 kWh gross per-car target against the validated duty cycle or raise a controlled change request
- freeze voltage window, pack segmentation, mass and cooling
- obtain IEC 62928, propagation, fire, EMC and software evidence for the quote

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-TRC-P050 — roof-mounted regen dump resistor and thermal shield kit

Default: Danotherm Electric — custom traction brake resistor, 600-3000 VDC family.

Published reference facts:

- rail traction brake-resistor family
- 600-3000 VDC published range
- IEC 60322 and IEC 61373 product-family statements
- roof/underframe installation options

Affordability/localisation basis: Buy the element pack and insulators; manufacture roof carrier, shield, duct and service guard locally after the hot-zone model is frozen.

Close before supplier freeze:

- derive resistance, continuous/pulse energy and duty cycle from simulation
- freeze enclosure, airflow, thermal switch and touch guards
- run worst-case stopped-train thermal test

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support

- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-TRC-P060 — station side-pin charging connector, actuator, shutter, and alignment target

Default: supplier-neutral 650-700 VDC side-contact RFQ; automated collector retained only as a concept alternative.

Published reference facts:

- automated conductive charging platform

Affordability/localisation basis: Prefer a proven automated collector geometry if it reduces bespoke side-pin risk; make station frame, guards and alignment target locally.

Close before supplier freeze:

- compare roof/bottom collector against the LM3 side-pin concept
- freeze current, voltage, touch safety, alignment and emergency release
- qualify stationary and vehicle halves together

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-TRC-P070 — HV contactor, fuse, pre-charge, service-disconnect, and current-sensor panel

Default: Schaltbau — C360K/300 railway bidirectional DC contactor.

Published reference facts:

- IEC 60077-2 category B
- 1000 V at pollution degree 3 / 1500 V at pollution degree 2
- 300 A at 70 deg C
- 3000 A one-second withstand
- 24/36-48/72-110 VDC coil options

Affordability/localisation basis: Buy contactors and qualified fuses; fabricate busbars, enclosure, precharge assembly and service-disconnect panel locally.

Close before supplier freeze:

- confirm breaking duty and prospective fault current
- select coil, auxiliary contacts and mounting orientation
- coordinate fuse, busbar, precharge and enclosure clearances

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-SAF-P010 — battery temperature/off-gas detection, electrical-enclosure smoke detection, and localized mist kit

Default: Xtralis / Li-ion Tamer — Li-ion Tamer GEN 3.

Published reference facts:

- electrolyte-vapour early detection
- temperature and humidity at sensing nodes
- relay and Modbus interfaces
- calibration-free sensing claim

Affordability/localisation basis: Buy sensing nodes/controller; make brackets, protected Ethernet/relay harness and test-gas service access locally.

Close before supplier freeze:

- verify sensor response in selected battery airflow and contaminants
- define safe-state action and false-alarm handling
- do not treat detection as suppression or a standalone safety system

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-BOG-P040` — powered-bogie wheelset with axle-mounted brake discs

Default: GHH-BONATRANS — urban-rail wheelset with axle-mounted disc interfaces.

Published reference facts:

- urban-rail wheelset supplier family

Affordability/localisation basis: Buy certified wheelsets initially; local wheel/axle manufacture requires a separately qualified metallurgical and NDT route.

Close before supplier freeze:

- freeze wheel profile/diameter, axle journals and disc seats
- issue load spectrum and duty
- obtain material, forging, heat-treatment, NDT, press-fit and fatigue evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-BOG-P041` — trailer-bogie wheelset with axle-mounted brake discs

Default: GHH-BONATRANS — urban-rail wheelset with axle-mounted disc interfaces.

Published reference facts:

- urban-rail wheelset supplier family

Affordability/localisation basis: Buy certified wheelsets initially; local wheel/axle manufacture requires a separately qualified metallurgical and NDT route.

Close before supplier freeze:

- freeze wheel profile/diameter, axle journals and disc seats
- issue load spectrum and duty
- obtain material, forging, heat-treatment, NDT, press-fit and fatigue evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-BOG-P042 — powered-wheelset axlebox, sealed bearing unit, speed and temperature sensor set

Default: SKF — sensor-ready railway tapered roller bearing unit.

Published reference facts:

- sealed and pre-lubricated ready-to-mount TBU family

Affordability/localisation basis: Buy bearing units; machine housings, sensor guards and cable brackets locally to the supplier-controlled fits.

Close before supplier freeze:

- calculate bearing life from journal, load spectrum and speed
- freeze exact designation, fit, seal, grease and grounding
- freeze speed/temperature sensor and cable interface

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-BOG-P043 — trailer-wheelset axlebox, sealed bearing unit, speed and temperature sensor set

Default: SKF — sensor-ready railway tapered roller bearing unit.

Published reference facts:

- sealed and pre-lubricated ready-to-mount TBU family

Affordability/localisation basis: Buy bearing units; machine housings, sensor guards and cable brackets locally to the supplier-controlled fits.

Close before supplier freeze:

- calculate bearing life from journal, load spectrum and speed
- freeze exact designation, fit, seal, grease and grounding
- freeze speed/temperature sensor and cable interface

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-BOG-P044 — powered-bogie primary suspension spring, guide and bump-stop set

Default: Continental — rail half-bellow air spring with integrated auxiliary spring.

Published reference facts:

- metro/local-transport air-spring family

- integrated rubber-metal auxiliary spring option

Affordability/localisation basis: Buy elastomer/spring/damper elements; fabricate spring seats, guides, centre pivot, yaw links and guards locally after calculation.

Close before supplier freeze:

- freeze load-deflection/damping curves from the vehicle dynamics model
- select primary springs, air springs, dampers and bump stops as one system
- obtain ageing, fatigue, fire and ride evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-BOG-P045 — trailer-bogie primary suspension spring, guide and bump-stop set

Default: Continental — rail half-bellow air spring with integrated auxiliary spring.

Published reference facts:

- metro/local-transport air-spring family
- integrated rubber-metal auxiliary spring option

Affordability/localisation basis: Buy elastomer/spring/damper elements; fabricate spring seats, guides, centre pivot, yaw links and guards locally after calculation.

Close before supplier freeze:

- freeze load-deflection/damping curves from the vehicle dynamics model
- select primary springs, air springs, dampers and bump stops as one system
- obtain ageing, fatigue, fire and ride evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-BOG-P046 — powered-bogie to carbody connection: air springs, emergency spring, centre pivot, yaw links and dampers

Default: Continental — rail half-bellow air spring with integrated auxiliary spring.

Published reference facts:

- metro/local-transport air-spring family
- integrated rubber-metal auxiliary spring option

Affordability/localisation basis: Buy elastomer/spring/damper elements; fabricate spring seats, guides, centre pivot, yaw links and guards locally after calculation.

Close before supplier freeze:

- freeze load-deflection/damping curves from the vehicle dynamics model
- select primary springs, air springs, dampers and bump stops as one system
- obtain ageing, fatigue, fire and ride evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-BOG-P047 — trailer-bogie to carbody connection: air springs, emergency spring, centre pivot, yaw links and dampers

Default: Continental — rail half-bellow air spring with integrated auxiliary spring.

Published reference facts:

- metro/local-transport air-spring family
- integrated rubber-metal auxiliary spring option

Affordability/localisation basis: Buy elastomer/spring/damper elements; fabricate spring seats, guides, centre pivot, yaw links and guards locally after calculation.

Close before supplier freeze:

- freeze load-deflection/damping curves from the vehicle dynamics model
- select primary springs, air springs, dampers and bump stops as one system
- obtain ageing, fatigue, fire and ride evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-BOG-P048 — powered-bogie brake calipers, parking actuators, pads and wheel-slide hardware

Default: Knorr-Bremse — WheelAct Compact RZKT with spring parking-brake option.

Published reference facts:

- 50 kN service pad force
- 45 kN spring parking force
- 68 kg
- 305 mm width
- plus/minus 25 mm lateral movement
- 8-10 year stated overhaul interval

Affordability/localisation basis: Buy first calipers/actuators; localise discs, hoses, brackets and overhaul parts only under brake-system approval.

Close before supplier freeze:

- confirm disc diameter/pad pair and required force from brake calculation
- freeze actuator, parking, WSP and degraded-mode architecture
- perform stopping, thermal, adhesion and endurance tests

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support

- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-BOG-P049 — trailer-bogie brake calipers, parking actuators, pads and wheel-slide hardware

Default: Knorr-Bremse — WheelAct Compact RZKT with spring parking-brake option.

Published reference facts:

- 50 kN service pad force
- 45 kN spring parking force
- 68 kg
- 305 mm width
- plus/minus 25 mm lateral movement
- 8-10 year stated overhaul interval

Affordability/localisation basis: Buy first calipers/actuators; localise discs, hoses, brackets and overhaul parts only under brake-system approval.

Close before supplier freeze:

- confirm disc diameter/pad pair and required force from brake calculation
- freeze actuator, parking, WSP and degraded-mode architecture
- perform stopping, thermal, adhesion and endurance tests

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-AUX-P010 — secondary-suspension compressor, dryer, reservoir, and isolation-manifold kit

Default: Knorr-Bremse — VV120-T 2.0 oil-free rail compressor / AirSupply Smart.

Published reference facts:

- oil-free rail compressor family
- variable-speed smart-control option
- published low-noise operating mode

Affordability/localisation basis: Buy compressor/dryer; fabricate reservoir, manifold, isolation, drains, mounts and acoustic enclosure locally to approved pressure codes.

Close before supplier freeze:

- size from suspension, brake and auxiliary air demand
- freeze dryer, reservoir, relief, noise and mounting package
- run duty, thermal, condensate and degraded-mode tests

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-END-P010 — automatic end coupler and crash-energy absorber

Default: Dellner — automatic coupler Type 430 with pivot anchor.

Published reference facts:

- light-rail/tram/monorail application
- 600 kN buff and 500 kN draft
- gas-hydraulic damper
- remote uncoupling and foldable options

Affordability/localisation basis: Buy coupler/head/absorber; make pocket, covers, brackets and harness locally to Dellner drawings.

Close before supplier freeze:

- freeze height, gathering range, fold, crash stroke and pocket loads
- freeze electrical head and rescue jumper pinout
- integrate into whole-vehicle crash-energy management

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-ART-P020 — articulation lower spherical pivot, bearing housing and pin set

Default: Schaeffler — ELGES maintenance-free spherical plain bearing and rod-end family.

Published reference facts:

- maintenance-free spherical plain-bearing family

Affordability/localisation basis: Buy bearing liners/rod ends; machine housings, pins, links and retained fasteners locally from released drawings.

Close before supplier freeze:

- derive static/dynamic load, pin diameter, misalignment and life
- freeze liner, seal, corrosion and temperature variant
- proof and fatigue-test the complete local housing/pin/link joint

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-ART-P021 — articulation upper lateral/yaw links, spherical joints and retained pins

Default: Schaeffler — ELGES maintenance-free spherical plain bearing and rod-end family.

Published reference facts:

- maintenance-free spherical plain-bearing family

Affordability/localisation basis: Buy bearing liners/rod ends; machine housings, pins, links and retained fasteners locally from released drawings.

Close before supplier freeze:

- derive static/dynamic load, pin diameter, misalignment and life
- freeze liner, seal, corrosion and temperature variant
- proof and fatigue-test the complete local housing/pin/link joint

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-ART-P022 — inter-car double-wall corrugated bellows and clamp-frame set

Default: HUEBNER — modular metro double-wall corrugated gangway.

Published reference facts:

- single/double-wall corrugated-bellows options
- bridge and elastic interior-panel options
- metro/urban-rail application

Affordability/localisation basis: Buy first bellows/bridge system; fabricate clamp frames, threshold, drains and service panels locally to released interfaces.

Close before supplier freeze:

- issue full articulation sweep and end-frame geometry
- freeze bellows, bridge, turntable, clamp and drainage
- perform fire, fatigue, water, passenger-load and pinch-gap tests

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-ART-P023 — inter-car passenger bridge, turntable and flexible interior-panel set

Default: HUEBNER — modular metro double-wall corrugated gangway.

Published reference facts:

- single/double-wall corrugated-bellows options
- bridge and elastic interior-panel options
- metro/urban-rail application

Affordability/localisation basis: Buy first bellows/bridge system; fabricate clamp frames, threshold, drains and service panels locally to released interfaces.

Close before supplier freeze:

- issue full articulation sweep and end-frame geometry
- freeze bellows, bridge, turntable, clamp and drainage
- perform fire, fatigue, water, passenger-load and pinch-gap tests

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support

- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-ART-P024 — articulation trainline carrier, support arms, abrasion liners and drain path

Default: igus / HARTING — rail e-chain carrier with Han HPR connector system.

Published reference facts:

- rail dynamic cable-carrier family
- rail connector/fire variants available

Affordability/localisation basis: Buy carriers/connectors; cut rail cable and hose, make support arms, drains and protective sleeves locally with controlled termination.

Close before supplier freeze:

- select carrier from bend radius, fill, travel and torsion
- freeze Han HPR inserts, housings, coding and breakaway
- cycle-test complete HV/LV/coolant bundle through the articulation envelope

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-CTRL-P010 — T-ECU/S and T-ECU/A compute and safety-control cabinet kit

Default: duagon — D-SC Controller with MH50C safe CPU and distributed safe I/O.

Published reference facts:

- applications up to SIL4 stated by supplier
- three-CPU safe controller
- safe I/O
- EN 50155 rolling-stock environment
- certification packages available

Affordability/localisation basis: Use duagon for the independent qualified channel; keep OSR application compute separate and portable. Build cabinet/harness locally.

Close before supplier freeze:

- allocate each LM3 safety function and required SIL
- freeze CPU/I/O/BSP/application configuration
- independently verify OSR integration and safe-state timing

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-CTRL-P020 — navigation, balise, 5G, LoRa, GNSS, IMU, and roof-antenna kit

Default: Westermo — Ibex-RT-630-5G.

Published reference facts:

- 3GPP Release 16 5G

- 4x4 sub-6 GHz MIMO
- 2x2 Wi-Fi
- EN 50155 and EN 45545-2
- M12 and IP66

Affordability/localisation basis: Buy router; integrate local SIM service, cybersecurity configuration, roof cables and cabinet harness.

Close before supplier freeze:

- confirm local 5G bands/SIMs and cybersecurity lifecycle
- freeze antenna/cable topology
- prove handover, loss-of-comms and update behaviour

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-CTRL-P030` — maintenance HMI, depot pendant, emergency controls, and safety-relay kit

Default: Pilz — PNOZ s4, railway order 751184.

Published reference facts:

- railway application note for order 751184
- three safety contacts
- redundant self-monitoring circuit

Affordability/localisation basis: Buy relays; fabricate labelled DIN cabinet, E-stop/pendant harness and replaceable terminal blocks locally.

Close before supplier freeze:

- use only for an allocated compatible function
- observe supplier accessibility restriction for railway use
- verify contact load, diagnostics and safe-state integration

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## `LM3-CTRL-P050` — operational and crashworthy event-recorder storage kit

Default: HaslerRail — JRU/EVA event-recorder platform.

Published reference facts:

- rail event-recording product family

Affordability/localisation basis: Buy protected recorder; use local commodity storage only for non-protected operational logs.

Close before supplier freeze:

- freeze jurisdictional data set, retention and clock
- select protected memory and download interfaces

- obtain crash, fire, environmental and chain-of-custody evidence

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-END-P020 — T-OBS nose sensor pack, heated window services, and washer kit

Default: Ouster — OS1 industrial lidar sensor.

Published reference facts:

- industrial digital lidar family

Affordability/localisation basis: Buy sensors; manufacture datum carrier, sacrificial heated window, washer, guard and service alignment fixture locally.

Close before supplier freeze:

- not a certified railway obstacle-detection function
- freeze field of view, range, latency, heater/washer and protective window
- validate sensing, diagnostics and failure response over route conditions

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-END-P040 — e-coupler LV jumper, recovery trainline, and end harness breakaway kit

Default: Dellner — automatic coupler Type 430 with pivot anchor.

Published reference facts:

- light-rail/tram/monorail application
- 600 kN buff and 500 kN draft
- gas-hydraulic damper
- remote uncoupling and foldable options

Affordability/localisation basis: Buy coupler/head/absorber; make pocket, covers, brackets and harness locally to Dellner drawings.

Close before supplier freeze:

- freeze height, gathering range, fold, crash stroke and pocket loads
- freeze electrical head and rescue jumper pinout
- integrate into whole-vehicle crash-energy management

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-END-P050 — sealed headlight, tail/marker light, threshold-warning, and end-lamp harness kit

Default: Teknoware — rolling-stock interior and emergency lighting platform.

Published reference facts:

- rolling-stock LED emergency-lighting platform

Affordability/localisation basis: Make the 1.2 m carrier, lens, brackets and harness locally around replaceable quoted LED modules.

Close before supplier freeze:

- freeze 24 V keyed cassette, optics and emergency duration
- obtain rail fire, EMC, ingress and photometry evidence
- separately select certified exterior head/tail lamps

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-ART-P030 — inter-car HV/LV jumper, coolant hose loop, energy chain, and drain sleeve kit

Default: igus / HARTING — rail e-chain carrier with Han HPR connector system.

Published reference facts:

- rail dynamic cable-carrier family
- rail connector/fire variants available

Affordability/localisation basis: Buy carriers/connectors; cut rail cable and hose, make support arms, drains and protective sleeves locally with controlled termination.

Close before supplier freeze:

- select carrier from bend radius, fill, travel and torsion
- freeze Han HPR inserts, housings, coding and breakaway
- cycle-test complete HV/LV/coolant bundle through the articulation envelope

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## LM3-ART-P040 — train-to-train open-end articulation, gangway, drawbar, turntable, and service-jumper cassette

Default: HUEBNER — modular metro double-wall corrugated gangway.

Published reference facts:

- single/double-wall corrugated-bellows options
- bridge and elastic interior-panel options
- metro/urban-rail application

Affordability/localisation basis: Buy first bellows/bridge system; fabricate clamp frames, threshold, drains and service panels locally to released interfaces.

Close before supplier freeze:

- issue full articulation sweep and end-frame geometry
- freeze bellows, bridge, turntable, clamp and drainage
- perform fire, fatigue, water, passenger-load and pinch-gap tests

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

### `LM3-ART-P041` — train-to-train jumper blanking, transition harness, isolation label, and dust-cover kit

Default: igus / HARTING — rail e-chain carrier with Han HPR connector system.

Published reference facts:

- rail dynamic cable-carrier family
- rail connector/fire variants available

Affordability/localisation basis: Buy carriers/connectors; cut rail cable and hose, make support arms, drains and protective sleeves locally with controlled termination.

Close before supplier freeze:

- select carrier from bend radius, fill, travel and torsion
- freeze Han HPR inserts, housings, coding and breakaway
- cycle-test complete HV/LV/coolant bundle through the articulation envelope

Override the default when:

- the selected order code exceeds the controlled design-reference envelope
- vehicle load, duty, thermal, EMC, fire, accessibility or RAM calculations require another rating
- the quoted configuration lacks the required rail evidence or lifecycle support
- a qualified local equivalent has lower whole-life cost after interface and regression testing

## Controlled manufacturer/reference sources

### `OSR-COTS-DOOR-IFE` — Knorr-Bremse IFE IFE modular sliding-plug entrance system

- Source class: `vehicle-specific-rfq`
- Selection state: `rfq-baseline`

### `OSR-COTS-GLASS-AGC` — AGC Automotive rail glazing with framing system

- Source class: `vehicle-specific-rfq`
- Selection state: `rfq-baseline`

### `OSR-COTS-FINISH-3M-180MC` — 3M Controltac Graphic Film with Comply Adhesive 180mC family

- Source class: `catalogue-family-with-rail-application-guidance`
- Selection state: `sample-and-system-rfq`

### OSR-COTS-COOLROOF-PURDUE-CACO3 — Purdue University research team (reference only) 2020 CaCO3-acrylic particle-matrix paint formulation

- Source class: `research-formulation-not-orderable`
- Selection state: `qualification-only`

### OSR-COTS-GLAZING-SIKA268 — Sika Sikaflex-268 PowerCure, 600 ml

- Source class: `vehicle-specific-rfq`
- Selection state: `rfq-baseline`

### OSR-COTS-PV-SUNMAN — Sunman Energy eArc lightweight PV module

- Source class: `catalogue-family`
- Selection state: `sample-ready`

### OSR-COTS-FLOOR-COMFLOOR — 3A Composites Mobility COMFLOOR rail floor panel

- Source class: `configurable-catalogue-system`
- Selection state: `rfq-baseline`

### OSR-COTS-FLOOR-FORBO-6R3883 — Forbo Flooring Systems Marmoleum Fresco FR2 6R3883 moonstone, 2.5 mm

- Source class: `exact-catalogue-product`
- Selection state: `sample-ready`

### OSR-COTS-SEAT-FAINSA — Fainsa metro and urban-rail seating family

- Source class: `vehicle-specific-rfq`
- Selection state: `rfq-baseline`

### OSR-COTS-PIS-LUMINATOR — Luminator Technology Group RailKom passenger-information and communication platform

- Source class: `configurable-catalogue-system`
- Selection state: `rfq-baseline`

### OSR-COTS-CAMERA-MOXA-P06HC — Moxa VPort P06HC-1MP-M12-CAM36

- Source class: `exact-catalogue-model`
- Selection state: `sample-ready`

### OSR-COTS-LIGHT-TEKNOWARE — Teknoware rolling-stock interior and emergency lighting platform

- Source class: `vehicle-specific-rfq`
- Selection state: `rfq-baseline`

### OSR-COTS-FASTENER-RIVNUT — Boellhoff RIVNUT metric M6/M8 steel or stainless blind rivet nuts

- Source class: `catalogue-family-with-sizing`
- Selection state: `sample-ready`

### OSR-COTS-ANTENNA-HS-85137717 — HUBER+SUHNER SENCITY Rail MIMO 5-port with GNSS/LNA, product 85137717

- Source class: `exact-catalogue-product`
- Selection state: `orderable-candidate`

### OSR-COTS-COMPOSITE-GURIT-130FR — Gurit SE 130FR / ST 130FR prepreg with SA130FR and SF130FR films

- Source class: `exact-catalogue-family`
- Selection state: `sample-ready`

### OSR-COTS-MOTOR-ABB-AMXE250 — ABB AMXE250 configurable traction motor

- Source class: `configurable-catalogue-machine`
- Selection state: `rfq-baseline`

### OSR-COTS-GEAR-VOITH-SE — Voith SE single-stage axle-mounted metro gear unit

- Source class: `vehicle-specific-rfq`
- Selection state: `rfq-baseline`

### OSR-COTS-CONVERTER-ABB-CC400 — ABB BORDLINE CC400 LRV compact converter

- Source class: `configurable-rail-product`
- Selection state: `rfq-baseline`

### OSR-COTS-BATTERY-HOPPECKE-LITRAC — HOPPECKE LiTrac modular high-voltage LFP rail traction battery

- Source class: `vehicle-specific-rfq`
- Selection state: `rfq-baseline`

### OSR-COTS-RESISTOR-DANOTHERM — Danotherm Electric custom traction brake resistor, 600-3000 VDC family

- Source class: `vehicle-specific-rfq`
- Selection state: `rfq-baseline`

### OSR-COTS-CHARGER-SCHUNK — Schunk Carbon Technology Smart Charging automated high-current collector platform

- Source class: `interface-rfq-baseline`
- Selection state: `concept-alternative`

### OSR-COTS-HV-SCHALTBAU-C360 — Schaltbau C360K/300 railway bidirectional DC contactor

- Source class: `exact-catalogue-model`
- Selection state: `sample-ready`

### OSR-COTS-HV-TE-HVP800 — TE Connectivity AMP+ HVP800 cable assembly 1-2286937-1

- Source class: `exact-catalogue-part`
- Selection state: `sample-ready`

### OSR-COTS-FIRE-LIIONTAMER-3 — Xtralis / Li-ion Tamer Li-ion Tamer GEN 3

- Source class: `exact-catalogue-system`
- Selection state: `sample-ready`

### OSR-COTS-FIRE-FOGTEC — FOGTEC Rail Systems rail high-pressure water-mist system

- Source class: `vehicle-specific-rfq`
- Selection state: `hazard-analysis-rfq`

### OSR-COTS-WHEELSET-GHH — GHH-BONATRANS urban-rail wheelset with axle-mounted disc interfaces

- Source class: `vehicle-specific-rfq`
- Selection state: `rfq-baseline`

### OSR-COTS-BEARING-SKF-TBU — SKF sensor-ready railway tapered roller bearing unit

- Source class: `vehicle-specific-rfq`
- Selection state: `calculation-then-rfq`

### OSR-COTS-SUSPENSION-CONTI — Continental rail half-bellow air spring with integrated auxiliary spring

- Source class: `vehicle-specific-rfq`
- Selection state: `dynamics-then-rfq`

### OSR-COTS-BRAKE-KNORR-RZKT — Knorr-Bremse WheelAct Compact RZKT with spring parking-brake option

- Source class: `configurable-catalogue-model`
- Selection state: `brake-calculation-then-rfq`

### OSR-COTS-AIR-KNORR-VV120T — Knorr-Bremse VV120-T 2.0 oil-free rail compressor / AirSupply Smart

- Source class: `configurable-rail-product`
- Selection state: `air-demand-then-rfq`

### OSR-COTS-COUPLER-DELLNER430 — Dellner automatic coupler Type 430 with pivot anchor

- Source class: `configurable-catalogue-model`
- Selection state: `rfq-baseline`

### OSR-COTS-JOINT-SCHAEFFLER — Schaeffler ELGES maintenance-free spherical plain bearing and rod-end family

- Source class: `catalogue-family-with-calculation`
- Selection state: `calculation-then-order-code`

### OSR-COTS-GANGWAY-HUBNER — HUEBNER modular metro double-wall corrugated gangway

- Source class: `vehicle-specific-rfq`

- Selection state: `kinematic-envelope-then-rfq`

### `OSR-COTS-TRAINLINE-IGUS-HARTING` — igus / HARTING rail e-chain carrier with Han HPR connector system

- Source class: `catalogue-family-with-sizing`
- Selection state: `sample-and-cycle-test`

### `OSR-COTS-CONTROL-DUAGON-MH50C` — duagon D-SC Controller with MH50C safe CPU and distributed safe I/O

- Source class: `certified-configurable-platform`
- Selection state: `safety-allocation-then-rfq`

### `OSR-COTS-COMPUTE-MOXA-V2406C` — Moxa V2406C-WL1-T railway computer

- Source class: `exact-catalogue-model`
- Selection state: `application-compute-candidate`

### `OSR-COTS-ROUTER-WESTERMO-630-5G` — Westermo Ibex-RT-630-5G

- Source class: `exact-catalogue-model`
- Selection state: `orderable-candidate`

### `OSR-COTS-SAFETYRELAY-PILZ-751184` — Pilz PNOZ s4, railway order 751184

- Source class: `exact-catalogue-order`
- Selection state: `bench-safety-relay-candidate`

### `OSR-COTS-RECORDER-HASLER` — HaslerRail JRU/EVA event-recorder platform

- Source class: `vehicle-specific-rfq`
- Selection state: `requirements-then-rfq`

### `OSR-COTS-LIDAR-OUSTER-OS1` — Ouster OS1 industrial lidar sensor

- Source class: `catalogue-sensor`
- Selection state: `development-sensor-candidate`

## Controlled source

- Candidate register: `lib/templates/trainset-cots-candidates.toml` (`0588d76029c2f426beadc09a5ba096848d2eb85a22fb4e1306c54d68931f3b94`)

# LM3 simplified exterior finish system

Repository source: `design/component-catalogue/catalog/buildable-trainset/exterior-finish-system.md`

Generated by `tools/automation/buildable-trainset.sh`. This controls the separation between mandatory base protection, replaceable livery film and the trial-only calcium-carbonate radiative roof coating.

- Design ID: `LM3-FIN-260`
- Status: `design-reference; CaCO3 roof route is trial-only`
- Principle: film simplifies livery but never replaces corrosion, composite-surface or fire protection
- Film procurement boundary: rail-application product selected by current supplier bulletin and project fire/adhesion evidence
- CaCO3 research screen: initial solar reflectance `0.955`; sky-window emissivity `0.94`. research screening targets only; measure the selected LM3 system new and aged

## Finish zones

| ID | Substrate | Mandatory base | Simplified finish | Replaceable | Prohibited coverage | Release evidence |
|---|---|---|---|---|---|---|
| `LM3-FIN-Z01` | S355 primary and secondary steel | qualified blast/clean, corrosion primer, stripe coat, topcoat and cavity protection | single light neutral topcoat; optional livery film only after full cure | no | weld inspection lands until released<br>earth studs<br>machined datums<br>drains<br>labels | surface-preparation record<br>coating batch<br>dry-film thickness<br>holiday/visual inspection<br>adhesion/cure release |
| `LM3-FIN-Z02` | clip-on GFRP side modules and end-cowl casts | fire/UV-qualified in-mould white gelcoat or compatible primer/base topcoat with sealed cut edges | pre-cut rail-use graphic film for coloured livery bands, logos and replaceable local graphics | yes | EPDM seals<br>drains<br>retained fasteners<br>service labels<br>glass/lamp edges<br>bond/seal lands | substrate cure/cleanliness<br>film-system certificate<br>adhesion coupon<br>edge/overlap map<br>removal/repair trial |
| `LM3-FIN-Z03` | exposed GFRP roof skins and removable HVAC/PV fairings | fire/UV-qualified in-mould white gelcoat or compatible rail coating | CaCO3-acrylic radiative coating candidate only after coupon and one-car qualification | yes | PV active area and clamps<br>HVAC intake/exhaust and heat exchangers<br>antennas and sensor apertures<br>walkways and anti-slip pads<br>lifting/jacking covers<br>earth bonds<br>glands, drains, seals, labels and service lands | fire/chemical compatibility<br>GFRP adhesion/flexibility<br>UV/abrasion/wash ageing<br>new and aged solar reflectance/emittance<br>glare/visibility review<br>one-car thermal and maintenance trial |

## Controlled route

| Seq. | Operation | Hold point |
|---|---|---|
| 10 | release corrosion, fire and composite base finish before decorative work | base finish records accepted |
| 20 | survey, repair, fully cure and clean each film/coating substrate | signed pre-installation inspection |
| 30 | cut film by module/bay and make film plus roof-coating witness coupons | coupon adhesion and appearance accepted |
| 40 | dry-apply livery film; mask roof keep-outs and apply qualified candidate coating | edges, overlaps, mask map and wet/dry film record accepted |
| 50 | inspect, water/wash test, retain coupons and complete removal/repair demonstration | new-build release or trial-only disposition signed |
| 60 | age coupons and one-car trial through UV, wash, abrasion and service exposure | aged optical/adhesion and maintenance evidence reviewed |

The CaCO3 values come from the Purdue research paper linked in `exterior-finish-process.md`. They are screening targets, not LM3 performance claims.

# LM3 pilot factory sizing and machinery plan

Repository source: `design/component-catalogue/catalog/buildable-trainset/factory-plan.md`

Generated by `tools/automation/buildable-trainset.sh`. This is a rough-order factory layout and machinery plan for the basic three-car LM3 trainset. It sizes a lean pilot plant, not a turnkey rolling-stock works.

- Family: `light-metro-3car`
- Candidate: `light-metro-3car__16p5m__reference-body__reference-bogie__motor-350kw-hm47-class__battery-225kwh-lfp-800v__hvac-24kw-direct-hv-dc__pv12`
- Planning basis: minimum pilot factory for one first-article LM3 three-car trainset at a time; one 55 m final assembly bay; chassis, bogies, moulded GFRP modules, and interiors run off-line in parallel
- Recommended enclosed factory: 3,515 m2 (37,835 ft2)
- Outside yard/test apron: 2,200 m2 (23,681 ft2)
- Dynamic test track: separate short depot/test track, nominal 150-300 m plus charging interface; not counted in enclosed factory area
- Rough-order machinery/setup: $1,021,200 including 20% setup contingency

## Factory Area By Cell

| Cell | Area | Supports | Included work |
|---|---|---|---|
| steel prep and chassis parts cell | 180 m2 (18 x 10 m) | `CP-020` | saw/plasma cutting, press-brake forming, drilling, deburr, and three-car chassis/body kitting |
| chassis weld and body-frame fixture cell | 640 m2 (32 x 20 m) | `CP-030`, `CP-040` | two underframe rotating fixtures, two side/roof frame fixtures, local bolster/coupler subfixtures, weld extraction, and fixture survey access |
| composite moulding, cure, trim, and dry-fit cell | 264 m2 (22 x 12 m) | `CP-060`, `CP-080` | four short GFRP moulds, lay-up tables, cure racks, CNC trim/drill table, master-frame dry-fit stand, and module staging |
| paint and corrosion protection cell | 336 m2 (28 x 12 m) | `CP-070` | one car-length paint booth, prep/mask lane, flash-off/inspection space, seam-seal and cavity-wax station |
| bogie assembly and test cell | 240 m2 (20 x 12 m) | `CP-050`, `CP-120` | three bogie stands, wheelset lane, brake/sensor bench, ride-height setup, and bogie-to-car marriage support tools |
| interior, HVAC duct, harness, and supplier kit bench | 160 m2 (16 x 10 m) | `CP-065`, `CP-110` | seat/grab-rail racks, floor and liner trim bench, lighting/PIS/CCTV label bench, quarantine shelves, and car-zone kitting |
| final assembly, bogie marriage, and static-test track | 600 m2 (60 x 10 m) | `CP-090`, `CP-100`, `CP-110`, `CP-120`, `CP-130`, `CP-140` | one 55 m controlled train bay with side access, roof platforms, HV lockout, shore power, charge simulator, jacks/mobile columns, and end-cowl stands |
| stores, incoming inspection, QA, toolroom, and offices | 392 m2 (28 x 14 m) | `CP-010` | controlled document desk, stores, receiving inspection, calibrated-tool cage, NCR quarantine, compressor/electrical room, and welfare/office space |
| Circulation, services, safety aisles | 703 m2 | all cells | 25% allowance over net process cells for forklifts, carts, fire egress, utilities, compressors, and WIP buffering |
| Total enclosed factory | 3,515 m2 | all cells | Minimum recommended lease/building area before offices are expanded or production rate is increased |

# Assembly-Time Rollup

| Scope | Tasks | Start d | Finish d | Elapsed d | Touch labour h | Peak crew eq |
|---|---|---|---|---|---|---|
| chassis and painted carbody frame fabrication | `CP-020`, `CP-030`, `CP-040`, `CP-070` | 2.0 | 15.0 | 13.0 | 1,284 | 13.1 |
| bogie build and bogie-to-carbody integration | `CP-050`, `CP-120` | 5.0 | 18.0 | 13.0 | 760 | 15.0 |
| GFRP moulding and clip-on body installation | `CP-060`, `CP-080` | 2.0 | 16.0 | 14.0 | 516 | 12.0 |
| interior furnishing pre-kit and installation | `CP-065`, `CP-110` | 2.0 | 22.0 | 20.0 | 780 | 17.5 |
| final assembly and static commissioning | `CP-090`, `CP-100`, `CP-110`, `CP-120`, `CP-130`, `CP-140` | 16.0 | 29.0 | 13.0 | 2,340 | 45.0 |
| dynamic commissioning and trial-running release | `CP-150` | 29.0 | 35.0 | 6.0 | 432 | 9.0 |

# Machinery And Setup Estimate

| ID | Item | Qty | Unit | Extended | Cell | Basis |
|---|---|---|---|---|---|---|
| M-010 | 4x8 or 5x10 CNC plasma table with extraction | 1 | $20,000 | $20,000 | steel prep | CNC plasma listings show 4x8 tables roughly in the $7k-$17k range; allowance includes extraction and industrialization. |
| M-020 | RHS/tube saw and general fabrication saws | 2 | $6,000 | $12,000 | steel prep | Shop-floor allowance for repeatable chassis tube cutting and backup saw capacity. |
| M-030 | 100-160 t CNC press brake | 1 | $45,000 | $45,000 | steel prep | Market check shows low FOB offers around $18k and local/dealer reality nearer $45k for 100 t class machines. |
| M-040 | drill/mill/magnetic-drill and deburr package | 1 | $18,000 | $18,000 | steel prep | Datum holes, inserts, fixtures, bracket slots, and local machining support. |
| M-050 | 500 A MIG/MAG welding sets | 8 | $2,000 | $16,000 | weld cell | Industrial 500 A MIG/MAG machines are commonly listed from sub-$1k FOB to around $1.5k-$2.5k retail; allowance includes torches/leads. |
| M-060 | weld fume extraction and screens | 1 | $25,000 | $25,000 | weld cell | Shared extraction, curtains, and local arms for two long fixtures plus bracket benches. |
| M-070 | underframe rotating weld fixtures | 2 | $40,000 | $80,000 | weld cell | Custom datum tooling for 16.5 m chassis underframes. |
| M-080 | side/roof frame fixtures | 2 | $30,000 | $60,000 | weld cell | Custom fixtures for door/window portals, roof bows, HVAC rails, and clip-grid datums. |
| M-090 | bogie frame fixture, three stands, and brake/sensor bench | 1 | $45,000 | $45,000 | bogie cell | Local assembly tooling for powered/trailer bogie frames and supplier wheelset/brake installation. |
| M-100 | 10 t bridge/gantry crane coverage and hoists | 2 | $37,500 | $75,000 | lifting | Crane price guides show 10 t single-girder equipment in the high single-digit to low tens of thousands FOB; allowance includes runway/installation margin. |
| M-110 | 3 t electric forklift | 1 | $25,000 | $25,000 | material handling | 2026 3 t electric forklift guide ranges around $18k-$30k for higher-spec lithium machines. |
| M-120 | mobile columns/jacks or shallow-pit bogie marriage kit | 1 | $75,000 | $75,000 | final assembly | Heavy-vehicle mobile-column sets range from lower-cost import sets to about $60k+ for branded 72,000 lb sets; allowance covers trainset adaptation. |
| M-130 | bus/truck-length paint booth and prep ventilation | 1 | $70,000 | $70,000 | paint cell | Truck/bus booth market checks show roughly $13k-$50k FOB and $80k-$90k for larger custom booths; allowance sits between. |
| M-140 | blast/strip prep, seam-seal, and cavity-wax package | 1 | $35,000 | $35,000 | paint cell | Lean in-house prep package; full blast hall can be outsourced or added later. |
| M-150 | four short GFRP moulds with trim/drill jigs | 1 | $40,000 | $40,000 | composite cell | Reusable one-metre side/roof mould set plus master trim gauges; no full-car mould. |
| ID | Item | Qty | Unit | Extended | Cell | Basis |
| M-160 | vacuum infusion/wet-layup pumps, reusable | 1 | $20,000 | $20,000 | composite cell | Vacuum infusion equipment is low-cost |

| ID | Item | Qty | Unit | Extended | Cell | Basis |
|---|---|---|---|---|---|---|
| | membranes, tables,and cure racks | | | | | at tool level; allowancecovers shop-readypumps, membranes,gauges, and racks. |
| M-170 | CNC router/trim table and composite dust extraction | 1 | $45,000 | $45,000 | composite cell | Trim/drill accuracy for side/window/door/roof variants and cabin liners. |
| M-180 | metrology, laser level/track, torque tools, and calibrated gauges | 1 | $35,000 | $35,000 | QA | Factory datum surveys, torque control, clip gauges, door/window gauges, and calibration control. |
| M-190 | HV insulation, continuity, shore-power, and charge-simulator tools | 1 | $70,000 | $70,000 | final assembly | Static commissioning of HV battery, traction, charging, door/HVAC, and train-control interfaces. |
| M-200 | interior trim benches, carts, racks, and hand tools | 1 | $25,000 | $25,000 | interior cell | Pre-kitting seats, floors, lighting, liners, PIS/CCTV, and labels by car zone. |
| M-210 | factory IT, traveler terminals, printers, labels, and document control | 1 | $15,000 | $15,000 | production control | Shop traveler, QR label, NCR, and QA evidence capture support. |
| Subtotal | | | | $851,000 | | |
| Setup contingency | 20% install/adaptation/ commissioning allowance | | | $170,200 | | |
| Rough-order machinery total | Excludes building/land/ taxes/freight/duty | | | $1,021,200 | | |

## Production Takt Scenarios

| Scenario | Trainsets/year | Final bays | Basis |
|---|---|---|---|
| first article / learning build | 4 | 1 | 35 working-day elapsed build with protected rework float and one final bay |
| low-rate repeat build | 8 | 1 | 25 working-day repeat takt after fixtures, supplier kits, and QA gates are stable |
| steady modular local production | 12 | 1 | 20 working-day repeat takt; add second final bay only if static commissioning or supplier rework blocks the first bay |

## Exclusions

- land, building shell, leasehold works, taxes, freight, duty, and utility connection upgrades
- full homologation test laboratory and destructive crash/fire testing rigs
- working capital, warranty spares, and production payroll

## Market Anchor Sources

The equipment costs are rough 2026 planning anchors, not supplier quotes. Final procurement must replace them with landed, installed, warranted offers.

- press brake: Alibaba/ADHMT 2026 press-brake market notes
- CNC plasma table: StyleCNC 2026 4x8 CNC plasma table listings
- truck/bus paint booth: Made-in-China 2026 bus spray booth listings
- vacuum infusion equipment: Easy Composites vacuum bagging/infusion equipment listings

- mobile column lifts: BendPak mobile column lift listings
- forklift: Hongli 2026 3-ton electric forklift guide

# LM3 factory drawing and interface readiness

Repository source: `design/component-catalogue/catalog/buildable-trainset/factory-release-readiness.md`

Generated by `tools/automation/buildable-trainset.sh`. This register is the review surface for issuing the 16 factory packages; blank template fields and `open-unissued` states are deliberate and are not release evidence.

- Template status: `unfilled-not-release-evidence`
- Packages: 16; open: 16
- Unique drawing IDs: 29
- Controlled product rows: 80
- Referenced tooling families: 30

| Package | Status | Drawings | Products | Prerequisites | Outputs | Verifications |
|---|---|---|---|---|---|---|
| `LM3-FRP-010` — primary chassis, transverse structure and stepped-floor drawing pack | `open-unissued` | 3 | 8 | 3 | 4 | 4 |
| `LM3-FRP-020` — one-metre exterior module variant and retention drawing pack | `open-unissued` | 3 | 5 | 3 | 4 | 4 |
| `LM3-FRP-030` — panoramic front-glass carrier, seal and drainage interface pack | `open-unissued` | 2 | 4 | 3 | 4 | 4 |
| `LM3-FRP-040` — reversible front-lamp cassette and fascia-service pack | `open-unissued` | 2 | 4 | 3 | 4 | 4 |
| `LM3-FRP-050` — roof curb, HVAC, PV, antenna, fairing and access-zone pack | `open-unissued` | 3 | 10 | 3 | 4 | 4 |
| `LM3-FRP-060` — interior moulding, floor, service-access and fitout pack | `open-unissued` | 2 | 19 | 3 | 4 | 4 |
| `LM3-FRP-070` — common service rail, fastener and fixture-adapter pack | `open-unissued` | 2 | 3 | 3 | 4 | 4 |
| `LM3-FRP-080` — pre-cut exterior film artwork, application and repair pack | `open-unissued` | 1 | 9 | 3 | 4 | 4 |
| `LM3-FRP-090` — radiative roof-coating coupon and one-car trial pack | `open-unissued` | 1 | 4 | 3 | 4 | 4 |
| `LM3-FRP-100` — vehicle jacking, lifting, towing and field-railing interface pack | `open-unissued` | 2 | 1 | 3 | 4 | 4 |
| `LM3-FRP-110` — primary end, battery, door and window structural-interface pack | `open-unissued` | 4 | 6 | 3 | 4 | 4 |
| `LM3-FRP-120` — configurable train-end and articulation structural-interface pack | `open-unissued` | 3 | 6 | 3 | 4 | 4 |
| `LM3-FRP-130` — powered-bogie local frame, bracket and harness drawing pack | `open-unissued` | 1 | 4 | 3 | 4 | 4 |
| `LM3-FRP-140` — trailer-bogie local frame, bracket and harness drawing pack | `open-unissued` | 1 | 3 | 3 | 4 | 4 |
| `LM3-FRP-150` — battery tray, high-voltage and coolant local-hardware pack | `open-unissued` | 2 | 3 | 3 | 4 | 4 |
| `LM3-FRP-160` — low-voltage trainline harness and terminal-distribution pack | `open-unissued` | 1 | 1 | 3 | 4 | 4 |

Fill the machine-readable `factory-release-record-template.json` during controlled drawing production. A package remains open until every source input, issued drawing, exact product configuration, tool/gauge record, required output, performed verification and named approval is accepted. Use the per-drawing `factory-drawings/` seeds as drafting/checking briefs, never as issued manufacturing drawings.

Boundary: These work packages define drawing and evidence scope. They are not approved drawings, supplier selections, signed calculations or physical first-article records.

# LM3 v2A factory drawing and interface-release work packages

Repository source: `design/component-catalogue/catalog/buildable-trainset/factory-release-work-packages.md`

Generated by `tools/automation/buildable-trainset.sh`. These packages turn the dedicated LM3 part families into an explicit drawing, datum, tooling and verification worklist without implying that supplier or physical evidence already exists. Package issue state is tracked in `factory-release-readiness.md`. Individual drafting briefs are under `factory-drawings/`.

- Design ID: `LM3-V2A-FACTORY-RELEASE`
- Status: `controlled-work-package-definitions; release evidence open`
- Work packages: `16`
- Controlled product rows represented: `80`
- Registered tooling referenced: `30`
- Reference work instructions: `manufacturing-and-assembly-controls.md`
- Boundary: These work packages define drawing and evidence scope. They are not approved drawings, supplier selections, signed calculations or physical first-article records.

## Package index

| Package | Scope | Drawings | Products | Tooling |

## LM3-FRP-010 — primary chassis, transverse structure and stepped-floor drawing pack

Release boundary: No steel cutting release until structural calculations, WPS/PQR, material certificates and drawing approval are present.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-BDY-P010 — laser-cut side sill beam, LH/RH | MAKE / release-candidate | 6 ea | LM3-BDY-SA110 | 16000 × 180 × 260 | local manufacture | one side-sill member with end datum faces |
| LM3-BDY-P020 — underframe centre spine and longitudinal load-path kit | MAKE / release-candidate | 3 kit | LM3-BDY-SA110 | 15800 × 2650 × 380 | local manufacture | centre spine and repeated cross-bearers |
| LM3-BDY-P021 — underframe cross-bearer, door-bay outrigger, and equipment-bracket pack | MAKE / release-candidate | 3 car pack | LM3-BDY-SA110 | 15200 × 2650 × 320 | local manufacture | stationed cross-bearers, door outriggers and equipment brackets |
| LM3-BDY-P030 — bolster box, air-spring pad, and centre-pivot insert set | MAKE / release-candidate | 6 set | LM3-BDY-SA110 | 1700 × 2650 × 420 | local manufacture | bolster box, spring pads and pivot land |
| LM3-BDY-P060 — low-floor centre pan and removable service-floor support set | MAKE / release-candidate | 3 set | LM3-BDY-SA120 | 15600 × 2650 × 460 | local manufacture | low-floor pan and raised bogie-end decks |
| LM3-BDY-P061 — raised bogie-end deck, transition ramp, and removable hatch-frame set | MAKE / release-candidate | 3 car set | LM3-BDY-SA120 | 5200 × 2650 × 460 | local manufacture | raised end decks, transition ramps and removable hatch frames |
| LM3-BDY-P070 — side-wall post, door portal, waist rail, and cant rail kit | MAKE / release-candidate | 6 side | LM3-BDY-SA120 | 15800 × 180 × 2850 | local manufacture | posts, door portals, waist and cant rails |
| LM3-BDY-P080 — roof bow, HVAC rail, PV rail, and cable-tray bracket kit | MAKE / release-candidate | 3 kit | LM3-ROOF-SA410 | 15600 × 2500 × 360 | local manufacture | roof bows and equipment/cable rails |

## Frozen inputs

- released structural load cases and material grades
- door, window, bogie, battery, coupler and roof interface reactions
- weld-class, distortion and corrosion-process requirements

## Controlled outputs

- member and plate drawings with datums, tolerances and material callouts
- cut, bend, machining and weld maps with heat/part trace fields
- fixture loading sequence and dimensional inspection characteristic list
- mass-properties contribution and controlled centre-of-gravity ledger rows

## Verification and hold points

- independent calculation review
- fixture and tack survey
- post-weld datum/straightness survey
- weld/NDT and corrosion hold-point records

Tooling: LM3-TOOL-STEEL-FIXTURE, LM3-TOOL-DATUM-GAUGE.

Reference controls: LM3-MFG-010, LM3-MFG-020, LM3-MFG-100.

# LM3-FRP-020 — one-metre exterior module variant and retention drawing pack

Release boundary: Module skins remain non-structural and may not close primary carbody or roof-equipment load paths.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-BDY-P130 — one-metre clip-on solid-side fiberglass body module | MAKE / release-candidate | 48 module | LM3-SHELL-A200 | 1000 × 120 × 3050 | local manufacture | one-metre clip-on side/roof module with solid attachment lands |
| LM3-BDY-P131 — one-metre clip-on window-edge fiberglass side module | MAKE / release-candidate | 24 module | LM3-SHELL-A200 | 1000 × 160 × 3050 | local manufacture | window-edge side module with reveal and drain clearance |
| LM3-BDY-P132 — one-metre clip-on door-edge fiberglass side module | MAKE / release-candidate | 24 module | LM3-SHELL-A200 | 1000 × 180 × 3050 | local manufacture | door-edge side module with pocket and threshold closeout |
| LM3-BDY-P133 — one-metre clip-on fiberglass roof skin and equipment-fairing module | MAKE / release-candidate | 48 module | LM3-SHELL-A200 | 1000 × 2850 × 420 | local manufacture | roof skin and equipment-fairing trim variant |
| LM3-BDY-P140 — keyed clip rail, captive retainer, anti-lift, and dry-seal car kit | MAKE / release-candidate | 3 car kit | LM3-SHELL-A200 | 15800 × 180 × 160 | local manufacture | keyed clip rail, retainers and dry-seal route |

## Frozen inputs

- accepted laminate, core, gelcoat, insert, seal and fire-material system
- frozen car bay map and door/window/roof service-clearance model
- released clip, anti-lift, pressure and debris load cases

## Controlled outputs

- A/B tool-face, split, draft, trim and insert drawings
- solid/window/door/roof variant CNC trim and drill definitions
- clip, seal, anti-lift and drain interface drawing
- serialized module/bay configuration and repair map

## Verification and hold points

- mould survey and witness coupon
- trim/drill first article
- master-frame interchange and anti-lift proof
- water, vibration and timed module replacement trial

Tooling: LM3-TOOL-SIDE-MOULD, LM3-TOOL-SIDE-VARIANT-NEST, LM3-TOOL-ROOF-MOULD, LM3-TOOL-TRIM-DRILL.

Reference controls: LM3-MFG-010, LM3-MFG-040, LM3-MFG-050, LM3-MFG-100.

# LM3-FRP-030 — panoramic front-glass carrier, seal and drainage interface pack

Release boundary: The selected glazing supplier retains responsibility for pane construction and its bonded cassette process.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-CWL-P016 — CWL-FRP-06 backing-ring flange fiberglass cast set | MAKE / buildable-after-supplier-freeze | 8 flange section | LM3-CWL-SA710 | 720 × 120 × 720 | local manufacture | backing-ring flange cast |
| LM3-FAS-P010 — panoramic front-glass carrier ring, setting-block pockets, and secondary-retention frame | MAKE / buildable-after-supplier-freeze | 2 end set | LM3-CWL-SA710 | 2300 × 260 × 1780 | local manufacture | panoramic glass carrier, setting blocks and secondary retention |
| LM3-FAS-P030 — front glazing/lamp EPDM seal, drain rail, washer sleeve, and edge-closeout kit | SOURCE / buildable-after-supplier-freeze | 2 end kit | LM3-CWL-SA710 | 2500 × 420 × 1950 | specified | glazing/lamp seals, drains, washer sleeves and closeouts |
| LM3-EXT-P030 — single panoramic heated end-glass assembly | BID / buildable-after-supplier-freeze | 2 ea | LM3-END-SA700 | 2300 × 110 × 1450 | specified | heated panoramic end glazing |

## Frozen inputs

- supplier glass construction, edge, mass, heater and retention loads
- accepted glazing adhesive/gasket and EPDM compatibility data
- released steel backing-ring and cowl flange datums

## Controlled outputs

- carrier segments, corner joints, setting blocks and secondary-retention drawing
- glass-edge clearance and seal-compression characteristic map
- drain rail, washer sleeve, earth and heater-service route
- protected removal path and lifting-tool access drawing

## Verification and hold points

- carrier and backing-ring datum survey
- retention calculation and representative proof
- compression/drain map and controlled spray test
- heated-pane service isolation and timed removal/refit trial

Tooling: LM3-TOOL-COWL-MOULD, LM3-TOOL-GLASS-CARRIER-NEST, LM3-TOOL-WATER-TEST.

Reference controls: LM3-MFG-010, LM3-MFG-040, LM3-MFG-050, LM3-MFG-100.

# LM3-FRP-040 — reversible front-lamp cassette and fascia-service pack

Release boundary: The jig establishes mechanical aim only; supplier and vehicle photometric evidence remains mandatory.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-CWL-P014 — CWL-FRP-04 lower apron and anti-climber cover fiberglass cast | MAKE / buildable-after-supplier-freeze | 2 ea | LM3-CWL-SA710 | 1000 × 2650 × 760 | local manufacture | lower apron and anti-climber cover cast |
| LM3-CWL-P015 — CWL-FRP-05 lamp, washer, and service-hatch fiberglass cast set | MAKE / buildable-after-supplier-freeze | 4 hatch | LM3-CWL-SA710 | 650 × 520 × 420 | local manufacture | lamp/washer/service-hatch cast set |
| LM3-FAS-P020 — reversible front-lamp cassette tray, aiming adjusters, and retained service bracket | MAKE / buildable-after-supplier-freeze | 2 end set | LM3-CWL-SA710 | 1850 × 720 × 420 | local manufacture | reversible lamp cassette tray and aiming adjusters |
| LM3-END-P050 — sealed headlight, tail/marker light, threshold-warning, and end-lamp harness kit | SOURCE / buildable-after-supplier-freeze | 2 end kit | LM3-END-SA700 | 1600 × 900 × 280 | specified | head/tail/marker/threshold lamps and harness |

## Frozen inputs

- selected lamp photometric, thermal, EMC, IP and connector data
- A/B end configuration and cowl service-hatch envelope
- released lamp reaction, aiming and retention requirements

## Controlled outputs

- common reversible tray, adjuster and retained service-bracket drawing
- lamp optical-axis datum and adjustment-limit schedule
- harness, earth, drip-loop and connector-access route
- A/B interchange and lamp-cassette configuration record

## Verification and hold points

- tray and optical-axis datum gauge
- aim range, lock and vibration-retention test
- thermal/IP/functional evidence review
- service-hatch and cassette removal demonstration

Tooling: LM3-TOOL-COWL-MOULD, LM3-TOOL-LAMP-AIM.

Reference controls: LM3-MFG-010, LM3-MFG-030, LM3-MFG-050, LM3-MFG-100.

# LM3-FRP-050 — roof curb, HVAC, PV, antenna, fairing and access-zone pack

Release boundary: No supplier unit or person load may be reacted through a clip-on skin or non-structural fairing.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-BDY-P080 — roof bow, HVAC rail, PV rail, and cable-tray bracket kit | MAKE / release-candidate | 3 kit | LM3-ROOF-SA410 | 15600 × 2500 × 360 | local manufacture | roof bows and equipment/cable rails |
| LM3-BDY-P133 — one-metre clip-on fiberglass roof skin and equipment-fairing module | MAKE / release-candidate | 48 module | LM3-SHELL-A200 | 1000 × 2850 × 420 | local manufacture | roof skin and equipment-fairing trim variant |
| LM3-ROOF-P010 — HVAC curb, drop-duct collar, condensate tray, and drain fitting kit | MAKE / release-candidate | 3 kit | LM3-ROOF-SA410 | 2800 × 1800 × 420 | local manufacture | HVAC curb, duct collar, tray and drains |
| LM3-ROOF-P020 — PV bonded-pad lands, raised rail kit, bonding jumpers, and roof isolation labels | MAKE / release-candidate | 3 car kit | LM3-ROOF-SA410 | 14000 × 2300 × 140 | local manufacture | PV rails, bonded pads, jumpers and isolation datums |
| LM3-ROOF-P030 — removable HVAC curb fairing, intake/exhaust skirt, and access-hatch moulding set | MAKE / buildable-after-supplier-freeze | 3 car set | LM3-ROOF-SA410 | 3200 × 2400 × 720 | local manufacture | removable HVAC curb fairing, skirts and access hatches |
| LM3-ROOF-P040 — PV junction plinth, cable-gland cover, antenna closeout, and walkway edge set | MAKE / buildable-after-supplier-freeze | 3 car set | LM3-ROOF-SA410 | 12000 × 2300 × 320 | local manufacture | PV plinth, glands, antenna closeouts and walkway edges |
| LM3-EXT-P040 — hvac-24kw-direct-hv-dc roof HVAC | BID / buildable-after-supplier-freeze | 3 ea | LM3-ROOF-SA410 | 2600 × 1900 × 620 | specified | roof HVAC casing, fans and curb interface |
| LM3-EXT-P050 — roof PV module and edge-clamp kit | SOURCE / release-candidate | 36 module | LM3-ROOF-SA410 | 1700 × 1050 × 45 | specified | PV laminate and edge-clamp datums |
| LM3-EXT-P070 — roof antennas, service walkway pads, lifting covers, and maintenance labels | SOURCE / buildable-after-supplier-freeze | 3 car kit | LM3-ROOF-SA410 | 2400 × 1500 × 260 | specified | antennas, walkway pads, covers and labels |
| LM3-TRC-P050 — roof-mounted regen dump resistor and thermal shield kit | SOURCE / buildable-after-supplier-freeze | 3 ea | LM3-ROOF-SA410 | 1900 × 750 × 420 | specified | regen resistor bank and thermal shield |

## Frozen inputs

- supplier HVAC, PV, resistor and antenna mass/reaction/service envelopes
- released roof-rail capacity, vehicle gauge and lifting/fall-access constraints
- accepted sealing, bonding, fire and electrical-isolation systems

## Controlled outputs

- roof equipment coordinate and penetration schedule
- curb, duct, drain, rail/pad, gland, bond and fairing drawings
- HVAC/PV/antenna removal paths and tool/worker access zones
- finish, anti-slip, heat and electrical keep-out mask map

## Verification and hold points

- rail/curb datum and equipment fit survey
- attachment proof, bond continuity and isolation checks
- roof/condensate water tests and airflow clearance review
- service-removal demonstration with adjacent equipment retained

Tooling: LM3-TOOL-ROOF-MOULD, LM3-TOOL-ROOF-FAIRING-MOULD, LM3-TOOL-WATER-TEST.

Reference controls: LM3-MFG-010, LM3-MFG-030, LM3-MFG-040, LM3-MFG-060, LM3-MFG-100.

# LM3-FRP-060 — interior moulding, floor, service-access and fitout pack

Release boundary: Interior finish panels carry no seat, handrail, equipment or passenger restraint load.

# Controlled products and geometry

|---|---|---|---|---|---|---|
| LM3-INT-P010 — HVAC diffusers, side return ducts, saloon grilles, and access panels | SOURCE / buildable-after-supplier-freeze | 3 car kit | LM3-INT-SA330 | 6000 × 2400 × 320 | specified | diffusers, returns, grilles and access panels |
| LM3-INT-P020 — FRP/phenolic ceiling liner panel set | MAKE / buildable-after-supplier-freeze | 3 car kit | LM3-INT-SA330 | 1000 × 2650 × 260 | local manufacture | ceiling liner, light trough and plenum cover |
| LM3-INT-P021 — ceiling light-trough bezel, diffuser carrier, and emergency-luminaire closeout set | MAKE / buildable-after-supplier-freeze | 3 car set | LM3-INT-SA330 | 1200 × 240 × 110 | local manufacture | light-trough bezels and diffuser carriers |
| LM3-INT-P022 — HVAC plenum cover, diffuser transition, detector bezel, and ceiling service-hatch set | MAKE / buildable-after-supplier-freeze | 3 car set | LM3-INT-SA330 | 1100 × 900 × 220 | local manufacture | HVAC transitions, detector bezels and ceiling service hatches |
| LM3-INT-P030 — FRP/phenolic sidewall liner panel set | MAKE / buildable-after-supplier-freeze | 6 side kit | LM3-INT-SA330 | 1000 × 140 × 2200 | local manufacture | sidewall liner, reveal and cable-cover panel |
| LM3-INT-P031 — window reveal, setting-block inspection cover, and blind/label land set | MAKE / buildable-after-supplier-freeze | 6 side set | LM3-INT-SA330 | 1750 × 180 × 1300 | local manufacture | four-piece removable window reveal and inspection covers |
| LM3-INT-P032 — waist cable-cover, low-voltage access lid, and retained quarter-turn fastener set | MAKE / buildable-after-supplier-freeze | 6 side set | LM3-INT-SA330 | 1000 × 220 × 520 | local manufacture | waist cable cover and retained access lid |
| LM3-INT-P040 — FRP battery strake cover panel set | MAKE / buildable-after-supplier-freeze | 3 car kit | LM3-INT-SA330 | 4800 × 720 × 780 | local manufacture | battery strake/seat-base/service-hatch shells |
| LM3-INT-P041 — seat-base fairing, retained equipment hatch, and rail-saddle closeout set | MAKE / buildable-after-supplier-freeze | 3 car set | LM3-INT-SA330 | 1600 × 780 × 820 | local manufacture | seat-base fairing and retained equipment hatch |
| LM3-INT-P050 — FRP vestibule kick-panel and threshold-closeout set | MAKE / buildable-after-supplier-freeze | 12 door-zone kit | LM3-INT-SA330 | 1100 × 420 × 1050 | local manufacture | vestibule, PRM and door-pocket trim set |
| LM3-INT-P051 — PRM transition-ramp, bogie-deck step-cover, contrast-nosing, and anti-slip set | MAKE / buildable-after-supplier-freeze | 6 end-zone set | LM3-INT-SA330 | 2500 × 1200 × 460 | local manufacture | PRM transition, step cover, nosing and anti-slip set |
| LM3-INT-P052 — door-pocket liner, sensitive-edge clearance trim, and removable jamb-cover set | MAKE / buildable-after-supplier-freeze | 12 door-zone set | LM3-INT-SA330 | 1200 × 420 × 2100 | local manufacture | door-pocket liner and removable jamb covers |
| LM3-EXT-P060 — stepped floor-board and removable service-hatch system | SOURCE / buildable-after-supplier-freeze | 135 m2 | LM3-INT-SA330 | 1000 × 1300 × 35 | specified | numbered floor board/removable hatch module |
| LM3-EXT-P061 — welded resilient floor covering, cove, nosing, and adhesive system | SOURCE / buildable-after-supplier-freeze | 135 m2 | LM3-INT-SA330 | 1000 × 1300 × 6 | specified | resilient covering and welded-seam allowance |
| LM3-EXT-P062 — longitudinal passenger and priority-seat modules | SOURCE / buildable-after-supplier-freeze | 60 seat | LM3-INT-SA330 | 1550 × 620 × 980 | specified | longitudinal passenger-seat module and rail saddles |
| LM3-EXT-P063 — stainless grab-pole, handrail, joint, and insulated adapter kit | SOURCE / buildable-after-supplier-freeze | 3 car kit | LM3-INT-SA330 | 2300 × 2300 × 2050 | specified | grab poles, rails and repeated adapters |
| LM3-EXT-P064 — passenger-information display, speaker, amplifier, and mounting kit | SOURCE / buildable-after-supplier-freeze | 3 car kit | LM3-INT-SA330 | 1100 × 220 × 420 | specified | display, loudspeaker and amplifier module |
| LM3-EXT-P065 — CCTV camera, passenger intercom, PoE/data, and mounting kit | SOURCE / buildable-after-supplier-freeze | 3 car kit | LM3-INT-SA330 | 650 × 420 × 260 | specified | CCTV/intercom modules and mounting datums |

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-EXT-P066 — PRM, safety-signage, emergency-lighting, extinguisher, and first-aid kit | SOURCE / buildable-after-supplier-freeze | 3 car kit | LM3-INT-SA330 | 1200 × 650 × 600 | specified | PRM controls, signs, lamps and emergency equipment |

## Frozen inputs

- accepted fire/smoke material and supplier equipment evidence
- frozen door/window/HVAC/lighting/seat/PRM equipment envelopes
- released passenger load, egress, accessibility and cleaning requirements

## Controlled outputs

- individual panel, mould, trim, edge-radius and insert drawings
- floor board/covering seam, hatch, ramp and threshold definitions
- service-access and sequential removal map for every concealed system
- serialized panel, fastener, equipment and label configuration schedule

## Verification and hold points

- mould/trim first article and fire-material trace review
- dry fit, gap, rattle, sharp-edge and captive-fastener inspections
- door/window/equipment removal sweeps and accessibility survey
- floor load, slip, seam, cleaning and water-path evidence

Tooling: LM3-TOOL-INT-CEILING-MOULD, LM3-TOOL-INT-SIDE-MOULD, LM3-TOOL-INT-STRAKE-MOULD, LM3-TOOL-INT-DOOR-PRM-MOULD, LM3-TOOL-FLOOR-TEMPLATE, LM3-TOOL-SERVICE-RAIL.

Reference controls: LM3-MFG-010, LM3-MFG-030, LM3-MFG-050, LM3-MFG-070, LM3-MFG-100.

# LM3-FRP-070 — common service rail, fastener and fixture-adapter pack

Release boundary: Each adapter needs its own released load case; one generic proof result cannot qualify every fixture.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-FIX-P010 — OSR-RAIL-42 common ceiling, waist, and seat-zone service rail kit | MAKE / release-candidate | 3 car kit | LM3-FIX-SA340 | 15000 × 42 × 18 | local manufacture | OSR-RAIL-42 extrusion with repeated datum marks |
| LM3-FIX-P020 — four-family captive fastener, floating nut, isolator, and access-fastener kit | SOURCE / buildable-after-supplier-freeze | 3 car kit | LM3-FIX-SA340 | 520 × 360 × 160 | specified | four captive fastener families and isolators |
| LM3-FIX-P030 — standard passenger-fixture saddle and equipment adapter kit | MAKE / concept | 3 car kit | LM3-FIX-SA340 | 520 × 420 × 180 | local manufacture | seat, handrail and equipment adapter variants |

## Frozen inputs

- fixture-specific service/ultimate loads and attachment envelopes
- selected rail alloy/temper, fastener, isolator and finish data
- carbody attachment capacity and electrical/galvanic constraints

## Controlled outputs

- rail extrusion, cut/drill, end-stop and foot drawing
- seat, handrail, PIS/CCTV and cable-support adapter variants

- fastener grip, locking, torque-authority and captive-part schedule
- installed coordinate, orientation and accessible-removal map

## Verification and hold points

- rail/foot and fixture-specific calculation review
- adapter and installed-grip gauges
- representative pull/slip/rotation proof
- egress, snag, isolation and timed replacement inspection

Tooling: `LM3-TOOL-SERVICE-RAIL`, `LM3-TOOL-FIXTURE-PROOF`.

Reference controls: `LM3-MFG-010`, `LM3-MFG-030`, `LM3-MFG-070`, `LM3-MFG-100`.

# LM3-FRP-080 — pre-cut exterior film artwork, application and repair pack

Release boundary: Film replaces decorative masking only and never substitutes for corrosion, fire, sealing or electrical protection.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| `LM3-FIN-P010` — pre-cut exterior livery graphic film, edge-seal, datum-mark, and repair-patch kit | `BID` / `buildable-after-supplier-freeze` | 3 car kit | `LM3-SHELL-A200` | 16000 × 1400 × 8 | `specified` | pre-cut side/cowl livery film, edge seals and repair patches |
| `LM3-BDY-P130` — one-metre clip-on solid-side fiberglass body module | `MAKE` / `release-candidate` | 48 module | `LM3-SHELL-A200` | 1000 × 120 × 3050 | local manufacture | one-metre clip-on side/roof module with solid attachment lands |
| `LM3-BDY-P131` — one-metre clip-on window-edge fiberglass side module | `MAKE` / `release-candidate` | 24 module | `LM3-SHELL-A200` | 1000 × 160 × 3050 | local manufacture | window-edge side module with reveal and drain clearance |
| `LM3-BDY-P132` — one-metre clip-on door-edge fiberglass side module | `MAKE` / `release-candidate` | 24 module | `LM3-SHELL-A200` | 1000 × 180 × 3050 | local manufacture | door-edge side module with pocket and threshold closeout |
| `LM3-CWL-P011` — CWL-FRP-01 upper brow and roof-cap fiberglass cast | `MAKE` / `buildable-after-supplier-freeze` | 2 ea | `LM3-CWL-SA710` | 1250 × 2750 × 720 | local manufacture | upper brow and roof-cap cast |
| `LM3-CWL-P012` — CWL-FRP-02 left cheek fiberglass cast | `MAKE` / `buildable-after-supplier-freeze` | 2 ea | `LM3-CWL-SA710` | 1150 × 700 × 2300 | local manufacture | handed cheek cast |
| `LM3-CWL-P013` — CWL-FRP-03 right cheek fiberglass cast | `MAKE` / `buildable-after-supplier-freeze` | 2 ea | `LM3-CWL-SA710` | 1150 × 700 × 2300 | local manufacture | handed cheek cast |
| `LM3-CWL-P014` — CWL-FRP-04 lower apron and anti-climber cover fiberglass cast | `MAKE` / `buildable-after-supplier-freeze` | 2 ea | `LM3-CWL-SA710` | 1000 × 2650 × 760 | local manufacture | lower apron and anti-climber cover cast |
| `LM3-CWL-P015` — CWL-FRP-05 lamp, washer, and service-hatch fiberglass cast set | `MAKE` / `buildable-after-supplier-freeze` | 4 hatch | `LM3-CWL-SA710` | 650 × 520 × 420 | local manufacture | lamp/washer/service-hatch cast set |

## Frozen inputs

- approved artwork, colours, logos and operator/legal markings
- selected rail-use film/ink/overlaminate/edge system
- accepted cured steel/GFRP base finishes and cleaning process

## Controlled outputs

- bay-numbered cut files with controlled seams, overlaps and datum marks
- substrate acceptance, environment and installer record forms
- edge/keep-out inspection map and patch/one-metre module repair instruction

- film material, print batch and retained-coupon trace schedule

### Verification and hold points

- actual-substrate adhesion/removal coupon
- first-car edge, seam and appearance inspection
- wash/water and cleaning-chemical compatibility test
- local patch and complete module removal demonstration

Tooling: `LM3-TOOL-FILM-TEMPLATE`, `LM3-TOOL-COATING-COUPON`.

Reference controls: `LM3-MFG-090`, `LM3-MFG-100`.

## LM3-FRP-090 — radiative roof-coating coupon and one-car trial pack

Release boundary: Research values are screening targets only; the baseline qualified light roof finish remains available if the trial fails.

### Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| `LM3-FIN-P020` — calcium-carbonate radiative roof-coating qualification and exposed-roof application kit | `BID` / `concept` | 3 car kit | `LM3-ROOF-SA410` | 16000 × 2700 × 8 | `specified` | masked exposed-roof radiative coating and witness coupons |
| `LM3-BDY-P133` — one-metre clip-on fiberglass roof skin and equipment-fairing module | `MAKE` / `release-candidate` | 48 module | `LM3-SHELL-A200` | 1000 × 2850 × 420 | local manufacture | roof skin and equipment-fairing trim variant |
| `LM3-ROOF-P030` — removable HVAC curb fairing, intake/exhaust skirt, and access-hatch moulding set | `MAKE` / `buildable-after-supplier-freeze` | 3 car set | `LM3-ROOF-SA410` | 3200 × 2400 × 720 | local manufacture | removable HVAC curb fairing, skirts and access hatches |
| `LM3-ROOF-P040` — PV junction plinth, cable-gland cover, antenna closeout, and walkway edge set | `MAKE` / `buildable-after-supplier-freeze` | 3 car set | `LM3-ROOF-SA410` | 12000 × 2300 × 320 | local manufacture | PV plinth, glands, antenna closeouts and walkway edges |

### Frozen inputs

- controlled formulation and application process
- accepted rail fire/chemical and GFRP compatibility evidence
- frozen roof equipment, service, drainage and keep-out map

### Controlled outputs

- coupon dimensions, substrate, coating thickness and exposure matrix
- new/aged/soiled/cleaned optical measurement procedure
- one-car paired roof-zone sensor and HVAC-energy trial plan
- inspection, cleaning, local repair and trial-removal instructions

### Verification and hold points

- adhesion, flexibility, thermal-cycle, UV, abrasion and wash ageing
- new and aged solar reflectance/emittance measurement
- glare, runoff, soiling and service-access review
- representative hot-service one-car trial and independent disposition

Tooling: `LM3-TOOL-RADIATIVE-COUPON`, `LM3-TOOL-COATING-RACK`.

Reference controls: `LM3-MFG-060`, `LM3-MFG-090`, `LM3-MFG-100`.

# LM3-FRP-100 — vehicle jacking, lifting, towing and field-rerailing interface pack

Release boundary: Automotive scissor jacks, unilateral lifts and work beneath an uncribbed hydraulic load remain prohibited.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| `LM3-BDY-P120` — jacking pad, lifting eye, towing lug, and recovery-label kit | `MAKE` / `release-candidate` | 3 car kit | `LM3-BDY-SA110` | 1600 × 900 × 280 | local manufacture | jacking, lifting and towing interface kit |

## Frozen inputs

- individual-car mass and centre-of-gravity envelopes
- released underframe, articulation, bogie-retention and coupler load cases
- selected depot and portable recovery equipment interfaces

## Controlled outputs

- J1--J4 pad, lifting eye, tow/rerailing lug and keyed-adapter drawings
- permitted support combinations, reactions, stop conditions and labels
- vehicle isolation, brake release, bogie retention and recovery diagrams
- proof-load, inspection, NDT, maintenance and damage-rejection schedule

## Verification and hold points

- structural and weld/NDT calculation review
- four-point datum/interchange gauge
- representative proof and asymmetric/loss-of-pressure trials
- timed depot lift and field rerailing demonstration by trained crews

Tooling: `LM3-TOOL-STEEL-FIXTURE`, `LM3-TOOL-DATUM-GAUGE`, `LM3-TOOL-LIFT-COLUMNS`.

Reference controls: `LM3-MFG-010`, `LM3-MFG-030`, `LM3-MFG-080`, `LM3-MFG-100`.

# LM3-FRP-110 — primary end, battery, door and window structural-interface pack

Release boundary: Reference envelopes do not release load paths, glazing retention, door carriers or battery restraints for manufacture.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| `LM3-BDY-P040` — coupler pocket, shear plate, and crash-can insert kit | `MAKE` / `release-candidate` | 2 set | `LM3-END-SA700` | 1250 × 1100 × 620 | local manufacture | coupler pocket and crash-can shear structure |
| `LM3-BDY-P050` — battery tray rails, vent plenum, and service-lid gutter kit | `MAKE` / `release-candidate` | 3 kit | `LM3-HV-SA510` | 6200 × 900 × 520 | local manufacture | battery support rails, vent plenum and service gutter |
| `LM3-BDY-P100` — door portal reinforcement, threshold beam, and cassette shim kit | `MAKE` / `release-candidate` | 12 opening kit | `LM3-DOOR-SA310` | 1500 × 260 × 2150 | local manufacture | door carrier/portal with threshold and four-point datum |
| `LM3-BDY-P110` — window carrier ring, bonded-gasket land, and replacement jack-point inserts | `MAKE` / `release-candidate` | 18 opening kit | `LM3-WIN-SA320` | 1650 × 140 × 1250 | local manufacture | replaceable glazing pressure frame, seal and drain |
| `LM3-DOOR-P010` — door four-point adjustable carrier, datum pin, dry seal, and keyed connector bracket kit | `MAKE` / `concept` | 12 opening kit | `LM3-DOOR-SA310` | 1500 × 260 × 2150 | local manufacture | door carrier/portal with threshold and four-point datum |
| `LM3-WIN-P010` — replaceable window pressure frame, dry seal, drain, and captive retention kit | `MAKE` / `concept` | 18 opening kit | `LM3-WIN-SA320` | 1650 × 140 × 1250 | local manufacture | replaceable glazing pressure frame, seal and drain |

## Frozen inputs

- released crash, battery-restraint, door and glazing interface reactions
- supplier-frozen coupler, battery, door and window installation envelopes
- released structural, seal/drain, corrosion and service-removal requirements

## Controlled outputs

- coupler-pocket, battery-rail, door-portal and window-carrier detail drawings
- machined datum, shim/adjustment, seal compression and drain schedules
- supplier keep-out, installation and complete service-removal maps
- weld/fastener/bond authority, tolerance and inspection characteristic lists

## Verification and hold points

- independent structural and retention calculation review
- post-weld datum plus door/window aperture survey
- carrier proof, dry fit and timed supplier-cassette replacement trials
- battery drain/vent and door/window water-ingress tests

Tooling: `LM3-TOOL-STEEL-FIXTURE`, `LM3-TOOL-DATUM-GAUGE`, `LM3-TOOL-DOOR-GAUGE`, `LM3-TOOL-WINDOW-GAUGE`, `LM3-TOOL-SEAL-GAUGE`.

Reference controls: `LM3-MFG-010`, `LM3-MFG-020`, `LM3-MFG-030`, `LM3-MFG-040`, `LM3-MFG-100`.

# LM3-FRP-120 — configurable train-end and articulation structural-interface pack

Release boundary: Exactly one end option is fitted at each position; neither option is released by this definition seed alone.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-BDY-P090 — end ring frame and anti-climber beam set | MAKE / release-candidate | 2 set | LM3-END-SA700 | 2700 × 260 × 2900 | local manufacture | end ring and anti-climber datum |
| LM3-END-P060 — common reversible end-interface carrier ring, option bolt grid, and sealing datum kit | MAKE / release-candidate | 2 end position | LM3-EIF-SA650 | 2650 × 280 × 2650 | local manufacture | reversible end carrier and option bolt grid |
| LM3-END-P061 — panoramic-end option shim, cowl/glass carrier, and sensor datum closeout kit | MAKE / release-candidate | 2 option kit | LM3-EIF-SA650 | 1250 × 2650 × 2650 | local manufacture | panoramic closeout, glass carrier and sensor datums |
| LM3-END-P062 — mid open-connection option portal trim, bellows clamp, threshold bridge, and drain kit | MAKE / release-candidate | 0 option kit | LM3-EIF-SA650 | 1300 × 2100 × 2350 | local manufacture | open portal, clamp, threshold and drain option |
| LM3-END-P030 — cowl service hatch, sensor backing bracket, washer-tube, and heater-cable clip kit | MAKE / release-candidate | 2 end kit | LM3-END-SA700 | 900 × 700 × 420 | local manufacture | service hatch, backing bracket and clipped services |
| LM3-ART-P010 — articulation adapter frame, anti-lift keeper, and shim kit | MAKE / release-candidate | 2 kit | LM3-ART-SA810 | 2400 × 300 × 2400 | local manufacture | articulation adapter and anti-lift interface |

## Frozen inputs

- released crash, articulation, anti-lift, gangway and end-equipment load cases
- frozen panoramic-end and open-mid supplier interface envelopes
- selected-end configuration, seal, drain, threshold and service-access requirements

## Controlled outputs

- common end ring, option bolt grid and articulation-adapter production drawings
- panoramic and open-mid shim/closeout configuration drawings
- anti-lift, service-hatch, sensor-backing, drain and threshold details
- serialized end-position option and interchangeability record

## Verification and hold points

- independent structural, fatigue and full-motion calculation review
- end-ring/bolt-grid datum survey and A/B interchange gauge
- articulation sweep plus keeper/pin-retention inspection
- configured-end water, drain, threshold and service-removal trials

Tooling: LM3-TOOL-STEEL-FIXTURE, LM3-TOOL-DATUM-GAUGE, LM3-TOOL-COWL-MOULD, LM3-TOOL-WATER-TEST.

Reference controls: LM3-MFG-010, LM3-MFG-030, LM3-MFG-040, LM3-MFG-080, LM3-MFG-100.

# LM3-FRP-130 — powered-bogie local frame, bracket and harness drawing pack

Release boundary: The package prohibits reuse of freight bogie frames and does not release a bogie before supplier certificates and physical tests close.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-BOG-P010 — powered bogie welded H-frame and motor-cradle weldment | MAKE / release-candidate | 3 ea | LM3-BOG-SA610 | 3400 × 2500 × 620 | local manufacture | welded H-frame with axlebox and bolster datums |
| LM3-BOG-P030 — powered-bogie guards, cable guides, WSP brackets, and inspection covers | MAKE / release-candidate | 3 kit | LM3-BOG-SA610 | 3200 × 2350 × 460 | local manufacture | guards, cable guides, brackets and covers |
| LM3-BOG-P050 — powered-bogie motor torque link, anti-rotation stop, and safety lanyard bracket kit | MAKE / release-candidate | 3 bogie kit | LM3-TRC-SA615 | 1400 × 420 × 300 | local manufacture | motor torque link, stop and lanyard bracket |
| LM3-BOG-P060 — powered-bogie brake/WSP/speed-sensor harness and junction-bracket kit | MAKE / release-candidate | 3 bogie kit | LM3-BOG-SA610 | 3000 × 2100 × 220 | local manufacture | bogie harness route and junction brackets |

## Frozen inputs

- released bogie-frame, motor, brake, suspension and fatigue load cases
- supplier-frozen wheelset, motor, gearbox, brake, spring and damper envelopes
- released weld class, machining datum, cable protection and motion keep-outs

## Controlled outputs

- powered H-frame cut, bend, machining and weld drawings
- motor cradle, torque-link, guard, brake and sensor bracket drawings
- brake/WSP/speed-sensor harness board, clamp-coordinate and junction schedule
- weld/NDT, corrosion, serial trace and bogie configuration maps

## Verification and hold points

- independent EN 13749 structural/fatigue calculation review
- fixture/tack, post-weld and machined-datum surveys
- classed weld NDT and torque-link/guard proof inspections
- supplier dry fit, harness motion sweep, continuity and insulation tests

Tooling: LM3-TOOL-BOGIE-STAND, LM3-TOOL-MOTOR-ALIGN, LM3-TOOL-HARNESS-BOARD, LM3-TOOL-DATUM-GAUGE.

Reference controls: LM3-MFG-010, LM3-MFG-020, LM3-MFG-030, LM3-MFG-070, LM3-MFG-100.

# LM3-FRP-140 — trailer-bogie local frame, bracket and harness drawing pack

Release boundary: The package prohibits reuse of freight bogie frames and does not release a bogie before supplier certificates and physical tests close.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-BOG-P020 — trailer bogie welded H-frame | MAKE / release-candidate | 3 ea | LM3-BOG-SA620 | 3400 × 2500 × 620 | local manufacture | welded H-frame with axlebox and bolster datums |
| LM3-BOG-P031 — trailer-bogie guards, cable guides, WSP brackets, and inspection covers | MAKE / release-candidate | 3 kit | LM3-BOG-SA620 | 3200 × 2350 × 460 | local manufacture | guards, cable guides, brackets and covers |
| LM3-BOG-P061 — trailer-bogie brake/WSP/speed-sensor harness and junction-bracket kit | MAKE / release-candidate | 3 bogie kit | LM3-BOG-SA620 | 3000 × 2100 × 220 | local manufacture | bogie harness route and junction brackets |

## Frozen inputs

- released bogie-frame, brake, suspension and fatigue load cases
- supplier-frozen wheelset, brake, spring and damper envelopes
- released weld class, machining datum, cable protection and motion keep-outs

## Controlled outputs

- trailer H-frame cut, bend, machining and weld drawings
- guard, brake, WSP and speed-sensor bracket drawings
- brake/WSP/speed-sensor harness board, clamp-coordinate and junction schedule
- weld/NDT, corrosion, serial trace and bogie configuration maps

## Verification and hold points

- independent EN 13749 structural/fatigue calculation review
- fixture/tack, post-weld and machined-datum surveys
- classed weld NDT and guard/bracket proof inspections
- supplier dry fit, harness motion sweep, continuity and insulation tests

Tooling: LM3-TOOL-BOGIE-STAND, LM3-TOOL-HARNESS-BOARD, LM3-TOOL-DATUM-GAUGE.

Reference controls: LM3-MFG-010, LM3-MFG-020, LM3-MFG-030, LM3-MFG-070, LM3-MFG-100.

# LM3-FRP-150 — battery tray, high-voltage and coolant local-hardware pack

Release boundary: No battery or HV hardware may be energised from this drawing definition; the supplier safety case and controlled energisation procedure remain mandatory.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| LM3-HV-P010 — battery sliding trays, retention straps, service interlocks, and drain pans | MAKE / release-candidate | 3 car kit | LM3-HV-SA510 | 5400 × 900 × 320 | local manufacture | sliding trays, retention and drain pan |
| LM3-HV-P020 — segregated HV cable tray, bonding studs, grommets, and orange cover set | MAKE / release-candidate | 3 car kit | LM3-HV-SA510 | 14000 × 420 × 180 | local manufacture | segregated HV tray, covers, grommets and studs |
| LM3-HV-P030 — coolant manifold brackets, bleed/drain points, and insulated pipe clamp kit | MAKE / release-candidate | 3 car kit | LM3-HV-SA510 | 6500 × 950 × 260 | local manufacture | coolant manifolds, clamps and bleed/drain points |

## Frozen inputs

- supplier-frozen pack mass, retention, vent, HV and coolant interfaces
- released crash/restraint, insulation, creepage, clearance and fire-barrier requirements
- released cable/pipe ratings, segregation, bend radius, drain and service rules

## Controlled outputs

- sliding-tray, retention, interlock, drain-pan and lifting detail drawings
- segregated HV tray, orange cover, bonding-stud and penetration schedule
- coolant manifold, insulated clamp, bleed/drain and service-removal drawings
- clamp-coordinate, label, continuity, pressure-test and configuration records

## Verification and hold points

- battery restraint and tray structural calculation review
- tray fit/removal, interlock and exterior-only vent-path inspection
- HV segregation, bond continuity, insulation and HVIL tests
- coolant pressure, bleed, drain and hot/cold movement checks

Tooling: `LM3-TOOL-HARNESS-BOARD`, `LM3-TOOL-FINAL-DATUM`, `LM3-TOOL-SEAL-GAUGE`.

Reference controls: `LM3-MFG-010`, `LM3-MFG-030`, `LM3-MFG-070`, `LM3-MFG-080`, `LM3-MFG-100`.

# LM3-FRP-160 — low-voltage trainline harness and terminal-distribution pack

Release boundary: Harness routes remain unissued until supplier connector data, EMC/fire evidence and safety I/O ownership are frozen.

## Controlled products and geometry

| Product | Route / maturity | Qty | Parent | Design-reference envelope (mm) | Reference default | Representation |
|---|---|---|---|---|---|---|
| `LM3-CTRL-P040` — pre-terminated LV trainline harness, DIN cabinet, and terminal-distribution kit | `MAKE` / `release-candidate` | 3 car kit | `LM3-SYS-SA900` | 8000 × 2000 × 240 | local manufacture | LV trainline harness and distribution cabinets |

## Frozen inputs

- frozen control, safety, PIS/CCTV, door, brake and inter-car I/O schedule
- selected rail cable, connector, cabinet and terminal component data
- released EMC, fire, segregation, service-loop and network requirements

## Controlled outputs

- wire/connector/terminal schedule and harness-board drawing
- per-car route, branch, penetration, clamp-coordinate and service-loop drawings
- cabinet/terminal allocation, ferrule, label and keying schedule
- continuity, insulation, network-enumeration and as-built configuration forms

## Verification and hold points

- independent schematic, pinout and segregation review
- first harness-board dimensional and connector-keying inspection
- 100 percent continuity/insulation test plus shield/bond audit
- installed bend-radius, chafe, service access and network-enumeration inspection

Tooling: `LM3-TOOL-HARNESS-BOARD`, `LM3-TOOL-FINAL-DATUM`.

Reference controls: LM3-MFG-010, LM3-MFG-030, LM3-MFG-070, LM3-MFG-100.

# LM3 First-Article Evidence Status

Repository source: `design/component-catalogue/catalog/buildable-trainset/first-article-evidence-status.md`

This register distinguishes public supplier data, planned procedures and solver-backed screening from supplier-controlled, laboratory and independently accepted release evidence. Planned work is never represented as a performed test.

Release ready: no · Accepted: 0 · Open: 13

| Evidence package | Repository status | Release gate | Planning / screening artifacts |
|---|---|---|---|
| `EVD-STR-001` — Carbody and chassis structural analysis | available-screening | open | present |
| `EVD-STR-002` — Bogie frame and equipment attachment structural analysis | available-screening | open | present |
| `EVD-TEST-001` — Carbody, bogie, articulation and local attachment proof tests | protocol-ready | open | present |
| `EVD-THM-001` — Battery, charger contact and cooling-system thermal test | protocol-ready | open | present |
| `EVD-ELEC-001` — Released HV/LV harness and protection definition | protocol-ready | open | present |
| `EVD-ELEC-002` — Harness continuity, insulation, dielectric and bonding tests | protocol-ready | open | present |
| `EVD-CTRL-001` — Safety-controller bench and hardware-in-the-loop evidence | protocol-ready | open | present |
| `EVD-SUP-001` — Bogie, wheelset, bearing, brake and suspension supplier data | protocol-ready | open | present |
| `EVD-SUP-002` — Door-system supplier data and type-test evidence | protocol-ready | open | present |
| `EVD-SUP-003` — Battery, converter, motor, gearbox and charger supplier data | protocol-ready | open | present |
| `EVD-SUP-004` — Glazing, HVAC, interior, lighting, passenger-system and fire-system supplier data | protocol-ready | open | present |
| `EVD-MFG-001` — Locally manufactured joints, inserts, glazing frames and interior modules | protocol-ready | open | present |
| `EVD-MASS-001` — Product, car, axle-load and complete-train mass properties | protocol-ready | open | present |

A gate becomes accepted only through a submission under `evidence/submissions/` containing accountable people, configuration/procedure revisions, calibrated equipment, raw/review artifacts and verified SHA-256 values.

# LM3 first-article execution pack

Repository source: `design/component-catalogue/catalog/buildable-trainset/first-article-execution-pack.md`

This is the single working page for converting `LM3-FA-001` from a controlled design candidate into a physically evidenced first article. It links the 41 sourced catalogue/RFQ/research candidates, 10 factory drawing/interface packages, 81 public work packages, shop travelers and the 13 evidence gates. The upstream supplier technical-support package controls legal/technical access, configuration-specific review, cross-supplier responsibility, separated quotation and local-capability evidence before those inputs enter this execution pack. Neither document claims that unperformed tests have passed.

## Release sequence

1. Hold the `LM3-FA-001` dimensions, duty cycle and product tree. A proposed change needs a configuration record, affected analyses and a regenerated city twin.
2. Issue the candidate-specific RFQs from `cots-candidates.md`. Require an exact order code, controlled drawings, mass, price, lead time, spares, software, RAMS, maintenance and compliance evidence.
3. Complete interfaces before purchase: mounting datums/envelopes, loads, voltage/current, cooling, network/I/O, protection, access, lifting and replacement.
4. Review bids by evidence and lifecycle cost, not headline unit price. Record every deviation and local-equivalent proposal.
5. Release detailed drawings and analyses only after chosen supplier interfaces are frozen.
6. Build coupons and subsystem rigs before the vehicle. Failed gates create an NCR and block dependent assembly release.
7. Build the first article from serialized parts and signed travelers. Preserve raw data, photographs, calibration records and software hashes.
8. Weigh received components, completed subassemblies, all three individual cars and the configured trainset; reconcile the nine categories, axle loads, centres of gravity and engineering reserve without deriving mass from envelope geometry.
9. Independent reviewers accept evidence packages. Generation scripts never convert a planned or supplier-claimed result into an accepted result.

# Evidence gates and executable work

| Gate | Work to perform | Minimum controlled output | Hold point |
|---|---|---|---|
| EVD-STR-001 carbody/chassis | Replace beam screening with released shell/solid geometry; apply the approved vehicle load specification; model welds, joints, doors/windows and equipment loads; run sensitivity and mesh-convergence studies; correlate to body proof test. | Native model, solver deck/version, load-case report, convergence results, weld/joint assessment, independent calculation review and correlation report. | No carbody production release before utilization, instability, fatigue and permanent-set dispositions are independently accepted. |
| EVD-STR-002 bogie/attachments | Issue bogie load spectrum; analyse frame, motor cradle, brake brackets, spring seats, pivot/yaw links and exceptional loads; extract weld-class stresses; correlate to frame proof/fatigue rig. | Released model/decks, load spectrum, convergence, weld assessment, attachment reactions, reviewer record and rig correlation. | No powered-bogie vehicle test before frame and attachment proof evidence is accepted. |
| EVD-TEST-001 physical proof | Approve fixtures and safe test method; identify specimen/as-built deviations; install calibrated force, displacement and strain channels; apply proof/fatigue/functi onal sequence; inspect before, during and after. | Procedure, risk assessment, fixture certificate, calibration register, raw time series, synchronized photographs, inspection/NDT, deviations, signed report and design disposition. | Test lead may stop at any unexpected deformation, noise, crack, leakage, temperature or instrumentation anomaly. |
| EVD-THM-001 battery/charger/cooling | Use the frozen city ambient and worst repeatable duty cycle; test charging, traction, regeneration, parked soak and blocked/degraded cooling; measure cells/modules, contacts, busbars, coolant and enclosure; verify every protective trip. | Loss/limit maps, rig diagram, channel list, raw temperatures/flows/pressures/current /voltage, thermal images, alarm/trip log and signed margin report. | No unattended charge or passenger operation before worst-case and single-fault results are accepted. |
| EVD-ELEC-001 harness/protection | Release the single-line, cable and connector schedules, pin maps, fuse/contactor/selectivity study, bonding plan, HVIL loop and routed harness drawings. Enforce HV, 110 V, 24 V, data and fluid segregation. | Drawing index plus supplier/order codes, conductor/temperature/fire ratings, termini/tooling, protection settings, load/voltage-drop calculations and configuration signature. | No harness cutting or energisation from an illustrative/preliminary drawing. |
| EVD-ELEC-002 electrical test | Test every serialized harness pin-to-pin; insulation resistance and dielectric withstand only at approved values; verify shields, bonds, polarity, keying and HVIL; record rework and retest. | Tester identity/calibration, automated raw result file, signed summary, fault/rework log and released serial list. | Any cross-wire, missing shield/bond, insulation failure or unapproved repair blocks installation. |
| EVD-CTRL-001 controller/HIL | Keep OSR application compute separate from the qualified safety channel. Freeze duagon/Pilz or accepted equivalents, firmware, BSP, I/O and timing. Run requirements-linked nominal, boundary, power, clock, bus, sensor, actuator, watchdog, reset and network fault tests. | Configuration hashes, requirements-to-test matrix, rig schematic, timestamped raw logs, safe-state measurements, coverage/deviation report and independent witness record. | OSR remains shadow/supervised until the allocated safety functions and complete vehicle interfaces are accepted. |
| EVD-SUP-001 bogie supply | RFQ wheelsets, bearings, suspension, brakes and compressor using the released load/duty envelopes and common interface sheets. | Exact order codes, supplier drawings, certificates, RAMS/maintenance/spares, type tests, price/lead time and signed interface acceptance. | No substitution by approximate size or catalogue photo. Brake and running-gear system authority must accept the combined configuration. |
| EVD-SUP-002 door supply | Issue aperture, kinematic, mounting, electrical/network and emergency-interface sheet to IFE and equivalents; request the exact cassette/controller and its type evidence. | Controlled GA/ICD, mass, order code, cycle/force/obstacle/emergency/water evidence, software/configuration and spares list. | Door portal/carrier detail and production opening remain conditional until the exact cassette is accepted. |
| EVD-SUP-003 traction energy | RFQ the motor, gearbox, converter, LFP battery, resistor, collector and HV panel as one compatible system. Require loss/thermal/derating maps and short-circuit/protection coordination. | Exact bill of supply, all ICDs, energy and mass reconciliation, RAMS, maintenance, software, fire/propagation, EMC/vibration and quotation validity. | Reject a bid that closes one component while leaving voltage, shaft, cooling, protection or software responsibility undefined. |
| EVD-SUP-004 fit-out/safety | Freeze glazing/bonding, floor, seats/rails, HVAC/ducts, PIS/CCTV, lighting and fire system using the published candidates and complete vehicle environment. | Exact products/configurations, fire/smoke matrix, abuse loads, EMC/IP where relevant, cleaning/maintenance, samples and first-fit records. | Public datasheets may start the RFQ; only controlled configuration evidence closes the gate. |
| EVD-MFG-001 local manufacture | Release drawings/tolerances for body joints, GFRP, inserts, window pressure frame, door carrier, seat/light rails, harnesses and ducts. Qualify material batches, operators, fixtures and processes with coupons and first-article inspection. | Drawing/process revisions, batch trace, operator qualification, gauge calibration, coupon/joint results, dimensional report, NCR disposition and signed FAI. | Local manufacture is encouraged but cannot bypass material, fire, structural, electrical or dimensional qualification. |
| EVD-MASS-001 mass properties | Fill the generated 120-row record using released production-CAD, exact supplier or calibrated weighed evidence; weigh each car and the complete configured trainset; reconcile AW0/AW2/AW3 axle loads, longitudinal/vertical CG, roof/battery distribution, category variance and reserve. | Completed checksummed mass record, scale/load-cell calibration, included/excluded scope, product/category reconciliation, three car reports, complete-train report, independent review and design-authority disposition. | No estimate or simplified-envelope calculation may close a row or reduce the 78.75 t controlled planning tare. |

# First purchase and rig priority

The lowest-risk sequence buys samples before committing to complete vehicle-specific systems:

1. Sika 268 PowerCure, Böllhoff RIVNUT samples, Forbo 6R3883, Gurit 130FR materials and TE HVP800 connector samples for local process coupons.

2. Schaltbau C360, Pilz 751184, Moxa V2406C/camera, Westermo router, Huber+Suhner antenna and Li-ion Tamer nodes for electrical/control benches.
3. One brake caliper, bearing unit, spring sample, articulation bearing and cable carrier for fit/load/cycle rigs after calculations select sizes.
4. Vehicle-specific supplier design/RFQ for wheelsets, door, glazing, HVAC, gangway, coupler, traction motor/gearbox/converter/battery/resistor/collector and fire suppression.
5. Only then place the serialized first-article order and update cost, lead time, purchase-order dates and cashflow in each generated city twin.

## Required submission structure

Start supplier evidence from `evidence/rfq-response-template.json`, controlled drawing/tooling records from the generated `evidence/factory-release-record-template.json`, performed test evidence from `evidence/test-run-template.json`, and weight/balance evidence from the generated `evidence/mass-properties-record-template.json`. A reviewer moves a gate to accepted only through the existing checksummed submission format. Supplier pages remain cited design inputs, not accepted submissions.

# LM3 First-Article Inspection and Test Plan

Repository source: `design/component-catalogue/catalog/buildable-trainset/first-article-inspection-plan.md`

> Status: unfilled protocol — not manufacturing, inspection or test evidence.

This plan converts every factory release package into uniquely identified hold, witness and record-review characteristics. Detailed result fields remain blank in the JSON until copied into an authorised first-article build record.

Packages: 16 · Characteristics: 416.

Point types: H mandatory hold, W witness, R record review.

## Package Index

| Package | Characteristics | H | W | R | Status |
|---|---|---|---|---|---|
| `LM3-FRP-010` — primary chassis, transverse structure and stepped-floor drawing pack | 27 | 17 | 3 | 7 | open |
| `LM3-FRP-020` — one-metre exterior module variant and retention drawing pack | 27 | 16 | 4 | 7 | open |
| `LM3-FRP-030` — panoramic front-glass carrier, seal and drainage interface pack | 24 | 14 | 4 | 6 | open |
| `LM3-FRP-040` — reversible front-lamp cassette and fascia-service pack | 23 | 13 | 4 | 6 | open |
| `LM3-FRP-050` — roof curb, HVAC, PV, antenna, fairing and access-zone pack | 32 | 20 | 5 | 7 | open |
| `LM3-FRP-060` — interior moulding, floor, service-access and fitout pack | 43 | 32 | 5 | 6 | open |
| `LM3-FRP-070` — common service rail, fastener and fixture-adapter pack | 22 | 12 | 4 | 6 | open |
| `LM3-FRP-080` — pre-cut exterior film artwork, application and repair pack | 25 | 18 | 2 | 5 | open |
| `LM3-FRP-090` — radiative roof-coating coupon and one-car trial pack | 21 | 13 | 3 | 5 | open |
| `LM3-FRP-100` — vehicle jacking, lifting, towing and field-rerailing interface pack | 21 | 11 | 4 | 6 | open |
| `LM3-FRP-110` — primary end, battery, door and window structural-interface pack | 31 | 18 | 5 | 8 | open |
| `LM3-FRP-120` — configurable train-end and articulation structural-interface pack | 29 | 17 | 5 | 7 | open |
| `LM3-FRP-130` — powered-bogie local frame, bracket and harness drawing pack | 25 | 15 | 5 | 5 | open |
| `LM3-FRP-140` — trailer-bogie local frame, bracket and harness drawing pack | 23 | 13 | 5 | 5 | open |
| `LM3-FRP-150` — battery tray, high-voltage and coolant local-hardware pack | 24 | 13 | 5 | 6 | open |
| `LM3-FRP-160` — low-voltage trainline harness and terminal-distribution pack | 19 | 10 | 4 | 5 | open |

## Execution Rules

- record actual results only while executing the identified work order and configuration

- a blank, planned or design-reference result does not satisfy a characteristic
- on failure stop, contain since the last accepted check, raise an NCR and extend inspection as the approved disposition requires
- do not waive a safety, structural, fire, braking, door, glazing, HV, lifting or recovery characteristic through routine sampling
- package acceptance requires every characteristic accepted, NCRs closed or expressly accepted, and named approvals recorded

Use `manufacturing-control-record-template.json` for the detailed operation record and retain characteristic IDs when importing this plan into a QMS. The factory release remains governed by `factory-release-readiness.md`.

# LM3 First-Article Public Work Packages

Repository source: `design/component-catalogue/catalog/buildable-trainset/first-article-work-packages.md`

Generated from the controlled LM3 manifest and closure-state overrides. An issue may close only after its required evidence is reviewed; repository generation never converts a planned test into performed evidence.

Baseline: `LM3-FA-001` · Open: 81 · Accepted: 0

| Work package | Status | Owner | Candidate / evidence route | Issue |
|---|---|---|---|---|
| `WP-LM3-ROOF-P030` — freeze removable HVAC curb fairing, intake/exhaust skirt, and access-hatch moulding set | open | local manufacturing engineer + design authority | `LM3-FRP-050`, `LM3-FRP-090`, `EVD-MASS-001`, `mass:roof HVAC` | ready to publish |
| `WP-LM3-ROOF-P040` — freeze PV junction plinth, cable-gland cover, antenna closeout, and walkway edge set | open | local manufacturing engineer + design authority | `LM3-FRP-050`, `LM3-FRP-090`, `EVD-MASS-001`, `mass:roof PV` | ready to publish |
| `WP-LM3-CWL-P010` — freeze end-cowl fiberglass laminate, insert, adhesive, and coupon material kit | open | materials/component engineer + procurement lead | `EVD-STR-001`, `EVD-MFG-001`, `EVD-MASS-001`, `mass:end cowls and interfaces` | ready to publish |
| `WP-LM3-CWL-P011` — freeze CWL-FRP-01 upper brow and roof-cap fiberglass cast | open | local manufacturing engineer + design authority | `LM3-FRP-080`, `EVD-STR-001`, `EVD-MFG-001`, `EVD-MASS-001`, `mass:end cowls and interfaces` | ready to publish |
| `WP-LM3-CWL-P012` — freeze CWL-FRP-02 left cheek fiberglass cast | open | local manufacturing engineer + design authority | `LM3-FRP-080`, `EVD-STR-001`, `EVD-MFG-001`, `EVD-MASS-001`, `mass:end cowls and interfaces` | ready to publish |
| `WP-LM3-CWL-P013` — freeze CWL-FRP-03 right cheek fiberglass cast | open | local manufacturing engineer + design authority | `LM3-FRP-080`, `EVD-STR-001`, `EVD-MFG-001`, `EVD-MASS-001`, `mass:end cowls and interfaces` | ready to publish |
| `WP-LM3-CWL-P014` — freeze CWL-FRP-04 lower apron and anti-climber cover fiberglass cast | open | local manufacturing engineer + design authority | `LM3-FRP-040`, `LM3-FRP-080`, `EVD-STR-001`, `EVD-MFG-001`, `EVD-MASS-001`, `mass:end cowls and interfaces` | ready to publish |
| `WP-LM3-CWL-P015` — freeze CWL-FRP-05 lamp, washer, and service-hatch fiberglass cast set | open | local manufacturing engineer + design authority | `LM3-FRP-040`, `LM3-FRP-080`, `EVD-STR-001`, `EVD-MFG-001`, `EVD-MASS-001`, `mass:end cowls and interfaces` | ready to publish |
| `WP-LM3-CWL-P016` — freeze CWL-FRP-06 backing-ring flange fiberglass cast set | open | local manufacturing engineer + design authority | `LM3-FRP-030`, `EVD-STR-001`, `EVD-MFG-001`, `EVD-MASS-001`, `mass:end cowls and interfaces` | ready to publish |
| `WP-LM3-FAS-P010` — freeze panoramic front-glass carrier ring, setting-block pockets, and secondary-retention frame | open | local manufacturing engineer + design authority | `LM3-FRP-030`, `EVD-MASS-001`, `mass:end cowls and interfaces` | ready to publish |
| `WP-LM3-FAS-P020` — freeze reversible front-lamp cassette tray, aiming adjusters, and retained service bracket | open | local manufacturing engineer + design authority | `LM3-FRP-040`, `EVD-MASS-001`, `mass:end cowls and interfaces` | ready to publish |
| `WP-LM3-FAS-P030` — freeze front glazing/lamp EPDM seal, drain rail, washer sleeve, and edge-closeout kit | open | materials/component engineer + procurement lead | `LM3-FRP-030`, `EVD-MASS-001`, `mass:end cowls and interfaces` | ready to publish |
| `WP-LM3-EXT-P010` — freeze electric plug/sliding door cassette | open | subsystem engineer + procurement lead | `OSR-COTS-DOOR-IFE`, `EVD-SUP-004`, `EVD-MASS-001`, `mass:doors, glazing, interior, and auxiliaries` | ready to publish |
| `WP-LM3-EXT-P020` — freeze side laminated glazing cassette | open | materials/component engineer + procurement lead | `OSR-COTS-GLASS-AGC`, `OSR-COTS-GLAZING-SIKA268`, `EVD-SUP-004`, `EVD-MASS-001`, `mass:doors, glazing, interior, and auxiliaries` | ready to publish |
| `WP-LM3-EXT-P030` — freeze single panoramic heated end-glass assembly | open | subsystem engineer + procurement lead | `OSR-COTS-GLASS-AGC`, `OSR-COTS-GLAZING-SIKA268`, `LM3-FRP-030`, `EVD-SUP-004`, `EVD-MASS-001`, `mass:doors, glazing, interior, and auxiliaries` | ready to publish |
| `WP-LM3-EXT-P040` — freeze hvac-24kw-direct-hv-dc roof HVAC | open | subsystem engineer + procurement lead | `OSR-COTS-HVAC-LONGERTEK`, `LM3-FRP-050`, `EVD-SUP-004`, `EVD-MASS-001`, `mass:roof HVAC` | ready to publish |
| `WP-LM3-EXT-P060` — freeze stepped floor-board and removable service-hatch system | open | materials/component engineer + procurement lead | `OSR-COTS-FLOOR-COMFLOOR`, `LM3-FRP-060`, `EVD-SUP-004`, `EVD-MASS-001`, `mass:doors, glazing, interior, and auxiliaries` | ready to publish |

| Work package | Status | Owner | Candidate / evidence route | Issue |
|---|---|---|---|---|
| WP-LM3-EXT-P061 — freeze welded resilient floor covering, cove, nosing, and adhesive system | open | materials/component engineer + procurement lead | OSR-COTS-FLOOR-FORBO-6R3883, LM3-FRP-060, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-EXT-P062 — freeze longitudinal passenger and priority-seat modules | open | materials/component engineer + procurement lead | OSR-COTS-SEAT-FAINSA, LM3-FRP-060, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-EXT-P063 — freeze stainless grab-pole, handrail, joint, and insulated adapter kit | open | materials/component engineer + procurement lead | OSR-COTS-SEAT-FAINSA, LM3-FRP-060, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-EXT-P064 — freeze passenger-information display, speaker, amplifier, and mounting kit | open | materials/component engineer + procurement lead | OSR-COTS-PIS-LUMINATOR, LM3-FRP-060, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-EXT-P065 — freeze CCTV camera, passenger intercom, PoE/data, and mounting kit | open | materials/component engineer + procurement lead | OSR-COTS-CAMERA-MOXA-P06HC, LM3-FRP-060, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-EXT-P066 — freeze PRM, safety-signage, emergency-lighting, extinguisher, and first-aid kit | open | materials/component engineer + procurement lead | OSR-COTS-LIGHT-TEKNOWARE, LM3-FRP-060, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-FIX-P020 — freeze four-family captive fastener, floating nut, isolator, and access-fastener kit | open | materials/component engineer + procurement lead | OSR-COTS-FASTENER-RIVNUT, LM3-FRP-070, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-FIX-P030 — freeze standard passenger-fixture saddle and equipment adapter kit | open | local manufacturing engineer + design authority | LM3-FRP-070, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-WIN-P010 — freeze replaceable window pressure frame, dry seal, drain, and captive retention kit | open | local manufacturing engineer + design authority | LM3-FRP-110, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-DOOR-P010 — freeze door four-point adjustable carrier, datum pin, dry seal, and keyed connector bracket kit | open | local manufacturing engineer + design authority | LM3-FRP-110, EVD-TEST-001, EVD-SUP-002, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-LGT-P010 — freeze 1.2 m plug-in main LED lighting cassette and captive mounting kit | open | materials/component engineer + procurement lead | OSR-COTS-LIGHT-TEKNOWARE, EVD-ELEC-001, EVD-ELEC-002, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-LGT-P020 — freeze emergency and doorway lighting modules with independent keyed feeder kit | open | subsystem engineer + procurement lead | OSR-COTS-LIGHT-TEKNOWARE, EVD-ELEC-001, EVD-ELEC-002, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-EXT-P070 — freeze roof antennas, service walkway pads, lifting covers, and maintenance labels | open | materials/component engineer + procurement lead | OSR-COTS-ANTENNA-HS-85137717, LM3-FRP-050, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-EXT-P080 — freeze fire-rated GFRP side-module laminate, core, gelcoat, and consumable kit | open | subsystem engineer + procurement lead | OSR-COTS-COMPOSITE-GURIT-130FR, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-EXT-P090 — freeze fire-rated GFRP roof-module, dry-seal, and removable skirt material kit | open | subsystem engineer + procurement lead | OSR-COTS-COMPOSITE-GURIT-130FR, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-FIN-P010 — freeze pre-cut exterior livery graphic film, edge-seal, datum-mark, and repair-patch kit | open | subsystem engineer + procurement lead | OSR-COTS-FINISH-3M-180MC, LM3-FRP-080, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-FIN-P020 — freeze calcium-carbonate radiative roof-coating qualification and exposed-roof application kit | open | subsystem engineer + procurement lead | OSR-COTS-COOLROOF-PURDUE-CACO3, LM3-FRP-090, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P010 — freeze HVAC diffusers, side return ducts, saloon grilles, and access panels | open | materials/component engineer + procurement lead | OSR-COTS-HVAC-LONGERTEK, LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:roof HVAC | ready to publish |

| Work package | Status | Owner | Candidate / evidence route | Issue |
|---|---|---|---|---|
| WP-LM3-INT-P020 — freeze FRP/phenolic ceiling liner panel set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P021 — freeze ceiling light-trough bezel, diffuser carrier, and emergency-luminaire closeout set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P022 — freeze HVAC plenum cover, diffuser transition, detector bezel, and ceiling service-hatch set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P030 — freeze FRP/phenolic sidewall liner panel set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P031 — freeze window reveal, setting-block inspection cover, and blind/label land set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P032 — freeze waist cable-cover, low-voltage access lid, and retained quarter-turn fastener set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P040 — freeze FRP battery strake cover panel set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P041 — freeze seat-base fairing, retained equipment hatch, and rail-saddle closeout set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P050 — freeze FRP vestibule kick-panel and threshold-closeout set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P051 — freeze PRM transition-ramp, bogie-deck step-cover, contrast-nosing, and anti-slip set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-INT-P052 — freeze door-pocket liner, sensitive-edge clearance trim, and removable jamb-cover set | open | local manufacturing engineer + design authority | LM3-FRP-060, EVD-SUP-004, EVD-MFG-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-TRC-P010 — freeze motor-350kw-hm47-class axle traction motor | open | subsystem engineer + procurement lead | OSR-COTS-MOTOR-ABB-AMXE250, EVD-STR-002, EVD-THM-001, EVD-SUP-003, EVD-MASS-001, mass:traction motors, gearboxes, and controllers | ready to publish |
| WP-LM3-TRC-P020 — freeze single-stage reduction gearbox and flexible coupling | open | subsystem engineer + procurement lead | OSR-COTS-GEAR-VOITH-SE, EVD-STR-002, EVD-THM-001, EVD-SUP-003, EVD-MASS-001, mass:traction motors, gearboxes, and controllers | ready to publish |
| WP-LM3-TRC-P030 — freeze two independent motor controllers, isolated LV DC/DC, MPPT, station protection, and cooling-loop kit | open | subsystem engineer + procurement lead | OSR-COTS-CONVERTER-ABB-CC400, EVD-STR-002, EVD-THM-001, EVD-SUP-003, EVD-MASS-001, mass:traction motors, gearboxes, and controllers | ready to publish |
| WP-LM3-TRC-P040 — freeze battery-225kwh-lfp-800v saloon-isolated side traction battery pack | open | subsystem engineer + procurement lead | OSR-COTS-BATTERY-HOPPECKE-LITRAC, EVD-STR-002, EVD-THM-001, EVD-SUP-003, EVD-MASS-001, mass:traction batteries | ready to publish |
| WP-LM3-TRC-P050 — freeze roof-mounted regen dump resistor and thermal shield kit | open | materials/component engineer + procurement lead | OSR-COTS-RESISTOR-DANOTHERM, LM3-FRP-050, EVD-STR-002, EVD-THM-001, EVD-SUP-003, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-TRC-P060 — freeze station side-pin charging connector, actuator, shutter, and alignment target | open | subsystem engineer + procurement lead | OSR-COTS-CHARGER-SCHUNK, EVD-STR-002, EVD-THM-001, EVD-SUP-003, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-TRC-P070 — freeze HV contactor, fuse, pre-charge, service-disconnect, and current-sensor panel | open | materials/component engineer + procurement lead | OSR-COTS-HV-SCHALTBAU-C360, OSR-COTS-HV-TE-HVP800, EVD-STR-002, EVD-THM-001, EVD-SUP-003, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |

| Work package | Status | Owner | Candidate / evidence route | Issue |
|---|---|---|---|---|
| WP-LM3-SAF-P010 — freeze battery temperature/off-gas detection, electrical-enclosure smoke detection, and localized mist kit | open | materials/component engineer + procurement lead | OSR-COTS-FIRE-FOGTEC, OSR-COTS-FIRE-LIIONTAMER-3, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-BOG-P040 — freeze powered-bogie wheelset with axle-mounted brake discs | open | subsystem engineer + procurement lead | OSR-COTS-WHEELSET-GHH, EVD-STR-002, EVD-TEST-001, EVD-ELEC-002, EVD-SUP-001, EVD-MASS-001, mass:bogie frames, wheelsets, brakes, and suspension | ready to publish |
| WP-LM3-BOG-P041 — freeze trailer-bogie wheelset with axle-mounted brake discs | open | subsystem engineer + procurement lead | OSR-COTS-WHEELSET-GHH, EVD-STR-002, EVD-TEST-001, EVD-ELEC-002, EVD-SUP-001, EVD-MASS-001, mass:bogie frames, wheelsets, brakes, and suspension | ready to publish |
| WP-LM3-BOG-P042 — freeze powered-wheelset axlebox, sealed bearing unit, speed and temperature sensor set | open | subsystem engineer + procurement lead | OSR-COTS-BEARING-SKF-TBU, EVD-STR-002, EVD-TEST-001, EVD-ELEC-002, EVD-SUP-001, EVD-MASS-001, mass:bogie frames, wheelsets, brakes, and suspension | ready to publish |
| WP-LM3-BOG-P043 — freeze trailer-wheelset axlebox, sealed bearing unit, speed and temperature sensor set | open | subsystem engineer + procurement lead | OSR-COTS-BEARING-SKF-TBU, EVD-STR-002, EVD-TEST-001, EVD-ELEC-002, EVD-SUP-001, EVD-MASS-001, mass:bogie frames, wheelsets, brakes, and suspension | ready to publish |
| WP-LM3-BOG-P044 — freeze powered-bogie primary suspension spring, guide and bump-stop set | open | subsystem engineer + procurement lead | OSR-COTS-SUSPENSION-CONTI, EVD-STR-002, EVD-TEST-001, EVD-ELEC-002, EVD-SUP-001, EVD-MASS-001, mass:bogie frames, wheelsets, brakes, and suspension | ready to publish |
| WP-LM3-BOG-P045 — freeze trailer-bogie primary suspension spring, guide and bump-stop set | open | subsystem engineer + procurement lead | OSR-COTS-SUSPENSION-CONTI, EVD-STR-002, EVD-TEST-001, EVD-ELEC-002, EVD-SUP-001, EVD-MASS-001, mass:bogie frames, wheelsets, brakes, and suspension | ready to publish |
| WP-LM3-BOG-P046 — freeze powered-bogie to carbody connection: air springs, emergency spring, centre pivot, yaw links and dampers | open | subsystem engineer + procurement lead | OSR-COTS-SUSPENSION-CONTI, EVD-STR-002, EVD-TEST-001, EVD-ELEC-002, EVD-SUP-001, EVD-MASS-001, mass:bogie frames, wheelsets, brakes, and suspension | ready to publish |
| WP-LM3-BOG-P047 — freeze trailer-bogie to carbody connection: air springs, emergency spring, centre pivot, yaw links and dampers | open | subsystem engineer + procurement lead | OSR-COTS-SUSPENSION-CONTI, EVD-STR-002, EVD-TEST-001, EVD-ELEC-002, EVD-SUP-001, EVD-MASS-001, mass:bogie frames, wheelsets, brakes, and suspension | ready to publish |
| WP-LM3-BOG-P048 — freeze powered-bogie brake calipers, parking actuators, pads and wheel-slide hardware | open | subsystem engineer + procurement lead | OSR-COTS-BRAKE-KNORR-RZKT, EVD-STR-002, EVD-TEST-001, EVD-ELEC-002, EVD-SUP-001, EVD-MASS-001, mass:bogie frames, wheelsets, brakes, and suspension | ready to publish |
| WP-LM3-BOG-P049 — freeze trailer-bogie brake calipers, parking actuators, pads and wheel-slide hardware | open | subsystem engineer + procurement lead | OSR-COTS-BRAKE-KNORR-RZKT, EVD-STR-002, EVD-TEST-001, EVD-ELEC-002, EVD-SUP-001, EVD-MASS-001, mass:bogie frames, wheelsets, brakes, and suspension | ready to publish |
| WP-LM3-AUX-P010 — freeze secondary-suspension compressor, dryer, reservoir, and isolation-manifold kit | open | materials/component engineer + procurement lead | OSR-COTS-AIR-KNORR-VV120T, EVD-SUP-004, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-END-P010 — freeze automatic end coupler and crash-energy absorber | open | subsystem engineer + procurement lead | OSR-COTS-COUPLER-DELLNER430, EVD-STR-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:end cowls and interfaces | ready to publish |
| WP-LM3-ART-P020 — freeze articulation lower spherical pivot, bearing housing and pin set | open | subsystem engineer + procurement lead | OSR-COTS-JOINT-SCHAEFFLER, EVD-TEST-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:inter-car articulation | ready to publish |
| WP-LM3-ART-P021 — freeze articulation upper lateral/yaw links, spherical joints and retained pins | open | subsystem engineer + procurement lead | OSR-COTS-JOINT-SCHAEFFLER, EVD-TEST-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:inter-car articulation | ready to publish |

| Work package | Status | Owner | Candidate / evidence route | Issue |
|---|---|---|---|---|
| WP-LM3-ART-P022 — freeze inter-car double-wall corrugated bellows and clamp-frame set | open | subsystem engineer + procurement lead | OSR-COTS-GANGWAY-HUBNER, EVD-TEST-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:inter-car articulation | ready to publish |
| WP-LM3-ART-P023 — freeze inter-car passenger bridge, turntable and flexible interior-panel set | open | subsystem engineer + procurement lead | OSR-COTS-GANGWAY-HUBNER, EVD-TEST-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:inter-car articulation | ready to publish |
| WP-LM3-ART-P024 — freeze articulation trainline carrier, support arms, abrasion liners and drain path | open | materials/component engineer + procurement lead | OSR-COTS-TRAINLINE-IGUS-HARTING, EVD-TEST-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:inter-car articulation | ready to publish |
| WP-LM3-CTRL-P010 — freeze T-ECU/S and T-ECU/A compute and safety-control cabinet kit | open | subsystem engineer + procurement lead | OSR-COTS-COMPUTE-MOXA-V2406C, OSR-COTS-CONTROL-DUAGON-MH50C, EVD-ELEC-001, EVD-ELEC-002, EVD-CTRL-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-CTRL-P020 — freeze navigation, balise, 5G, LoRa, GNSS, IMU, and roof-antenna kit | open | materials/component engineer + procurement lead | OSR-COTS-ANTENNA-HS-85137717, OSR-COTS-ROUTER-WESTERMO-630-5G, EVD-ELEC-001, EVD-ELEC-002, EVD-CTRL-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-CTRL-P030 — freeze maintenance HMI, depot pendant, emergency controls, and safety-relay kit | open | subsystem engineer + procurement lead | OSR-COTS-SAFETYRELAY-PILZ-751184, EVD-ELEC-001, EVD-ELEC-002, EVD-CTRL-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-CTRL-P050 — freeze operational and crashworthy event-recorder storage kit | open | materials/component engineer + procurement lead | OSR-COTS-RECORDER-HASLER, EVD-ELEC-001, EVD-ELEC-002, EVD-CTRL-001, EVD-MASS-001, mass:doors, glazing, interior, and auxiliaries | ready to publish |
| WP-LM3-END-P020 — freeze T-OBS nose sensor pack, heated window services, and washer kit | open | subsystem engineer + procurement lead | OSR-COTS-LIDAR-OUSTER-OS1, EVD-STR-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:end cowls and interfaces | ready to publish |
| WP-LM3-END-P040 — freeze e-coupler LV jumper, recovery trainline, and end harness breakaway kit | open | subsystem engineer + procurement lead | OSR-COTS-COUPLER-DELLNER430, EVD-STR-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:end cowls and interfaces | ready to publish |
| WP-LM3-END-P050 — freeze sealed headlight, tail/marker light, threshold-warning, and end-lamp harness kit | open | materials/component engineer + procurement lead | OSR-COTS-LIGHT-TEKNOWARE, LM3-FRP-040, EVD-STR-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:end cowls and interfaces | ready to publish |
| WP-LM3-ART-P030 — freeze inter-car HV/LV jumper, coolant hose loop, energy chain, and drain sleeve kit | open | subsystem engineer + procurement lead | OSR-COTS-HV-TE-HVP800, OSR-COTS-TRAINLINE-IGUS-HARTING, EVD-TEST-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:inter-car articulation | ready to publish |
| WP-LM3-ART-P040 — freeze train-to-train open-end articulation, gangway, drawbar, turntable, and service-jumper cassette | open | subsystem engineer + procurement lead | OSR-COTS-GANGWAY-HUBNER, EVD-TEST-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:inter-car articulation | ready to publish |
| WP-LM3-ART-P041 — freeze train-to-train jumper blanking, transition harness, isolation label, and dust-cover kit | open | materials/component engineer + procurement lead | OSR-COTS-TRAINLINE-IGUS-HARTING, EVD-TEST-001, EVD-ELEC-001, EVD-ELEC-002, EVD-MASS-001, mass:inter-car articulation | ready to publish |

# LM3 joint and fastener control schedule

Repository source: `design/component-catalogue/catalog/buildable-trainset/joint-control-schedule.md`

Generated from every parent/child integration step in the trainset product tree. It makes joining method and torque authority machine-readable. Numeric torques are intentionally prohibited until the named supplier instruction or joint calculation is accepted; nominal bolt diameter alone is not a safe preload specification.

Controlled integration joints: 145.

| Joint ID | Parent child | Join classes | Torque authority | Release status |

## Release use

A traveler may reference a joint ID, but no fastener is released for final torque until its status is closed by the authority named above. The released record must also state fastener grade, coating/lubrication condition, locking method, calibrated tool range, witness marking, and re-torque rule. Supplier wheelset, bearing, brake, coupler, door, HVAC, battery, traction, and gangway values remain supplier-controlled and must not be replaced with generic tables.

# LM3 Manufacturing and Assembly Reference Controls

Repository source: `design/component-catalogue/catalog/buildable-trainset/manufacturing-and-assembly-controls.md`

> Status: reference defaults — not a production or vehicle release.

These are affordable pilot-factory defaults for work that should not wait for a bespoke invention. They make assembly planning, quotations, travelers and first-article inspection concrete while preserving every supplier, calculation, drawing and approval gate.

## How authority works

Reference defaults for first-article planning only. A released drawing, joint calculation, qualified process specification, supplier instruction, or authorised deviation takes precedence. These values do not release a vehicle, structural joint, glazing system, pressure boundary, HV system, lifting operation, or safety-critical installation.

The word must below controls use of this reference package; it does not certify a component. Where a numerical product value is safety- or supplier-dependent, the default states the required authority instead of guessing it.

## Common inspection escalation

- First article: 100% of defined characteristics.
- Safety and interfaces: 100% unless an approved control plan says more.
- Routine non-safety: first-off, last-off and 10%, minimum three per batch.
- Failure: on any failure, stop the batch, contain since last accepted check and inspect 100% until the approved control plan restores sampling.

## LM3-MFG-010 — Drawing, Datum And Measurement Control

Applies to: all MAKE parts, all assembly fixtures, all marriage interfaces.

Reference work instructions:

1. Use vehicle coordinates X forward, Y left and Z up; identify the car centre plane, bogie-centre planes and underframe top plane on every assembly drawing.
2. Locate work by a 3-2-1 datum scheme. Do not dimension serial features from one another or use an unverified body panel as a master datum.
3. Treat CAD nominal geometry as basic only where the released drawing provides a geometric tolerance; otherwise the dimension is not released for manufacture.
4. For non-safety brackets and trim only, use a provisional general shop tolerance of ±0.5 mm to 300 mm, ±1.0 mm from 300–1,000 mm and ±2.0 mm above 1,000 mm; hole position ±0.5 mm. A drawing-specific tolerance is mandatory at bogie, coupler, door, glazing, bearing, articulation and crash interfaces.
5. Verify each fixture at installation, after any move or repair, and before each first-article batch against traceable artefacts; record as-found and as-left results.

Inspection: 100% first article and all safety/interface datums; routine non-safety dimensions use first-off, last-off and at least one in ten, with a minimum of three per batch.

Stop and raise an NCR when: missing drawing revision; damaged or out-of-calibration gauge; datum disagreement above released tolerance; unrecorded CAD or NC revision.

Release evidence that supersedes/closes this default: checked detail/assembly drawing, tolerance analysis, inspection plan and calibrated measurement record.

## LM3-MFG-020 — Steel Preparation, Fit-Up And Welding

Applies to: underframe, body frame, bolsters, end rings, roof frame, bogie frame if locally manufactured.

Reference work instructions:

1. Receive material by heat/lot and preserve traceability through cutting and kitting; quarantine unidentified offcuts from structural use.

2 Deburr and remove cutting dross; keep weld lands free of oil, moisture, scale, coating and zinc unless the qualified procedure explicitly permits it.

3 Dry-build in the surveyed fixture, restrain only at released hard points, and record diagonals, twist, bogie centres, coupler centreline and door-portal datums before welding.

4 Use a balanced weld sequence from the centre outward, with inter-pass temperature, consumables, tack removal and distortion correction controlled by the qualified WPS.

5 No flame straightening, weld repair, weld-size substitution or hole enlargement is permitted without an approved repair/deviation instruction.

Inspection: 100% visual inspection and dimensional survey of first article; NDT method, extent and acceptance follow the released weld map and qualified procedure, never this default.

Stop and raise an NCR when: material certificate mismatch; unqualified welder or WPS; fit-up outside drawing tolerance; arc strike or crack; fixture movement.

Release evidence that supersedes/closes this default: released weld map/WPS, welder qualifications, material certificates, NDT plan and signed dimensional report.

## LM3-MFG-030 — Bolted And Captive-Fastener Joints

Applies to: service rails, interior modules, removable panels, roof equipment, structural bolted interfaces.

Reference work instructions:

1 Kit fasteners by joint ID, grade, coating, locking device and lot; do not mix visually similar hardware or substitute stainless/plated pairs without galvanic review.

2 Bring multi-fastener joints to contact by hand, seat in a cross-pattern, then apply the released final torque in at least two stages.

3 Use sockets within the calibrated tool range, record actual tool ID and setting, and apply a visible witness mark after final acceptance.

4 Do not publish or infer numerical torque from nominal diameter. Lubrication, coating, insert strength, prevailing-torque devices and supplier bearing limits control preload.

5 Replace single-use prevailing-torque fasteners and any fastener rejected by the released reuse rule; never re-torque a witness-marked joint unless the procedure requires it.

Inspection: 100% identity and witness-mark check on safety, roof, door, glazing, bogie, coupler, articulation and HV enclosure joints; normal service-rail joints first/last and 10% minimum three.

Stop and raise an NCR when: no numerical torque authority; tool outside calibration; cross-threading or spinning insert; witness mark broken; joint gap after seating.

Release evidence that supersedes/closes this default: joint calculation or supplier instruction, released joint schedule, batch record and signed torque trace.

## LM3-MFG-040 — Adhesive Bonding, Sealing And Glazing

Applies to: panoramic end glass, side glazing, bonded GFRP, roof PV laminates, sealed penetrations.

Reference work instructions:

1 Work in an enclosed clean zone at 18–30 °C, 30–75% RH and at least 3 °C above dew point unless the qualified product procedure is narrower.

2 Record substrate, cleaner, primer, adhesive/sealant and applicator batch/expiry; perform the supplier surface-preparation route and a witnessed adhesion coupon at the start of each shift/material combination.

3 Dry-fit with hard locators before priming. The released drawing must state glass edge clearance, adhesive bite/thickness, spacer hardness, drain path and installation gap.

4 Record start/end application times, environmental readings, bead continuity and clamp/removal time. Supplier open-time and cure limits are mandatory and are not replaced by this default.

5 Protect bond lines from movement, water, dust and coating until released cure; water-test glazing and roof penetrations before interior closure.

Inspection: 100% first article, every safety glazing perimeter and every roof penetration; retain witness coupons by material lot and shift through the defined evidence-retention period.

Stop and raise an NCR when: substrate below dew-point margin; expired or unmatched batch; missed open time; primer contamination; bead discontinuity; glass edge contact.

Release evidence that supersedes/closes this default: supplier-qualified bonding procedure, released glazing/bond drawing, coupon results, environment log and leak-test record.

## LM3-MFG-050 — Gfrp Body, Fascia And Roof Moulded Parts

Applies to: side and roof panels, front fascia pieces, lamp bezels, interior liners, fairings.

Reference work instructions:

1. Survey each mould from tooling datums before first use and after repair; clean, release and inspect it before lay-up.
2. Issue a ply/cut kit and resin/gelcoat batch traveler. Fibre type, orientation, overlap, core, resin ratio, vacuum level and cure cycle come from the qualified laminate schedule.
3. Use moulded or drill-jigged locator features; CNC-trim only from released datums and trial-fit the first part in the master body/fascia frame before drilling production parts.
4. Bond or mould inserts only with positive anti-rotation/pull-out features and witness samples; prevent exposed fibre and seal all trimmed edges and penetrations.
5. The fascia master gauge must simultaneously accept the glass dummy, lamp gauges, washer/sensor keep-outs and removable service panels without forced fit.

Inspection: 100% first article visual, thickness, mass, trim, insert and master-gauge inspection; production sampling follows the qualified control plan, while every safety insert remains individually traceable.

Stop and raise an NCR when: mould datum out; unreleased laminate schedule; cure excursion; dry fibre/void/delamination; insert movement; forced master-gauge fit.

Release evidence that supersedes/closes this default: qualified laminate/process specification, mould acceptance, coupon/mechanical evidence, trim program revision and signed first-article report.

## LM3-MFG-060 — Roof Hvac, Solar And Weatherproofing Assembly

Applies to: HVAC modules, PV rails and laminates, fairings, cable glands, condensate and roof drains.

Reference work instructions:

1. Complete a bench dry-build of rails, HVAC support frame, fairings, glands, drain paths and removable envelopes before the car roof is closed.
2. Lift equipment only from supplier points with a released lift plan; do not use PV rails, fairings or duct flanges as lifting points.
3. Maintain physical segregation between HV/PV, LV/data, condensate and fresh-air paths; route drains continuously downhill and provide cleanable traps only where shown.
4. Install replaceable equipment without permanent adhesive across its removal boundary; preserve roof access, fall-protection and emergency-isolation zones.
5. Perform staged water tests after bare roof sealing, after equipment installation and after fairing closure; electrically test bonding, insulation and PV isolation before energisation.

Inspection: 100% roof fasteners, penetrations, drains, isolation labels and leak-test zones on every car.

Stop and raise an NCR when: standing water; unsealed penetration; blocked removal path; missing lift point; failed bond/insulation test; supplier mass/CG absent.

Release evidence that supersedes/closes this default: released roof arrangement and load calculation, supplier manuals, lift plan, water-test map, electrical test and mass/CG record.

## LM3-MFG-070 — Interior Fit-Out And Service Routing

Applies to: floors, seats, panels, lighting, grab rails, PIS/CCTV, harnesses, hoses.

Reference work instructions:

1. Complete concealed harness, duct, drain and fire-barrier inspection before floors, ceilings or service panels close the zone.
2. Use the common service rail and keyed connectors for non-structural modular fit-out; passenger load-bearing fixtures require a released load path and proof evidence.
3. Route cables and hoses in dedicated trays, protect every edge crossing, support branches close to connectors, and preserve supplier minimum bend radius and service loop.
4. Apply unique labels at both ends and every branch; run continuity/insulation/network checks before energisation and again after panel closure.
5. Dry-fit floors and panels from the centre datum outward, preserve drainage/inspection hatches, eliminate trip lips and sharp edges, then gauge PRM aisle, door circulation and emergency access.

Inspection: 100% concealed-route photo/map, connector identity, safety fixture and accessibility check; cosmetic modules use first/last plus 10% minimum three.

Stop and raise an NCR when: unreleased routing drawing; chafing or unsupported span; mixed HV/LV zone; blocked access panel; failed fire barrier; PRM gauge obstruction.

Release evidence that supersedes/closes this default: released routing and fit-out drawings, fixture load calculation/test, cable test report, fire-material evidence and dimensional gauge record.

## LM3-MFG-080 — Module Marriage, Lifting And Recovery Interfaces

Applies to: body-to-bogie marriage, battery/HVAC modules, train ends, articulation, jacking and rerailing points.

Reference work instructions:

1. Weigh each accepted module and record centre of gravity before planning the lift; compare cumulative body mass and reactions with the controlled mass ledger.
2. Use only marked, rated and proof-accepted lifting/jacking points with positive cribbing and a released synchronous lift plan; establish an exclusion zone and appoint one lift controller.
3. Mobile lifting columns are the factory default for carbody/bogie marriage. Portable screw or scissor jacks are a recovery option only when the selected units, foundations/packing, side-load restraint and vehicle jacking pads are specifically engineered and proof tested.
4. Raise in defined increments while monitoring level and pad load; stop on unequal load, unexpected deformation, loss of communication or support movement.
5. After marriage, record ride heights, axle loads, clearances, hoses/cables, retention devices and fastener witness marks before static energisation.

Inspection: 100% lift-point identity, equipment certificates, pre-use check, lift log and post-marriage geometry for every vehicle movement.

Stop and raise an NCR when: unknown mass/CG; expired lifting certificate; unverified ground or cribbing; side-loaded jack; pad load imbalance; person beneath unsupported vehicle.

Release evidence that supersedes/closes this default: checked lift/recovery plan, equipment schedule/certificates, jacking-pad calculation and proof test, lift log and post-marriage survey.

## LM3-MFG-090 — Finish, Corrosion Protection And Livery

Applies to: steel structure, GFRP exterior, livery film, roof radiative coating trial.

Reference work instructions:

1. Inspect and record hidden steel preparation and base corrosion system before panels, floors or equipment conceal it.
2. Use pre-coloured GFRP and replaceable rail-rated livery film on approved smooth zones to reduce spray finishing; seal cut edges and keep film clear of joints, vents, drains, labels, sensors and inspection areas.
3. Apply film to a clean dry surface within the film supplier temperature window, use knifeless tape at visible boundaries and record batch, installer and adhesion trial.
4. Calcium-carbonate nanoparticle roof coating remains a controlled trial over the mandatory fire/UV/weathering-compatible base system; it must not cover PV, bonded joints, walkways, vents, drains or earth bonds.

5 Compare trial and control coupons for adhesion, fire/smoke, UV/weathering, cleanability, solar reflectance and thermal benefit before fleet use.

Inspection: 100% hidden base protection, prohibited zones and first livery/roof trial; routine film appearance and edge adhesion by first/last plus 10% minimum three zones.

Stop and raise an NCR when: unprotected steel; surface contamination; film over inspection/safety feature; roof coating without compatible base; failed coupon or peel edge.

Release evidence that supersedes/closes this default: released finish-zone map, coating/film supplier system, environmental log, coupon qualification and signed appearance/corrosion inspection.

## LM3-MFG-100 — Ncr, Rework And Configuration Handback

Applies to: all parts, all suppliers, all build cells, all test stages.

Reference work instructions:

1 Tag and segregate nonconforming material or digitally inhibit its next operation; never erase the original result or repair before disposition.

2 Disposition is use-as-is, rework to the original requirement, repair to an approved instruction, return/scrap, or design change. Only the named design authority may approve use-as-is, repair or design change.

3 Repeat all inspections invalidated by rework and extend the check to adjacent features that could have been affected.

4 Before cell handback, reconcile installed serial/lot numbers, software/configuration IDs, concessions, open work, tool records and measured mass with the as-built record.

5 A red-line is temporary build evidence, not a revised design; incorporate accepted changes into controlled source and reissue before repetition.

Inspection: 100% NCR and concession traceability; quality independently verifies closure and configuration reconciliation before the next release gate.

Stop and raise an NCR when: unidentified part; unapproved repair; repeat defect trend; missing retest; as-built/configuration mismatch; open safety NCR.

Release evidence that supersedes/closes this default: approved NCR disposition, repair instruction, repeat-inspection evidence, updated design revision and signed configuration handback.

# LM3 manufacturing methods and tooling

Repository source: `design/component-catalogue/catalog/buildable-trainset/manufacturing-methods.md`

Pilot local-manufacture route for one LM3 three-car trainset; elapsed allowances support factory planning but never override a released material datasheet, supplier manual, WPS, adhesive open/cure time, or competent engineering decision.

Release boundary: Not a construction release. Supplier freeze, controlled drawings, structural calculations, fire/rail evidence, qualified special processes, first-article tests, independent safety assessment, and national authorisation remain mandatory.

| Controlled coverage | Value |
|---|---|
| Product rows linked to at least one method | 120 / 120 |
| Manufacturing methods | 9 |
| Named tooling/fixture families | 30 |

## Method index

| Method | Work centre | Crew | Planning cycle | Products | Tooling |
|---|---|---|---|---|---|
| LM3-MFG-010 — Locally fabricated steel body, bogie and interface structures | local steel preparation, weld and metrology cells | 6 | 72 h | 19 | 2 |
| LM3-MFG-020 — Reusable GFRP body, roof, end-cowl and interior panel mould families | local composite moulding, cure, trim and dry-fit cell | 3 | 24 h | 27 | 10 |
| LM3-MFG-030 — In-mould base finish, applied livery film, and qualified radiative roof-coating route | local surface preparation, film application and controlled coating cell | 2 | 16 h | 12 | 4 |
| LM3-MFG-040 — Replaceable side-window cassette, pressure frame, seal and drain installation | local glazing preparation and vehicle fit-out cell | 2 | 3 h | 6 | 3 |
| LM3-MFG-050 — Supplier door cassette on locally made four-point adjustable carrier | local door preparation, installation and static-test cell | 3 | 5 h | 3 | 2 |
| LM3-MFG-060 — Removable floor panels, transport flooring and common passenger-fixture rail | local interior panel, floor and fixture preassembly cell | 4 | 16 h | 21 | 2 |
| LM3-MFG-070 — Supplier traction motor/gearbox integration into locally fabricated powered bogie | local bogie build, alignment and static-test cell | 4 | 12 h | 18 | 2 |
| LM3-MFG-080 — Lighting, HVAC, HV/LV services and keyed replaceable modules | local harness, interior systems and roof-module preassembly cells | 4 | 16 h | 23 | 3 |
| LM3-MFG-090 — Three-car final assembly, static test and manufacturing release | 55 m local final assembly and static-test road | 8 | 48 h | 19 | 2 |

## LM3-MFG-010 — Locally fabricated steel body, bogie and interface structures

- Work centre: local steel preparation, weld and metrology cells
- Crew / planning cycle: 6 people / 72 hours elapsed
- Product IDs: `LM3-BDY-P010`, `LM3-BDY-P020`, `LM3-BDY-P021`, `LM3-BDY-P030`, `LM3-BDY-P040`, `LM3-BDY-P050`, `LM3-BDY-P060`, `LM3-BDY-P061`, `LM3-BDY-P070`, `LM3-BDY-P080`, `LM3-BDY-P090`, `LM3-BDY-P100`, `LM3-BDY-P110`, `LM3-BDY-P120`, `LM3-FAS-P010`, `LM3-FAS-P020`, `LM3-ART-P010`, `LM3-BOG-P010`, `LM3-BOG-P020`
- Tooling: `LM3-TOOL-STEEL-FIXTURE`, `LM3-TOOL-DATUM-GAUGE`
- Joining parts: released structural welds; machined datum inserts; OSR-FST-M8-FLOAT only for calculated secondary interfaces; galvanic-isolation shims
- Release gate: Controlled cut/flat-pattern pack, WPS/WPQR, qualified welders, weld map, NDT plan, dimensional survey and released structural proof.

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| 10 — Release material and fixture | 120 min | Verify drawing revision, heat certificates, section/plate identity, fixture calibration | yes |

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| | | and datum targets before cutting.Quarantine substitutions. | |
| 20 — Cut, form, machine and deburr | 960 min | Produce the controlled cut list and flat patterns; protect datum and bond lands; identify every primary part to heat and drawing position. | no |
| 30 — Fixture, tack and survey | 480 min | Load parts against the 3-2-1 datum scheme, install calibrated shims/stops, tack to the released sequence and survey before production welding. | yes |
| 40 — Qualified weld and controlled cool | 1680 min | Execute only the released weld map/WPS with heat-input and consumable records; use a balanced sequence and controlled cooling or stress relief where specified. | no |
| 50 — NDT, machine datums and coat | 1080 min | Complete VT and classed MT/UT, repair through an NCR, machine released interfaces, survey the frame, restore edge/cavity protection and record coating batches. | yes |

# LM3-MFG-020 — Reusable GFRP body, roof, end-cowl and interior panel mould families

- Work centre: local composite moulding, cure, trim and dry-fit cell
- Crew / planning cycle: 3 people / 24 hours elapsed
- Product IDs: `LM3-BDY-P130`, `LM3-BDY-P131`, `LM3-BDY-P132`, `LM3-BDY-P133`, `LM3-BDY-P140`, `LM3-CWL-P010`, `LM3-CWL-P011`, `LM3-CWL-P012`, `LM3-CWL-P013`, `LM3-CWL-P014`, `LM3-CWL-P015`, `LM3-CWL-P016`, `LM3-ROOF-P030`, `LM3-ROOF-P040`, `LM3-EXT-P080`, `LM3-EXT-P090`, `LM3-INT-P020`, `LM3-INT-P021`, `LM3-INT-P022`, `LM3-INT-P030`, `LM3-INT-P031`, `LM3-INT-P032`, `LM3-INT-P040`, `LM3-INT-P041`, `LM3-INT-P050`, `LM3-INT-P051`, `LM3-INT-P052`
- Tooling: `LM3-TOOL-SIDE-MOULD`, `LM3-TOOL-SIDE-VARIANT-NEST`, `LM3-TOOL-ROOF-MOULD`, `LM3-TOOL-ROOF-FAIRING-MOULD`, `LM3-TOOL-COWL-MOULD`, `LM3-TOOL-TRIM-DRILL`, `LM3-TOOL-INT-CEILING-MOULD`, `LM3-TOOL-INT-SIDE-MOULD`, `LM3-TOOL-INT-STRAKE-MOULD`, `LM3-TOOL-INT-DOOR-PRM-MOULD`
- Joining parts: potted threaded inserts; solid laminate clip lands; OSR-FST-M6-CAPTIVE; keyed over-centre clips; replaceable EPDM dry seals
- Release gate: Released laminate/core/insert map, fire evidence, material shelf life, mould survey, vacuum leak check, cure record, witness coupon, trim report, insert pull-out sample and master-frame dry fit.

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| 10 — Inspect, clean and release mould | 60 min | Inspect mould A-surface, split line, vacuum ports and datums; clean with the qualified system and apply the released semi-permanent release process. Record mould and release lots. | yes |
| 20 — Apply exterior finish primer or gelcoat | 75 min | Apply the released UV/fire-compatible finish layer at controlled wet-film thickness. The supplier minimum/maximum overcoat window overrides this planning allowance. | no |
| 30 — Load reinforcement, core, solid lands and inserts | 180 min | Place identified dry plies, local core and solid laminate lands to the released ply book; pot or fixture inserts and build a co-cured witness coupon. | yes |
| 40 — Bag, leak-test and infuse | 120 min | Install peel ply/flow media/bag and resin lines, record a stable vacuum leak test, then infuse within supplier temperature, viscosity and working-time limits. | yes |
| 50 — Cure in mould | 720 min | Hold the supplier-qualified time/temperature cure and record thermocouples. Do not demould on elapsed time alone; cure acceptance or hardness/Tg evidence controls release. | yes |
| 60 — Demould, trim, seal and dry-fit | 285 min | Demould without prying on show surfaces; inspect/tap-check, CNC trim and drill in the datum fixture, seal every cut edge, install inserts/seals, gauge the part and dry-fit it to the master frame. | yes |

# LM3-MFG-030 — In-mould base finish, applied livery film, and qualified radiative roof-coating route

- Work centre: local surface preparation, film application and controlled coating cell
- Crew / planning cycle: 2 people / 16 hours elapsed
- Product IDs: `LM3-BDY-P130`, `LM3-BDY-P131`, `LM3-BDY-P132`, `LM3-BDY-P133`, `LM3-CWL-P011`, `LM3-CWL-P012`, `LM3-CWL-P013`, `LM3-CWL-P014`, `LM3-CWL-P015`, `LM3-CWL-P016`, `LM3-FIN-P010`, `LM3-FIN-P020`
- Tooling: `LM3-TOOL-COATING-RACK`, `LM3-TOOL-COATING-COUPON`, `LM3-TOOL-FILM-TEMPLATE`, `LM3-TOOL-RADIATIVE-COUPON`
- Joining parts: in-mould white gelcoat or qualified base topcoat; rail-application livery film and edge treatment; sealed GFRP edges; masked CaCO3-acrylic candidate roof coating; traceable new/aged witness coupons
- Release gate: Base corrosion/fire protection accepted first; then film substrate/adhesion/edge/removal evidence and radiative-coating fire, adhesion, weathering, cleanability, glare and measured new/aged solar reflectance/emittance. No cooling or energy-saving claim before one-car thermal and maintenance trials.

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| 10 — Condition and inspect substrate | 60 min | Verify cured laminate, sealed edges, moisture/temperature limits and defect repair; mask bonds, seals, datums, windows, sensors and electrical earths. | yes |
| 20 — Prepare base finish and cut film | 120 min | Accept the fully cured corrosion/gelcoat base, make adhesion coupons, and plot/cut the livery film from controlled bay templates. Do not apply film over seals, drains, earths, labels, service lands or unresolved defects. | no |
| 30 — Apply livery film and candidate roof coating | 120 min | Dry-apply and squeegee the selected rail-use film with controlled seams/edges. On qualified exposed-roof zones only, mask all keep-outs and apply the CaCO3 candidate beside retained witness coupons to the released wet/dry-film range. | no |
| 40 — Controlled cure | 600 min | Maintain the film/coating suppliers' temperature, humidity and ventilation limits; post-heat or edge-treat film only where the selected system requires it, and let the roof coating reach its released cure before handling. | yes |
| 50 — Inspect and retain coupons | 60 min | Inspect bubbles, wrinkles, seams, edges and prohibited-zone masking; record coating thickness/adhesion/cure, colour/gloss and measured solar reflectance/emittance, and retain labelled coupons for UV, abrasion and wash ageing. | yes |

# LM3-MFG-040 — Replaceable side-window cassette, pressure frame, seal and drain installation

- Work centre: local glazing preparation and vehicle fit-out cell
- Crew / planning cycle: 2 people / 3 hours elapsed
- Product IDs: `LM3-BDY-P110`, `LM3-WIN-P010`, `LM3-EXT-P020`, `LM3-EXT-P030`, `LM3-FAS-P010`, `LM3-FAS-P030`
- Tooling: `LM3-TOOL-WINDOW-GAUGE`, `LM3-TOOL-GLASS-CARRIER-NEST`, `LM3-TOOL-WATER-TEST`
- Joining parts: supplier-bonded aluminium glazing cassette; replaceable closed-cell/EPDM outer seal; aluminium pressure frame; OSR-FST-M6-CAPTIVE; drain rail and jack points
- Release gate: Supplier glazing/edge certificate, retained frame calculation, approved surface preparation, seal compression map, drain test, water-ingress test, heater/isolation test where fitted and timed replacement demonstration.

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| 10 — Receive and inspect cassette | 25 min | Confirm pane/cassette identity and orientation; inspect laminate, edges, frame bond and heater terminals. Quarantine any edge impact, delamination or expired adhesive evidence. | yes |
| **Seq.** | **Planning time** | **Instruction** | **Hold point** |
| 20 — Gauge aperture and dry-fit | 35 min | Gauge carrier-ring datums and drains, protect glass edges, place the cassette on | yes |

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| | | nonmetallic setting blocks and confirmuniform design clearance without forcingthe glass. | |
| 30 — Install dry seal and pressure frame | 55 min | Fit the one-piece keyed seal without stretch, lubricants or unapproved sealant; install the pressure frame and tighten captive fasteners in the released cross-pattern to the joint schedule. | no |
| 40 — Verify compression, drains and services | 25 min | Measure seal compression at the released witness points; confirm drain continuity, secondary retention, electrical isolation and heater continuity where fitted. | yes |
| 50 — Water and replacement test | 40 min | Run the controlled spray test, inspect the dry side and drains, then remove/refit the first article with the documented lifting/jacking method and record elapsed replacement time. | yes |

# LM3-MFG-050 — Supplier door cassette on locally made four-point adjustable carrier

- Work centre: local door preparation, installation and static-test cell
- Crew / planning cycle: 3 people / 5 hours elapsed
- Product IDs: `LM3-BDY-P100`, `LM3-DOOR-P010`, `LM3-EXT-P010`
- Tooling: `LM3-TOOL-DOOR-GAUGE`, `LM3-TOOL-SEAL-GAUGE`
- Joining parts: four adjustable carrier shoes; two hardened datum pins; replaceable dry perimeter seal; OSR-FST-M10-SEAL; keyed body-side connector bracket
- Release gate: Supplier and interface freeze, carrier load proof, EN 14752/national evidence as applicable, datum and seal maps, closed-and-locked loop, obstacle detection, emergency release, water test and timed cassette replacement.

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| 10 — Accept supplier cassette and portal | 45 min | Verify serial/revision/evidence, inspect seals/leaf/drive and gauge the locally made portal and four carrier datums before lifting the cassette. | yes |
| 20 — Lift, pin and adjust carrier | 75 min | Use the approved lift points; engage datum pins, install four carrier shoes and adjust only within their released range to achieve leaf/aperture geometry without distorting the cassette. | yes |
| 30 — Join, seal and connect | 60 min | Install sealed fasteners to the controlled joint schedule, fit the keyed replaceable seal and connector, retain service loops and record final adjuster positions and witness marks. | no |
| 40 — Static functional and safety tests | 75 min | Test open/close cycles, obstruction detection, closed-and-locked circuit, traction interlock, emergency release, local isolation and degraded/manual operation under the supplier procedure. | yes |
| 50 — Ingress and replacement demonstration | 45 min | Run the controlled water test and first-article removal/refit; repeat safety tests after replacement and record time, tooling and adjustments. | yes |

# LM3-MFG-060 — Removable floor panels, transport flooring and common passenger-fixture rail

- Work centre: local interior panel, floor and fixture preassembly cell
- Crew / planning cycle: 4 people / 16 hours elapsed
- Product IDs: `LM3-EXT-P060`, `LM3-EXT-P061`, `LM3-EXT-P062`, `LM3-EXT-P063`, `LM3-EXT-P064`, `LM3-EXT-P065`, `LM3-EXT-P066`, `LM3-FIX-P010`, `LM3-FIX-P020`, `LM3-FIX-P030`, `LM3-INT-P020`, `LM3-INT-P021`, `LM3-INT-P022`, `LM3-INT-P030`, `LM3-INT-P031`, `LM3-INT-P032`, `LM3-INT-P040`, `LM3-INT-P041`, `LM3-INT-P050`, `LM3-INT-P051`, `LM3-INT-P052`
- Tooling: `LM3-TOOL-FLOOR-TEMPLATE`, `LM3-TOOL-FIXTURE-PROOF`
- Joining parts: removable sealed floor boards/hatches; rail-qualified resilient floor covering; OSR-RAIL-42; OSR-FST-M8-FLOAT; calculated seat/handrail saddles; OSR-FST-QT-CAPTIVE access panels

- Release gate: Fire/smoke certificates, substrate moisture/flatness, adhesive batch and open time, seam/edge detail, slip resistance, hatch removal, fixture load calculations and proof samples, PRM/egress gauge and snag/rattle inspection.

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| 10 — Dry-build removable floor and service hatches | 180 min | Gauge floor supports, dry-fit numbered boards/hatches, verify flush joints, edge radii, lift points and uninterrupted access to battery/HV inspection zones. | yes |
| 20 — Prepare floor and pre-cut covering | 150 min | Verify substrate flatness, dryness and cleanliness; cut labelled floor pieces from controlled CAD templates and preserve access-hatch breaks, coved edges and drainage paths. | no |
| 30 — Bond covering | 210 min | Condition material, apply only the selected supplier adhesive at specified spread rate/open time, lay without trapped air, roll in both directions and complete released seam/edge treatment. | yes |
| 40 — Install service rails and inserts | 180 min | Set blind threaded inserts perpendicular with the supplier force-controlled tool and sampled pull checks; gauge OSR-RAIL-42 pitch/alignment and preserve galvanic isolation. | yes |
| 50 — Mount and proof passenger fixtures | 180 min | Install seats, handrails and equipment through released saddles/joints; record torque/locking, then proof-load first articles to the approved fixture calculation without using trim as a load path. | yes |
| 60 — Finish, cure and inspect | 60 min | Respect adhesive return-to-service time, inspect adhesion/seams/slip and PRM geometry, remove/refit every service hatch and complete snag, sharp-edge and rattle checks. | yes |

# LM3-MFG-070 — Supplier traction motor/gearbox integration into locally fabricated powered bogie

- Work centre: local bogie build, alignment and static-test cell
- Crew / planning cycle: 4 people / 12 hours elapsed
- Product IDs: `LM3-BOG-P010`, `LM3-BOG-P030`, `LM3-BOG-P031`, `LM3-BOG-P040`, `LM3-BOG-P041`, `LM3-BOG-P042`, `LM3-BOG-P043`, `LM3-BOG-P044`, `LM3-BOG-P045`, `LM3-BOG-P046`, `LM3-BOG-P047`, `LM3-BOG-P048`, `LM3-BOG-P049`, `LM3-BOG-P050`, `LM3-BOG-P060`, `LM3-BOG-P061`, `LM3-TRC-P010`, `LM3-TRC-P020`
- Tooling: `LM3-TOOL-BOGIE-STAND`, `LM3-TOOL-MOTOR-ALIGN`
- Joining parts: supplier motor and gearbox mounting kit; calculated high-integrity bolted joints; torque link and safety lanyard; flexible coupling; bonding braid; sealed harness brackets
- Release gate: Supplier motor/gearbox/wheelset/brake freeze, bogie-frame proof/NDT, mount-load proof, certified fastener/joint schedule, alignment and backlash, lubrication, insulation/bonding, rotation, brake and thermal instrumentation tests.

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| 10 — Accept frame and supplier kits | 90 min | Verify bogie frame NDT/datum survey and all serialized motor, gearbox, coupling, wheelset, bearing, brake and suspension evidence before unpacking. | yes |
| 20 — Set wheelsets and running gear | 150 min | Load the controlled bogie stand, install axlebox/suspension/brake kits under supplier instructions and record orientation, clearances, lubrication and safety locking. | yes |
| 30 — Install and align motor/gearbox | 180 min | Use the dedicated alignment fixture; lift from supplier points, set mount shims, coupling/gear mesh and torque link, then close released high-integrity joints with calibrated tools and independent witness. | yes |
| 40 — Route services and guards | 90 min | Install bonding, temperature/speed/WSP harnesses, junctions, guards and safety lanyards with released bend radii, movement envelope and service access. | no |
| 50 — Static rotation, brake and electrical tests | 150 min | Check free rotation, alignment/backlash, oil level/leaks, brake application/release, insulation resistance, bonding and sensor polarity before powered testing. | yes |
| 60 — Release and preserve | 60 min | Record mass/ride-height setup, close inspection covers, apply witness marks and preservation, and quarantine the bogie until vehicle marriage. | yes |

# LM3-MFG-080 — Lighting, HVAC, HV/LV services and keyed replaceable modules

- Work centre: local harness, interior systems and roof-module preassembly cells
- Crew / planning cycle: 4 people / 16 hours elapsed
- Product IDs: `LM3-LGT-P010`, `LM3-LGT-P020`, `LM3-INT-P010`, `LM3-EXT-P040`, `LM3-EXT-P050`, `LM3-EXT-P070`, `LM3-ROOF-P010`, `LM3-ROOF-P020`, `LM3-ROOF-P030`, `LM3-ROOF-P040`, `LM3-HV-P010`, `LM3-HV-P020`, `LM3-HV-P030`, `LM3-TRC-P030`, `LM3-TRC-P040`, `LM3-TRC-P050`, `LM3-TRC-P060`, `LM3-TRC-P070`, `LM3-CTRL-P040`, `LM3-END-P020`, `LM3-END-P030`, `LM3-END-P050`, `LM3-FAS-P020`
- Tooling: `LM3-TOOL-SERVICE-RAIL`, `LM3-TOOL-HARNESS-BOARD`, `LM3-TOOL-LAMP-AIM`
- Joining parts: OSR-RAIL-42; OSR-FST-M6-CAPTIVE; OSR-CON-LV4; OSR-CON-LVDATA12; sealed HV connectors; segregated service trays; removable HVAC curb seal
- Release gate: Supplier evidence, fire/EMC/vibration/IP checks, harness 100% continuity and insulation, keyed/polarity audit, HVIL, fluid pressure/drain tests, lighting lux/emergency-duration test, HVAC airflow and condensate test.

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| 10 — Preassemble and test modules off vehicle | 180 min | Build lighting, harness, duct, tray and cabinet modules on dedicated boards/rails; record serials, connectors, firmware/configuration and incoming evidence. | yes |
| 20 — Install rails, trays, ducts and curb seals | 180 min | Gauge common datums, install isolated rails/trays and supplier-approved seals, protect fire barriers and preserve removable access zones. | no |
| 30 — Install keyed LV/data and segregated HV services | 240 min | Route pre-terminated looms to released clips and bend radii; keep HV, LV/data and fluids segregated, fit service loops and blanking caps, and prevent field-cut lighting wires. | yes |
| 40 — Install HVAC, batteries and power modules | 180 min | Use approved lifts and supplier mounting kits; close coolant, drain, bond, service-disconnect and HVIL interfaces under LOTO. | yes |
| 50 — Cold commissioning | 120 min | Complete continuity, insulation, bonding, connector keying, sensor enumeration, pressure/leak and drain-flow tests before energisation. | yes |
| 60 — Functional release | 60 min | Run lighting lux/emergency tests, HVAC airflow/condensate tests and controlled HVIL/pre-charge checks; attach actual records to the train configuration. | yes |

# LM3-MFG-090 — Three-car final assembly, static test and manufacturing release

- Work centre: 55 m local final assembly and static-test road
- Crew / planning cycle: 8 people / 48 hours elapsed
- Product IDs: `LM3-END-P010`, `LM3-END-P040`, `LM3-END-P060`, `LM3-END-P061`, `LM3-END-P062`, `LM3-ART-P020`, `LM3-ART-P021`, `LM3-ART-P022`, `LM3-ART-P023`, `LM3-ART-P024`, `LM3-ART-P030`, `LM3-ART-P040`, `LM3-ART-P041`, `LM3-AUX-P010`, `LM3-SAF-P010`, `LM3-CTRL-P010`, `LM3-CTRL-P020`, `LM3-CTRL-P030`, `LM3-CTRL-P050`
- Tooling: `LM3-TOOL-LIFT-COLUMNS`, `LM3-TOOL-FINAL-DATUM`
- Joining parts: released bogie-to-body joints; articulation/coupler supplier kits; segregated trainline jumpers; bonding network; configuration-controlled safety/control equipment
- Release gate: All child travelers accepted, train mass/geometry/clearance, brake/door/HV/communications/fire-detection tests, software/configuration hashes, static and low-speed test evidence, open NCR review and independent manufacturing release.

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| 10 — Accept child assemblies and final road | 240 min | Verify signed child travelers, serial/configuration records, lifting-column certification, track level and vehicle datum survey; unresolved safety NCRs block marriage. | yes |

| Seq. | Planning time | Instruction | Hold point |
|---|---|---|---|
| 20 — Bogie marriage and articulation | 600 min | Lift only at released points, roll accepted bogies into surveyed positions, lower onto interfaces, close body/bogie and articulation joints, and independently witness safety-critical locking. | yes |
| 30 — Close trainlines, couplers and remaining fit-out | 480 min | Connect labelled HV/LV/data/coolant/air paths, install end equipment and remaining service panels, then perform continuity, leak, movement-envelope and access checks. | yes |
| 40 — Static systems commissioning | 720 min | Run brake, door/interlock, lighting, HVAC, battery/HVIL, detection, communications, passenger systems, emergency and degraded-mode procedures against released test scripts. | yes |
| 50 — Geometry, mass and water tests | 360 min | Survey ride height/body/articulation/clearance, weigh the train, run roof/door/window ingress tests and reconcile the as-built mass and configuration records. | yes |
| 60 — Independent review and controlled release | 480 min | Review all records and NCRs, freeze software/configuration hashes and issue only a manufacturing release to the authorised low-speed/static test programme—not passenger service approval. | yes |

## External design references

These links explain the engineering basis; they are not copied supplier instructions or a substitute for the selected product's current technical datasheet.

- ERA LOC&PAS TSI application guide — Passenger-door, glazing, structure and rolling-stock evidence gates; deployment authority must select the legally applicable national/current standards.
- Composites One vacuum infusion process — Generic closed-mould sequence: dry reinforcement, vacuum/process materials, resin infusion, controlled cure and demould. Product-specific laminate and resin instructions remain controlling.
- Sika rail bonding, sealing and glazing application overview — Surface preparation, controlled bead geometry, glazing, floor/interior bonding and exterior sealing process categories; the selected adhesive technical datasheet controls primers, open time, cure and safe handling.
- Forbo rail flooring installation and maintenance download centre — Rail-floor material, installation, cleaning and maintenance evidence route; selected floor and adhesive documents control actual installation.
- US Department of Energy guidelines for high-reflectance, high-emittance surfaces — Screening rationale for measuring solar reflectance and thermal emittance. Building-roof thresholds are not transferred as rail certification or an LM3 performance claim.
- 3M Application: Rail instruction bulletin — Rail-vehicle graphic-film substrate inspection, cleaning, adhesion trial, dry application, edge treatment, inspection, maintenance and removal route; the selected film and overlaminate product bulletins remain controlling.
- Purdue full daytime sub-ambient CaCO3-acrylic radiative-cooling paint paper — Research basis for the CaCO3-acrylic candidate and initial optical targets. It is not rail qualification, a commercial product release, or evidence of durability on moving-vehicle GFRP.
- Böllhoff RIVNUT installation and setting guidance — One-sided threaded insert installation, perpendicularity, supplier setting force and tool-control principles. Released joint loads and supplier data control selection.
- Knorr-Bremse IFE modular rail entrance systems — Complete supplier-owned door cassette, drive, controller, obstacle detection, commissioning and lifecycle boundary.
- ABB AMXM railway traction motor family — Supplier-frozen railway traction-motor envelope and evidence route; no vendor model or rating is selected by this reference.

## Controlled inputs

- Method source: `lib/templates/trainset-manufacturing-methods.toml` (`814542c64f387f4ba32a2126552ec5636f0839dfdaf547fdea6ae56b0ab1b06d`)

- Product manifest: `design/component-catalogue/catalog/buildable-trainset/buildable-trainset-manifest.json` (`ca385a6d3c27ee343d7f4bc4c90b4f4e27058380ff82a0aa76ca573275149703`)

# LM3 controlled mass budget

Repository source: `design/component-catalogue/catalog/buildable-trainset/mass-budget.md`

Generated from the promoted design candidate and baseline constants. This record resolves the earlier ambiguity between the optimizer subtotal and the planning tare; it is not a substitute for drawing-level or as-built weighing.

- Candidate: `light-metro-3car__16p5m__reference-body__reference-bogie__motor-350kw-hm47-class__battery-225kwh-lfp-800v__hvac-24kw-direct-hv-dc__pv12`
- Document revision: `A-DRAFT`
- Release status: `planning-control`

| Category | Modeled mass (kg) |
|---|---|
| carbody primary structure | 25,623.53 |
| bogie frames, wheelsets, brakes, and suspension | 20,190.00 |
| traction motors, gearboxes, and controllers | 3,360.00 |
| traction batteries | 4,350.00 |
| roof HVAC | 1,530.00 |
| roof PV | 864.00 |
| doors, glazing, interior, and auxiliaries | 16,350.00 |
| end cowls and interfaces | 1,240.00 |
| inter-car articulation | 1,800.00 |
| Modeled subtotal | 75,308 |
| Engineering reserve (4.57 %) | 3,442 |
| Controlled planning tare | 78,750 |

## Closure rule

Replace category estimates with weighed, supplier-frozen, or CAD-derived masses; transfer consumed reserve to the affected category; do not reduce controlled tare until the signed trainset weigh establishes the as-built value.

The reserve currently covers unclosed wiring, fluids, fasteners, coatings, production tolerances, and supplier mass growth. Every released drawing or supplier selection must update its category without hiding growth in another line. Final closure requires individual car weights and a complete trainset weight recorded by serial number.

# LM3 product-level mass closure and lightweighting ledger

Repository source: `design/component-catalogue/catalog/buildable-trainset/mass-closure-ledger.md`

This ledger assigns every product row to one controlled planning category. It does not divide the category allowance into invented part masses: the current product geometry is an envelope/representation set, not production-solid mass evidence.

- Controlled planning tare: 78,750 kg
- Modeled exact subtotal: 75,307.53 kg
- Engineering reserve: 3,442 kg
- Coverage: 120/120 rows mapped; 0/117 active rows mass-closed

## Category responsibility

| Planning category | Budget (kg) | Rows | Active | Closed active | Status |
|---|---|---|---|---|---|
| carbody primary structure | 25,623.53 | 19 | 19 | 0 | `open-product-mass-evidence` |
| bogie frames, wheelsets, brakes, and suspension | 20,190.00 | 17 | 17 | 0 | `open-product-mass-evidence` |
| traction motors, gearboxes, and controllers | 3,360.00 | 3 | 3 | 0 | `open-product-mass-evidence` |
| traction batteries | 4,350.00 | 4 | 4 | 0 | `open-product-mass-evidence` |
| roof HVAC | 1,530.00 | 4 | 4 | 0 | `open-product-mass-evidence` |
| roof PV | 864.00 | 3 | 3 | 0 | `open-product-mass-evidence` |
| doors, glazing, interior, and auxiliaries | 16,350.00 | 43 | 43 | 0 | `open-product-mass-evidence` |
| end cowls and interfaces | 1,240.00 | 18 | 17 | 0 | `open-product-mass-evidence` |
| inter-car articulation | 1,800.00 | 9 | 7 | 0 | `open-product-mass-evidence` |

## Lightweighting decision

The lightest feasible candidate already present in the declared design space is `light-metro-3car__16p5m__light-body__light-bogie__motor-350kw-hm47-class__battery-225kwh-lfp-800v__hvac-24kw-direct-hv-dc__pv12` at 73,375.62 kg before reserve. It saves 1,931.91 kg (2.57%) against the selected modeled candidate. Keeping the reserve unchanged gives 76,817.62 kg, not a closed new tare.

Decision: retain the 78,750 kg controlled planning tare; the lighter candidate is a study option, not achieved mass.

Promotion gates:

- close every active product row with accepted CAD, supplier and/or calibrated weigh evidence
- reconcile individual-car and complete-train weights, axle loads and longitudinal/vertical centre of gravity
- repeat structural, crash, fatigue, dynamics, braking, thermal and manufacturability substantiation for changed gauges
- approve reserve drawdown and configuration change through the design authority

## Recovery reaction link

All cases retain the 200 kN/point rail-rated portable-cylinder envelope.

| Mass scenario | Status | Train (kg) | Full car, 4-point (kN/point) | One end, 2-point (kN/point) |
|---|---|---|---|---|
| `controlled-planning-tare` | controlled design basis; product mass evidence open | 78,750.00 | 130.32 | 156.39 |
| `lightest-existing-feasible-design-space-with-same-reserve` | unpromoted candidate; structural, dynamic, manufacturing and mass closure required | 76,817.62 | 127.12 | 152.55 |
| `tare-minus-10-percent` | sensitivity only; no corresponding closed design candidate | 70,875.00 | 117.29 | 140.75 |
| `tare-minus-20-percent` | sensitivity only; no corresponding closed design candidate | 63,000.00 | 104.26 | 125.11 |

Lower mass reduces calculated reactions, but it does not authorise scissor jacks, unilateral lifting or a reduced-capacity recovery kit.

# Product closure rows

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| LM3-BDY-P010 — laser-cut side sill beam, LH/RH | MAKE | 6 ea | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BDY-P020 — underframe centre spine and longitudinal load-path kit | MAKE | 3 kit | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BDY-P021 — underframe cross-bearer, door-bay outrigger, and equipment-bracket pack | MAKE | 3 car pack | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BDY-P030 — bolster box, air-spring pad, and centre-pivot insert set | MAKE | 6 set | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BDY-P040 — coupler pocket, shear plate, and crash-can insert kit | MAKE | 2 set | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BDY-P050 — battery tray rails, vent plenum, and service-lid gutter kit | MAKE | 3 kit | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BDY-P060 — low-floor centre pan and removable service-floor support set | MAKE | 3 set | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BDY-P061 — raised bogie-end deck, transition ramp, and removable hatch-frame set | MAKE | 3 car set | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BDY-P070 — side-wall post, door portal, waist rail, and cant rail kit | MAKE | 6 side | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BDY-P080 — roof bow, HVAC rail, PV rail, and cable-tray bracket kit | MAKE | 3 kit | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BDY-P090 — end ring frame and anti-climber beam set | MAKE | 2 set | carbody primary structure | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-END-P060 — common reversible end-interface carrier ring, option bolt grid, and sealing datum kit | MAKE | 2 end position | end cowls and interfaces | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| `LM3-END-P061` — panoramic-end option shim, cowl/glass carrier, and sensor datum closeout kit | `MAKE` | 2 option kit | end cowls and interfaces | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-END-P062` — mid open-connection option portal trim, bellows clamp, threshold bridge, and drain kit | `MAKE` | 0 option kit | end cowls and interfaces | `inactive-option-not-weighed` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-BDY-P100` — door portal reinforcement, threshold beam, and cassette shim kit | `MAKE` | 12 opening kit | carbody primary structure | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-BDY-P110` — window carrier ring, bonded-gasket land, and replacement jack-point inserts | `MAKE` | 18 opening kit | carbody primary structure | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-BDY-P120` — jacking pad, lifting eye, towing lug, and recovery-label kit | `MAKE` | 3 car kit | carbody primary structure | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-BDY-P130` — one-metre clip-on solid-side fiberglass body module | `MAKE` | 48 module | carbody primary structure | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-BDY-P131` — one-metre clip-on window-edge fiberglass side module | `MAKE` | 24 module | carbody primary structure | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-BDY-P132` — one-metre clip-on door-edge fiberglass side module | `MAKE` | 24 module | carbody primary structure | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-BDY-P133` — one-metre clip-on fiberglass roof skin and equipment-fairing module | `MAKE` | 48 module | carbody primary structure | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-BDY-P140` — keyed clip rail, captive retainer, anti-lift, and dry-seal car kit | `MAKE` | 3 car kit | carbody primary structure | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-ROOF-P010` — HVAC curb, drop-duct collar, condensate tray, and drain fitting kit | `MAKE` | 3 kit | roof HVAC | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-ROOF-P020` — PV bonded-pad lands, raised rail kit, bonding jumpers, and roof isolation labels | `MAKE` | 3 car kit | roof PV | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| **Product** | **Route** | **Qty** | **Mass responsibility** | **Evidence state** | **Minimum evidence** |
| `LM3-ROOF-P030` — removable HVAC curb fairing, intake/exhaust skirt, and access-hatch | `MAKE` | 3 car set | roof HVAC | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; |

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| moulding set | | | | | first-article calibratedcomponent or completed-subassembly weigh record |
| LM3-ROOF-P040 — PV junction plinth, cable-gland cover, antenna closeout, and walkway edge set | MAKE | 3 car set | roof PV | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-CWL-P010 — end-cowl fiberglass laminate, insert, adhesive, and coupon material kit | SOURCE | 2 kit | end cowls and interfaces | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-CWL-P011 — CWL-FRP-01 upper brow and roof-cap fiberglass cast | MAKE | 2 ea | end cowls and interfaces | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-CWL-P012 — CWL-FRP-02 left cheek fiberglass cast | MAKE | 2 ea | end cowls and interfaces | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-CWL-P013 — CWL-FRP-03 right cheek fiberglass cast | MAKE | 2 ea | end cowls and interfaces | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-CWL-P014 — CWL-FRP-04 lower apron and anti-climber cover fiberglass cast | MAKE | 2 ea | end cowls and interfaces | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-CWL-P015 — CWL-FRP-05 lamp, washer, and service-hatch fiberglass cast set | MAKE | 4 hatch | end cowls and interfaces | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-CWL-P016 — CWL-FRP-06 backing-ring flange fiberglass cast set | MAKE | 8 flange section | end cowls and interfaces | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-FAS-P010 — panoramic front-glass carrier ring, setting-block pockets, and secondary-retention frame | MAKE | 2 end set | end cowls and interfaces | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-FAS-P020 — reversible front-lamp cassette tray, aiming adjusters, and retained service bracket | MAKE | 2 end set | end cowls and interfaces | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-FAS-P030 — front glazing/lamp EPDM seal, drain rail, washer sleeve, and edge-closeout kit | SOURCE | 2 end kit | end cowls and interfaces | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-ART-P010 — articulation adapter frame, anti-lift keeper, and shim kit | MAKE | 2 kit | inter-car articulation | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| LM3-BOG-P010 — powered bogie welded H-frame and motor-cradle weldment | MAKE | 3 ea | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BOG-P020 — trailer bogie welded H-frame | MAKE | 3 ea | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BOG-P030 — powered-bogie guards, cable guides, WSP brackets, and inspection covers | MAKE | 3 kit | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BOG-P031 — trailer-bogie guards, cable guides, WSP brackets, and inspection covers | MAKE | 3 kit | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BOG-P050 — powered-bogie motor torque link, anti-rotation stop, and safety lanyard bracket kit | MAKE | 3 bogie kit | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BOG-P060 — powered-bogie brake/WSP/speed-sensor harness and junction-bracket kit | MAKE | 3 bogie kit | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-BOG-P061 — trailer-bogie brake/WSP/speed-sensor harness and junction-bracket kit | MAKE | 3 bogie kit | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-EXT-P010 — electric plug/sliding door cassette | BID | 12 ea | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-EXT-P020 — side laminated glazing cassette | SOURCE | 18 ea | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-EXT-P030 — single panoramic heated end-glass assembly | BID | 2 ea | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-EXT-P040 — hvac-24kw-direct-hv-dc roof HVAC | BID | 3 ea | roof HVAC | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-EXT-P050 — roof PV module and edge-clamp kit | SOURCE | 36 module | roof PV | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| LM3-EXT-P060 — stepped floor-board and removable service-hatch system | SOURCE | 135 m2 | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-EXT-P061 — welded resilient floor covering, cove, nosing, and adhesive system | SOURCE | 135 m2 | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-EXT-P062 — longitudinal passenger and priority-seat modules | SOURCE | 60 seat | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-EXT-P063 — stainless grab-pole, handrail, joint, and insulated adapter kit | SOURCE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-EXT-P064 — passenger-information display, speaker, amplifier, and mounting kit | SOURCE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-EXT-P065 — CCTV camera, passenger intercom, PoE/data, and mounting kit | SOURCE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-EXT-P066 — PRM, safety-signage, emergency-lighting, extinguisher, and first-aid kit | SOURCE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-FIX-P010 — OSR-RAIL-42 common ceiling, waist, and seat-zone service rail kit | MAKE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-FIX-P020 — four-family captive fastener, floating nut, isolator, and access-fastener kit | SOURCE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-FIX-P030 — standard passenger-fixture saddle and equipment adapter kit | MAKE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-WIN-P010 — replaceable window pressure frame, dry seal, drain, and captive retention kit | MAKE | 18 opening kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| **Product** | **Route** | **Qty** | **Mass responsibility** | **Evidence state** | **Minimum evidence** |
| LM3-DOOR-P010 — door four-point adjustable carrier, datum pin, dry seal, | MAKE | 12 opening kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness |

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| and keyed connector bracket kit | | | | | and finish density;first-article calibratedcomponent or completed-subassembly weigh record |
| `LM3-LGT-P010` — 1.2 m plug-in main LED lighting cassette and captive mounting kit | `SOURCE` | 66 module | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-LGT-P020` — emergency and doorway lighting modules with independent keyed feeder kit | `BID` | 3 car kit | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-EXT-P070` — roof antennas, service walkway pads, lifting covers, and maintenance labels | `SOURCE` | 3 car kit | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-EXT-P080` — fire-rated GFRP side-module laminate, core, gelcoat, and consumable kit | `BID` | 6 side kit | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-EXT-P090` — fire-rated GFRP roof-module, dry-seal, and removable skirt material kit | `BID` | 3 car kit | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-FIN-P010` — pre-cut exterior livery graphic film, edge-seal, datum-mark, and repair-patch kit | `BID` | 3 car kit | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-FIN-P020` — calcium-carbonate radiative roof-coating qualification and exposed-roof application kit | `BID` | 3 car kit | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-INT-P010` — HVAC diffusers, side return ducts, saloon grilles, and access panels | `SOURCE` | 3 car kit | roof HVAC | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-INT-P020` — FRP/phenolic ceiling liner panel set | `MAKE` | 3 car kit | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-INT-P021` — ceiling light-trough bezel, diffuser carrier, and emergency-luminaire closeout set | `MAKE` | 3 car set | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| `LM3-INT-P022` — HVAC plenum cover, diffuser transition, detector bezel, and ceiling service-hatch set | `MAKE` | 3 car set | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| LM3-INT-P030 — FRP/phenolic sidewall liner panel set | MAKE | 6 side kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-INT-P031 — window reveal, setting-block inspection cover, and blind/label land set | MAKE | 6 side set | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-INT-P032 — waist cable-cover, low-voltage access lid, and retained quarter-turn fastener set | MAKE | 6 side set | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-INT-P040 — FRP battery strake cover panel set | MAKE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-INT-P041 — seat-base fairing, retained equipment hatch, and rail-saddle closeout set | MAKE | 3 car set | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-INT-P050 — FRP vestibule kick-panel and threshold-closeout set | MAKE | 12 door-zone kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-INT-P051 — PRM transition-ramp, bogie-deck step-cover, contrast-nosing, and anti-slip set | MAKE | 6 end-zone set | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-INT-P052 — door-pocket liner, sensitive-edge clearance trim, and removable jamb-cover set | MAKE | 12 door-zone set | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-TRC-P010 — motor-350kw-hm47-class axle traction motor | BID | 6 ea | traction motors, gearboxes, and controllers | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-TRC-P020 — single-stage reduction gearbox and flexible coupling | BID | 6 ea | traction motors, gearboxes, and controllers | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-TRC-P030 — two independent motor controllers, isolated LV DC/DC, MPPT, station protection, and cooling-loop kit | BID | 3 car kit | traction motors, gearboxes, and controllers | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-TRC-P040 — battery-225kwh-lfp-800v saloon-isolated side traction battery pack | BID | 3 ea | traction batteries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| LM3-HV-P010 — battery sliding trays, retention straps, service interlocks, and drain pans | MAKE | 3 car kit | traction batteries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-HV-P020 — segregated HV cable tray, bonding studs, grommets, and orange cover set | MAKE | 3 car kit | traction batteries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-HV-P030 — coolant manifold brackets, bleed/drain points, and insulated pipe clamp kit | MAKE | 3 car kit | traction batteries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-TRC-P050 — roof-mounted regen dump resistor and thermal shield kit | SOURCE | 3 ea | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-TRC-P060 — station side-pin charging connector, actuator, shutter, and alignment target | BID | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-TRC-P070 — HV contactor, fuse, pre-charge, service-disconnect, and current-sensor panel | SOURCE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-SAF-P010 — battery temperature/off-gas detection, electrical-enclosure smoke detection, and localized mist kit | SOURCE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-BOG-P040 — powered-bogie wheelset with axle-mounted brake discs | BID | 6 wheelset | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-BOG-P041 — trailer-bogie wheelset with axle-mounted brake discs | BID | 6 wheelset | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-BOG-P042 — powered-wheelset axlebox, sealed bearing unit, speed and temperature sensor set | BID | 6 wheelset set | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-BOG-P043 — trailer-wheelset axlebox, sealed bearing unit, speed and temperature sensor set | BID | 6 wheelset set | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| **Product** | **Route** | **Qty** | **Mass responsibility** | **Evidence state** | **Minimum evidence** |
| LM3-BOG-P044 — powered-bogie primary suspension spring, guide | BID | 3 bogie set | bogie frames, wheelsets, brakes, and suspension | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate |

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| and bump-stop set | | | | | with included/excludedscope; calibrated receiptweigh or acceptedinstalled-systemreconciliation |
| `LM3-BOG-P045` — trailer-bogie primary suspension spring, guide and bump-stop set | `BID` | 3 bogie set | bogie frames, wheelsets, brakes, and suspension | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-BOG-P046` — powered-bogie to carbody connection: air springs, emergency spring, centre pivot, yaw links and dampers | `BID` | 3 bogie set | bogie frames, wheelsets, brakes, and suspension | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-BOG-P047` — trailer-bogie to carbody connection: air springs, emergency spring, centre pivot, yaw links and dampers | `BID` | 3 bogie set | bogie frames, wheelsets, brakes, and suspension | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-BOG-P048` — powered-bogie brake calipers, parking actuators, pads and wheel-slide hardware | `BID` | 3 bogie set | bogie frames, wheelsets, brakes, and suspension | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-BOG-P049` — trailer-bogie brake calipers, parking actuators, pads and wheel-slide hardware | `BID` | 3 bogie set | bogie frames, wheelsets, brakes, and suspension | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-AUX-P010` — secondary-suspension compressor, dryer, reservoir, and isolation-manifold kit | SOURCE | 3 car kit | doors, glazing, interior, and auxiliaries | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-END-P010` — automatic end coupler and crash-energy absorber | `BID` | 2 ea | end cowls and interfaces | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-ART-P020` — articulation lower spherical pivot, bearing housing and pin set | `BID` | 2 joint set | inter-car articulation | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-ART-P021` — articulation upper lateral/yaw links, spherical joints and retained pins | `BID` | 2 joint set | inter-car articulation | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-ART-P022` — inter-car double-wall corrugated bellows and clamp-frame set | `BID` | 2 gangway set | inter-car articulation | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| **Product** | **Route** | **Qty** | **Mass responsibility** | **Evidence state** | **Minimum evidence** |
| `LM3-ART-P023` — inter-car passenger bridge, turntable and flexible interior-panel set | `BID` | 2 gangway set | inter-car articulation | `unclosed-evidence-required` | selected exact supplier configuration mass declaration or certificate with included/excluded |

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| | | | | | scope; calibrated receiptweigh or acceptedinstalled-systemreconciliation |
| LM3-ART-P024 — articulation trainline carrier, support arms, abrasion liners and drain path | SOURCE | 2 carrier set | inter-car articulation | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-CTRL-P010 — T-ECU/S and T-ECU/A compute and safety-control cabinet kit | BID | 1 trainset kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-CTRL-P020 — navigation, balise, 5G, LoRa, GNSS, IMU, and roof-antenna kit | SOURCE | 1 trainset kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-CTRL-P030 — maintenance HMI, depot pendant, emergency controls, and safety-relay kit | BID | 1 trainset kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-CTRL-P040 — pre-terminated LV trainline harness, DIN cabinet, and terminal-distribution kit | MAKE | 3 car kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-CTRL-P050 — operational and crashworthy event-recorder storage kit | SOURCE | 1 trainset kit | doors, glazing, interior, and auxiliaries | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-END-P020 — T-OBS nose sensor pack, heated window services, and washer kit | BID | 2 ea | end cowls and interfaces | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-END-P030 — cowl service hatch, sensor backing bracket, washer-tube, and heater-cable clip kit | MAKE | 2 end kit | end cowls and interfaces | unclosed-evidence-required | released production-solid CAD mass-property report with material, thickness and finish density; first-article calibrated component or completed-subassembly weigh record |
| LM3-END-P040 — e-coupler LV jumper, recovery trainline, and end harness breakaway kit | BID | 2 end kit | end cowls and interfaces | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-END-P050 — sealed headlight, tail/marker light, threshold-warning, and end-lamp harness kit | SOURCE | 2 end kit | end cowls and interfaces | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| LM3-ART-P030 — inter-car HV/LV jumper, coolant hose loop, energy chain, and drain sleeve kit | BID | 2 articulation kit | inter-car articulation | unclosed-evidence-required | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |

| Product | Route | Qty | Mass responsibility | Evidence state | Minimum evidence |
|---|---|---|---|---|---|
| `LM3-ART-P040` — train-to-train open-end articulation, gangway, drawbar, turntable, and service-jumper cassette | `BID` | 0 joint kit | inter-car articulation | `inactive-option-not-weighed` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |
| `LM3-ART-P041` — train-to-train jumper blanking, transition harness, isolation label, and dust-cover kit | `SOURCE` | 0 joint kit | inter-car articulation | `inactive-option-not-weighed` | selected exact supplier configuration mass declaration or certificate with included/excluded scope; calibrated receipt weigh or accepted installed-system reconciliation |

## Closure rule

Do not reduce controlled tare until all active row evidence is accepted and a signed trainset weight-and-balance report closes category totals, individual-car weights, axle loads and centre of gravity.

# Trainset open release gap register

Repository source: `design/component-catalogue/catalog/buildable-trainset/open-release-gaps.md`

Generated from the same controlled product rows used by the definition and shop-traveler packs. Product ownership and procurement-BOM links are already resolved; the rows below still require supplier, component, or interface evidence before their maturity can become `release-candidate`.

Open product rows: 81 of 120.

| LM3-ART-P021 | B9 | BID | buildable-after-supplier-freeze | articulation upper lateral/yaw links, spherical joints and retained pins | LM3-ART-SA810 | link buckling/fatigue proof; joint angular capacity; pin retention inspection; full-motion sweep |
| LM3-ART-P022 | B9 | BID | buildable-after-supplier-freeze | inter-car double-wall corrugated bellows and clamp-frame set | LM3-ART-SA820 | fire/smoke evidence; pressure/water ingress test; fatigue-cycle evidence; replaceable-clamp demonstration |
| LM3-ART-P023 | B9 | BID | buildable-after-supplier-freeze | inter-car passenger bridge, turntable and flexible interior-panel set | LM3-ART-SA820 | passenger load proof; anti-slip evidence; gap/step gauge; pinch/shear hazard review; full-motion sweep |
| LM3-ART-P024 | B24 | SOURCE | buildable-after-supplier-freeze | articulation trainline carrier, support arms, abrasion liners and drain path | LM3-ART-SA830 | rated bend radius; dynamic sweep; abrasion/fire evidence; drain test; service replacement trial |
| LM3-CTRL-P010 | E1, E2, E6, E14, E15 | BID | buildable-after-supplier-freeze | T-ECU/S and T-ECU/A compute and safety-control cabinet kit | LM3-SYS-SA900 | hardware BOM check; self-test; network enumeration; firmware record; safety-output test |
| LM3-CTRL-P020 | E3, E4, E5, E6, E7, E8, E21 | SOURCE | buildable-after-supplier-freeze | navigation, balise, 5G, LoRa, GNSS, IMU, and roof-antenna kit | LM3-SYS-SA900 | SKU/firmware record; antenna VSWR; GNSS/IMU test; balise read; radio link test |
| LM3-CTRL-P030 | E10, E11, E12, E13, E16 | BID | buildable-after-supplier-freeze | maintenance HMI, depot pendant, emergency controls, and safety-relay kit | LM3-SYS-SA900 | key/guarded-control test; emergency input test; 2oo2 relay test; stowage and access check |
| LM3-CTRL-P050 | E9, E23 | SOURCE | buildable-after-supplier-freeze | operational and crashworthy event-recorder storage kit | LM3-SYS-SA900 | write/read test; retention configuration; crashworthy certificate; download/recovery test |
| LM3-END-P020 | E15, E18, E19 | BID | buildable-after-supplier-freeze | T-OBS nose sensor pack, heated window services, and washer kit | LM3-END-SA700 | sensor calibration; washer/heater test; 2oo2 verdict interface test |
| LM3-END-P040 | B22, E17 | BID | buildable-after-supplier-freeze | e-coupler LV jumper, recovery trainline, and end harness breakaway kit | LM3-END-SA700 | pinout test; breakaway force check; ingress protection; rescue compatibility |
| LM3-END-P050 | B17 | SOURCE | buildable-after-supplier-freeze | sealed headlight, tail/marker light, threshold-warning, and end-lamp harness kit | LM3-END-SA700 | photometric certificate; function/polarity test; ingress protection; A/B-end interchange check |
| LM3-ART-P030 | B24 | BID | buildable-after-supplier-freeze | inter-car HV/LV jumper, coolant hose loop, energy chain, and drain sleeve kit | LM3-ART-SA830 | bend-radius sweep; trainline continuity; coolant pressure test; water-drain test |
| LM3-ART-P040 | B9, B29 | BID | buildable-after-supplier-freeze | train-to-train open-end articulation, gangway, drawbar, turntable, and service-jumper cassette | LM3-TTART-SA850 | train-to-train motion-envelope proof; walk-through gangway fire evidence; trainline continuity; water ingress/drain test |
| LM3-ART-P041 | B24 | SOURCE | buildable-after-supplier-freeze | train-to-train jumper blanking, transition harness, isolation label, and dust-cover kit | LM3-TTART-SA850 | pinout test; blanking cover ingress check; isolation label inspection; bend-radius sweep |

## Non-product release gates

The product rows above do not close controlled manufacturing drawings, supplier-specific mass/power/envelope freezes, structural proof, physical first-article inspection, or signed shop-traveler evidence.

# LM3 Production-Data Release Register

Repository source: `design/component-catalogue/catalog/buildable-trainset/production-data-release-register.md`

> Status: all locally made production data open and unissued.

This register connects every locally made product to its drawing package, planning route, tooling, work instruction, inspection characteristics and required production artifacts. Fill the JSON records only in a controlled project copy.

Products: 62 · Open: 62 · Required artifact slots: 472.

## Planning Route Summary

| Route | Products |
|---|---|
| `composite-mould-trim-and-fit` | 16 |
| `cut-form-machine-fixture-and-join` | 19 |
| `harness-cut-terminate-formboard-and-test` | 3 |
| `mixed-kit-cut-form-machine-and-fit` | 13 |
| `section-cut-machine-drill-and-fit` | 9 |
| `tube-cut-bend-bracket-and-pressure-test` | 2 |

# Per-Product Ownership

| Product | Planning route | Packages | Drawings | Artifacts | Inspection links | Status |
|---|---|---|---|---|---|---|
| LM3-ART-P010 — articulation adapter frame, anti-lift keeper, and shim kit | cut-form-machine-fixture-and-join | LM3-FRP-120 | 1 | 8 | 7 | open-unissued |
| LM3-BDY-P010 — laser-cut side sill beam, LH/RH | section-cut-machine-drill-and-fit | LM3-FRP-010 | 3 | 7 | 7 | open-unissued |
| LM3-BDY-P020 — underframe centre spine and longitudinal load-path kit | cut-form-machine-fixture-and-join | LM3-FRP-010 | 3 | 8 | 7 | open-unissued |
| LM3-BDY-P021 — underframe cross-bearer, door-bay outrigger, and equipment-bracket pack | cut-form-machine-fixture-and-join | LM3-FRP-010 | 3 | 8 | 7 | open-unissued |
| LM3-BDY-P030 — bolster box, air-spring pad, and centre-pivot insert set | cut-form-machine-fixture-and-join | LM3-FRP-010 | 3 | 8 | 7 | open-unissued |
| LM3-BDY-P040 — coupler pocket, shear plate, and crash-can insert kit | cut-form-machine-fixture-and-join | LM3-FRP-110 | 1 | 8 | 7 | open-unissued |
| LM3-BDY-P050 — battery tray rails, vent plenum, and service-lid gutter kit | mixed-kit-cut-form-machine-and-fit | LM3-FRP-110 | 1 | 7 | 7 | open-unissued |
| LM3-BDY-P060 — low-floor centre pan and removable service-floor support set | cut-form-machine-fixture-and-join | LM3-FRP-010 | 3 | 8 | 7 | open-unissued |
| LM3-BDY-P061 — raised bogie-end deck, transition ramp, and removable hatch-frame set | cut-form-machine-fixture-and-join | LM3-FRP-010 | 3 | 8 | 7 | open-unissued |
| LM3-BDY-P070 — side-wall post, door portal, waist rail, and cant rail kit | cut-form-machine-fixture-and-join | LM3-FRP-010 | 3 | 8 | 7 | open-unissued |
| LM3-BDY-P080 — roof bow, HVAC rail, PV rail, and cable-tray bracket kit | cut-form-machine-fixture-and-join | LM3-FRP-010, LM3-FRP-050 | 6 | 8 | 16 | open-unissued |
| LM3-BDY-P090 — end ring frame and anti-climber beam set | cut-form-machine-fixture-and-join | LM3-FRP-120 | 1 | 8 | 7 | open-unissued |
| LM3-BDY-P100 — door portal reinforcement, threshold beam, and cassette shim kit | section-cut-machine-drill-and-fit | LM3-FRP-110 | 1 | 7 | 7 | open-unissued |
| LM3-BDY-P110 — window carrier ring, bonded-gasket land, and replacement jack-point inserts | section-cut-machine-drill-and-fit | LM3-FRP-110 | 1 | 7 | 7 | open-unissued |
| LM3-BDY-P120 — jacking pad, lifting eye, towing lug, and recovery-label kit | cut-form-machine-fixture-and-join | LM3-FRP-100 | 2 | 8 | 7 | open-unissued |
| LM3-BDY-P130 — one-metre clip-on solid-side fiberglass body module | composite-mould-trim-and-fit | LM3-FRP-020, LM3-FRP-080 | 4 | 8 | 12 | open-unissued |
| LM3-BDY-P131 — one-metre clip-on window-edge fiberglass side module | composite-mould-trim-and-fit | LM3-FRP-020, LM3-FRP-080 | 4 | 8 | 12 | open-unissued |
| LM3-BDY-P132 — one-metre clip-on door-edge fiberglass side module | composite-mould-trim-and-fit | LM3-FRP-020, LM3-FRP-080 | 4 | 8 | 12 | open-unissued |
| LM3-BDY-P133 — one-metre clip-on fiberglass roof skin and equipment-fairing module | composite-mould-trim-and-fit | LM3-FRP-020, LM3-FRP-050, LM3-FRP-090 | 7 | 8 | 22 | open-unissued |
| LM3-BDY-P140 — keyed clip rail, captive retainer, anti-lift, and dry-seal car kit | section-cut-machine-drill-and-fit | LM3-FRP-020 | 3 | 7 | 8 | open-unissued |

| Product | Planning route | Packages | Drawings | Artifacts | Inspection links | Status |
|---|---|---|---|---|---|---|
| LM3-BOG-P010 — powered bogie welded H-frame and motor-cradle weldment | cut-form-machine-fixture-and-join | LM3-FRP-130 | 1 | 8 | 7 | open-unissued |
| LM3-BOG-P020 — trailer bogie welded H-frame | cut-form-machine-fixture-and-join | LM3-FRP-140 | 1 | 8 | 7 | open-unissued |
| LM3-BOG-P030 — powered-bogie guards, cable guides, WSP brackets, and inspection covers | cut-form-machine-fixture-and-join | LM3-FRP-130 | 1 | 8 | 7 | open-unissued |
| LM3-BOG-P031 — trailer-bogie guards, cable guides, WSP brackets, and inspection covers | cut-form-machine-fixture-and-join | LM3-FRP-140 | 1 | 8 | 7 | open-unissued |
| LM3-BOG-P050 — powered-bogie motor torque link, anti-rotation stop, and safety lanyard bracket kit | cut-form-machine-fixture-and-join | LM3-FRP-130 | 1 | 8 | 7 | open-unissued |
| LM3-BOG-P060 — powered-bogie brake/WSP/speed-sensor harness and junction-bracket kit | harness-cut-terminate-formboard-and-test | LM3-FRP-130 | 1 | 8 | 7 | open-unissued |
| LM3-BOG-P061 — trailer-bogie brake/WSP/speed-sensor harness and junction-bracket kit | harness-cut-terminate-formboard-and-test | LM3-FRP-140 | 1 | 8 | 7 | open-unissued |
| LM3-CTRL-P040 — pre-terminated LV trainline harness, DIN cabinet, and terminal-distribution kit | harness-cut-terminate-formboard-and-test | LM3-FRP-160 | 1 | 8 | 6 | open-unissued |
| LM3-CWL-P011 — CWL-FRP-01 upper brow and roof-cap fiberglass cast | composite-mould-trim-and-fit | LM3-FRP-080 | 1 | 8 | 4 | open-unissued |

| `LM3-INT-P020` — FRP/phenolic ceiling liner panel set | `composite-mould-trim-and-fit` | `LM3-FRP-060` | 2 | 8 | 8 | `open-unissued` |
| `LM3-INT-P021` — ceiling light-trough bezel, diffuser carrier, and emergency-luminaire closeout set | `mixed-kit-cut-form-machine-and-fit` | `LM3-FRP-060` | 2 | 7 | 8 | `open-unissued` |
| `LM3-INT-P022` — HVAC plenum cover, diffuser transition, detector bezel, and ceiling service-hatch set | `mixed-kit-cut-form-machine-and-fit` | `LM3-FRP-060` | 2 | 7 | 8 | `open-unissued` |
| `LM3-INT-P030` — FRP/phenolic sidewall liner panel set | `composite-mould-trim-and-fit` | `LM3-FRP-060` | 2 | 8 | 8 | `open-unissued` |
| `LM3-INT-P031` — window reveal, setting-block inspection cover, and blind/label land set | `mixed-kit-cut-form-machine-and-fit` | `LM3-FRP-060` | 2 | 7 | 8 | `open-unissued` |
| `LM3-INT-P032` — waist cable-cover, low-voltage access lid, and retained quarter-turn fastener set | `mixed-kit-cut-form-machine-and-fit` | `LM3-FRP-060` | 2 | 7 | 8 | `open-unissued` |
| `LM3-INT-P040` — FRP battery strake cover panel set | `composite-mould-trim-and-fit` | `LM3-FRP-060` | 2 | 8 | 8 | `open-unissued` |
| `LM3-INT-P041` — seat-base fairing, retained equipment hatch, and rail-saddle closeout set | `mixed-kit-cut-form-machine-and-fit` | `LM3-FRP-060` | 2 | 7 | 8 | `open-unissued` |
| `LM3-INT-P050` — FRP vestibule kick-panel and threshold-closeout set | `composite-mould-trim-and-fit` | `LM3-FRP-060` | 2 | 8 | 8 | `open-unissued` |
| `LM3-INT-P051` — PRM transition-ramp, bogie-deck step-cover, contrast-nosing, and anti-slip set | `mixed-kit-cut-form-machine-and-fit` | `LM3-FRP-060` | 2 | 7 | 8 | `open-unissued` |
| `LM3-INT-P052` — door-pocket liner, sensitive-edge clearance trim, and removable jamb-cover set | `mixed-kit-cut-form-machine-and-fit` | `LM3-FRP-060` | 2 | 7 | 8 | `open-unissued` |

| Product | Planning route | Packages | Drawings | Artifacts | Inspection links | Status |
|---|---|---|---|---|---|---|
| `LM3-ROOF-P010` — HVAC curb, drop-duct collar, condensate tray, and drain fitting kit | `mixed-kit-cut-form-machine-and-fit` | `LM3-FRP-050` | 3 | 7 | 9 | `open-unissued` |
| `LM3-ROOF-P020` — PV bonded-pad lands, raised rail kit, bonding jumpers, and roof isolation labels | `section-cut-machine-drill-and-fit` | `LM3-FRP-050` | 3 | 7 | 9 | `open-unissued` |
| `LM3-ROOF-P030` — removable HVAC curb fairing, intake/exhaust skirt, and access-hatch moulding set | `composite-mould-trim-and-fit` | `LM3-FRP-050`, `LM3-FRP-090` | 4 | 8 | 14 | `open-unissued` |
| `LM3-ROOF-P040` — PV junction plinth, cable-gland cover, antenna closeout, and walkway edge set | `mixed-kit-cut-form-machine-and-fit` | `LM3-FRP-050`, `LM3-FRP-090` | 4 | 7 | 14 | `open-unissued` |
| `LM3-WIN-P010` — replaceable window pressure frame, dry seal, drain, and captive retention kit | `section-cut-machine-drill-and-fit` | `LM3-FRP-110` | 1 | 7 | 7 | `open-unissued` |

## Release Rule

No locally made product may enter production until every required artifact is issued, revision-compatible, hash-bound, checked and approved and its package hold points permit work.

Use the drawing seeds to develop the issued drawings, the manufacturing controls for work execution, and the first-article ITP for actual acceptance results.

Boundary: This register assigns production-data ownership and evidence slots. Geometry envelopes, planning routes and blank artifact records are not shop dimensions, approved process data, inspection results or authority to manufacture. A competent design authority must issue the exact material, datums, tolerances, NC/flat-pattern or mould data and special-process controls.

# LM3 small-component and fixture standard

Repository source: `design/component-catalogue/catalog/buildable-trainset/small-component-standard.md`

Generated by `tools/automation/buildable-trainset.sh`. This is the controlled supplier-neutral design reference for repeatable interior and cassette hardware. It does not release structural loads or numeric torque values.

- Revision: `A-DRAFT`
- Status: `design-reference-not-released`
- Principle: Use one datum rail and the smallest qualified fastener/connector family that matches load and service frequency; preserve supplier ownership of doors, glazing and safety-critical internal mechanisms.

## Common datum rail

- ID: `OSR-RAIL-42`
- Section: `42.0 × 18.0 mm`
- Datum pitch: `50.0 mm`
- Material/interface: extruded aluminium rail with electrically isolated body attachments where required
- Functions: repeatable mounting datum; floating-nut capture; cable and connector bracket attachment; trim edge alignment
- Release evidence: fixture-specific load path calculation; rail pull-out and slip test; shock/vibration evidence; galvanic-isolation and fire-material review

## Four fastener families

| ID | Nominal arrangement | Intended uses | Prohibited uses | Installation control | Release authority |
|---|---|---|---|---|---|
| `OSR-FST-M6-CAPTIVE` | M6 captive flanged screw into floating service-rail nut | light cassettes; trim and service panels; small PIS and cable supports | seat or handhold primary load paths; door primary retention; glazing retention | positive seating, released torque table, witness mark and visual captive-part check | small-component standard plus accepted fastener batch and calibrated-tool procedure |
| `OSR-FST-M8-FLOAT` | M8 flanged bolt into floating nutplate or qualified blind-rivet nut | calculated seat and handrail adapters; door/window secondary carriers; PIS equipment trays | uncalculated passenger-restraint joints; primary crash structure; bogie or coupler joints | joint-specific load/preload calculation, released torque, locking feature and witness mark | released interface calculation and drawing plus accepted fastener batch |
| `OSR-FST-QT-CAPTIVE` | tool-operated captive quarter-turn stud and receptacle | frequently opened trim; lighting diffuser; inspection and access covers | structural retention; passenger handholds; door or glazing retention | supplier grip-range gauge, closed-position indication and pull-check sampling | accepted supplier part and receptacle/grip schedule |
| `OSR-FST-M10-SEAL` | M10 isolating flanged bolt into sealed floating nutplate | external cassette carriers; removable exterior equipment adapters | direct glass clamping; unsealed wet cavities; primary crash joints without calculation | interface calculation, seal compression gauge, released torque and water-ingress test | released cassette interface drawing and calculation plus supplier installation manual |

## Keyed connector families

| ID | Service | Interface | Keying | Release evidence |
|---|---|---|---|---|
| `OSR-CON-LV4` | 24 V/48 V main and emergency lighting | touch-safe keyed four-pole plug with retained strain relief | main and emergency feeds use mechanically incompatible keys | rail fire/smoke evidence; shock/vibration evidence; pinout and polarity test; connector retention test |
| `OSR-CON-LVDATA12` | door, PIS, CCTV and local low-voltage/data services | keyed twelve-position plug family with blanking cap and fixed body-side bracket | different voltage/data duties use unique shell keys and labels | rail fire/smoke evidence; shock/vibration evidence; EMC-compatible termination; 100% continuity test |

## Modular illumination

- Main modules per car: `22 × 1200.0 mm`.
- Independent emergency modules per car: `4`.
- Door-threshold modules per car: `4`.
- Replacement rule: one module, two captive screws and one keyed plug; no field-cut strip or loose wire termination

## Door cassette boundary

- Supplier boundary: complete certified supplier cassette including leaf, operator, lock, seals and controller
- OSR interface: four adjustable carrier shoes, two datum pins, dry perimeter seal and one keyed service bracket
- Release gate: supplier freeze, structural interface calculation and all applicable door safety tests

## Window cassette boundary

- Supplier boundary: glass remains bonded to its supplier aluminium frame
- OSR interface: replaceable pressure frame, dry outer seal, drain path and captive secondary retention
- Replacement rule: remove internal pressure frame and withdraw cassette; do not cut adhesive at the carbody
- Release gate: glazing certificate, retention calculation, seal compression and water-ingress test

## Design sources

- EU LOC&PAS TSI, Commission Regulation (EU) No 1302/2014: interior fixture retention, glazing, passenger doors and fire-safety release gates.
- ERA guide for the PRM TSI: emergency-lighting and evacuation-visibility intent.
- Knorr-Bremse IFE entrance systems: complete supplier-owned modular door system boundary.
- AGC glass with framing system: supplier-bonded framed glazing and rapid cassette replacement.
- Bollhoff RIVNUT blind-rivet nuts: controlled one-side thread installation in thin sections.
- Southco DZUS quarter-turn fasteners: captive, vibration-resistant repeated-access panel retention.
- HARTING compact railway connectors: compact rail-qualified plug interfaces for lights, doors and displays.

# LM3 supplier anchors and local equivalents

Repository source: `design/component-catalogue/catalog/buildable-trainset/supplier-anchors.md`

Real supplier product families provide a purchasable/RFQ baseline and a reproducible interface target. They are anchors, not mandatory brands: a local equivalent is accepted only after the same controlled equivalence dossier passes.

Release boundary: A web page is not a purchase specification. Design authority must freeze the exact supplier part number, configuration, drawings, software, evidence, commercial terms and spares through RFQ before release. Safety-critical substitutes require calculation, test, independent assessment and authority acceptance.

Checked against manufacturer sources on 2026-08-30.

## How to use this register

1. Use the named family to obtain an RFQ, sample, interface drawing and evidence pack; do not infer an order code from the family page.
2. Freeze the chosen order code/configuration and its controlled supplier documents in the city revision.
3. A local supplier may propose an equivalent. Compare it against every mandatory rule and product acceptance item, then repeat affected subassembly and vehicle tests.
4. Preserve the original anchor, accepted-equivalent record and hashes so later regeneration changes cost and geometry without silently changing safety assumptions.

Mandatory equivalence dossier:

- same or better released fit, mounting datums, connector keying and service envelope
- same or better mass, load, duty-cycle, thermal, electrical and environmental ratings
- same or better functional safety, fire, EMC, cybersecurity and applicable rail evidence
- documented failure modes, maintenance intervals, spares and obsolescence route
- first-article inspection plus component, subassembly and vehicle regression tests
- signed design-authority substitution record preserving the original anchor and evidence hashes

## Controlled coverage

| Measure | Value |
|---|---|
| Bought-in product rows with one primary anchor | 56 / 56 |
| Primary anchor families | 27 |

# Anchor families

| Anchor | Manufacturer product family | State | Product rows | Local-equivalent route |
|---|---|---|---|---|
| OSR-ANC-DOOR-IFE | Knorr-Bremse IFE — IFE modular entrance systems | rfq-required | LM3-EXT-P010 | Buy the first fleet cassettes and controls; localise portal, threshold, harness and service parts first; replace the cassette only after EN 14752-equivalent validation. |
| OSR-ANC-GLASS-AGC | AGC Automotive — rail glazing with framing system | rfq-required | LM3-EXT-P020, LM3-EXT-P030 | Local glass processors may replace AGC after laminate, heater, optical, edge, fire, impact and bond-system qualification against the frozen cassette drawing. |
| OSR-ANC-FINISH-3M | 3M Commercial Branding and Transportation — rail-application graphic films including Controltac 180mC | sample-and-system-rfq | LM3-FIN-P010 | Print, plot, kit, apply, inspect and repair locally using the selected film/ink/overlaminate system; qualify a regional equivalent only as a complete system on the released LM3 base finish. |
| OSR-ANC-COOLROOF-PURDUE | Purdue University research reference — no nominated commercial supplier — 2020 CaCO3-acrylic passive radiative-cooling paint formulation | coupon-development-and-one-car-trial-only | LM3-FIN-P020 | Develop/mix trial coupons locally under competent coatings and occupational-hygiene control; do not purchase or apply fleet-wide until a controlled commercial formulation and rail evidence are released. |
| OSR-ANC-HVAC-LONGERTEK | Longertek — direct-DC rail HVAC platform | rfq-required | LM3-EXT-P040, LM3-INT-P010 | Keep the released 800 V-class input, thermal duty, refrigerant, drains, duct and CAN/Ethernet interface; source local coils, ducts and service parts after performance testing. |
| OSR-ANC-PV-SUNMAN | Sunman Energy — eArc lightweight photovoltaic modules | sample-and-rfq | LM3-EXT-P050, LM3-EXT-P070 | Equivalent local modules are acceptable after roof fire, isolation, vibration, hail/impact, walk-zone and bonded/clamped retention tests. |
| OSR-ANC-FLOOR-FORBO | Forbo Flooring Systems — Transport Flooring rail systems | sample-and-rfq | LM3-EXT-P060, LM3-EXT-P061 | Use the supplier system for first articles; qualify local board/covering as a complete substrate, adhesive, weld, cove, hatch and fire-tested system rather than swapping one layer. |
| OSR-ANC-SEAT-FAINSA | Fainsa — Metro and urban rail passenger seating | rfq-required | LM3-EXT-P062, LM3-EXT-P063 | The OSR common rail and adapters are local; seat shells, frames and handrails may be locally made after fire, abuse-load, sharp-edge, corrosion and accessibility validation. |
| OSR-ANC-PASSENGER-LUMINATOR | Luminator Technology Group — rail passenger information, video and communication systems | rfq-required | LM3-EXT-P064, LM3-EXT-P065 | Use open Ethernet/IP interfaces and OSR mounting adapters so displays, cameras, audio and intercoms can be substituted individually after EMC, cybersecurity, accessibility and system regression tests. |
| OSR-ANC-LIGHT-TEKNOWARE | Teknoware — rail interior, emergency and exterior lighting | rfq-required | LM3-EXT-P066, LM3-LGT-P010, LM3-LGT-P020, LM3-END-P050 | Local luminaires are acceptable at the standard plug and mounting cassette after photometry, glare, fire, EMC, IP, emergency-duration and temperature tests. |
| OSR-ANC-FASTENER-BOLLHOFF | Böllhoff — RIVNUT blind rivet nuts and setting systems | catalogue-sourceable-after-sizing | LM3-FIX-P020 | Equivalent inserts and captive hardware are allowed only by joint family after substrate-specific setting trials, proof loads, corrosion and removal-cycle tests. |
| OSR-ANC-COMPOSITE-GURIT | Gurit — fire-retardant composite laminating and core materials | sample-and-rfq | LM3-EXT-P080, LM3-EXT-P090 | Resin, reinforcement, core and coating may be sourced locally only as a qualified laminate system with coupon, fire, weathering, insert and full-module evidence. |
| OSR-ANC-MOTOR-ABB-AMXM | ABB — AMXM railway traction motor | rfq-required | LM3-TRC-P010 | Buy the initial motor; local rewind, bearings and eventually a locally manufactured equivalent require the frozen torque-speed, cooling, insulation, shaft, foot, mass and EMC interfaces plus type tests. |
| **Anchor** | **Manufacturer product family** | **State** | **Product rows** | **Local-equivalent route** |
| OSR-ANC-GEAR-VOITH-SE | Voith — SE-type single-stage axle-mounted metro gear unit and gear coupling | rfq-required | LM3-TRC-P020 | Local housings/gears may replace the anchor only after tooth, bearing, lubrication, fatigue, efficiency, noise, |

| Anchor | Manufacturer product family | State | Product rows | Local-equivalent route |
|---|---|---|---|---|
| | | | | overspeed and endurancequalification with the frozenmotor/wheel set interfaces. |
| OSR-ANC-TRACTION-ABB | ABB — BORDLINE CC400/ESC/PB and Traction Battery Pro reference platform | architecture-rfq-required | LM3-TRC-P030, LM3-TRC-P040, LM3-TRC-P050, LM3-TRC-P060, LM3-TRC-P070 | Treat each converter, battery, charger/contact system and protection panel as separable behind frozen DC-link, cooling, HVIL, network and mechanical interfaces; qualify lower-cost local modules one at a time. |
| OSR-ANC-FIRE-FOGTEC | FOGTEC — rail fire detection and high-pressure water-mist systems | rfq-and-hazard-test-required | LM3-SAF-P010 | Local detectors, pipework, reservoir and pumps may be introduced only within a vehicle fire-hazard analysis and propagation-tested suppression/detection system. |
| OSR-ANC-WHEELSET-GHH | GHH-BONATRANS — urban-rail wheelsets | rfq-required | LM3-BOG-P040, LM3-BOG-P041 | Local wheel/axle manufacture is encouraged only after metallurgy, forging, heat treatment, NDT, press-fit, profile, fatigue and route-specific standards are qualified and independently accepted. |
| OSR-ANC-AXLEBOX-SKF | SKF — ready-to-mount railway axlebox bearing units with sensors | rfq-required | LM3-BOG-P042, LM3-BOG-P043 | Local housings and sensor brackets may be made to the supplier-controlled bearing unit; an alternative bearing unit needs L10/load, fit, seal, grease, thermal, shock and field-monitoring evidence. |
| OSR-ANC-SUSPENSION-CONTI | Continental — rail primary suspension and secondary air-spring systems | rfq-and-dynamics-freeze-required | LM3-BOG-P044, LM3-BOG-P045, LM3-BOG-P046, LM3-BOG-P047 | Springs, bushes and dampers may be sourced regionally after the multibody model, load-deflection/damping curves, compound ageing, fatigue and ride tests are repeated; pivot/anti-lift hardware stays separately calculated. |
| OSR-ANC-BRAKE-KNORR | Knorr-Bremse — WheelAct/AxleAct rail brake actuation and PistonSupply/DrySupply air supply | system-rfq-required | LM3-BOG-P048, LM3-BOG-P049, LM3-AUX-P010 | Pads, discs, hoses and overhaul parts can localise first under brake-supplier approval; caliper/actuator or compressor substitutes require stopping, parking, thermal, WSP, degraded-mode and endurance revalidation. |
| OSR-ANC-COUPLER-DELLNER430 | Dellner — automatic coupler Type 430 with pivot anchor | rfq-required | LM3-END-P010, LM3-END-P040 | Local pocket, covers and harness may be manufactured to the Dellner interface; another coupler requires buff/draft, crash, rescue, gathering range, electrical head and fatigue compatibility evidence. |
| OSR-ANC-JOINT-SCHAEFFLER | Schaeffler — ELGES maintenance-free spherical plain bearings and rod ends | calculation-and-rfq-required | LM3-ART-P020, LM3-ART-P021 | Local housings, pins and links are preferred; bearing or rod-end substitution requires static/dynamic capacity, misalignment, liner, corrosion, temperature, sealing and fatigue equivalence. |
| OSR-ANC-GANGWAY-HUBNER | HÜBNER — modular metro/urban-rail gangway systems | rfq-required | LM3-ART-P022, LM3-ART-P023, LM3-ART-P040 | Bellows textile, panels and bridge pieces may localise after fire, fatigue, water, passenger load, pinch-gap and full-motion testing to the frozen clamp frames. |
| OSR-ANC-TRAINLINE-IGUS-HARTING | igus / HARTING — e-chain dynamic cable carriers with Han rail connectors | sample-and-rfq | LM3-ART-P024, LM3-ART-P030, LM3-ART-P041 | Hoses and cables may be made locally to controlled drawings; carrier, connector or jacket substitutions require bend-cycle, separation, IP, fire, current, pressure, EMC and breakaway tests. |
| OSR-ANC-CONTROL-MOXA | Moxa — EN 50155 railway computers, Ethernet switches and wireless gateways | architecture-rfq-required | LM3-CTRL-P010, LM3-CTRL-P020, LM3-CTRL-P030 | OSR software remains portable behind published I/O, TSN/Ethernet and update interfaces; alternate compute/network hardware must pass timing, safety allocation, EMC, environmental, cybersecurity and whole-train hardware-in-loop tests. |
| OSR-ANC-RECORDER-HASLER | HaslerRail — JRU/EVA event recording systems | rfq-required | LM3-CTRL-P050 | Operational storage can be local commodity hardware; the protected recorder, data set, clock, crash/fire resistance and download chain require independently accepted railway evidence. |

| Anchor | Manufacturer product family | State | Product rows | Local-equivalent route |
|---|---|---|---|---|
| OSR-ANC-OBS-OUSTER | Ouster — OS industrial digital lidar sensor family | sample-and-safety-validation-required | LM3-END-P020 | The nose carrier accepts alternative lidar/camera/radar modules after field of view, latency, heating/washer, ingress, EMC, failure-detection and complete obstacle-detection safety validation. |

# Parts subassemblies final trainset

These generated chains make the structural and mechanical ownership explicit. Repeated car/end/joint quantities remain in the product manifest.

| Starting part | Controlled assembly chain |
|---|---|
| LM3-BDY-P010 laser-cut side sill beam, LH/RH | LM3-BDY-P010 laser-cut side sill beam, LH/RH LM3-BDY-SA110 underframe datum weldment LM3-BDY-SA120 carbody spaceframe and floor assembly LM3-SHELL-A200 painted carbody frame with one-metre clip-on fiberglass exterior LM3-CAR-A900 complete repeated car module LM3-TRAINSET-A000 complete light-metro trainset |
| LM3-BDY-P020 underframe centre spine and longitudinal load-path kit | LM3-BDY-P020 underframe centre spine and longitudinal load-path kit LM3-BDY-SA110 underframe datum weldment LM3-BDY-SA120 carbody spaceframe and floor assembly LM3-SHELL-A200 painted carbody frame with one-metre clip-on fiberglass exterior LM3-CAR-A900 complete repeated car module LM3-TRAINSET-A000 complete light-metro trainset |
| LM3-BDY-P030 bolster box, air-spring pad, and centre-pivot insert set | LM3-BDY-P030 bolster box, air-spring pad, and centre-pivot insert set LM3-BDY-SA110 underframe datum weldment LM3-BDY-SA120 carbody spaceframe and floor assembly LM3-SHELL-A200 painted carbody frame with one-metre clip-on fiberglass exterior LM3-CAR-A900 complete repeated car module LM3-TRAINSET-A000 complete light-metro trainset |
| LM3-CWL-P010 end-cowl fiberglass laminate, insert, adhesive, and coupon material kit | LM3-CWL-P010 end-cowl fiberglass laminate, insert, adhesive, and coupon material kit LM3-CWL-SA710 front/back fiberglass cowl cast kit LM3-END-SA700 train-end cowl, coupler, crash, and sensor assembly LM3-TRAINSET-A000 complete light-metro trainset |
| LM3-END-P010 automatic end coupler and crash-energy absorber | LM3-END-P010 automatic end coupler and crash-energy absorber LM3-END-SA700 train-end cowl, coupler, crash, and sensor assembly LM3-TRAINSET-A000 complete light-metro trainset |
| LM3-ART-P020 articulation lower spherical pivot, bearing housing and pin set | LM3-ART-P020 articulation lower spherical pivot, bearing housing and pin set LM3-ART-SA810 structural articulation joint and anti-lift load path LM3-ART-SA800 complete inter-car structural articulation, passenger gangway and service transfer LM3-TRAINSET-A000 complete light-metro trainset |

# Known fit gaps

- OSR-ANC-DOOR-IFE: Exact aperture, stroke, voltage, software and certification configuration remains to be quoted.

- `OSR-ANC-GLASS-AGC`: Curvature, heater power, optical zones, laminate stack and frame/bond geometry remain project-specific.
- `OSR-ANC-FINISH-3M`: Exact film, colour/ink, overlaminate, edge treatment, fire evidence, hot-climate durability and warranty territory remain to be selected and tested.
- `OSR-ANC-COOLROOF-PURDUE`: No commercial rail-qualified product, vehicle durability pack, fire evidence or released LM3 application procedure is established by the research paper.
- `OSR-ANC-HVAC-LONGERTEK`: Public material does not freeze the LM3 24 kW duty, rail evidence or roof envelope.
- `OSR-ANC-PV-SUNMAN`: Select an exact module and rail-compatible clamp/bond stack after the roof curvature and electrical string are frozen.
- `OSR-ANC-FLOOR-FORBO`: Structural board selection and the final covering/adhesive combination remain to be frozen.
- `OSR-ANC-SEAT-FAINSA`: Exact seat model, upholstery, spacing, handrail geometry and calculated attachment loads remain open.
- `OSR-ANC-PASSENGER-LUMINATOR`: Exact display, camera, amplifier, intercom, recorder and software licences remain to be selected.
- `OSR-ANC-LIGHT-TEKNOWARE`: Exact lamp models, optics, voltage variants and emergency battery arrangement remain open.
- `OSR-ANC-FASTENER-BOLLHOFF`: Exact grip range, head, thread, material and setting force must be selected from each released joint drawing.
- `OSR-ANC-COMPOSITE-GURIT`: No public product family alone establishes the complete LM3 rail fire/structural laminate; formulation and process qualification remain open.
- `OSR-ANC-MOTOR-ABB-AMXM`: The current HM47-class planning envelope is not an ABB order code; ABB must confirm a 250 kW continuous / 350 kW short-peak, 800 V-compatible configuration and mass envelope.
- `OSR-ANC-GEAR-VOITH-SE`: Ratio, centre distance, torque, coupling, reaction-link and lubrication configuration remain to be quoted.
- `OSR-ANC-TRACTION-ABB`: The ABB platform is a rail-qualified architecture anchor, not proof that one published configuration meets the LM3 800 V LFP, 225 kWh/car, side-pin charging, packaging or price targets.
- `OSR-ANC-FIRE-FOGTEC`: Battery chemistry, enclosure, detection thresholds, nozzle layout, reservoir and control integration remain project-specific.
- `OSR-ANC-WHEELSET-GHH`: Wheel profile, diameter, axle journal, disc seats, material grades and load spectrum remain to be frozen.
- `OSR-ANC-AXLEBOX-SKF`: Bearing size, journal fit, housing, grounding, speed/temperature sensor and cable interfaces remain to be frozen.
- `OSR-ANC-SUSPENSION-CONTI`: Continental anchors spring systems; centre pivot, yaw-link and damper suppliers still require project RFQ and a common body-to-bogie interface control drawing.
- `OSR-ANC-BRAKE-KNORR`: The LM3 brake concept needs supplier confirmation of actuation energy, caliper variant, disc/pad pair, parking brake and whether the suspension-only compressor can support the selected brake architecture.
- `OSR-ANC-COUPLER-DELLNER430`: The published 600/500 kN family is an anchor; height, articulation, fold, electrical head, crash stroke and OSR pocket loads remain to be frozen.
- `OSR-ANC-JOINT-SCHAEFFLER`: No catalogue bearing is selected until the articulation load spectrum, pin diameter, angular motion and safety factors are released.
- `OSR-ANC-GANGWAY-HUBNER`: The vehicle-specific bellows, bridge, turntable, clamp and open-end drawbar geometry remains to be engineered with the supplier.
- `OSR-ANC-TRAINLINE-IGUS-HARTING`: The final carrier series, connector inserts, cable compounds, hose lengths and articulation sweep remain to be frozen.
- `OSR-ANC-CONTROL-MOXA`: Moxa anchors computing/network hardware only; the independent safety controller, navigation sensors, HMI and safety relays need exact part selection and safety allocation.
- `OSR-ANC-RECORDER-HASLER`: Exact recorder family, protected memory, interfaces and national event-data requirements remain open.

- `OSR-ANC-OBS-OUSTER`: The commercial sensor is an envelope/data anchor, not railway obstacle-detection certification or a complete T-OBS function.

## Controlled inputs

- Anchor source: `lib/templates/trainset-supplier-anchors.toml` (`4621199776db6c8c0074555b71bfb03657967cd7d563e204accd009d647ea820`)
- Product manifest: `design/component-catalogue/catalog/buildable-trainset/buildable-trainset-manifest.json` (`ca385a6d3c27ee343d7f4bc4c90b4f4e27058380ff82a0aa76ca573275149703`)

# LM3 configurable train-end interface

Repository source: `design/component-catalogue/catalog/buildable-trainset/train-end-interface.md`

Generated by `tools/automation/buildable-trainset.sh`. This design note records the single train end structure that can be dressed as either the normal panoramic glass front/end or a mid-train open connection for joining two train modules into a longer walk-through consist.

- Candidate: `light-metro-3car__16p5m__reference-body__reference-bogie__motor-350kw-hm47-class__battery-225kwh-lfp-800v__hvac-24kw-direct-hv-dc__pv12`
- Document revision: `A-DRAFT`
- Release status: `interface-design-basis`
- Principle: One train/car end structure is carried as a common configurable interface. Each end position is dressed with exactly one option: the closed panoramic glass end or the open mid-train connection.

## Common Interface

- Assembly: `LM3-EIF-SA650`
- Owned items: `LM3-END-P060`, `LM3-END-P061`, `LM3-END-P062`

Interfaces:

- common S355 end carrier ring and option bolt grid
- replaceable EPDM sealing datum and drain lands
- shared underframe/coupler/articulation load-path datums
- protected HV/LV/trainline/coolant/HVAC service routes
- configuration record that locks each end as panoramic or open-mid

Manufacturing route:

- jig-weld and machine the common end carrier ring
- survey the common bolt grid and seal lands
- fit either panoramic closeout hardware or open-portal clamp/threshold hardware
- record selected end option before final trainset integration

## Selectable End Options

| Option | Assembly | Ref qty | Use case | Uses | Omits | Acceptance |
|---|---|---|---|---|---|---|
| `panoramic-glass-front-end` | `LM3-END-SA700` | 2 | outer A and C ends of the reference three-car trainset | LM3-END-P061 panoramic option shim/closeout kit<br>LM3-CWL-SA710 multi-part fiberglass cowl<br>LM3-EXT-P030 heated panoramic glass<br>LM3-END-P010 automatic coupler/crash absorber<br>LM3-END-P020 T-OBS sensor pack | open passenger portal<br>train-to-train bellows and turntable<br>through-passenger threshold bridge | panoramic option fit gauge<br>glass/cowl datum transfer<br>sensor calibration<br>coupler datum survey<br>water-ingress pre-test |
| `mid-open-train-to-train-connection` | `LM3-TTART-SA850` | 0 | optional end treatment when two complete train modules are semi-permanently married into one walk-through consist | LM3-END-P062 open-portal clamp/threshold/drain kit<br>LM3-ART-P040 train-to-train articulation and gangway cassette<br>LM3-ART-P041 service-jumper blanking and transition kit | panoramic glass<br>fiberglass nose cowl<br>nose-mounted T-OBS sensor pack at the joined end | open-portal gauge<br>bellows clamp fit<br>threshold/turntable level check<br>train-to-train motion-envelope proof<br>trainline continuity<br>water ingress/drain test |

## Selection And Assembly Rules

- Each end position must select one option only. A panoramic end may not carry the open-portal threshold hardware, and an open-mid end may not carry the panoramic cowl/glass/sensor stack.

- Keep the common end-interface survey before option fit-out. Install panoramic hardware during outer-end assembly, or install the open gangway cassette only after both train modules are on the final assembly track and aligned at the train-to-train joint.

# LM3 trainset build cost estimate

Repository source: `design/component-catalogue/catalog/buildable-trainset/trainset-build-cost.md`

Generated by `tools/automation/buildable-trainset.sh`. This is a rough-order build cost for one three-car LM3 trainset using the updated modular glass-fibre body, explicit assembly labour plan, and requested unexpected-cost premium.

- Candidate: `light-metro-3car__16p5m__reference-body__reference-bogie__motor-350kw-hm47-class__battery-225kwh-lfp-800v__hvac-24kw-direct-hv-dc__pv12`
- Family: `light-metro-3car`
- Release status: rough-order planning; not a supplier quote or signed production budget

| Cost bucket | Basis | Cost |
|---|---|---|
| Direct material and supplier modules | Promoted design candidate cost metric | $682,431 |
| Direct labour | 5,524 h at $10/h | $55,240 |
| Subtotal before premium | Material/supplier modules plus direct labour | $737,671 |
| Unexpected-cost premium | 20% for rework, logistics, consumables, local fabrication variation, and shop learning | $147,534 |
| Total per 3-car trainset | Recalculated build estimate | $885,205 |
| Rounded local-owner planning unit | Retained city-CAPEX reporting bucket | $900,000 |

## Basis

Direct material and supplier-module cost comes from the promoted design candidate; labour hours come from the generated critical-path plan; the 20% premium covers unexpected local fabrication, rework, logistics, consumables, and shop-learning costs.

## Included Fit-Out, Doors, And Glazing Scope

The direct material and supplier-module bucket already includes the interior fit-out, HVAC, windows, and doors below; do not add a second $20k interior allowance unless a separate contingency is intentionally being carried.

| Included scope | BOM lines | Included base cost |
|---|---|---|
| seats, floors, grab rails, and interior lighting | B12, B13, B14, B15, B16 | $17,500 |
| roof HVAC | T14 | $17,250 |
| side windows, side doors, door sill/emergency kits, and panoramic end glass | B10, B11, B25, B27 | $112,000 |
| Requested scope total | Seats/floors/lighting + HVAC + doors/windows/end glass | $146,750 |

The seats/floors/grab-rail/lighting subset is $17,500, close to the $20k check value. HVAC adds $17,250, and doors/glazing add $112,000 before labour and premium.

Exclusions:

- route/platform compatibility changes
- supplier certification and homologation campaigns
- warranty and initial spares
- production-plant fixtures and tooling carried in the separate plant allowance

# Generated design-system artifacts

Repository source: `design/component-catalogue/catalog/design-system/README.md`

This folder is generated by:

```
tools/automation/design-iterate.sh
```

The JSON and Markdown outputs record the best feasible rolling-stock candidate inside the declared design space, plus ranked shortlists for review. They are planning artefacts that guide which candidate should be promoted into FreeCAD/FEM, not homologated design releases.

# Rolling-stock design iteration summary

Repository source: `design/component-catalogue/catalog/design-system/design-iteration-summary.md`

This file is generated by `tools/automation/design-iterate.sh`. It records the best candidate inside the declared discrete design space; it is not a supplier freeze or homologated drawing release.

- Iterations evaluated: 81
- Best candidate: `light-metro-3car__16p5m__reference-body__reference-bogie__motor-350kw-hm47-class__battery-225kwh-lfp-800v__hvac-24kw-direct-hv-dc__pv12`
- Feasible: `true`
- Score: `92.628`

## Best-candidate metrics

| Metric | Value |
|---|---|
| `cars` | 3.0 |
| `trainset_length_m` | 49.5 |
| `platform_margin_m` | 10.0 |
| `mass_t` | 75.308 |
| `cost_usd` | 682431.18 |
| `axle_load_kg` | 6275.63 |
| `installed_continuous_kw` | 1500.0 |
| `traction_margin` | 2.845 |
| `battery_usable_kwh` | 540.0 |
| `offwire_range_km` | 68.915 |
| `hvac_margin` | 1.2 |
| `pv_peak_kw` | 15.12 |
| `manufacturing_complexity_index` | 1.0 |

## Best-candidate modeled mass breakdown

This is the optimizer subtotal before the promoted engineering reserve.

| Category | Mass (kg) |
|---|---|
| carbody primary structure | 25623.53 |
| bogie frames, wheelsets, brakes, and suspension | 20190.00 |
| traction motors, gearboxes, and controllers | 3360.00 |
| traction batteries | 4350.00 |
| roof HVAC | 1530.00 |
| roof PV | 864.00 |
| doors, glazing, interior, and auxiliaries | 16350.00 |
| end cowls and interfaces | 1240.00 |
| inter-car articulation | 1800.00 |
| Modeled subtotal | 75307.53 |

## Best-candidate parameters

| Parameter | Value |
|---|---|
| family | `light-metro-3car` |
| car length | `16.5 m` |
| body structure gauge | `reference` |
| bogie frame gauge | `reference` |
| motor | `motor-350kw-hm47-class` |
| battery | `battery-225kwh-lfp-800v` |
| HVAC | `hvac-24kw-direct-hv-dc` |
| PV modules per car | `12` |

# Design hierarchy

## External components

| ID | Role | Selection class |
|---|---|---|
| `motor-350kw-hm47-class` | traction motor | 350 kW peak heavy-vehicle PMSM, HM47-class qualified reference envelope |
| `battery-225kwh-lfp-800v` | traction battery pack per car | 225 kWh gross / 180 kWh usable liquid-cooled LFP, 650–700 V nominal |
| `hvac-24kw-direct-hv-dc` | roof HVAC per car | 24 kW direct 650–700 V DC packaged roof HVAC for high ambient |

## Fabricated parts

| ID | Role | Process |
|---|---|---|
| `fab-carbody-primary-shell` | primary car body shell, side frames, floor pan, roof bows | CNC cut, press-brake, MIG/MAG weld, adhesive bond |
| `fab-bogie-frame-powered` | powered bogie frame and motor cradle weldment | cut plate, fixture weld, machine pivot/air-spring datums |
| `fab-bogie-frame-trailer` | trailer bogie frame weldment | cut plate, fixture weld, machine pivot/air-spring datums |
| `fab-cowl-and-interface-kit` | fiberglass end cowl casts, crash ring, backing ring, lamp/sensor hatches | low-volume moulding, trim/drill jig, adhesive bond |
| `fab-articulation-adapter-kit` | inter-car adapter frames, anti-lift keepers, service-loop brackets | cut, weld, machine shims and datum faces |

## Subassemblies

| ID | Role | Acceptance checks |
|---|---|---|
| `sub-car-module` | one repeated 16.5 m car module | body datum survey<br>door cassette gauge<br>battery vent and service-lid gauge<br>roof HVAC/PV clearance |
| `sub-powered-bogie` | powered bogie with motor, gearbox, brakes, wheelsets, and suspension | weld records<br>wheelbase/gauge survey<br>motor cradle load proof |
| `sub-final-trainset` | complete cabless consist assembled from repeated cars | trainset envelope<br>mass budget<br>traction/brake thermal budget<br>FEM screening |

# Top ten feasible candidates

| Rank | Candidate | Score | Mass t | Cost USD | Range km | Traction margin |
|---|---|---|---|---|---|---|
| 1 | light-metro-3car__16p5m__reference-body__reference-bogie__motor-350kw-hm47-class__battery-225kwh-lfp-800v__hvac-24kw-direct-hv-dc__pv12 | 92.628 | 75.308 | 682431 | 68.915 | 2.845 |

# FEA Screening Outputs

Repository source: `design/component-catalogue/catalog/fea/README.md`

This folder contains generated FreeCAD/CalculiX first-pass screening artifacts. The Python source under `../../src/osr_mech/freecad_fea.py` defines the beam models, loads, supports, result parsing, and FreeCAD visual document generation. Each regeneration clears the old solver output folders and summaries first, then rewrites the stable latest paths documented below. Each study folder also includes a solver-derived `*-result.png` plot: deformed beam shape, support/load markers, and CalculiX von Mises stress colour scale parsed from the `.dat` output.

## Outputs

| Path | Purpose |
|---|---|
| `screening-summary.md` | Human-readable result summary |
| `screening-summary.json` | Machine-readable result summary |
| `dependency-check.json` | FreeCAD/FEM/CalculiX/gmsh availability captured at generation time |
| `chassis-bogie-screen/` | Low-floor chassis supported at bogie connectors: `.inp`, `.dat`, `.frd`, `.sta`, `.cvg`, `.12d`, and solver log |
| `chassis-aw3-proof-screen/` | 1.5 x vertical AW3 proof-load screen for the low-floor chassis |
| `chassis-track-twist-screen/` | Asymmetric track-twist / uneven-load chassis screen |
| `bogie-frame-screen/` | Motor/trailer bogie H-frame screening model raw CalculiX inputs and outputs |
| `bogie-brake-traction-screen/` | Bogie vertical plus longitudinal brake/traction reaction screen |
| `full-body-frame-screen/` | Full car body side/roof frame screening model raw CalculiX inputs and outputs |
| `full-body-lateral-sway-screen/` | Full body side-frame lateral sway/racking screen |
| `train-to-train-joint-vertical-screen/` | Local open train-to-train joint vertical passenger/gangway load screen |
| `train-to-train-joint-lateral-sway-screen/` | Local open train-to-train joint lateral/racking load screen |

## Raw File Index

Every study folder contains the same generated file set: `{slug}.inp`, `{slug}.dat`, `{slug}.frd`, `{slug}.sta`, `{slug}.cvg`, `{slug}.12d`, `{slug}.ccx.log`, and `{slug}-result.png`.

| Study | Result PNG |
|---|---|
| Chassis service gravity | `chassis-bogie-screen-result.png` |
| Chassis AW3 proof | `chassis-aw3-proof-screen-result.png` |
| Chassis track twist | `chassis-track-twist-screen-result.png` |
| Bogie vertical | `bogie-frame-screen-result.png` |
| Bogie brake/traction | `bogie-brake-traction-screen-result.png` |
| Full body vertical | `full-body-frame-screen-result.png` |
| Full body lateral sway | `full-body-lateral-sway-screen-result.png` |
| Train-to-train joint vertical | `train-to-train-joint-vertical-screen-result.png` |
| Train-to-train joint lateral sway | `train-to-train-joint-lateral-sway-screen-result.png` |

Regenerate from the repository root with:

```
tools/automation/freecad-generate.sh --fem --screenshots
```

Or regenerate from `design/component-catalogue/` with the lower-level launchers:

```
scripts/freecad_fea.sh
scripts/freecad_screenshots.sh
```

The FreeCAD visual document is `../../models/cad/fea-screening-models.FCStd`, and the rendered review screenshots are embedded in `docs/rolling-stock/light-metro-3car/README.md`.

# Rolling-Stock FEA Screening Summary

Repository source: `design/component-catalogue/catalog/fea/screening-summary.md`

This is a first-pass FreeCAD/CalculiX beam-model screen for gross load paths. It is not a homologation, fatigue, crashworthiness, weld, shell-buckling, or supplier-final mesh.

## FEA Stack

- FreeCAD importable: True
- FreeCAD version: ['1', '1', '4', '45039 (Git)', 'https://github.com/FreeCAD/FreeCAD.git', '2026/09/28 13:46:34', '(HEAD detached at 1.1.4)', '4fd3bf320d9566a27e60069fc8387448aaa3a094']
- Modules: {'Fem': True, 'femtools': True, 'femmesh': True, 'Assembly': True}
- Executables: {'ccx': {'path': '/app/bin/ccx', 'version': ['This is Version 2.23']}, 'gmsh': {'path': '/app/bin/gmsh', 'version': ['4.15.0-git']}}

# Results

| Study | Load case | Nodes | Elements | Applied load kN | Vertical load kN | Max displacement mm | Target mm | Max von Mises MPa | SF to S355 yield | Result PNG | Status |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Low-floor chassis supported at bogie connectors | 360 kN vertical service load distributed over low-floor and high-floor bearer grid | 155 | 159 | 360.0 | 360.0 | 20.885 | 25.0 | 101.1 | 3.51 | PNG | OK |
| Low-floor chassis AW3 vertical proof-load screen | 540 kN vertical proof load: 1.5 x the baseline 360 kN service gravity case | 155 | 159 | 540.0 | 540.0 | 31.327 | 35.0 | 151.6 | 2.34 | PNG | OK |
| Low-floor chassis asymmetric track-twist screen | Asymmetric 65/110/125 % side load bias plus 25 kN diagonal equipment offset | 155 | 159 | 385.0 | 385.0 | 24.205 | 30.0 | 121.2 | 2.93 | PNG | OK |

# Study Notes

## Low-floor chassis supported at bogie connectors

- Bogie support points represent four secondary-air-spring/chassis interface pads.
- Reworked chassis uses deep side torsion boxes, twin keel beams, upper battery-zone chords, and stiffer cross-bearers.

## Low-floor chassis AW3 vertical proof-load screen

- Uses the same bogie support pads as the service screen with a 1.5 x vertical load multiplier.
- This is a static proof-load screen only; fatigue and local weld toe stresses remain v2 work.

### Low-floor chassis asymmetric track-twist screen

- Represents uneven passenger/load distribution during a track-twist or low-speed ramp transition.
- The diagonal equipment allowance biases the roof-side service mass onto one chassis side.

### Motor/trailer bogie H-frame screening model

- Axlebox/primary-suspension support nodes constrain vertical displacement.
- Motor reaction brackets are not included in this load case; use the motor connector CAD for interface review.

### Bogie frame brake/traction longitudinal load screen

- Adds a longitudinal force path through the secondary-seat structure on top of the vertical bogie case.
- Gearbox, axle, and detailed motor-bracket local stresses are still outside this beam-model screen.

### Full car body side/roof frame screening model

- Side posts, side sills, waist rails, cant rails, and roof bows are idealised as S355 beams.
- Revised body includes diagonal side-frame racking members added after the initial lateral-sway exceedance.
- Composite panels and glazing are treated as non-structural for this screening pass.

### Full car body lateral sway screen

- Applies an approximate 0.15 g lateral inertial load through the occupied side-frame height.
- The current candidate includes diagonal side-frame racking members and enlarged side/roof bearers.
- This complements the vertical body frame case; it is not a modal, ride, or fatigue analysis.

### Train-to-train open joint vertical load screen

- Screens the local common end-interface carrier rings and open gangway cassette.
- The fixed-side ring is supported along its full moulded end-frame interface, matching the chassis/body pick-up concept.
- Passenger threshold bridge and gangway loads are included as vertical distributed loads.

### Train-to-train open joint lateral/racking screen

- Complements the open-end vertical screen with a local racking case.
- The fixed-side ring is supported laterally along its full moulded end-frame interface.
- Supplier bellows fabric, rubber fatigue, clamps, and fastener details still require supplier proof evidence.

## Geometry/Model Caveats

- Native study walls and B32R BOX sections share explicit dimensions and proposed 8 mm walls. These research sections are not supplier/CAD-catalogue acceptance; old solid-envelope results are historical diagnostics.
- Composite body panels, glazing, adhesive lands, local brackets, bolt holes, weld toes, and notches are not meshed.
- Loads are static screening loads only; no crash, fatigue spectrum, modal, thermal, or derailment cases are included.
- Any stress above the 0.6 x S355 yield service screen should trigger a detailed shell/solid mesh and local joint design.

# One-metre clip-on glass-fibre body design

Repository source: `design/component-catalogue/catalog/modular-fiberglass-body/README.md`

Generated from `osr_mech.rolling_stock.modular_fiberglass_body`. The moulded GFRP panels are a non-structural weather skin over the welded steel frame.

| Parameter | Value |
|---|---|
| Longitudinal module pitch | 1,000 mm |
| Bays per car | 16 |
| Modules per car | 48 |
| Modules per 3-car trainset | 144 |
| Exterior-body assembly elapsed time | 8.0 h |

## Moulded module fabrication route

| Seq | Activity | Work center | Release check |
|---|---|---|---|
| 10 | Release mould, trim fixture, laminate schedule, core map, insert map, and module serial range | production control | traveler revision, material certificates, and mould release are accepted |
| 20 | Clean mould, inspect A-surface, apply release system, and apply UV-stable gelcoat or paint-primer layer | composite moulding cell | mould surface record and release-system lot recorded |
| 30 | Cut glass reinforcement and local core, lay up solid clip lands, pot insert bosses, and bag or close mould | composite moulding cell | ply/core/insert checklist matches the released module variant |
| 40 | Infuse or wet-lay laminate, control cure, demould, post-cure where specified, and keep witness coupons with the batch | controlled cure area | cure time/temperature record, coupon ID, and demould inspection complete |
| 50 | CNC trim door/window/roof variant, drill clip grid from datum, seal all cut edges, and mark serial/revision | trim and drill cell | trim gauge, hole-position gauge, and edge-seal record accepted |
| 60 | Fit captive inserts, clips, anti-lift features, drain details, and EPDM seals; dry-fit to master frame | module fit-up cell | insert pull-out lot, gasket compression witness, and master-frame fit accepted |

Side, window-edge, door-edge, and roof variants share the same 1,000 mm mould pitch, clip datum, trim datum, edge-seal rule, and master-frame dry-fit check. The moulded module batch is complete before the eight-hour trainset installation shift starts.

Required fabrication evidence includes the mould release record, laminate schedule, resin and fibre batch trace, cure time/temperature record, witness coupon, CNC trim report, insert pull-out lot, sealed-edge record, and master-frame dry-fit record.

## One-shift route

| Seq | Activity | Elapsed | Parallel crews | Release check |
|---|---|---|---|---|
| 10 | Receive three released frames and verify clip-rail datums | 0.5 h | 3 | frame and kit revision match |
| 20 | Fit dry EPDM seals and inspect keyed clip receptacles | 1.0 h | 6 | continuous seal and open drains |
| 30 | Hang and latch left/right 1 m side modules | 3.0 h | 6 | every captive witness mark visible |
| 40 | Hang and latch 1 m roof modules from mobile access stands | 1.5 h | 6 | anti-lift retainers closed |
| 50 | Fit corner closures, skirts, labels, and earth bonds | 1.0 h | 6 | bond continuity and service access |
| 60 | Water test, rattle check, snag closeout, and QA release | 1.0 h | 3 | dry interior and signed module map |

The eight-hour claim applies to installation and release of the exterior body modules on three completed, painted, dimensionally accepted frames. Doors, glazing, traction equipment, bogies, commissioning, and homologation remain separate controlled work.

# Mechanical FreeCAD Library

Repository source: `design/component-catalogue/models/cad/README.md`

This folder contains `.FCStd` review assemblies generated directly from the parametric source under `../../src/osr_mech/`, which remains the authoritative geometry.

## Documents

| File | Purpose |
|---|---|
| `lm3-parts/` | 120 separate native FreeCAD part documents: one controlled product-tree item per file, with selectable solids, envelope, route, maturity and source-manifest hash |
| `lm3-assemblies/` | 26 subassembly/car/final-train documents containing every descendant part on a deterministic inspection fixture; start with `LM3-TRAINSET-A000.FCStd` |
| `lm3-product-library.index.json` | Exact file inventory, hashes, primitive counts and final-assembly reachability result |
| `trainset-light-metro-3car.FCStd` | Full light-metro trainset review assembly generated from source geometry |
| `trainset-light-metro-3car.installed-coordinate.json` | Source-to-controlled-ID occurrence map, installed positions and nominal/curve/twist review states for that assembly |
| `stations/` | Seven native station product assemblies covering all 45 controlled station products, with installed/exploded geometry, hierarchy, controlled datums/zones, semantic class and fidelity metadata |
| `../manufacturing-reference/` | STEP, DXF inspection projections and browser-viewable three-view SVG references for all 46 LM3 `MAKE` rows |
| `single-car-assembly.FCStd` | Corrected urban-shuttle single-car assembly with both bogies on the shared ±6,150 mm chassis datums |
| `chassis-bogie-assembly-states.FCStd` | Chassis and bogie connector review with assembled and exploded state groups |
| `full-body-assembly-states.FCStd` | Body frame, roof, windows, doors, floor, battery, bench, HVAC, lighting, and sensor attachment review states |
| `lm3-manufacturing-tooling.FCStd` | Twenty separately selectable local-manufacture mould, fixture, gauge, harness-board, bogie-alignment and final-assembly tooling families with product IDs, method steps, timings and release gates |
| `fea-screening-models.FCStd` | Visual FreeCAD document for the expanded CalculiX screening models and support/load markers |
| `station-scenes.FCStd` | Station, ballastless track, and driverless train review scenes for at-grade, elevated, and elevated interchange configurations |
| `civil-systems-integration-test.FCStd` | Source-driven civil/rolling-stock twin containing a ground station, 1:9 junction, six double-track viaduct spans, an elevated station, and two complete trains |
| `civil-systems-integration-test.json` | Portable twin asset, transform, relationship, state, validation, and FCStd-hash snapshot |
| `../../../../docs/assets/digital-twin-animation.gif` | 160-frame FreeCAD/Coin3D operating animation with correctly framed LM3 ground and elevated movements |
| `native-catalogue-parts.FCStd` | Native FreeCAD replacements for civil, track, station, depot, and fabrication-template source families |
| `battery-pack-set.FCStd` | Per-car battery-pack source-geometry review document |
| `car-body-17m.FCStd` | Canonical car-body source-geometry review document |
| `motor-bogie.FCStd` | Powered-bogie source-geometry review document |
| `trailer-bogie.FCStd` | Trailer-bogie source-geometry review document |
| `raked-sensor-cowl.FCStd` | Raked obstacle-sensor end-cowl review document |
| `platform-at-grade-assembly.FCStd` | At-grade slab, platform edge, and complete track-panel assembly |
| `platform-elevated-assembly.FCStd` | U-girder, elevated deck, and complete track-panel assembly |
| `station-platform-canopy-assembly.FCStd` | Platform edge, track, canopy portals, roof, and PV assembly |
| `assembly-geometry-review.md` | Geometry-review notes for assembled and exploded FreeCAD documents |

The matching captured review images are documented in `docs/rolling-stock/light-metro-3car/README.md` and `docs/stations/README.md`. The scripts below replace their stable output filenames on each run, so the README screenshots and `.FCStd` links always point at the latest generated review set.

The split library is generated from one shared 120-item geometry registry and contains 619 native OCC primitives. Assembly documents preserve all 26 EBOM/ MBOM hierarchy nodes and include every active product in the final trainset. Their spaced layout remains an inspection fixture. Installed source occurrences and four kinematic review states are recorded separately in the trainset installed-coordinate sidecar; neither artifact is a released tolerance stack. The matching dependency-timed `fabrication-assembly` twin tests the build order and provides the animated review.

## Add-on and Render Toolchain

The supported launcher checks the `org.freecad.FreeCAD` Flatpak and records the actual runtime in generated evidence. Optional workbenches are review aids; they do not change the Python geometry or IFC/Bonsai authority boundaries.

| Capability | Installed tool | Current use |
|---|---|---|
| Assembly review | FreeCAD 1.1 built-in Assembly, Assembly4, A2plus | Existing generated review states remain source-driven; Assembly4/A2plus are available for GUI datum, constraint, and kinematic inspection experiments |

| Capability | Installed tool | Current use |
|---|---|---|
| Structural testing | FreeCAD FEM plus CalculiX | Already used for chassis, bogie, body, and train-to-train joint screening cases in `../../catalog/fea/` |
| Mould/manufacturing checks | DFM workbench with `OCP`, `vtk`, and `gmsh` in FreeCAD's Flatpak Python | Available for draft, undercut, wall/thickness, bridge-span, and process checks on moulded GFRP/end-cowl candidates; not yet a release gate |
| High-quality stills | Render workbench plus the optional Blender/Cycles export path | `--high-quality-renders` uses Blender when installed; the GIF path does not require it |

For repeatable repository animation, the selected path is FreeCAD's built-in Coin3D view renderer plus ImageMagick GIF encoding. The runner checks both dependencies and operates directly on the generated FCStd review file. Blender's Python animation API is the stronger future route for cinematic lighting and materials, while Godot's glTF/3D scene importer is suitable for a user-driven interactive twin. Neither Blender nor Godot is needed for the tracked GIF. FreeCAD's optional Animation workbench is also not required because the repository script drives placements and frames directly.

The MBDyn-style multibody dynamics add-ons were reviewed as candidates for rail dynamic testing, but are not installed as a default repo dependency because the available public workbench path is not yet a clean, maintained, headless pipeline for these models. Dynamic release therefore remains represented here by CalculiX quasi-static structural screens plus operational/dynamic commissioning plans, not by validated multibody ride simulation.

# Regenerate

From the repository root, the canonical orchestrator is:

```
tools/automation/freecad-generate.sh --models --assemblies --station-library --neutral-exports --civil-systems --fem --
screenshots --station-scenes --digital-twin-animation --high-quality-renders
```

When iterating on one document, run the lower-level package launchers from `design/component-catalogue/`:

```
scripts/freecad_trainset.sh --family light-metro-3car
scripts/freecad_assembly_review.sh
scripts/freecad_product_library.sh
scripts/freecad_station_library.sh
scripts/freecad_neutral_exports.sh
scripts/freecad_fea.sh
scripts/freecad_screenshots.sh
scripts/freecad_station_scenes.sh
scripts/freecad_catalog.sh
scripts/freecad_civil_systems_example.sh
scripts/freecad_digital_twin_animation.sh
scripts/freecad_mesh_exports.sh
scripts/blender_freecad_renders.sh
```

# Civil systems integration test

The integration document is organized into five independently selectable FreeCAD groups: an at-grade ground station, an at-grade 1:9 junction, viaduct approaches/substructure, an elevated station, and rolling stock. It assembles 82 placed source components and 13,861 native solids, including 12 U-girders on nine shared piers, direct-fixation track, platform edge kits, four solar canopies, translucent controlled kinematic envelopes, and two complete three-car light-metro trainsets.

Every placed feature carries a stable asset ID, asset class, parent zone, geometry role, and JSON operational state in its FreeCAD properties. The paired JSON snapshot records the same 82 assets, five zones, 86 relationships, two train states, nine interface checks, nine native clearance-clash checks, and a SHA-256 link back to the exact FCStd artifact. It is suitable for deterministic design review and as an initial-state handoff to OCC/CBM tooling; it does not claim to be a live telemetry feed.

Generation stops before saving if any native shape is null or invalid, or if an interface check fails. The checked datums are pier bearing-to-girder soffit, viaduct-to-station track support, 350 mm platform height above top of rail, and 75 mm platform clearance from the tangent dynamic envelope; both complete rolling-stock assemblies must also be present. Open the document's `IntegrationReviewNotes` object to see the recorded PASS results.

The four zones form a review test site, not an operational alignment. In particular, no vertical transition is implied between its at-grade and elevated zones. The wide elevated-station deck is explicitly a project-specific coordination envelope; structural, seismic, bearing, erection, and geotechnical design remain release work.

The animated review reopens the unchanged FCStd model for each scene, selects the relevant integration zones, moves each complete LM3 train along its checked track Y/Z datum, and computes the axonometric camera from visible source geometry. FreeCAD/Coin3D renders the PNG frames and ImageMagick encodes the looping GIF. No FreeCAD animation workbench is required. Regenerate and enforce the repository's strict sub-20-MB media limit with:

```
tools/automation/freecad-generate.sh --digital-twin-animation
```

The repository contains no Build123d implementation or dependency. The portable `osr_mech.cad` layer remains as the tested parametric source so geometry can be checked without FreeCAD; the documents above are the native FreeCAD replacement and review handoff.

The high-quality render path writes transient STL files to `design/component-catalogue/catalog/render-meshes/`. That directory is intentionally ignored because it is large and fully reproducible from the tracked FreeCAD documents and render scripts.

# FreeCAD Assembly Geometry Review

Repository source: `design/component-catalogue/models/cad/assembly-geometry-review.md`

Generated directly from parametric source geometry. The checks below use FreeCAD/OCC `Shape.isValid()`, `Shape.check(True)`, solid counts, volume, and bounding-box sanity checks on each assembled-state input.

## Chassis + Bogie Assembly

| Item | Source | Valid | OCC check | Solids | Volume mm^3 | Bounding box mm | Issue |

## Geometry Issues

- No invalid source shapes or zero-size bounding boxes detected.

# Developing-Country Planning Briefs

## Angola National OpenSourceRail Strategy

Repository source: `cities/catalogue/central-africa/Angola/NATIONAL-BRIEF.md`

This page contains only Angola-specific aggregation. Shared network, service, energy, civil, cost, finance, QA and validation methods are defined once in the deployment planning reference.

> Important
> Foreign-capital advantage: against the default equivalent foreign-turnkey sensitivity, this national programme avoids $25.69 B (88.0%) of external capital and $31.58 B of external interest. Capital plus saved interest totals $57.27 B.

### National Programme

| Local measure | Planning value |
|---|---|
| Catalogue cities | 9 |
| Represented population | 13,135,000 |
| Trainsets / vehicle modules | 1,992 / 8,533 |
| City infrastructure and fleet CAPEX | $15.53 B |
| Shared national factory | $651.8 M |
| Factory sizing basis | 5,502 modules for Luanda, then reused nationally |
| Total national programme | $16.22 B |

### Capital And Funding

| Local funding measure | Planning value |
|---|---|
| Imported / external capital | $3.52 B (21.7%) |
| Domestic / local capital | $12.71 B (78.3%) |
| Annual external capital draw | $703.2 M / yr |
| Annual local capital draw | $2.54 B / yr |
| Annual public construction commitment | $1.84 B / yr for 5 years |
| Annual post-grace debt service | $1.40 B / yr |
| Default foreign-turnkey external capital | $29.20 B |
| External capital saved | $25.69 B |
| Capital + lifetime external interest saved | $57.27 B |

### Procurement-Origin Composition

| CAPEX bucket | Total | Imported | Local value |
|---|---|---|---|
| Civil works | $7.28 B | $1.09 B | $6.19 B |
| Stations | $2.84 B | $567.1 M | $2.27 B |
| Depots | $902.6 M | $225.6 M | $676.9 M |
| Rolling stock | $2.44 B | $854.7 M | $1.59 B |
| Dedicated solar plants | $945.6 M | $425.5 M | $520.1 M |
| Residual train control | $40.0 M | $20.0 M | $20.0 M |
| Charging microgrids | $126.5 M | $50.6 M | $75.9 M |
| EPC / project services | $999.5 M | $149.9 M | $849.6 M |
| Shared national trainset factory | $651.8 M | $130.4 M | $521.4 M |
| Total | $16.22 B | $3.52 B | $12.71 B |

# City Programme

| City | Population | Fleet | City CAPEX | External capital | Local capital | Lines | Added lines | Original circles | Current circles |
|---|---|---|---|---|---|---|---|---|---|
| Luanda | 9,085,000 | 917 | $9.08 B | $2.07 B | $7.00 B | 14 | 5 | 40.8% | 40.9% |
| Huambo | 800,000 | 211 | $1.16 B | $239.1 M | $923.0 M | 5 | 2 | 20.5% | 28.6% |
| Lubango | 700,000 | 223 | $1.32 B | $272.2 M | $1.05 B | 4 | 1 | 15.3% | 30.3% |
| Benguela | 600,000 | 221 | $1.24 B | $257.2 M | $984.5 M | 5 | 2 | 30.4% | 40.4% |
| Lobito | 500,000 | 134 | $770.7 M | $157.9 M | $612.7 M | 4 | 1 | 18.2% | 33.2% |
| Malanje | 500,000 | 53 | $325.7 M | $67.4 M | $258.3 M | 2 | 0 | 12.9% | 11.6% |
| Uige | 400,000 | 39 | $218.4 M | $45.6 M | $172.8 M | 1 | 0 | 6.2% | 14.0% |
| Namibe | 300,000 | 109 | $786.0 M | $146.5 M | $639.5 M | 5 | 2 | 43.6% | 40.3% |
| Soyo | 250,000 | 85 | $624.3 M | $118.9 M | $505.3 M | 4 | 1 | 32.8% | 28.5% |

# Local Basis And Regeneration

Country finance parameters use AO in `lib/templates/country-finance.toml`. The factory is counted once nationally and excluded from city CAPEX. City values come from each local `design.toml` and expanded scenario; common limitations and interpretation are not repeated here.

```
python3 tools/automation/generate-national-briefs.py
```

# Population-led route regeneration (2026-10-09)

The city inventories include additional lines selected from retained unserved residential areas, continuous corridor junctions and bounded station spacing. Fleet, depots, construction, energy, staffing and country finance use those revised inventories. The working target is 80% within 1 km circles of emitted stations; remaining gaps and missing data stay explicit.

Coverage uses retained 2020 city-bbox population counts. Overlapping city populations are not added to claim national coverage. These circles are not current census, surveyed walking catchments, observed fare demand or construction approval. The catalogue comparison records targets and evidence limits.

# DR Congo National OpenSourceRail Strategy

Repository source: `cities/catalogue/central-africa/DR Congo/NATIONAL-BRIEF.md`

This page contains only DR Congo-specific aggregation. Shared network, service, energy, civil, cost, finance, QA and validation methods are defined once in the deployment planning reference.

> Important
> Foreign-capital advantage: against the default equivalent foreign-turnkey sensitivity, this national programme avoids $41.48 B (87.9%) of external capital and $53.58 B of external interest. Capital plus saved interest totals $95.05 B.

## National Programme

| Local measure | Planning value |
|---|---|
| Catalogue cities | 7 |
| Represented population | 27,007,000 |
| Trainsets / vehicle modules | 2,731 / 14,047 |
| City infrastructure and fleet CAPEX | $25.46 B |
| Shared national factory | $715.7 M |
| Factory sizing basis | 10,650 modules for Kinshasa, then reused nationally |
| Total national programme | $26.23 B |

## Capital And Funding

| Local funding measure | Planning value |
|---|---|
| Imported / external capital | $5.73 B (21.9%) |
| Domestic / local capital | $20.49 B (78.1%) |
| Annual external capital draw | $573.4 M / yr |
| Annual local capital draw | $2.05 B / yr |
| Annual public construction commitment | $2.80 B / yr for 10 years |
| Annual post-grace debt service | $2.54 B / yr |
| Default foreign-turnkey external capital | $47.21 B |
| External capital saved | $41.48 B |

## Local Basis And Regeneration

Country finance parameters use `MZ` in `lib/templates/country-finance.toml`. The factory is counted once nationally and excluded from city CAPEX. City values come from each local `design.toml` and expanded scenario; common limitations and interpretation are not repeated here.

```
python3 tools/automation/generate-national-briefs.py
```

## Population-led route regeneration (2026-10-09)

The city inventories include additional lines selected from retained unserved residential areas, continuous corridor junctions and bounded station spacing. Fleet, depots, construction, energy, staffing and country finance use those revised inventories. The working target is 80% within 1 km circles of emitted stations; remaining gaps and missing data stay explicit.

Coverage uses retained 2020 city-bbox population counts. Overlapping city populations are not added to claim national coverage. These circles are not current census, surveyed walking catchments, observed fare demand or construction approval. The catalogue comparison records targets and evidence limits.

# Rwanda National OpenSourceRail Strategy

Repository source: `cities/catalogue/east-africa/Rwanda/NATIONAL-BRIEF.md`

This page contains only Rwanda-specific aggregation. Shared network, service, energy, civil, cost, finance, QA and validation methods are defined once in the deployment planning reference.

> Important
> Foreign-capital advantage: against the default equivalent foreign-turnkey sensitivity, this national programme avoids $8.76 B (89.1%) of external capital and $10.98 B of external interest. Capital plus saved interest totals $19.73 B.

## National Programme

| Local measure | Planning value |
|---|---|
| Catalogue cities | 3 |
| Represented population | 1,708,000 |
| Trainsets / vehicle modules | 460 / 1,434 |
| City infrastructure and fleet CAPEX | $4.61 B |
| Shared national factory | $794.6 M |
| Factory sizing basis | 1,028 modules for Kigali, then reused nationally |
| Total national programme | $5.46 B |

## Capital And Funding

| Local funding measure | Planning value |
|---|---|
| Imported / external capital | $1.08 B (19.7%) |
| Domestic / local capital | $4.39 B (80.3%) |

# Local Basis And Regeneration

Country finance parameters use `UG` in `lib/templates/country-finance.toml`. The factory is counted once nationally and excluded from city CAPEX. City values come from each local `design.toml` and expanded scenario; common limitations and interpretation are not repeated here.

```
python3 tools/automation/generate-national-briefs.py
```

# Population-led route regeneration (2026-10-09)

The city inventories include additional lines selected from retained unserved residential areas, continuous corridor junctions and bounded station spacing. Fleet, depots, construction, energy, staffing and country finance use those revised inventories. The working target is 80% within 1 km circles of emitted stations; remaining gaps and missing data stay explicit.

Coverage uses retained 2020 city-bbox population counts. Overlapping city populations are not added to claim national coverage. These circles are not current census, surveyed walking catchments, observed fare demand or construction approval. The catalogue comparison records targets and evidence limits.

# Zambia National OpenSourceRail Strategy

Repository source: `cities/catalogue/east-africa/Zambia/NATIONAL-BRIEF.md`

This page contains only Zambia-specific aggregation. Shared network, service, energy, civil, cost, finance, QA and validation methods are defined once in the deployment planning reference.

> Important
> Foreign-capital advantage: against the default equivalent foreign-turnkey sensitivity, this national programme avoids $9.15 B (87.7%) of external capital and $11.48 B of external interest. Capital plus saved interest totals $20.63 B.

## National Programme

| Local measure | Planning value |
|---|---|
| Catalogue cities | 1 |
| Represented population | 3,037,000 |
| Trainsets / vehicle modules | 472 / 2,832 |
| City infrastructure and fleet CAPEX | $5.25 B |
| Shared national factory | $516.9 M |
| Factory sizing basis | 2,832 modules for Lusaka, then reused nationally |
| Total national programme | $5.80 B |

## Capital And Funding

| Local funding measure | Planning value |
|---|---|
| Imported / external capital | $1.29 B (22.2%) |
| Domestic / local capital | $4.51 B (77.8%) |
| Annual external capital draw | $183.7 M / yr |
| Annual local capital draw | $644.9 M / yr |
| Annual public construction commitment | $782.7 M / yr for 7 years |
| Annual post-grace debt service | $675.3 M / yr |
| Default foreign-turnkey external capital | $10.44 B |
| External capital saved | $9.15 B |
| Capital + lifetime external interest saved | $20.63 B |

### Procurement-Origin Composition

| CAPEX bucket | Total | Imported | Local value |

# Tunisia National OpenSourceRail Strategy

Repository source: `cities/catalogue/north-africa/Tunisia/NATIONAL-BRIEF.md`

This page contains only Tunisia-specific aggregation. Shared network, service, energy, civil, cost, finance, QA and validation methods are defined once in the deployment planning reference.

> Important
> Foreign-capital advantage: against the default equivalent foreign-turnkey sensitivity, this national programme avoids $7.17 B (88.9%) of external capital and $8.82 B of external interest. Capital plus saved interest totals $15.99 B.

## National Programme

| Local measure | Planning value |
|---|---|
| Catalogue cities | 1 |
| Represented population | 2,900,000 |
| Trainsets / vehicle modules | 344 / 1,376 |
| City infrastructure and fleet CAPEX | $3.99 B |
| Shared national factory | $457.2 M |
| Factory sizing basis | 1,376 modules for Tunis, then reused nationally |
| Total national programme | $4.48 B |

## Capital And Funding

| Local funding measure | Planning value |
|---|---|
| Imported / external capital | $896.6 M (20.0%) |
| Domestic / local capital | $3.59 B (80.0%) |
| Annual external capital draw | $179.3 M / yr |
| Annual local capital draw | $717.1 M / yr |
| Annual public construction commitment | $441.9 M / yr for 5 years |
| Annual post-grace debt service | $322.8 M / yr |
| Default foreign-turnkey external capital | $8.07 B |
| External capital saved | $7.17 B |
| Capital + lifetime external interest saved | $15.99 B |

### Procurement-Origin Composition

| CAPEX bucket | Total | Imported | Local value |
|---|---|---|---|
| Civil works | $2.46 B | $368.8 M | $2.09 B |
| Stations | $457.4 M | $91.5 M | $365.9 M |
| Depots | $159.4 M | $39.8 M | $119.5 M |
| Rolling stock | $385.3 M | $134.8 M | $250.4 M |
| Dedicated solar plants | $250.2 M | $112.6 M | $137.6 M |
| Residual train control | $13.4 M | $6.7 M | $6.7 M |
| Charging microgrids | $23.3 M | $9.3 M | $14.0 M |
| EPC / project services | $276.8 M | $41.5 M | $235.3 M |
| Shared national trainset factory | $457.2 M | $91.4 M | $365.8 M |
| Total | $4.48 B | $896.6 M | $3.59 B |

## City Programme

| City | Population | Fleet | City CAPEX | External capital | Local capital | Lines | Added lines | Original circles | Current circles |
|---|---|---|---|---|---|---|---|---|---|
| Tunis | 2,900,000 | 344 | $3.99 B | $800.4 M | $3.19 B | 8 | 3 | 35.0% | 32.8% |

## Local Basis And Regeneration

Country finance parameters use `TN` in `lib/templates/country-finance.toml`. The factory is counted once nationally and excluded from city CAPEX. City values come from each local `design.toml` and expanded scenario; common limitations and interpretation are not repeated here.

```
python3 tools/automation/generate-national-briefs.py
```

# Population-led route regeneration (2026-10-09)

The city inventories include additional lines selected from retained unserved residential areas, continuous corridor junctions and bounded station spacing. Fleet, depots, construction, energy, staffing and country finance use those revised inventories. The working target is 80% within 1 km circles of emitted stations; remaining gaps and missing data stay explicit.

Coverage uses retained 2020 city-bbox population counts. Overlapping city populations are not added to claim national coverage. These circles are not current census, surveyed walking catchments, observed fare demand or construction approval. The catalogue comparison records targets and evidence limits.

# South Africa National OpenSourceRail Strategy

Repository source: `cities/catalogue/south-africa/South Africa/NATIONAL-BRIEF.md`

This page contains only South Africa-specific aggregation. Shared network, service, energy, civil, cost, finance, QA and validation methods are defined once in the deployment planning reference.

> Important
> Foreign-capital advantage: against the default equivalent foreign-turnkey sensitivity, this national programme avoids $23.47 B (88.0%) of external capital and $28.85 B of external interest. Capital plus saved interest totals $52.32 B.

## National Programme

| Local measure | Planning value |
|---|---|
| Catalogue cities | 5 |
| Represented population | 6,200,000 |
| Trainsets / vehicle modules | 1,674 / 7,370 |
| City infrastructure and fleet CAPEX | $13.90 B |
| Shared national factory | $863.1 M |
| Factory sizing basis | 4,872 modules for Durban, then reused nationally |
| Total national programme | $14.82 B |

## Capital And Funding

| Local funding measure | Planning value |
|---|---|
| Imported / external capital | $3.21 B (21.7%) |
| Domestic / local capital | $11.61 B (78.3%) |
| Annual external capital draw | $642.5 M / yr |
| Annual local capital draw | $2.32 B / yr |
| Annual public construction commitment | $1.58 B / yr for 5 years |
| Annual post-grace debt service | $1.19 B / yr |
| Default foreign-turnkey external capital | $26.68 B |
| External capital saved | $23.47 B |
| Capital + lifetime external interest saved | $52.32 B |

### Procurement-Origin Composition

| CAPEX bucket | Total | Imported | Local value |
|---|---|---|---|
| Civil works | $6.85 B | $1.03 B | $5.82 B |
| Stations | $2.24 B | $447.0 M | $1.79 B |
| Depots | $718.3 M | $179.6 M | $538.8 M |
| Rolling stock | $2.11 B | $738.5 M | $1.37 B |
| Dedicated solar plants | $1.02 B | $457.5 M | $559.2 M |
| Residual train control | $36.2 M | $18.1 M | $18.1 M |
| Charging microgrids | $91.5 M | $36.6 M | $54.9 M |
| EPC / project services | $903.1 M | $135.5 M | $767.6 M |
| Shared national trainset factory | $863.1 M | $172.6 M | $690.5 M |
| Total | $14.82 B | $3.21 B | $11.61 B |

## City Programme

| City | Population | Fleet | City CAPEX | External capital | Local capital | Lines | Added lines | Original circles | Current circles |
|---|---|---|---|---|---|---|---|---|---|
| Durban | 3,900,000 | 812 | $9.05 B | $2.01 B | $7.03 B | 14 | 5 | 28.1% | 31.0% |
| East London Za | 800,000 | 221 | $1.25 B | $265.1 M | $989.0 M | 5 | 2 | 34.3% | 35.6% |
| Bloemfontein | 600,000 | 354 | $1.92 B | $415.4 M | $1.50 B | 5 | 2 | 39.1% | 51.5% |
| Polokwane | 600,000 | 199 | $1.03 B | $214.5 M | $812.1 M | 5 | 2 | 23.0% | 36.5% |
| Nelspruit | 300,000 | 88 | $653.6 M | $122.4 M | $531.1 M | 4 | 1 | 40.1% | 37.8% |

## Local Basis And Regeneration

Country finance parameters use ZA in `lib/templates/country-finance.toml`. The factory is counted once nationally and excluded from city CAPEX. City values come from each local `design.toml` and expanded scenario; common limitations and interpretation are not repeated here.

```
python3 tools/automation/generate-national-briefs.py
```

## Population-led route regeneration (2026-10-09)

## Local Basis And Regeneration

Country finance parameters use `NP` in `lib/templates/country-finance.toml`. The factory is counted once nationally and excluded from city CAPEX. City values come from each local `design.toml` and expanded scenario; common limitations and interpretation are not repeated here.

```
python3 tools/automation/generate-national-briefs.py
```

# Population-led route regeneration (2026-10-09)

The city inventories include additional lines selected from retained unserved residential areas, continuous corridor junctions and bounded station spacing. Fleet, depots, construction, energy, staffing and country finance use those revised inventories. The working target is 80% within 1 km circles of emitted stations; remaining gaps and missing data stay explicit.

Coverage uses retained 2020 city-bbox population counts. Overlapping city populations are not added to claim national coverage. These circles are not current census, surveyed walking catchments, observed fare demand or construction approval. The catalogue comparison records targets and evidence limits.

# Pakistan National OpenSourceRail Strategy

Repository source: `cities/catalogue/south-asia/Pakistan/NATIONAL-BRIEF.md`

This page contains only Pakistan-specific aggregation. Shared network, service, energy, civil, cost, finance, QA and validation methods are defined once in the deployment planning reference.

> Important

## Local Basis And Regeneration

Country finance parameters use `MM` in `lib/templates/country-finance.toml`. The factory is counted once nationally and excluded from city CAPEX. City values come from each local `design.toml` and expanded scenario; common limitations and interpretation are not repeated here.

```
python3 tools/automation/generate-national-briefs.py
```

# Population-led route regeneration (2026-10-09)

The city inventories include additional lines selected from retained unserved residential areas, continuous corridor junctions and bounded station spacing. Fleet, depots, construction, energy, staffing and country finance use those revised inventories. The working target is 80% within 1 km circles of emitted stations; remaining gaps and missing data stay explicit.

Coverage uses retained 2020 city-bbox population counts. Overlapping city populations are not added to claim national coverage. These circles are not current census, surveyed walking catchments, observed fare demand or construction approval. The catalogue comparison records targets and evidence limits.

# Philippines National OpenSourceRail Strategy

Repository source: `cities/catalogue/southeast-asia/Philippines/NATIONAL-BRIEF.md`

This page contains only Philippines-specific aggregation. Shared network, service, energy, civil, cost, finance, QA and validation methods are defined once in the deployment planning reference.

> Important
> Foreign-capital advantage: against the default equivalent foreign-turnkey sensitivity, this national programme avoids $7.87 B (88.7%) of external capital and $9.67 B of external interest. Capital plus saved interest totals $17.54 B.

## National Programme

| Local measure | Planning value |
|---|---|
| Catalogue cities | 1 |
| Represented population | 1,827,000 |
| Trainsets / vehicle modules | 379 / 1,516 |
| City infrastructure and fleet CAPEX | $4.53 B |
| Shared national factory | $369.9 M |
| Factory sizing basis | 1,516 modules for Davao, then reused nationally |
| Total national programme | $4.93 B |

## Capital And Funding

| Local funding measure | Planning value |
|---|---|
| Imported / external capital | $1.00 B (20.3%) |
| Domestic / local capital | $3.93 B (79.7%) |
| Annual external capital draw | $200.3 M / yr |
| Annual local capital draw | $785.0 M / yr |
| Annual public construction commitment | $396.8 M / yr for 5 years |
| Annual post-grace debt service | $279.0 M / yr |
| Default foreign-turnkey external capital | $8.87 B |
| External capital saved | $7.87 B |
| Capital + lifetime external interest saved | $17.54 B |

### Procurement-Origin Composition

## Local Basis And Regeneration

Country finance parameters use `NG` in `lib/templates/country-finance.toml`. The factory is counted once nationally and excluded from city CAPEX. City values come from each local `design.toml` and expanded scenario; common limitations and interpretation are not repeated here.

```
python3 tools/automation/generate-national-briefs.py
```

## Population-led route regeneration (2026-10-09)

The city inventories include additional lines selected from retained unserved residential areas, continuous corridor junctions and bounded station spacing. Fleet, depots, construction, energy, staffing and country finance use those revised inventories. The working target is 80% within 1 km circles of emitted stations; remaining gaps and missing data stay explicit.

Coverage uses retained 2020 city-bbox population counts. Overlapping city populations are not added to claim national coverage. These circles are not current census, surveyed walking catchments, observed fare demand or construction approval. The catalogue comparison records targets and evidence limits.

# Local Basis And Regeneration

Country finance parameters use `EG` in `lib/templates/country-finance.toml`. The factory is counted once nationally and excluded from city CAPEX. City values come from each local `design.toml` and expanded scenario; common limitations and interpretation are not repeated here.

```
python3 tools/automation/generate-national-briefs.py
```

# Population-led route regeneration (2026-10-09)

The city inventories include additional lines selected from retained unserved residential areas, continuous corridor junctions and bounded station spacing. Fleet, depots, construction, energy, staffing and country finance use those revised inventories. The working target is 80% within 1 km circles of emitted stations; remaining gaps and missing data stay explicit.

Coverage uses retained 2020 city-bbox population counts. Overlapping city populations are not added to claim national coverage. These circles are not current census, surveyed walking catchments, observed fare demand or construction approval. The catalogue comparison records targets and evidence limits.

# Iraq National OpenSourceRail Strategy

Repository source: `cities/catalogue/west-asia/Iraq/NATIONAL-BRIEF.md`

## Current Iraq planning basis — 2026-10-06

Current country basis · Baghdad summary · Connected design, production and energy study.

The retained `local_positive` Baghdad financial comparator is USD 8.667bn, with IQD 0.000tn unsourced support and IQD 0.000tn terminal debt. All debt clears at model month 295, conditional on the recorded funding assumptions. Its prices and facilities are unquoted and uncommitted. It does not price the complete accelerated construction and battery scenario.

The accelerated scenario's complete CAPEX, financing, net island savings and accepted opening dates remain unknown. Its USD 9m / 18-launcher allowance covers purchase cash only; freight, assembly, commissioning, transporters, lifting frames, temporary supports, spares, crews and relocations require separate scope-matched prices. The earlier delivered-and-commissioned interpretation is not used. No launcher saving is added to an installed civil rate before removing a verified matching embedded allowance.

Iraq has existing precast facilities and expertise; qualify contracted civil supply and price tooling/upgrades. Baghdad trainset assembly and component-process allowances remain in the financial comparator. Additional national plant capacity and transfer costs require separate scope reconciliation.

The coordinated industrialisation programme joins vehicle interfaces, staged bogie localisation and the standard viaduct system. Its possible vendor register records official-source component and equipment leads for comparison. Iraq already has many precast facilities and relevant expertise; plant capability, compatible tooling and available production slots require qualification. No listed vendor is a selected supplier or a manufacturing-rights agreement.

The coupled service–OD–cost–finance study now derives capacity-limited passenger itineraries from completed train sections and carries the same grid purchases and train distance into conditional monthly finance. Its demand and retained prices/opening months are explicit sensitivities. Complete line openings additionally require stations, specials, track, energy, depots, fleet, testing and approvals; missing dates or prices remain unknown. No coupled case is an accepted forecast or an adopted national budget.

No current consolidated national budget or funded rollout is established. Other Iraqi city catalogue estimates and the earlier generic foreign-turnkey calculation remain separately identified comparators. Their differences are scenario arithmetic, not realised capital or interest savings. Baghdad's later scope cannot be mixed into an older national aggregate and presented as one complete budget.

### Construction sensitivities

| Case | Days for modelled running bays | Scope |
|---|---|---|
| full-doubling | 1022 | identified catalogue planning spans only; unresolved closures, station structures and special crossings remain separate gates |
| higher-productivity | 1098 | identified catalogue planning spans only; unresolved closures, station structures and special crossings remain separate gates |
| initial-accelerated | 1218 | identified catalogue planning spans only; unresolved closures, station structures and special crossings remain separate gates |
| initial-accelerated-reassigned | 966 | identified catalogue planning spans only; unresolved closures, station structures and special crossings remain separate gates |
| initial-six-day-calendar | 1348 | identified catalogue planning spans only; unresolved closures, station structures and special crossings remain separate gates |

These are conditional resource schedules. Station structures, special/closure spans, approved pier locations, delivery access and release evidence remain opening gates. Empty supplier/contract registers indicate missing qualifying evidence; they do not imply that Iraqi industry lacks capability.

### Chronological energy study

| Case, lower-solar duty | Minimum SOC | Unserved traction kWh |
|---|---|---|
| lfp-throughout | 0.0% | 676,286 |
| sodium-both | 0.0% | 4,024,245 |
| sodium-stationary | 0.0% | 676,383 |

The fixed-assignment diagnostic above uses both ring directions, declared dispatch stations and native rest-to-rest section timing. The current screen spans 4,440 continuous model minutes (3.08 days), including overnight state carry-over and a

study strategy permitting grid replenishment within remaining site import capacity. Charge-rate, thermal and life inputs are unqualified profiles, so these results do not establish a chemistry advantage or suitability.

The separate coupled energy/service controller keeps reserve-limited trains at their actual stations, continues charging, and reflects their availability in subsequent dispatch opportunities.

| Controlled case | Completed journeys | Missed dispatch opportunities | Distinct energy-held journeys |
|---|---|---|---|
| lfp-throughout | 17,491 | 909 | 706 |
| sodium-both | 8,536 | 9,605 | 2,761 |
| sodium-stationary | 17,492 | 908 | 719 |

Geometry/operating-distance findings remain recorded. Conflict-capable timetable, berth/depot access, transient traction and operational multi-day acceptance remain open. Current station passenger demand is unknown where no surveyed station/OD assignment has been entered; the common 3,000 pax/h value is retained only as a separate stress case.

## City estimates and their scope

| City | Population | Fleet | City-case capital | Assumed imported purchases | Basis | | --- | ---: | ---: | ---: | ---: | --- | | Baghdad | 9,780,429 | 809 | $8.67 B | $2.02 B | Retained local_positive comparator; accelerated scope unpriced | 14 | 5 | 40.3% | 27.7% | | Basra | 3,955,000 | 557 | $6.58 B | $1.40 B | Catalogue base estimate; scope and field releases open | 11 | 4 | 42.9% | 38.3% | | Sulaymaniyah | 2,150,000 | 144 | $2.00 B | $398.7 M | Catalogue base estimate; scope and field releases open | 6 | 2 | 35.5% | 31.1% | | Erbil | 1,952,000 | 261 | $2.35 B | $489.5 M | Catalogue base estimate; scope and field releases open | 8 | 3 | 31.8% | 29.8% | | Mosul | 1,940,000 | 308 | $3.93 B | $763.6 M | Catalogue base estimate; scope and field releases open | 9 | 3 | 40.6% | 41.0% | | Kirkuk | 1,780,000 | 235 | $2.81 B | $556.2 M | Catalogue base estimate; scope and field releases open | 8 | 3 | 41.2% | 41.1% | | Najaf | 1,540,000 | 309 | $3.33 B | $674.7 M | Catalogue base estimate; scope and field releases open | 9 | 3 | 33.3% | 46.2% | | Karbala | 1,390,000 | 253 | $2.84 B | $567.5 M | Catalogue base estimate; scope and field releases open | 9 | 3 | 46.1% | 42.0% | | Nasiriyah | 705,000 | 184 | $1.09 B | $221.0 M | Catalogue base estimate; scope and field releases open | 5 | 2 | 41.8% | 34.8% | | Hillah | 700,000 | 236 | $1.19 B | $250.8 M | Catalogue base estimate; scope and field releases open | 5 | 2 | 29.0% | 37.7% | | Amarah | 660,000 | 177 | $1.13 B | $224.6 M | Catalogue base estimate; scope and field releases open | 5 | 2 | 37.4% | 35.1% | | Ramadi | 525,000 | 181 | $978.5 M | $204.3 M | Catalogue base estimate; scope and field releases open | 5 | 2 | 30.0% | 36.9% | | Baqubah | 470,000 | 243 | $1.32 B | $275.3 M | Catalogue base estimate; scope and field releases open | 5 | 2 | 37.2% | 33.8% | | Diwaniyah | 440,000 | 198 | $1.07 B | $222.2 M | Catalogue base estimate; scope and field releases open | 5 | 2 | 30.6% | 49.1% | | Kut | 410,000 | 166 | $1.05 B | $209.6 M | Catalogue base estimate; scope and field releases open | 5 | 2 | 40.8% | 42.7% | | Samawah | 373,770 | 182 | $1.03 B | $211.9 M | Catalogue base estimate; scope and field releases open | 5 | 2 | 40.9% | 47.8% | | Duhok | 360,000 | 213 | $1.08 B | $235.9 M | Catalogue base estimate; scope and field releases open | 4 | 1 | 46.8% | 53.3% | | Fallujah | 360,000 | 195 | $1.06 B | $218.6 M | Catalogue base estimate; scope and field releases open | 5 | 2 | 35.4% | 30.3% |

These case envelopes have different appraisal scopes. They are not summed into a current national project budget. Baghdad's included assembly/component facilities must be reconciled with any national shared-factory allowance before aggregation.

Shared assumptions and interpretation are in the deployment planning reference.

## Regeneration

Run `python3 tools/automation/generate-national-briefs.py --country IQ` after regenerating the Baghdad study, then publish the current city/country documents and proposal archive.

## Population-led route regeneration (2026-10-09)

The city inventories include additional lines selected from retained unserved residential areas, continuous corridor junctions and bounded station spacing. Fleet, depots, construction, energy, staffing and country finance use those revised inventories. The working target is 80% within 1 km circles of emitted stations; remaining gaps and missing data stay explicit.

Coverage uses retained 2020 city-bbox population counts. Overlapping city populations are not added to claim national coverage. These circles are not current census, surveyed walking catchments, observed fare demand or construction approval. The catalogue comparison records targets and evidence limits.

## Local Basis And Regeneration

Country finance parameters use `JO` in `lib/templates/country-finance.toml`. The factory is counted once nationally and excluded from city CAPEX. City values come from each local `design.toml` and expanded scenario; common limitations and interpretation are not repeated here.

```
python3 tools/automation/generate-national-briefs.py
```

## Population-led route regeneration (2026-10-09)

The city inventories include additional lines selected from retained unserved residential areas, continuous corridor junctions and bounded station spacing. Fleet, depots, construction, energy, staffing and country finance use those revised inventories. The working target is 80% within 1 km circles of emitted stations; remaining gaps and missing data stay explicit.

Coverage uses retained 2020 city-bbox population counts. Overlapping city populations are not added to claim national coverage. These circles are not current census, surveyed walking catchments, observed fare demand or construction approval. The catalogue comparison records targets and evidence limits.

# Lebanon National OpenSourceRail Strategy

Repository source: `cities/catalogue/west-asia/Lebanon/NATIONAL-BRIEF.md`

This page contains only Lebanon-specific aggregation. Shared network, service, energy, civil, cost, finance, QA and validation methods are defined once in the deployment planning reference.

> Important
> Foreign-capital advantage: against the default equivalent foreign-turnkey sensitivity, this national programme avoids $8.50 B (88.9%) of external capital and $10.76 B of external interest. Capital plus saved interest totals $19.27 B.

## National Programme

| Local measure | Planning value |
|---|---|
| Catalogue cities | 3 |
| Represented population | 3,230,000 |
| Trainsets / vehicle modules | 520 / 1,739 |
| City infrastructure and fleet CAPEX | $4.45 B |
| Shared national factory | $811.1 M |
| Factory sizing basis | 1,052 modules for Beirut, then reused nationally |
| Total national programme | $5.31 B |

## Capital And Funding

| Local funding measure | Planning value |
|---|---|
| Imported / external capital | $1.06 B (20.0%) |
| Domestic / local capital | $4.25 B (80.0%) |
| Annual external capital draw | $132.9 M / yr |
| Annual local capital draw | $531.4 M / yr |
| Annual public construction commitment | $1.00 B / yr for 8 years |
| Annual post-grace debt service | $914.3 M / yr |
| Default foreign-turnkey external capital | $9.57 B |
| External capital saved | $8.50 B |
| Capital + lifetime external interest saved | $19.27 B |

# Baghdad Structured Funding Appraisal

## Baghdad — Urban Rail Network

Repository source: `cities/catalogue/west-asia/Iraq/Baghdad/README.md`

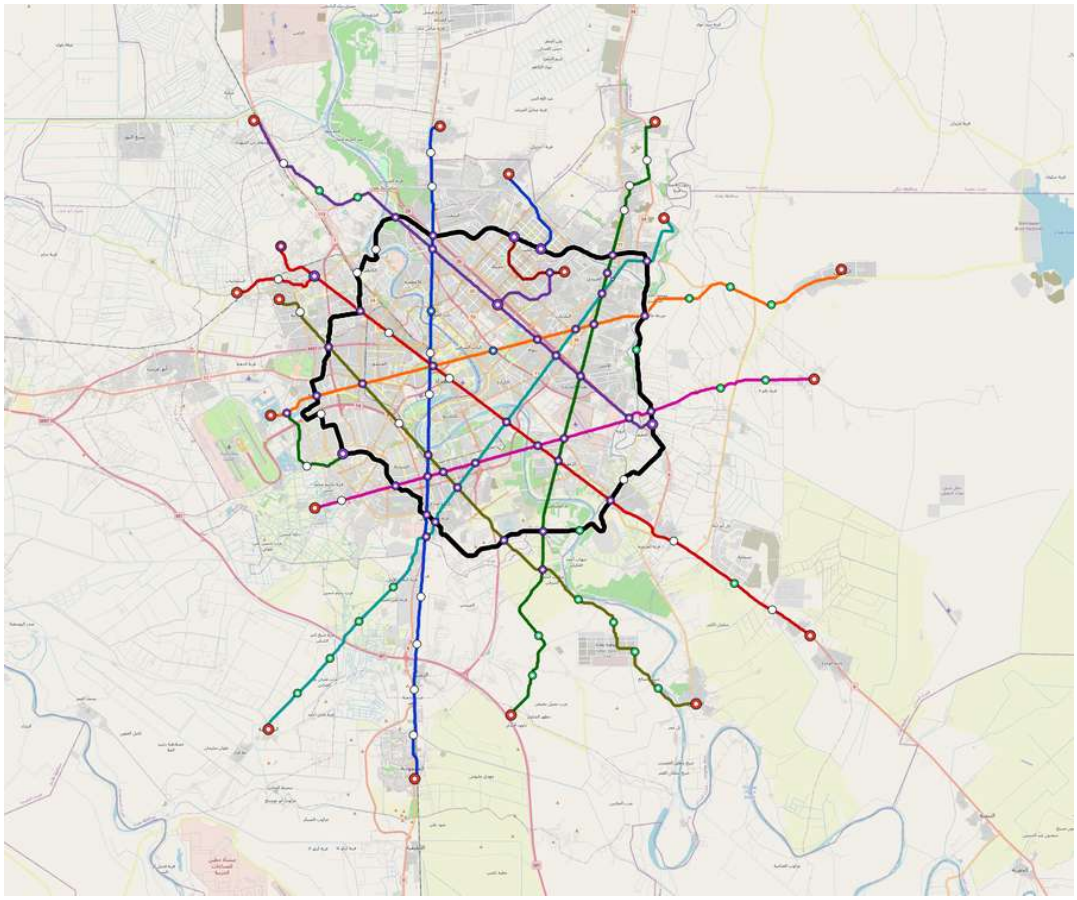
Current design coverage, geometry and open gates · Placed station IFC and map.

Country: IQ · Population: 9,780,429 · Current Iraq planning basis

Current planning basis: 2026-10-04 programme recalculation, `local_positive` conditional local-production case. The main route is the reworked city-centre elevated planning alignment; service remains a capacity-led assumption. Revised scope is unquoted and uncommitted; this is not a construction design or an operating release.

Connected construction and battery study, 2026-10-06 now reconciles island topology, 18 launchers/two shifts, supplier/logistics constraints, equipment cash and sodium alternatives. Its full-network energy duties report service shortfalls; supplier contracts, installed-rate credits and accessible-entrance coverage remain unqualified. The financial figures below are retained comparators and do not include an accepted accelerated-build saving. Base programme planning allowance is USD 8.667bn, including line-local depots, final assembly and selected upstream component plants. Assumed facilities cover the modelled cash deficits; their placement is uncommitted, and the case retains IQD 0.000tn terminal debt. Local special/segmental structures, installed grid/charging upgrades, actual foundations, land and utilities remain unpriced. Removing search penalties establishes no realised saving. Older catalogue financial passes establish arithmetic for their own assumptions, not viability of this revised scope.

### Network



Baghdad rail network on OpenStreetMap

Lines / unique stations / interchanges: 14 / 159 / 45; Route length: 513.3 km double track; Direct transfers / reachable line pairs: 39.6% / 100.0%; Residents within 800 m radial station catchments: 1,129,864 (2020 raster; 18.9% of bbox).

Service span / peak headway: 05:30–02:00 / 3 min; Fleet: 809 × 6-car `metro-6car` trainsets (728 peak revenue); Peak network throughput: 403,200 passengers/hour; Practical service capacity: 3,615,840 passenger-trips/day.

Annual paid-trip planning range: 659.9–1055.8 M.

## Lines

| Line | Length | Stations | Trainsets | Termini |
|---|---|---|---|---|
| line-1 | 49.1 km | 17 | 86 | S Outer  N Outer |
| line-2 | 52.9 km | 14 | 95 | SE Outer  NW Mid |
| line-3 | 49.5 km | 16 | 90 | S Outer  NE Outer |
| line-4 | 41.9 km | 12 | 76 | NW Outer  E Mid |
| line-5 | 47.3 km | 16 | 86 | W Mid  E Outer |
| line-6 | 52.5 km | 16 | 95 | SW Outer  NE Mid |
| line-7 | 40.0 km | 13 | 72 | E Outer  SW Mid |
| line-8 | 48.1 km | 15 | 89 | SE Outer  NW Mid |
| line-9 | 97.7 km | 26 | 45 | NW Mid  NW Mid |
| line-10 | 6.8 km | 3 | 15 | N Mid  NE Mid |
| line-11 | 6.9 km | 2 | 14 | N Mid  N Mid |
| line-12 | 6.6 km | 3 | 15 | NW Mid  NW Outer |
| line-13 | 8.0 km | 4 | 18 | W Mid  W Mid |
| line-14 | 6.0 km | 2 | 13 | N Inner  NE Mid |
| Total | 513.3 km | 159 unique | 809 | |

Population access uses retained native count pixels where available; radial catchments require pedestrian/feeder validation. The former demand-score resident proxy is retired. Access and transfers · Building, support and terrain clearance.

# Energy

Scheduled service: 6,278 one-way journeys / 215,989 train-km/day; Annual traction demand: 2,043.4 GWh; Station/depot PV / storage: 46.4 MW / 316.0 MWh; Aggregate charging power: 278.0 MW.

Dedicated solar plant: 1,019.7 MW; Residual grid/PPA import: 0.0 GWh/yr; Worst powered-stop gap: line-6: 18.9 km / 305 kWh; Lowest traversal charging margin: line-11: 74 kWh. These energy quantities describe the current regenerated scenario. Zero annual residual grid import is an accounting balance, not accepted hourly autonomy. Depot charging/grid upgrades, duty and launch conflicts remain open.

# Current capital and operating people

| Revised capital scope | USD equivalent million |
|---|---|
| Civil and bearing allowance | 4,058.152 |
| Stations and core elevated access | 1,269.500 |
| Rolling stock | 1,219.590 |
| Final assembly and component plants | 416.253 |
| Line-local depots | 289.645 |
| Solar and charging | 874.140 |
| Signalling and programme overhead | 539.271 |
| Total programme | 8,666.552 |

There are 14 depots, one per line, with 809 storage slots for all 111 m six-car trains plus clearance. Depot reference capital is USD 289.645m, replacing the old USD 8m once. Workshop bays are sized separately by workload. The current case gives no capacity credit to station stabling. Actual land, foundations, connected access, installed charging and morning launch acceptance remain open. Depot quantities · Items.

The operating establishment is 3,523 FTE, including 1,572 station-cover FTE. Two staff per station and two normal eight-hour shifts give 636 daily shift assignments; retained 20.5-hour service also funds late cover and weekly/leave/training/sickness relief. Loaded annual payroll is IQD 83.415bn, with subsequent OPEX inflation. General pay starts at IQD 1,175,455/month, 50% above the historical employee median indexed to 2026. Technical/supervisor/senior/director grades are separate; this is not a newly measured median. Roles and wages. Final assembly has 1215 production and 183 support FTE; selected upstream plants add 290 production and 45 support FTE. Their 59 paid production months are separate from permanent railway jobs. Construction crew screen is incomplete; contractor labour is already inside contract rates.

# Iraqi manufacture and USD capital exposure

bogie: 9708 (Local process option); motor-inverter-set: 9708 (Local process option); battery-225kwh-pack: 4854 (Local process option); door-cassette: 19416 (Local process option); window-cassette: 29124 (Bought component).

Imported process machinery supports the selected Iraqi fabrication and assembly options shown above. Cells/BMS, wheels/axles/bearings, inverters and other critical inputs retain imports. Products with negative Baghdad-only whole-order margins remain bought in this case. Plant readiness/qualification within 18 months is assumed, not demonstrated. Make/buy

appraisal.

Compared with the matched bought-component case, capital changes from USD 8.795bn to USD 8.667bn; imported invoice exposure changes from USD 2.358bn (26.82%) to USD 2.016bn (23.27%). The historical 148 km / USD 18bn proposal has a different scope and assumed all-USD funding; it is not a matched tender saving.

## Current funding and cashflows

Government capital is exactly 25%. Imports use 50% government USD cash / 50% proposed Chinese USD credit. Only Chinese debt is USD; the rest of government cash, bonds, bank/gap credit and mezzanine is IQD. Government invoice downpayments are scheduled within the total 25% contribution. FX is the historical planning anchor of IQD 1,300/USD.

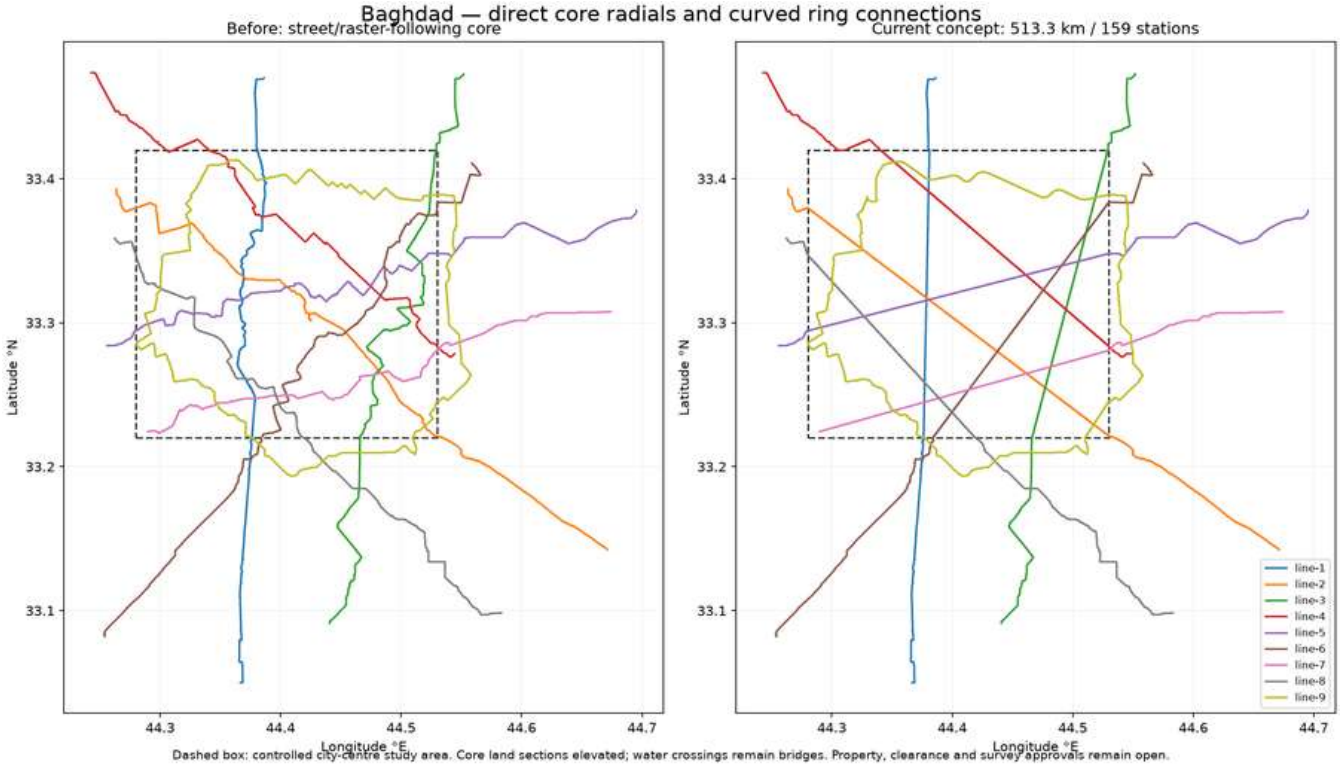
| Capital-only source | Currency | Native amount |
|---|---|---|
| Government import cash | USD | 1,008,216,375 |
| Government local cash | IQD | 1,505,948,192,086 |
| Chinese capital credit | USD | 1,008,216,375 |
| Ordinary capital bonds | IQD | 4,182,186,517,697 |
| Green capital bonds | IQD | 1,147,843,845,665 |
| Senior bank capital credit | IQD | 1,776,676,787,787 |
| Conditional climate grant | IQD | 32,500,000,000 |

Interest/fees, reserve cash, OPEX and gap facilities are additional cashflows, not capital added twice. Fares, kiosks, advertising, additional receipts and fare/OPEX indexation are included. Green/grant/rights terms and concessional gap credit remain uncommitted. Conditional first/full line revenue is month 40 / 81; physical and financing gates are open.

The tested IQD mezzanine leaves 81 defaulted draw vintages and increases terminal debt to IQD 0.000tn. It does not establish sustainable repayment. Monthly cashflow · Six-month bond/loan placements · All 13 cases · Cost and demand review.

## City-centre elevated alignment

The main design uses straight core radial tangents and broad curved ring connections where the retained water evidence permits them, inside the explicit 33.22–33.42°N / 44.28–44.53°E study area. Shoreline detours retain their separate curve and structure review gates. Land sections there are elevated; water crossings remain bridges. The final water-constrained core routes change from 301.670 km to 286.225 km. The main network is 513.336 route km, with 56.73% elevated across the whole system. Maps, station placement, fleet, civil quantities, staff and finance use that reworked design. Analytical controls and limitations.



Earlier corridors and current central alignment

Property/air rights, obstacles, protected sites, surveyed heights, utilities, piers, foundations, transition curves and vertical alignment remain open. Existing outer approaches retain street/raster bends; exceptional geometry still requires realignment

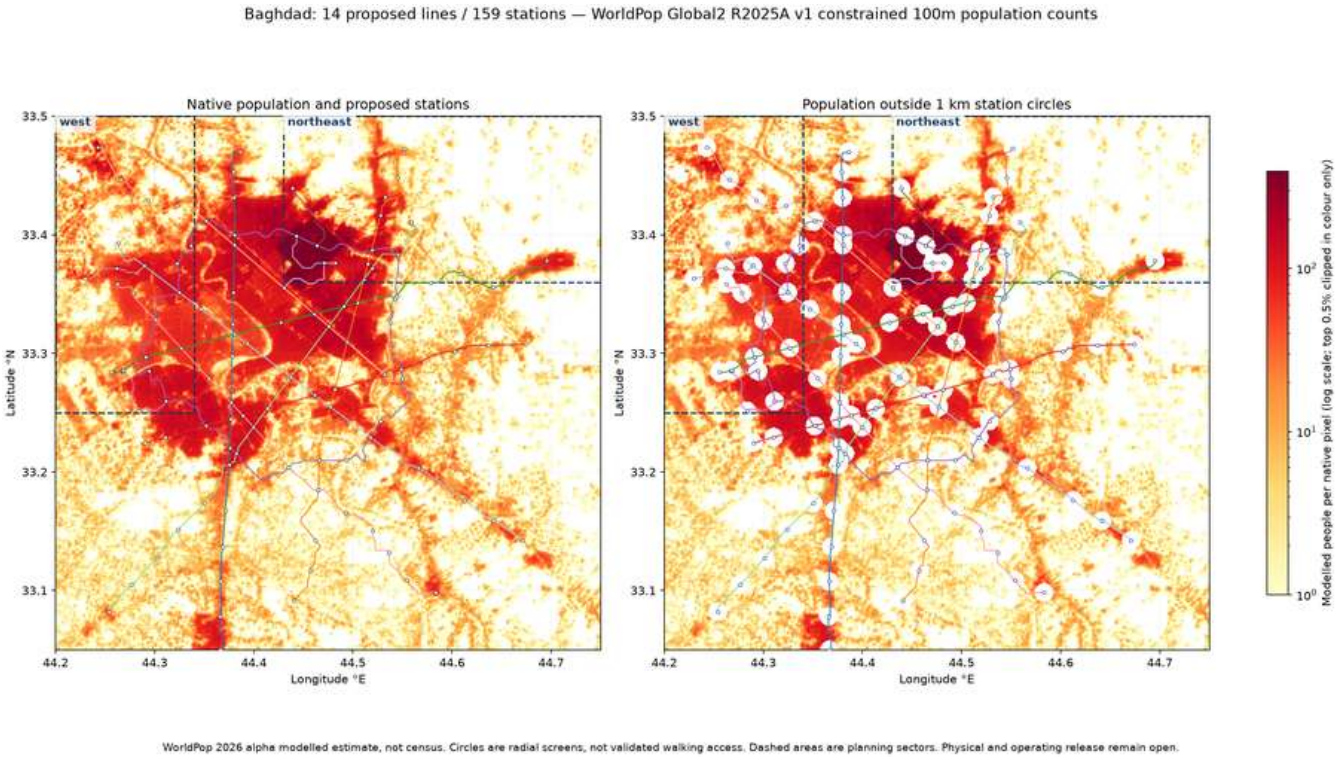
or special products. Additional outer grade-separation sensitivities add 7.924 km and retain current dates; they are not the adopted core geometry or an achieved routing-penalty saving.

## Neighbourhood population and mapping sources

Native WorldPop 2026 counts guide the compact corridor additions, with separate GHSL 2025 and retained WorldPop 2020 comparisons. The 2026 epoch is an alpha modelled projection using older population inputs, not the 2024 census. Planning sectors are explicit rectangles, not administrative boundaries.

| Sector | Modelled native population | Within 1 km of emitted stations | Outside station circles |
|---|---|---|---|
| northeast | 2,197,150 | 38.4% | 1,353,322 |
| west | 1,459,449 | 29.6% | 1,027,430 |

Measured Baghdad traffic counts, speeds and OD demand remain unavailable. Pedestrian topology is screened on a dated OSM graph; station entrances, snap connections, sidewalks and accessible paths remain unverified. Station circles are potential radial access, not validated walking coverage or paid trips. Source comparisons, licences and neighbourhood gaps.



Population and underserved planning sectors

## Evidence and regeneration

Complete proposal PDF · Editable proposal · Supporting data · Planning-only ERP drafts · Original catalogue finance · Original depot/stabling screen. Simulation, energy and asset evidence uses the current reworked geometry; the new staffing/depot/factory plans do not create accepted sites, appointed employees or operational assets.

Auto-planned by the OpenSourceRail design pipeline. Shared assumptions are in the deployment planning reference. Inputs: design, scenario, map, package evidence. City-local simulation, energy, GIS, operations and delivery retain their recorded planning/release gates. For presentation-only updates, run `.venv/bin/python tools/automation/publish-city-summary.py`; add `--check` to detect drift. The city regeneration pipeline uses this publisher. A stale scope study stops publication rather than silently restoring the original cost headline. Publication provenance is in publication-manifest.json.

# Baghdad programme recalculation

Repository source: `cities/catalogue/west-asia/Iraq/Baghdad/engineering/programme-recalculation/README.md`

Controlled planning basis, 2026-10-04; unquoted and uncommitted. This is the latest staffing/depot/local-production review. Existing cost and financing cases remain historical comparators; no survey, manufacturing qualification or lender commitment is created.

## Operating people and wages

The 159 stations require two concurrent staff during two normal eight-hour shifts: 636 daily shift assignments, not a headcount of people working every day. Retaining 20.5 service hours also requires 4.5 hours of separately funded late cover per station. Weekly cover, leave, training, sickness and handovers give 1572 station-cover FTE, within 3523 permanent operating FTE. Full-operation loaded payroll is IQD 83.415bn/year (USD 64.165m equivalent), indexed thereafter with OPEX.

The employee median is IQD 614,000 from the 2021 Labour Force Survey, cited in the IMF 2023 report. Applying an assumed 5% annual index to 2026 gives IQD 783,637; the general-worker floor is IQD 1,175,455/month, 50% higher. Technical, supervisor, senior and director roles use 2.25/3/4/5 times that indexed proxy. This is a historical observation plus an editable index, not a measured current national median. Employer costs and overtime are priced separately. Roles and recruitment/cohorts retain appointment and competence gates.

ERP planning drafts map the revised Staffing Plan, depot Project/Asset budgets and factory Workstations to native business records; they create no Employee, appointment, transaction or approval.

Construction workers, factory production/support workers and permanent operators are separate populations. Construction applies explicit trade-crew allowances to actual work-package resource lanes/dates, counting overlapping use of the same lane once; its peak is 429 FTE. It is not a measured complete contractor crew schedule; revised depot and upstream factory construction crews still require their own work-package schedules. Construction labour is already inside contract rates; its unknown payroll-content overlap remains unpriced, preventing a duplicate charge. A separate wage-content stress increases assumed labour content (20% of affected contracts) by 50%, with incremental EPC once; it is an overlap sensitivity, not proof of contractor wage contents. Existing assembly wages are replaced using an explicitly assumed embedded payroll credit; component process labour is inside component unit prices. Paid production capacity above those productive hours is added separately, never charged twice.

The final-assembly establishment is 1215 production FTE plus 183 support FTE. The scheduled order requires 59 paid months from month 18 through month 76; payroll follows this calendar, rather than dividing the order by a theoretical steady-state rate and losing ramp-up/idle months. Each upstream plant also funds its whole production establishment for that period, with the productive labour already in unit prices deducted once. These jobs are additional to permanent railway operations; no national order or permanent post-order subsidy is assumed.

## One depot per line, full-size trains and fleet

There are 14 line-local depots, providing 809 storage slots for all six-car revenue/spare/reserve trains. Slots use the actual 111 m train plus 10 m clearance. Workshop bays follow annual bay-hour demand and usable bay capacity; parking slots are not maintenance bays. Station storage is an option without any capacity credit in this case. Full overnight-to-morning launch and throat conflicts remain unvalidated.

| Line | Trainsets/storage slots | Tracks | Workshop bays | Land envelope ha | Reference USD m |
|---|---|---|---|---|---|
| line-1 | 86 | 29 | 12 | 11.50 | 27.045 |
| line-2 | 95 | 32 | 14 | 12.72 | 36.828 |
| line-3 | 90 | 30 | 13 | 11.94 | 28.589 |
| line-4 | 76 | 26 | 11 | 10.40 | 24.991 |
| line-5 | 86 | 29 | 12 | 11.50 | 27.045 |
| line-6 | 95 | 32 | 14 | 12.72 | 30.328 |
| line-7 | 72 | 24 | 10 | 9.62 | 23.282 |
| line-8 | 89 | 30 | 13 | 11.94 | 28.559 |
| line-9 | 45 | 15 | 7 | 6.32 | 17.210 |
| line-10 | 15 | 5 | 3 | 2.57 | 9.624 |
| line-11 | 14 | 5 | 2 | 2.45 | 8.335 |
| line-12 | 15 | 5 | 3 | 2.57 | 9.624 |
| line-13 | 18 | 6 | 3 | 2.89 | 9.879 |
| line-14 | 13 | 5 | 2 | 2.45 | 8.305 |

Total depot reference: USD 289.645m, replacing the original USD 8m exactly once. Storage, workshop and access tracks, points, drainage/access, workshop shell/equipment/services, yard lighting/fire services, wash plant, wheel lathe,

offices/stores and rescue/quarantine are visible. Access-track length is an editable allowance, not a connected site alignment. Existing depot PV/BESS is retained once. Land/title, utility relocation, actual soil/foundations, installed charger/grid upgrades and tax/duties remain unpriced. Item register.

## Core elevated stations

The reworked core has 84 station platforms with raised-structure/access scope. The register replaces their catalogue allowance with a separately stated elevated reference, adding USD 292.500m direct, with incremental EPC and operating maintenance once. Elevated interchange allowances are already present where catalogued; they receive no duplicate uplift. Other core stations use a 30% structure allowance plus USD 1m for vertical access. These are unquoted allowances, not released multi-level junction or station designs. Core station register.

## Iraqi component manufacture

| Product | Network quantity | Required units/year | Cells | Production/support FTE | Factory capital USD m | Unit make/buy USD | Whole-order margin USD m |
|---|---|---|---|---|---|---|---|
| bogie | 9708 | 2582 | 30 | 140/21 | 42.568 | 15156/25000 | 41.595 |
| motor-inverter-set | 9708 | 2582 | 20 | 70/11 | 29.253 | 11078/15000 | 2.088 |
| battery-225kwh-pack | 4854 | 1291 | 8 | 38/6 | 25.577 | 29828/45000 | 42.977 |
| door-cassette | 19416 | 5164 | 12 | 42/7 | 15.351 | 2023/3333 | 6.269 |
| window-cassette | 29124 | 7746 | 9 | 32/5 | 22.392 | 687/1111 | -14.256 |

Make/buy inputs price imported process machinery, Iraqi buildings/site work, qualification, residual imported inputs, local materials, graded labour, process overhead, fixed support and plant maintenance. Cells are sized to the existing train factory's required production rate, not a small demonstration line. The order is 1.092 GWh of gross onboard packs. Battery pack assembly is evaluated; imported cells/BMS remain. Bogie wheels/axles/bearings, motor inverters/magnets, door safety electronics and glazing feedstock also retain imports. Local manufacture does not mean zero USD input.

The buy case itemises these five imported completed products; the old blanket vehicle import percentage is retained only for other parent scope. This prevents replacing already-local scope with a second import credit. The all-product and positive-margin selections are separate unquoted cases. Whole-order margins are before finance/tax/risk; vendor prices, license, QA, process yield, supply commitments and first articles must validate them. No future national order pays Baghdad debt or makes an uneconomic line look profitable. Serial component qualification is assumed within the 18-month readiness target, not proven. A six-month supplier delay shifts rolling-stock invoices and opening/service cash, extends the full operating horizon and prices idle production payroll. A 25% raw-input price stress preserves the same selected facilities. Rejected/reworked product still needs a measured production replay. Existing final assembly tooling remains priced; upstream machinery is added without an unproven overlap credit.

## Paid journeys and transfers

Revenue remains a capacity-led sensitivity rather than a surveyed OD forecast. The reference uses one boarding per paid journey, a zero-transfer upper-bound assumption. Integrated-fare sensitivities use 1.25, 1.5 and 2 boardings per journey: only fare receipts are divided; kiosk/rental/advertising receipts, service, staffing and energy are retained. These are uncalibrated factors, not estimates of Baghdad travel. Physical access and surveyed OD/section loads must qualify any adopted demand forecast. Demand handoff.

## More elevation and fewer bends

The current main design adopts the straight central elevated alignment. The screening policy allows up to 65% elevated and at least 25% at grade, subject to site/design acceptance. Baghdad currently has 56.73% elevated. Investigation windows around all 49 exceptional segments add 7.924 km of candidate at-grade conversion, reaching 58.27%; overlapping intervals are merged and existing viaduct/bridge lengths excluded. Approach length is at least 300.0 m from assumed height/gradient.

Elevation alone removes no horizontal bend. Wider-radius geometry, station moves, ROW, vertical alignment, ramps, egress, ground/utility evidence, crossings and whole-life costs must be designed together. The additional-elevation case includes only its base allowance; routing scores are excluded from money and the old 25%/50% penalty-removal cases are retired. Special designs and consequential installed costs remain unknown. The added standard civil allowance uses the conservative simple-span bearing index. Candidate intervals.

# Funding and mezzanine comparison

Government capital remains exactly 25% of the scenario total. Imported invoices receive 50% government USD cash / 50% Chinese USD credit. Remaining government cash, bonds, senior bank/gap credit and mezzanine are IQD. Government USD payment dates follow machinery/input invoices; the remaining appropriation is allocated proportionally to local invoices, so a machinery-heavy month need not be falsely limited to 25% government cash. Chinese supplier origin and export-credit eligibility are assumptions requiring vendor/lender confirmation. China Exim describes buyer credit for Chinese products, technologies and services; machinery eligibility is not a loan commitment (official product description).

The positive-margin local-production senior case's capital-only sources are shown below. They sum to its capital uses; gap credit, interest/fees, reserve funding and operating receipts are additional cashflows in its monthly ledger and six-month placement schedule. Ordinary and green bonds are separate placements, never added again to a combined bond figure. Bond face units are IQD 1m; rounded placement envelopes are not additional cash raised.

| Capital source | Currency | Native amount | USD equivalent m |
|---|---|---|---|
| Government import cash | USD | 1,008,216,375 | 1008.216 |
| Government local cash | IQD | 1,505,948,192,086 | 1158.422 |
| Chinese capital credit | USD | 1,008,216,375 | 1008.216 |
| Ordinary capital bonds | IQD | 4,182,186,517,697 | 3217.067 |
| Green capital bonds | IQD | 1,147,843,845,665 | 882.957 |
| Senior bank capital credit | IQD | 1,776,676,787,787 | 1366.674 |
| Conditional climate capital grant | IQD | 32,500,000,000 | 25.000 |

Mezzanine replaces 10% of domestic residual capital borrowing; it is not extra capital on top of the uses. The IQD case has 6% cash coupon, 4% PIK, 2% arrangement fee and a 15-year balloon from each draw. Deferred cash coupon and PIK increase outstanding debt until maturity. Thereafter the overdue principal is retained with separately disclosed simple 10% contractual-interest sensitivity; arrears are not compounded and the balloon is not silently extended. Cash junior payments require senior DSCR of 1.20, funded reserves and actual residual cash; new gap draws/unfunded support cannot pay junior debt. No conversion, fresh equity or automatic refinancing is invented. Unpaid maturity balances/defaults remain visible. Mezzanine is structurally junior to senior debt and senior to equity, as described by UNCITRAL; the rates here are project sensitivities.

| Matched case / six-month placement schedule | CAPEX USD bn | USD capital intensity | Peak IQD gap tn | Terminal all debt IQD tn | Unfunded IQD tn | Junior defaulted vintages |
|---|---|---|---|---|---|---|
| revised_scope_buy | 8.795 | 26.82% | 5.109 | 0.000 | 0.000 | 0 |
| local_all | 8.677 | 23.12% | 5.059 | 0.000 | 0.000 | 0 |
| local_positive | 8.667 | 23.27% | 5.033 | 0.000 | 0.000 | 0 |
| local_positive_mezzanine | 8.667 | 23.27% | 4.267 | 0.000 | 0.000 | 81 |
| local_positive_commercial_gap | 8.667 | 23.27% | 12.041 | 0.000 | 0.000 | 0 |
| local_positive_mezzanine_stress | 8.667 | 23.27% | 9.117 | 21.346 | 0.000 | 83 |
| additional_elevation_base_allowance | 8.731 | 23.20% | 5.114 | 0.000 | 0.000 | 0 |
| local_positive_raw_price_stress | 8.770 | 23.74% | 5.128 | 0.000 | 0.000 | 0 |
| local_positive_supplier_delay | 8.667 | 23.27% | 5.366 | 0.000 | 0.000 | 0 |
| construction_wage_content_stress | 9.267 | 22.77% | 5.927 | 0.000 | 0.000 | 0 |
| integrated_fare_1_25_boardings | 8.667 | 23.27% | 9.220 | 0.000 | 0.000 | 0 |
| integrated_fare_1_5_boardings | 8.667 | 23.27% | 13.000 | 10.554 | 0.406 | 0 |
| integrated_fare_2_boardings | 8.667 | 23.27% | 13.000 | 13.000 | 12.070 | 0 |

The 4 positive-margin process options reduce capital from USD 8.795bn to USD 8.667bn, and imported invoice exposure from USD 2.358bn to USD 2.016bn. Half of that exposure is government USD cash and half Chinese USD credit; all other capital funding is IQD. The historical 148 km / USD 18bn third-party benchmark has a different scope and assumed full foreign-currency financing; this is a planning comparison, not a like-for-like tender saving. The reworked 513.3 km network's 40.5% legacy routing-demand cell fraction is not population access. Its former resident multiplication is retired; see the native population and transfer audit.

Current financial conclusion: the positive-margin senior case records IQD 0.000tn of residual unsourced support after assumed facilities and retains IQD 0.000tn of debt at the horizon. Its company NPV before finance is USD -3.246bn at the assumed nominal discount rate. Adding mezzanine does not change the underlying operating return: it leaves IQD 0.000tn of

total debt and 81 unpaid junior vintages. It is not recommended as a cure for the funding deficit. Fare and OPEX indexation, kiosks/advertising and inherited additional receipts are already included; new verified capital, affordable revenue or accepted scope savings are still needed.

All cases use the same revised staff, depot and indexed fare/OPEX assumptions. Six months of scheduled senior service are reserved from the first draw; three months of OPEX plus explicit industrial working capital are restricted. This revised reserve policy differs from older reference cases, so compare matched cases in this table when judging mezzanine. Concessional 2% gap funding, grants/rights/additional income and enhanced green coupons are uncommitted; the 8% gap and high mezzanine-rate case expose that dependence. There are zero dividends. Cash/principal/PIK identities, maturity risk, monthly draws and six-month bond denominations are retained for every case.

Regenerate with `.venv/bin/python tools/automation/baghdad_programme_recalculation.py`; verify with `--check`. Complete installed scope, construction wage-content adjustment, local-pay survey, validated demand/timetable and supplier/lender agreements remain open.

# Iraq funding programme and Baghdad planning status

Repository source: `cities/catalogue/west-asia/Iraq/IRAQ-FUNDING-PROGRAMME.md`

## Current Iraq planning basis — 2026-10-06

Current country basis · Baghdad summary · Connected design, production and energy study.

The retained `local_positive` Baghdad financial comparator is USD 8.667bn, with IQD 0.000tn unsourced support and IQD 0.000tn terminal debt. All debt clears at model month 295, conditional on the recorded funding assumptions. Its prices and facilities are unquoted and uncommitted. It does not price the complete accelerated construction and battery scenario.

The accelerated scenario's complete CAPEX, financing, net island savings and accepted opening dates remain unknown. Its USD 9m / 18-launcher allowance covers purchase cash only; freight, assembly, commissioning, transporters, lifting frames, temporary supports, spares, crews and relocations require separate scope-matched prices. The earlier delivered-and-commissioned interpretation is not used. No launcher saving is added to an installed civil rate before removing a verified matching embedded allowance.

Iraq has existing precast facilities and expertise; qualify contracted civil supply and price tooling/upgrades. Baghdad trainset assembly and component-process allowances remain in the financial comparator. Additional national plant capacity and transfer costs require separate scope reconciliation.

The coordinated industrialisation programme joins vehicle interfaces, staged bogie localisation and the standard viaduct system. Its possible vendor register records official-source component and equipment leads for comparison. Iraq already has many precast facilities and relevant expertise; plant capability, compatible tooling and available production slots require qualification. No listed vendor is a selected supplier or a manufacturing-rights agreement.

The coupled service–OD–cost–finance study now derives capacity-limited passenger itineraries from completed train sections and carries the same grid purchases and train distance into conditional monthly finance. Its demand and retained prices/opening months are explicit sensitivities. Complete line openings additionally require stations, specials, track, energy, depots, fleet, testing and approvals; missing dates or prices remain unknown. No coupled case is an accepted forecast or an adopted national budget.

No current consolidated national budget or funded rollout is established. Other Iraqi city catalogue estimates and the earlier generic foreign-turnkey calculation remain separately identified comparators. Their differences are scenario arithmetic, not realised capital or interest savings. Baghdad's later scope cannot be mixed into an older national aggregate and presented as one complete budget.

### Construction sensitivities

| Case | Days for modelled running bays | Scope |
|---|---|---|
| full-doubling | 1022 | identified catalogue planning spans only; unresolved closures, station structures and special crossings remain separate gates |
| higher-productivity | 1098 | identified catalogue planning spans only; unresolved closures, station structures and special crossings remain separate gates |
| initial-accelerated | 1218 | identified catalogue planning spans only; unresolved closures, station structures and special crossings remain separate gates |
| initial-accelerated-reassigned | 966 | identified catalogue planning spans only; unresolved closures, station structures and special crossings remain separate gates |
| initial-six-day-calendar | 1348 | identified catalogue planning spans only; unresolved closures, station structures and special crossings remain separate gates |

These are conditional resource schedules. Station structures, special/closure spans, approved pier locations, delivery access and release evidence remain opening gates. Empty supplier/contract registers indicate missing qualifying evidence; they do not imply that Iraqi industry lacks capability.

### Chronological energy study

| Case, lower-solar duty | Minimum SOC | Unserved traction kWh |
|---|---|---|
| lfp-throughout | 0.0% | 676,286 |
| sodium-both | 0.0% | 4,024,245 |
| sodium-stationary | 0.0% | 676,383 |

The fixed-assignment diagnostic above uses both ring directions, declared dispatch stations and native rest-to-rest section timing. The current screen spans 4,440 continuous model minutes (3.08 days), including overnight state carry-over and a

study strategy permitting grid replenishment within remaining site import capacity. Charge-rate, thermal and life inputs are unqualified profiles, so these results do not establish a chemistry advantage or suitability.

The separate coupled energy/service controller keeps reserve-limited trains at their actual stations, continues charging, and reflects their availability in subsequent dispatch opportunities.

| Controlled case | Completed journeys | Missed dispatch opportunities | Distinct energy-held journeys |
|---|---|---|---|
| lfp-throughout | 17,491 | 909 | 706 |
| sodium-both | 8,536 | 9,605 | 2,761 |
| sodium-stationary | 17,492 | 908 | 719 |

Geometry/operating-distance findings remain recorded. Conflict-capable timetable, berth/depot access, transient traction and operational multi-day acceptance remain open. Current station passenger demand is unknown where no surveyed station/OD assignment has been entered; the common 3,000 pax/h value is retained only as a separate stress case.

# Historical funding calculation — retained comparator

The calculation below retains the earlier USD 7.581bn scope and its own assumptions. Its debt-clearance months and financial differences do not describe the current `local_positive` comparator or the unpriced accelerated scenario.

Scope: Baghdad and one manufacturing plant sized for Baghdad. Samawah, Mosul and every other city are excluded. All funding is proposed and uncommitted.

# Independent reconciliation, priced gap finance and six-month tranches

Capital sources still total USD 7,951.287m. The independent pooled-cash reconstruction requires USD 3,193.940m of gross extra cash and retains USD 7,867.053m later, leaving a USD -4,673.113m nominal net deficit before pricing additional gap finance. These three amounts answer different questions. The original capital principal is repaid in the lifetime cash ledger, not added to CAPEX a second time. City EPC is now spread over direct works; the initial baseline-freeze task no longer receives the full programme overhead allowance.

Detailed arithmetic and Iraqi financing routes · six-month reference bond/loan requirements · six-month blended candidate · independent calculation.

Green debt replaces qualified conventional borrowing; grants replace domestic capital debt; guarantees supply credit enhancement rather than cash. The new sensitivity charges supplemental IQD funding for interest and fees, sweeps later surplus to repayment, and exposes cash beyond its illustrative IQD 13tn cap and any unpaid terminal loan. The earlier gross cash-support figures below assume external contributions; they are not a priced bridge-loan requirement.

| Priced gap-finance sensitivity | Gross gap draws, IQD tn | Uncovered cash, IQD tn | Unpaid terminal loan, IQD tn |
|---|---|---|---|
| unfunded reference | 0.000 | 4.152 | 0.000 |
| green label only | 0.000 | 4.152 | 0.000 |
| zero cost liquidity bound | 4.152 | 0.000 | 0.000 |
| commercial gap credit | 13.000 | 7.067 | 13.000 |
| concessional gap credit | 5.318 | 0.000 | 0.000 |
| blended candidate | 3.574 | 0.000 | 0.000 |
| green concessional only | 4.433 | 0.000 | 0.000 |
| fare 5pct flat costs fixed demand | 2.003 | 0.000 | 0.000 |
| fare 5pct flat costs elastic | 2.232 | 0.000 | 0.000 |
| fixed fare 5pct opex | 13.185 | 0.486 | 13.000 |
| fare 5pct opex 5pct | 2.293 | 0.000 | 0.000 |
| fare 5pct opex 7pct | 2.471 | 0.000 | 0.000 |
| fare 5pct opex 5pct income 2pct | 2.491 | 0.000 | 0.000 |
| variable fare 5pct opex 5pct | 2.216 | 0.000 | 0.000 |
| fare 5pct opex 5pct rents indexed | 2.254 | 0.000 | 0.000 |

The candidate mix is uncommitted: eligible IQD green bonds at an assumed 4% plus enhancement fees; USD 25m equivalent climate capital grant; USD 300m equivalent net development-rights proceeds; and USD 25m equivalent annual new net local receipts at full opening. The grant, valuation, legal powers and IQD concessional facility need evidence. Existing rents/fare receipts cannot be counted again. With constant nominal fares and OPEX, a terminal unpaid loan means that sensitivity has not achieved self-financing.

# Additional pricing and OPEX inflation sensitivities

The requested paired sensitivity increases fares and OPEX 5% annually from financial close, while testing income growth separately. At 5% income growth and assumed -0.30 real-price elasticity, the illustrative blended case peaks at IQD 2.102tn supplemental debt and ends with IQD 0.000tn unpaid. The case repays the facility within the model horizon under these conditional assumptions. Placed early financing, candidate grant/rights receipts, fixed nominal debt terms and income growth remain assumptions. It is not a committed funding outcome.

Average nominal tickets move from IQD 1,525 at first opening to IQD 1,765 at full opening; 44 trips remain 11.7% of the indexed income proxy when incomes grow 5%. Separate cases test 2% income growth, 7% OPEX inflation, peak/off-peak tiers, fixed demand, and rental indexation. Capital escalation and future FX changes remain outside these sensitivities.

Paired 5% six-month financing · monthly tickets and affordability · variable-ticket six-month financing. The detailed report contains the NPV, all assumptions and downside cases.

# Surplus cash and early repayment

These cases use identical paired 5% fare/OPEX/income assumptions and the same conditional blended capital sources. Each pays OPEX, scheduled principal, interest and fees, then funds the debt-service reserve and a three-month current-OPEX buffer before voluntary repayment. Borrowed gap proceeds and uncovered external cash cannot fund early payments. The extra buffer remains cash held at the terminal horizon and earns no interest.

Compare strategies against buffered gap-only, rather than attributing the buffer change to repayment savings. Loans-first pays bank credit, Chinese credit and gap credit before bonds. Cost priority pays bank (9%), ordinary bonds (8%), Chinese credit (5%), green bonds (4% plus 0.5% annual guarantee), then gap credit (2%). It is an interest-rate heuristic, not a proof of the globally best strategy.

| Surplus strategy | All debt cleared, month from close | Finance cost saving vs buffered gap-only, USD equivalent m | Early-payment premiums, USD equivalent m | Peak gap debt, IQD tn | Terminal unrestricted cash, IQD tn |
|---|---|---|---|---|---|
| gap only buffered | 369 | 0.000 | 0.000 | 2.208 | 44.706 |
| gap then core | 209 | 506.359 | 36.995 | 2.208 | 45.364 |
| loans then bonds | 207 | 653.848 | 42.809 | 2.158 | 45.556 |
| cost priority | 203 | 988.754 | 56.843 | 2.158 | 45.991 |
| cost priority zero premium | 203 | 1,060.010 | 0.000 | 2.156 | 46.084 |
| cost priority noncallable bonds | 369 | 260.705 | 12.395 | 2.158 | 45.045 |

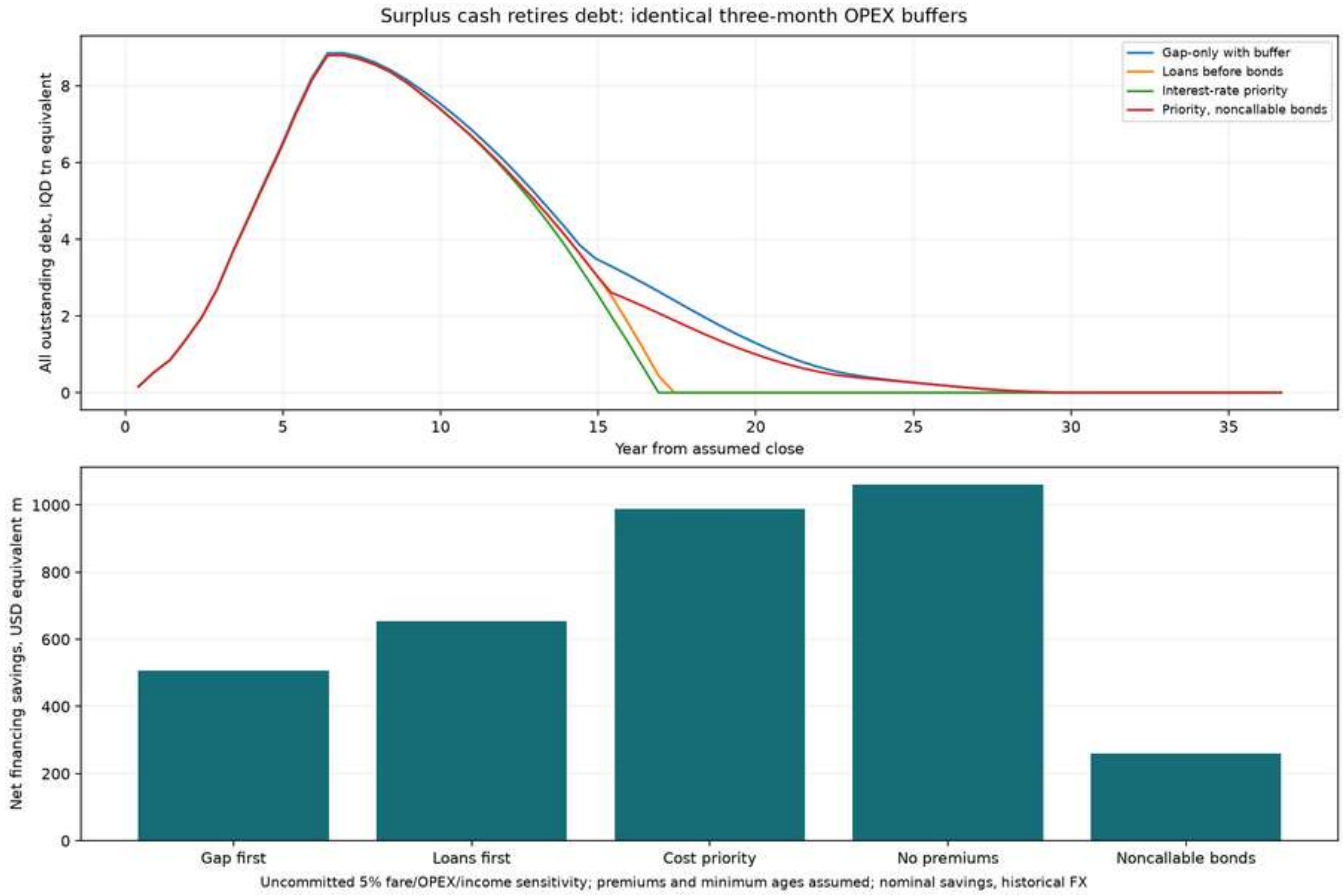
Cost-priority debt is cleared in month 203; buffered gap-only debt is cleared in month 369. Net nominal financing savings are USD 988.754m equivalent, after USD 56.843m assumed early-payment premiums. Savings include core interest, annual green guarantee charges and supplemental interest/draw fees; they exclude principal, which is returned once. All cases retain IQD 0.386tn operating buffer separately from unrestricted cash. There is no additional government contribution above 25% of CAPEX in these cases.

Assumed premiums are 1% of bank/Chinese/green principal and 2% of ordinary bond principal. A minimum draw age of 6 months (bank), 12 (Chinese) and 24 (both bonds) prevents immediate issue-and-redemption. Eligible vintages are repaid oldest first; contractual instalments are kept and maturity shortens. Notice, issuer call rights, investor consent, buyback price, remaining-maturity compensation, tax and FX require actual agreements. Noncallable-bond sensitivity makes no voluntary bond payments; zero-premium sensitivity removes only the assumed premium, retaining minimum ages.

| Facility | Buffered gap-only final principal payment month | Cost-priority final principal payment month | Early principal, native currency | Premium, native currency |
|---|---|---|---|---|
| bank credit | 165 | 122 | IQD 636.771bn | IQD 6.368bn |
| domestic bonds | 285 | 167 | IQD 2,547.814bn | IQD 50.956bn |
| chinese export credit | 309 | 175 | USD 592.389m | USD 5.924m |
| green bonds | 369 | 184 | IQD 887.075bn | IQD 8.871bn |

The gap facility's final principal payment is in month 203. Later surplus remains unrestricted cash after debt retirement. Each month's native debt balance equals prior balance plus draws minus scheduled and early principal. Each six-month closing balance is its final month's balance; payments, premiums, interest and reserve movements are period sums. Contractual repayment windows in tranche files describe the original draw terms; the actual final-payment months above incorporate early repayment.

Monthly cost-priority repayments · six-month repayment tranches · loans-first tranches · all six complete calculations



Surplus repayment comparison

Loan prepayment can carry redeployment/unwind charges: the World Bank Treasury FAQ illustrates the concept, without establishing Chinese or Iraqi loan terms. The US Treasury buyback FAQ and published purchase results illustrate issuer authority and priced buybacks rather than automatic par redemption; they do not supply an Iraqi legal mandate.

This repayment allocation does not change the unlevered project NPV or validate demand. Nominal savings over several decades are not present-value gains. CAPEX escalation, FX, lifecycle replacement, floating-rate risk and the uncommitted early funding still require appraisal.

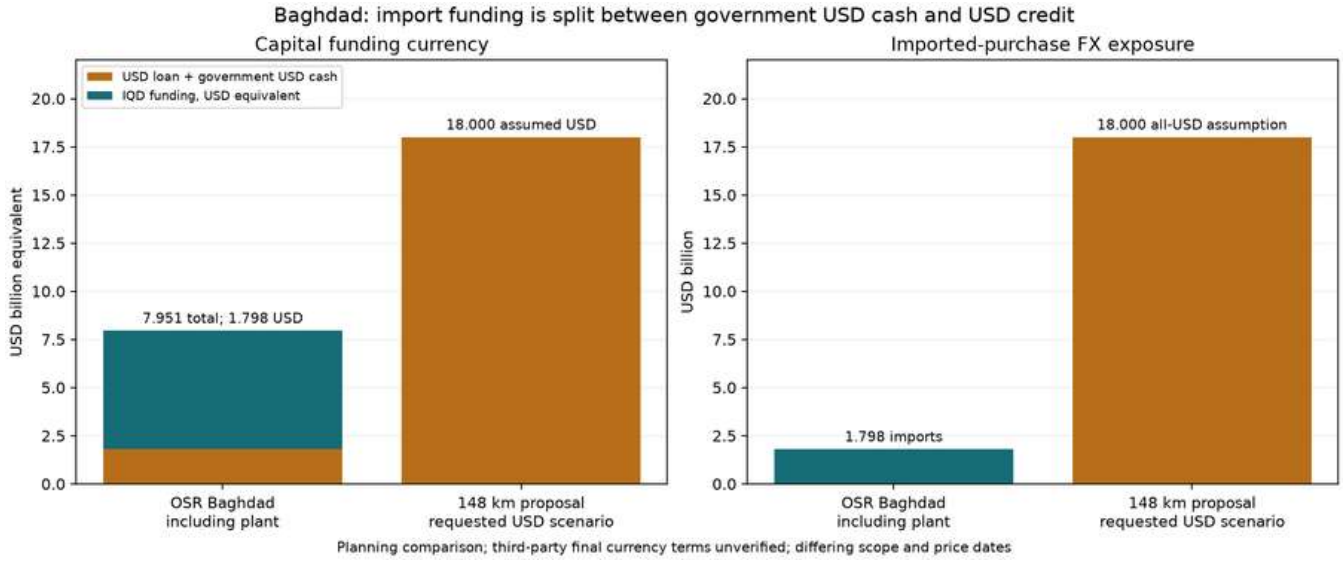
## Consolidated sources and uses

Government contributes 25% of total capital uses, including the plant and EPC. Imported purchases are split 50% government USD cash and 50% proposed Chinese USD credit, assuming the full imported basket can qualify. That USD government cash is inside the 25% total contribution; the rest of the government contribution is IQD. The remaining balance after those two sources is split 75% domestic IQD bonds and 25% IQD bank term credit.

| Proposed capital source | Currency | Native amount, billions | USD equivalent, million | Share of total capital |
|---|---|---|---|---|
| chinese export credit | USD | 0.899 | 898.82 | 11.30% |
| government import cash | USD | 0.899 | 898.82 | 11.30% |
| government local cash | IQD | 1,415.697 | 1,089.00 | 13.70% |
| domestic bonds | IQD | 4,938.025 | 3,798.48 | 47.77% |
| bank credit | IQD | 1,646.008 | 1,266.16 | 15.92% |
| Total capital uses | Mixed | — | 7,951.29 | 100% |

Baghdad city CAPEX is USD 7,626.54 million. The plant is counted once at USD 303.50 million plus USD 21.25 million EPC. Its sizing basis is 4,854 vehicle/car modules from Baghdad's controlled fleet and car count. Imported tooling receives proposed Chinese credit within that plant budget. The physical cell/floor/tooling envelope replaces the smaller module allowance where necessary; both remain unquoted engineering assumptions.

# Currency and USD capital intensity



Funding currency and imported-purchase FX comparison

Only Chinese credit is USD-denominated debt: USD 898.82 million. Government additionally provides USD 898.82 million cash for imports. Combined USD capital funding is 22.61% of uses; the remaining 77.39% is IQD government cash, IQD bonds and IQD bank credit. Revenue and local OPEX are also budgeted in IQD. At the historical planning conversion of 1,300 IQD/USD, the local government cash allowance is IQD 1.416 trillion, alongside its separate USD import cash. Together they equal 25% of total capital. USD columns are comparison equivalents, not a requirement to borrow or appropriate those domestic amounts in dollars.

Funding currency and procurement currency differ. Estimated imported purchases total USD 1,797.65 million (22.61% of capital), including plant imports. The government supplies half directly in USD cash; proposed Chinese credit supplies half as USD debt. The full import pool, including categories beyond the initially selected solar, bogies, batteries, windows, doors and tooling, is assumed lender-eligible pending origin qualification. If that expanded basket cannot qualify, its loan funding is uncovered; it is not automatically replaced by IQD bank credit or another grant. IQD borrowing reduces the revenue/debt currency mismatch; it does not remove Chinese debt-service FX risk, imported maintenance costs, domestic interest, inflation or placement constraints.

Eligibility sensitivity: the original named-component categories cover USD 849.64 million of invoices. At a 50% advance, they alone support USD 424.82 million of proposed credit. If the additional imported categories cannot qualify, USD 474.00 million of planned capital loan proceeds remains uncovered, in addition to the base support requirement below. Even the original categories remain unqualified; this screen is not a lender approval. No extra government contribution is assumed to replace that missing loan.

# What the 25% government limit leaves unfunded

The 25% capital contribution is USD 1,987.82 million. If that is also the limit on all public cash, the model leaves USD 4,013.14 million of additional funding requirements across the full construction, operating and debt horizon. These are interest, fees, reserve and operating/debt cash needs after modelled revenue; they are not additional approved government contributions.

Peak annual capital contribution is USD 394.38 million. Peak annual additional funding requirement is USD 986.21 million. If all additional support were provided publicly, conditional lifetime public cash would be USD 6,000.96 million, with a combined annual peak of USD 1,135.99 million. This exceeds the requested contribution and is shown only to expose the funding gap.

Across the 36.8-year nominal model horizon, additional requirements divide into USD 1,888.68 million before Baghdad's full-network opening, USD 1,699.66 million during Baghdad operations/debt tail, and USD 424.80 million for plant capital financing. Principal repayment before opening is part of the pre-opening requirement. This base withholds all fares until full-network completion; the separate phased sensitivity below tests earlier revenue. Gross additional support is a liquidity requirement over time, not net lifetime loss: later retained cash cannot repay earlier obligations without an approved bridge.

The programme CSVs distinguish the capped capital contribution, additional funding requirement and conditional payment requirements. Underlying city and factory ledgers calculate the support needed to pay scheduled obligations; their positive reserve balances and completed repayments are conditional on that support being raised. They are not a cash-solvent forecast under the public cash cap. No bridge, equity investor, rollover or extra appropriation is invented to close the gap.

# Cash and contractual structure

1. An Iraqi public sponsor seeks MoF authority for proposed sovereign IQD bonds through the established MoF/CBI issuance route, subject to legal review and placement. Municipal borrowing powers are not assumed. The 25% limit is the direct capital contribution, not a limit on sovereign bond liabilities, guarantees or lifetime public exposure.
2. Chinese export buyer credit is allocated to qualified Chinese invoices for solar equipment, bogies, batteries, windows, doors and Baghdad plant tooling. The requested 50% loan advance is matched by 50% government USD cash. All other imported categories also require Chinese supplier-origin and lender qualification before the full-basket financing assumption is valid. Noneligible imports still need foreign currency. Eligibility and origin require supplier evidence.
3. Government's 25% capital contribution covers the planned eligible downpayment; bonds and bank credit cover the remaining capital balance. Fees, construction interest and reserve funding are separate cash requirements, not silently capitalised or counted as capital-source proceeds.
4. Each draw starts its own grace and repayment clock. Planned receipts match procurement milestones; no actual payment or lender commitment is asserted. Chinese credit uses USD, bonds and bank credit IQD. Terms remain unconfirmed appraisal assumptions: 5%/48-month grace/180-month repayment, 8%/24/180, and 9%/0/84 respectively.
5. Revenue pays OPEX first and debt service next; subsidy is excluded from DSCR. Additional support shown by the city and plant models is an unfunded requirement under the cap. The factory model covers capital financing only; manufacturing income and factory OPEX need a separate business case.
6. Declined Chinese finance, delayed contributions, FX changes and bullet redemption are separately tested in the Baghdad appraisal. None creates an automatic facility or refinancing source.

## Rollout and financial close

Baghdad's current capital milestones span 82 calendar months. Full-network fare revenue begins after all budget milestones. Lowering the capital grant increases borrowing and cash-service needs; it does not shorten this schedule. The city-sized Baghdad plant becomes available after 390 working days (18 months from NTP), followed by the separately scheduled first-article series-release gate. The separate phased sensitivity uses this integrated planning schedule; actual plant and line acceptance and a commissioned operating baseline remain pending.

Required before financial close: approved sponsor and borrowing powers; appropriation limited to the agreed government contribution; a funded solution for the additional cash gap; supplier quotations and origin evidence; signed term sheets, guarantees and insurance; IQD placement/redemption plan; lender draw windows and FX access; surveyed demand/fare policy; tax, duty, land and utility pricing; accepted resource calendar and reserve covenants.

## Model and evidence

Programme monthly cashflow · annual cashflow · machine-readable programme · Baghdad city appraisal · editable assumptions. Other Iraqi city appraisals remain standalone examples outside this programme.

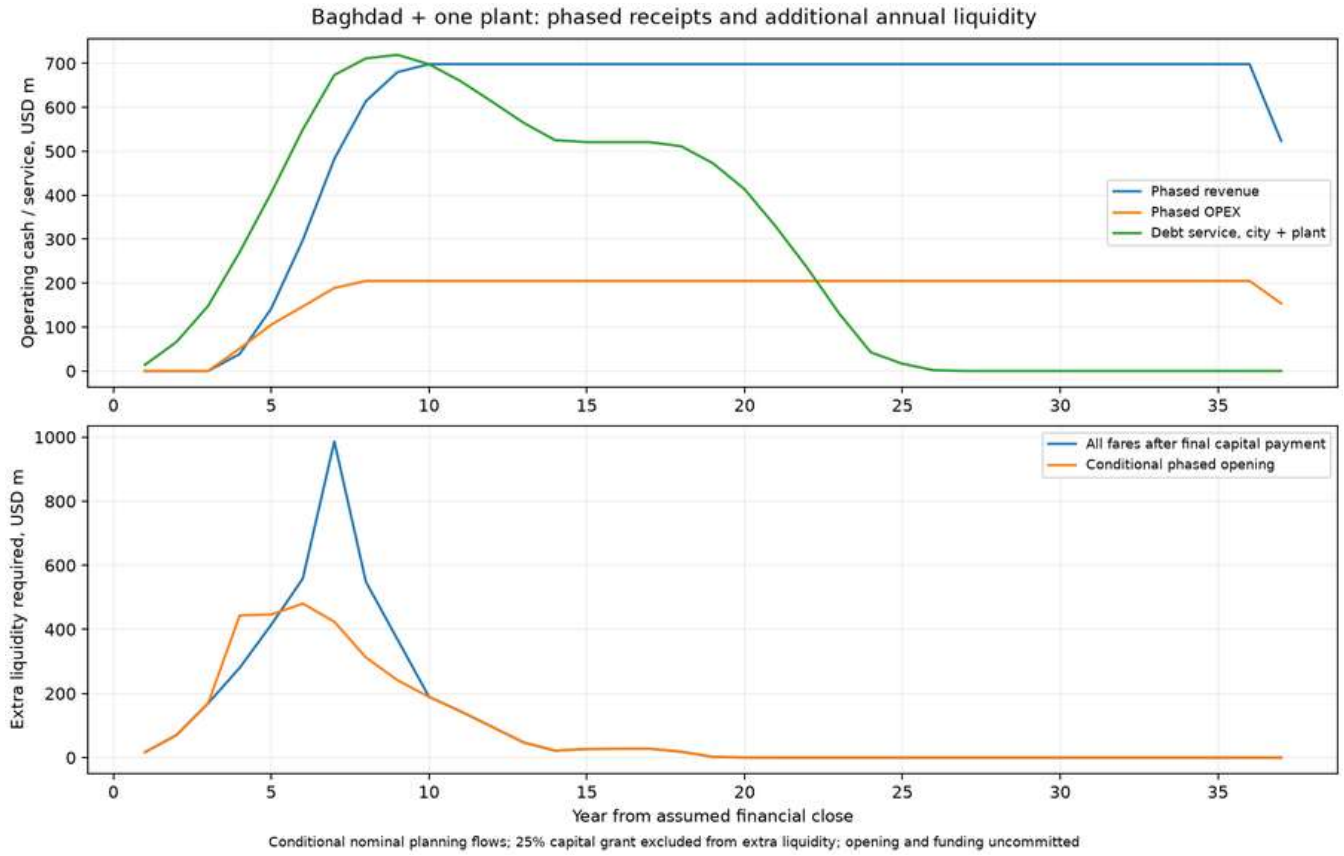
IMF 2025 Article IV supplies the historical 2024 FX anchor, not a current dealing rate. CBI fiscal-agent description and Injaz issue example support sovereign-bond context. China Exim export buyer credit supports the instrument concept; numeric terms and eligibility are unconfirmed assumptions.

## Recalculation: conditional phased opening

The earlier USD 9.890 billion result combined whole-fleet stage batching, no fares before the final capital payment and reserve deposits always funded with additional public cash. Ready-task dispatch now pipelines work within the same resource limits, gates train production on the new plant, and funds reserves from available project cash before seeking support. The full-network-only result above remains a conservative comparator.

With line openings tied to completed line and shared/depot work plus a 3-month commissioning allowance, first revenue begins in month 40, and all nine lines operate from month 81 after financial close. These dates are conditional planning milestones, not authorisation to run trains.

Each line's controlled trainset share allocates revenue and variable OPEX; its own 50% / 75% / 100% ramp applies. From first opening, 25% of full-network OPEX is fixed and 75% scales with opened fleet. This proxy can misstate early demand, central staffing and transfer benefits; a surveyed phase-specific operating plan is required. The same nominal fares, capital total, debt terms and 25% grant apply in every case.



Phased operating cash and additional liquidity

| Opening / demand scenario | Additional funding beyond 25% capital, USD bn | Conditional lifetime public cash, USD bn |
|---|---|---|
| All fares after final capital payment | 4.013 | 6.001 |
| Phased: commissioning delay two years | 4.192 | 6.180 |
| Phased: demand minus 40 percent | 7.076 | 9.063 |
| Phased: low demand | 3.205 | 5.193 |

| Line | Planned opening month | Fleet / variable-cost share |
|---|---|---|
| line-1 | 40 | 10.63% |
| line-10 | 41 | 1.85% |
| line-11 | 43 | 1.73% |
| line-12 | 42 | 1.85% |
| line-13 | 44 | 2.22% |
| line-14 | 44 | 1.61% |
| line-2 | 50 | 11.74% |
| line-3 | 55 | 11.12% |
| line-4 | 59 | 9.39% |
| line-5 | 64 | 10.63% |
| line-6 | 69 | 11.74% |
| line-7 | 73 | 8.90% |
| line-8 | 78 | 11.00% |
| line-9 | 81 | 5.56% |

All these are gross nominal liquidity contributions, conditional on funding. Later operating surplus is retained and is not netted against earlier required injections. The phased city ledger ends with USD 7.878 billion of unrestricted cash; no distribution or return to the sponsor is assumed. The plant ledger has no manufacturing income/OPEX: it remains a capital-financing allowance. A 25% direct grant also does not cap sovereign IQD bond liabilities or guarantees.

Phased programme monthly cashflow · phased programme annual cashflow

# Comparison with the historical 148 km third-party proposal

The July 2024 report, citing the prime minister's adviser, gives USD 18 billion, 148 km, seven lines and 64 stations. The NIC procurement notice describes DBOMFT and requires bidders to submit a funding plan. Neither establishes a final all-USD financing contract. The 100% USD foreign-loan/government-cash comparator below is the user's requested scenario, not a verified split of debt and grants. The older USD estimate has not been restated to a common price date.

| Measure | Current OpenSourceRail Baghdad plan | Historical proposal / requested USD scenario |
|---|---|---|
| Route km (not track km) | 513.3 | 148 |
| Lines / stations | 14 / 159 | 7 / 64 |
| Capital uses, USD equivalent bn | 7.951, including one plant | 18.000, reported estimate |
| Capital intensity, USD equivalent m / route km | 15.49 | 121.62 |
| USD-denominated capital funding, USD bn | 1.798, half loan / half government cash | 18.000, assumed USD cash + loans |
| IQD-denominated capital funding, IQD tn | 8.000 | Zero in requested scenario |
| Imported-purchase FX exposure, USD bn | 1.798 | 18.000 only under all-USD purchase assumption |
| USD purchase intensity, USD m / route km | 3.50 | 121.62 under that assumption |
| Contracted fares / debt terms | Planning fare and uncommitted facilities | Not established by these sources |

The OSR plan has 3.47 times the route length and 2.48 times the stations. Its planning capital estimate is 55.8% below USD 18 billion. Under the requested all-USD funding scenario, USD-denominated capital funding is 90.0% lower; under an all-USD purchase scenario, imported-purchase exposure is 90.0% lower. These measure different exposures and are not interchangeable debt-service savings.

The planning comparison is not a like-for-like qualified bid: route geometry, tunnelling/structures, land, utilities, taxes/duties, contingency, escalation, supplier qualification and acceptance maturity differ or remain unresolved. The older report's four-year completion expectation also differs substantially from OSR's current 82-month capital schedule. A lower capital estimate does not establish an earlier or more sustainable delivered service.

# Fares, population access and financial sustainability

The modelled average paid-trip fare is IQD 1,317 (USD 1.01 comparison equivalent), denominated in IQD rather than automatically indexed to the USD loan. It derives from the retained USD 380/month income proxy, equivalent to IQD 494,000/month at the planning anchor. Thirty paid trips consume 8.0% of that proxy income; 44 commuter trips cost IQD 57,963, or 11.7%. This is an average-trip yield assumption, not an adopted tariff or unlimited monthly pass; concessions, transfers and family affordability need an explicit tariff and household survey.

Low/high capacity-use cases assume 1,807,920 / 2,892,672 paid trips/day, not unique people or surveyed demand. Low-case steady annual revenue is IQD 908.0 billion; OPEX is IQD 266.5 billion. At that trip volume, the OPEX-only neutral fare is IQD 345, with nonfare receipts held constant. It excludes capital, debt and reserve funding.

In the first complete operating year, the 50% revenue ramp produces 329.9 million paid trips. Holding those trips and nonfare receipts fixed, covering OPEX, scheduled debt service and fees requires approximately IQD 3,417 per paid trip, excluding reserve deposits and factory debt. This is a cash threshold, not a recommended tariff; higher fares can reduce demand. Minimum annual operating DSCR before support is 0.04. Higher utilisation improves later cashflow but cannot fund the long pre-opening debt-service period. Neither this fare nor IQD denomination closes the additional funding gap shown above.

The design retains a planning population of 9,780,429. The legacy 40.5% routing-demand cell fraction is not a population percentage; its former multiplication into a resident estimate is retired. See the native population-count and multi-hop transfer audit for radius sensitivities, date, bbox denominator and access limitations. The older report's 80% city-coverage ambition uses no published comparable denominator or access method; it cannot establish that either plan reaches more residents. The 159 station platforms and 14 routes offer a network to test, not proof of superior walking coverage.

# Direct Iraqi labour and industrial benefits

Approximately USD 6.154 billion equivalent (77.4%) of programme procurement is assigned to local suppliers under the editable origin assumptions. This is potential local expenditure, not wages, GDP added or guaranteed Iraqi content. City civil works alone allocate USD 3.346 billion locally; rolling stock allocates USD 883.43 million locally, with plant local expenditure separately counted.

Local train assembly and fabrication create work in body modules, fit-out, wiring, coatings, systems integration, inspection and maintenance while bogies, batteries, windows and doors remain imported inputs requiring supplier and process qualification. Infrastructure work supports Iraqi concrete/precast production, civil erection, stations, utilities, solar installation and supervision. Tooling, training, process qualification and supplier access can leave reusable industrial capacity, shorter repair chains and retained skills after construction. Local employment and supplier income circulate in IQD and can generate Iraqi tax receipts; no multiplier or tax recovery is booked without evidence.

The operating allowance supports 3,422 indicative FTE with annual labour cost of IQD 50.29 billion. These are operating positions, not construction or manufacturing job counts. Construction employment requires validated work hours, productivity, wage rates, shift cover and local-content contracts; no fabricated job total is assigned. The third-party proposal may also use Iraqi civil labour, so its local share cannot be assumed zero.

A sustainable appraisal must demonstrate phased service before full-network completion, realistic paid demand and affordable tariffs, funded debt/interest/reserves within the public limit, placed IQD facilities, supplier and labour qualification,

lifecycle replacement funding and an accepted environmental/physical design. Current software and ledger checks establish planning consistency, not those outcomes.

# Baghdad financing reconciliation and six-month placement programme

Repository source: `cities/catalogue/west-asia/Iraq/Baghdad/engineering/finance/FUNDING-RECONCILIATION.md`

> Original catalogue or earlier scope reference. The figures and policies below retain their original assumptions; they are not the latest Baghdad staffing, depot, procurement or funding basis. See the current Baghdad recalculation and current city summary. National/portfolio totals have not been repriced with that conditional Baghdad option.

Scope: Baghdad city and one Baghdad manufacturing plant. Samawah, Mosul and every other city are excluded. Month zero is an assumed financial close, not an approved date. All financing and additional revenues remain uncommitted.

## The numbers that must add up

The original capital sources and uses reconcile. The confusion was combining upfront capital, repayment of that same capital debt, gross liquidity injections and later retained cash. The revised schedule also spreads city EPC overhead across direct works instead of paying the entire programme allowance against the initial five-day baseline-freeze task. Capital cost is unchanged. An independent implementation rebuilds every debt vintage, interest charge, principal payment and financing fee from native draws; it does not copy the reported support total.

| Capital source | Native currency | Native amount, billion | USD equivalent, million |
|---|---|---|---|
| chinese export credit | USD | 0.898824 | 898.824 |
| government import cash | USD | 0.898824 | 898.824 |
| government local cash | IQD | 1,415.697277 | 1,088.998 |
| domestic bonds | IQD | 4,938.025474 | 3,798.481 |
| bank credit | IQD | 1,646.008491 | 1,266.160 |
| Capital uses / sources | Mixed | — | 7,951.287 |

Government cash remains 25% of capital, with government USD import cash inside that contribution. Imports are financed 50% government USD cash / 50% Chinese USD loan. Every other loan and bond is IQD. An international green lender must provide confirmed IQD on-lending or a priced currency hedge to preserve that strategy. A green label does not supply additional money.

| Lifetime operating / finance reconciliation | USD equivalent, million |
|---|---|
| Fare and existing nonfare receipts | 21,638.485 |
| OPEX | 6,591.251 |
| Repayment of originally drawn capital principal | 5,963.465 |
| Interest on original capital financing | 4,367.991 |
| Original financing fees | 42.664 |
| Net nominal lifetime liquidity deficit | -4,673.113 |
| Gross extra cash required as bills fall due | 3,193.940 |
| Later unrestricted cash retained if those requirements are met | 7,867.053 |

USD 3,193.940m gross injections minus USD 7,867.053m retained cash equals USD -4,673.113m net deficit. Capital purchases are already financed by their capital sources; principal repayments belong to the lifetime cash ledger and must not be added to the construction budget again. Net reserve deposits are zero at the end. This is a nominal identity, not discounted viability, and assumes city/plant cash can legally be pooled

A zero-interest, zero-fee revolving bridge is only a mathematical lower bound. Real gap funding must charge interest and fees on the borrowing needed to carry early deficits, repay itself from later surplus and show any terminal debt. Later surplus cannot be counted both as retained cash and as loan repayment.

## Tickets, kiosk rents and advertising already included

| Full-network steady annual receipts | IQD billion | USD equivalent, million |
|---|---|---|
| Passenger tickets | 869.296 | 668.689 |
| Station shops and kiosk leases | 15.538 | 11.952 |
| Advertising space | 23.180 | 17.831 |
| Total existing operating receipts | 908.015 | 698.473 |

Tickets use 659.89m annual paid trips at IQD 1,317 average yield. This is assumed capacity use, not calibrated demand. Shops/kiosks use 37,232 m² at IQD 39,520/m²/month and 88% occupancy; advertising uses 6,572 boards at IQD 345,800/month and 85% occupancy. Rates derive from the retained income proxy, not Baghdad lease quotes. These are gross

rental/advertising receipts; dedicated concession costs, tenant demand and collection losses require appraisal.

All three receipts enter the existing operating cashflows and therefore already reduce the financing gap. The phased sensitivity scales the combined receipts by opened-fleet share and the separate 50% / 75% / 100% revenue ramp for each line. Retail and advertising demand may follow different ramps in practice. Proposed naming rights, telecom leases, parking, development proceeds or new commercial receipts must be genuinely additional and net of costs; existing rents cannot be booked again or sold upfront while also retained in future revenue.

# What gap finance actually does

The illustrative maximum outstanding facility is IQD 13.000 trillion (USD 10.000bn equivalent). This is a size assumption, not proof that the Iraqi banking market can place it. All available surplus after core obligations and reserves is swept to its repayment. No refinancing or debt forgiveness is assumed at the final maturity.

| Scenario | Gross new liquidity draws, IQD tn | Peak facility balance, IQD tn | Uncovered cash beyond facility, IQD tn | Terminal unpaid facility, IQD tn |
|---|---|---|---|---|
| unfunded reference | 0.000 | 0.000 | 4.152 | 0.000 |
| green label only | 0.000 | 0.000 | 4.152 | 0.000 |
| zero cost liquidity bound | 4.152 | 4.152 | 0.000 | 0.000 |
| commercial gap credit | 13.000 | 13.000 | 7.067 | 13.000 |
| concessional gap credit | 5.318 | 5.317 | 0.000 | 0.000 |
| blended candidate | 3.574 | 3.384 | 0.000 | 0.000 |
| green concessional only | 4.433 | 4.428 | 0.000 | 0.000 |

Reference and label-only cases have no gap facility: their uncovered column is the required external cash contribution, not an approved government top-up. With a facility, uncovered cash excludes the separate terminal loan balance; both need a solution. Gross draws can exceed the maximum outstanding commitment when a revolving facility is repaid and redrawn. Conditional ledgers do not establish that an unfunded payment occurred.

Commercial gap credit assumes 8% interest and 1.0% draw fees. Concessional gap credit assumes 2% interest and 0.5% draw fees. Neither is a term sheet or an available GCF line. Funding old debt-service deficits is not automatically eligible green use of proceeds.

# Explicit blended sensitivity

Candidate climate expenditure is USD 2,233.26m of electric rolling stock, solar and charging provision, including USD 1,367.13m assigned locally. Climate benefit, supplier qualification and green eligibility require independent review. Candidate green bonds replace only domestic bonds attributable to those expenditures; civil works and unrelated overhead are not automatically relabelled.

The blended sensitivity replaces that eligible bond portion with proposed IQD green bonds/sukuk at 4%, 48 months' grace and 240 months' amortisation, with 0.75% arrangement fees and 0.5%/year enhancement fees on outstanding principal. The lower rate depends on a concessional or guarantee structure; a green label alone retains the original 8% terms and changes no financial outcome.

Additional targets are a USD 25m climate capital grant translated into IQD receipts, replacing domestic borrowing against eligible local capital after month 24; USD 300m net development-rights proceeds in 6 six-month instalments from month 24; and USD 25m/year genuinely new net local receipts at full opening, scaled with the opened fleet. These are editable targets, not appraisals, GCF approvals, developer contracts or statutory levies. Existing rents, advertising and fares cannot be counted again; transaction/development costs and displaced future rents must be deducted. Public land contribution also needs economic valuation.

Solving the model rather than declaring the targets sufficient requires approximately USD 0.00m/year additional NET receipts (IQD 0.00bn/year at full opening) to eliminate both uncovered cash and the terminal facility under the other blended assumptions. This is a break-even funding requirement, not a forecast or a recommended passenger fare increase. Any covenant, inflation, FX or demand change can raise it.

# Variable tickets, annual price changes and OPEX inflation

The following cases retain the same conditional blended capital/grant/rights/2% IQD facility assumptions. They change fares, OPEX and income separately. A 5% tariff increase with flat costs is an optimistic sensitivity; the paired 5% OPEX case is the requested inflation comparison. None is an adopted fare, a lender commitment or an Iraqi inflation forecast.

Indices compound in annual steps from financial close, including the years before first opening. No tickets are sold before service starts; the nominal launch price reflects elapsed inflation. Existing retail/advertising are held flat unless the case explicitly indexes those rents. New net income and rights targets remain fixed nominal amounts. CAPEX escalation and future

FX changes still require a separate full nominal appraisal.

Demand responds to fare relative to the indexed income proxy with an illustrative elasticity of -0.30, except the explicitly fixed-demand cases. Income growth is a separate assumption, not evidence that wages will keep pace. Discount-led demand growth is capped at 2.0 times the baseline, within the original practical capacity. There is no calibrated Baghdad peak-switching or household demand model.

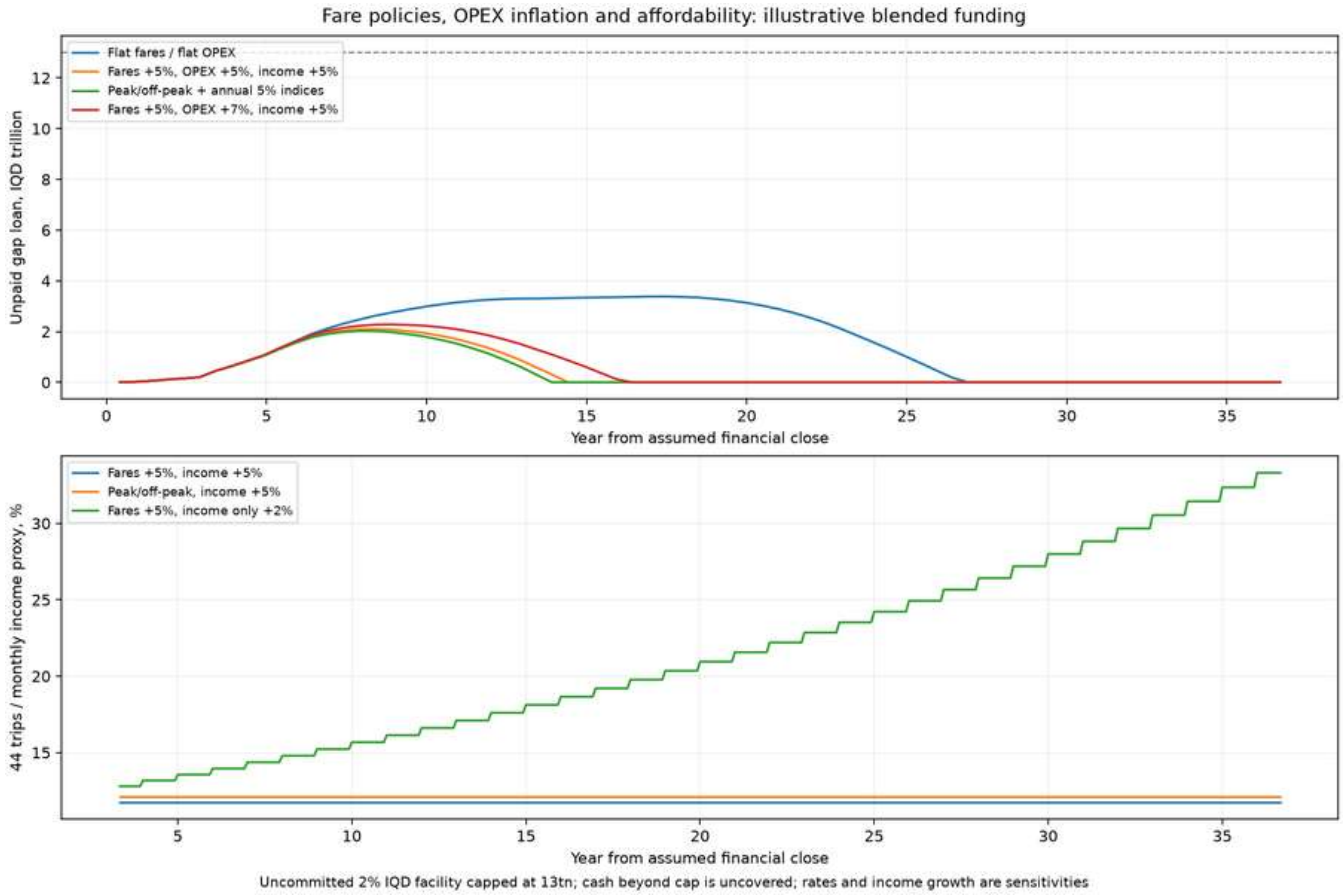
Variable tickets assume 40% of baseline trips in a peak tier at 1.25 times the standard fare, and remaining trips at 0.90 times it. Each tier gets its own demand response before revenues are combined. Concessions, commuter caps, integrated transfers and off-peak eligibility require an actual tariff design and funding contract; their costs are not silently waived.

| Pricing sensitivity | Fare / OPEX / income growth | Full-opening average fare, IQD | 44 trips / income at full opening | Peak facility, IQD tn | Uncovered cash, IQD tn | Terminal debt, IQD tn |
|---|---|---|---|---|---|---|
| fare 5pct flat costs fixed demand | 5% / 0% / 0% | 1,765 | 15.7% | 1.807 | 0.000 | 0.000 |
| fare 5pct flat costs elastic | 5% / 0% / 0% | 1,765 | 15.7% | 2.037 | 0.000 | 0.000 |
| fixed fare 5pct opex | 0% / 5% / 5% | 1,317 | 8.8% | 13.000 | 0.486 | 13.000 |
| fare 5pct opex 5pct | 5% / 5% / 5% | 1,765 | 11.7% | 2.102 | 0.000 | 0.000 |
| fare 5pct opex 7pct | 5% / 7% / 5% | 1,765 | 11.7% | 2.283 | 0.000 | 0.000 |
| fare 5pct opex 5pct income 2pct | 5% / 5% / 2% | 1,765 | 14.0% | 2.302 | 0.000 | 0.000 |
| variable fare 5pct opex 5pct | 5% / 5% / 5% | 1,822 | 12.1% | 2.025 | 0.000 | 0.000 |
| fare 5pct opex 5pct rents indexed | 5% / 5% / 5% | 1,765 | 11.7% | 2.063 | 0.000 | 0.000 |

In the paired 5% case, the first line's average nominal fare is IQD 1,525 in month 40; at full opening in month 81 it is IQD 1,765. Its maximum supplemental facility is IQD 2.102tn, with IQD 0.000tn uncovered cash and IQD 0.000tn unpaid at the end. The case repays the facility within the model horizon under these conditional assumptions. Early borrowing still needs placed facilities.

At an 5% general-price assumption, the 8% real discount assumption becomes 13.4% nominal. The paired-case unlevered NPV is USD -1.670bn equivalent before grants/new rights/net-income targets and with capital still un-escalated. Large distant nominal balances are not present-value wealth or proof of project viability.

If income rises with fares, the modelled commuting share stays broadly constant. With income rising only 2%, the same ticket policy becomes progressively less affordable and reduces paid trips. If OPEX rises 7% against 5% fares, the tested financing again leaves uncovered requirements and terminal debt. Maintaining an affordable real tariff, collecting revenue and placing the required early IQD facility matter as much as the nominal annual increase.



Fare and OPEX inflation sensitivities

Paired 5% six-month funding requirements · paired monthly prices and affordability · variable-ticket funding requirements · variable monthly tickets

The initial real-fare multiplier required to remove both terminal debt and uncovered cash under paired 5% indices and the other blended assumptions is approximately 1.000 times the existing baseline. This is a conditional break-even sensitivity, not a tariff recommendation; it does not guarantee the facility can be placed or that households' incomes will grow.

# Surplus cash and early repayment

These cases use identical paired 5% fare/OPEX/income assumptions and the same conditional blended capital sources. Each pays OPEX, scheduled principal, interest and fees, then funds the debt-service reserve and a three-month current-OPEX buffer before voluntary repayment. Borrowed gap proceeds and uncovered external cash cannot fund early payments. The extra buffer remains cash held at the terminal horizon and earns no interest.

Compare strategies against buffered gap-only, rather than attributing the buffer change to repayment savings. Loans-first pays bank credit, Chinese credit and gap credit before bonds. Cost priority pays bank (9%), ordinary bonds (8%), Chinese credit (5%), green bonds (4% plus 0.5% annual guarantee), then gap credit (2%). It is an interest-rate heuristic, not a proof of the globally best strategy.

| Surplus strategy | All debt cleared, month from close | Finance cost saving vs buffered gap-only, USD equivalent m | Early-payment premiums, USD equivalent m | Peak gap debt, IQD tn | Terminal unrestricted cash, IQD tn |
|---|---|---|---|---|---|
| gap only buffered | 369 | 0.000 | 0.000 | 2.208 | 44.706 |
| gap then core | 209 | 506.359 | 36.995 | 2.208 | 45.364 |
| loans then bonds | 207 | 653.848 | 42.809 | 2.158 | 45.556 |
| cost priority | 203 | 988.754 | 56.843 | 2.158 | 45.991 |
| cost priority zero premium | 203 | 1,060.010 | 0.000 | 2.156 | 46.084 |
| cost priority noncallable bonds | 369 | 260.705 | 12.395 | 2.158 | 45.045 |

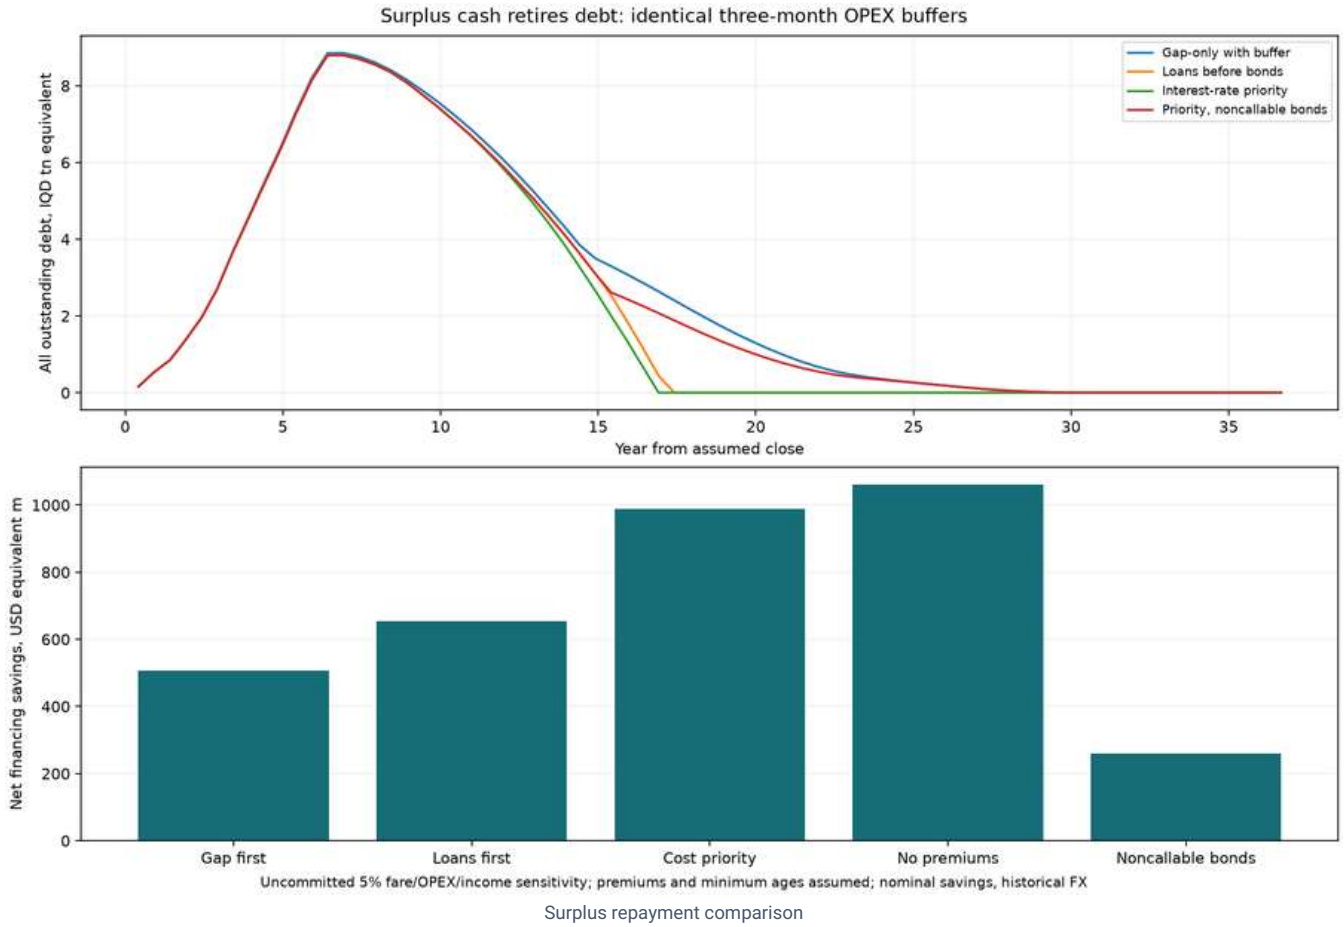
Cost-priority debt is cleared in month 203; buffered gap-only debt is cleared in month 369. Net nominal financing savings are USD 988.754m equivalent, after USD 56.843m assumed early-payment premiums. Savings include core interest, annual green guarantee charges and supplemental interest/draw fees; they exclude principal, which is returned once. All cases retain IQD 0.386tn operating buffer separately from unrestricted cash. There is no additional government contribution above 25% of CAPEX in these cases.

Assumed premiums are 1% of bank/Chinese/green principal and 2% of ordinary bond principal. A minimum draw age of 6 months (bank), 12 (Chinese) and 24 (both bonds) prevents immediate issue-and-redemption. Eligible vintages are repaid oldest first; contractual instalments are kept and maturity shortens. Notice, issuer call rights, investor consent, buyback price, remaining-maturity compensation, tax and FX require actual agreements. Noncallable-bond sensitivity makes no voluntary bond payments; zero-premium sensitivity removes only the assumed premium, retaining minimum ages.

| Facility | Buffered gap-only final principal payment month | Cost-priority final principal payment month | Early principal, native currency | Premium, native currency |
|---|---|---|---|---|
| bank credit | 165 | 122 | IQD 636.771bn | IQD 6.368bn |
| domestic bonds | 285 | 167 | IQD 2,547.814bn | IQD 50.956bn |
| chinese export credit | 309 | 175 | USD 592.389m | USD 5.924m |
| green bonds | 369 | 184 | IQD 887.075bn | IQD 8.871bn |

The gap facility's final principal payment is in month 203. Later surplus remains unrestricted cash after debt retirement. Each month's native debt balance equals prior balance plus draws minus scheduled and early principal. Each six-month closing balance is its final month's balance; payments, premiums, interest and reserve movements are period sums. Contractual repayment windows in tranche files describe the original draw terms; the actual final-payment months above incorporate early repayment.

Monthly cost-priority repayments · six-month repayment tranches · loans-first tranches · all six complete calculations

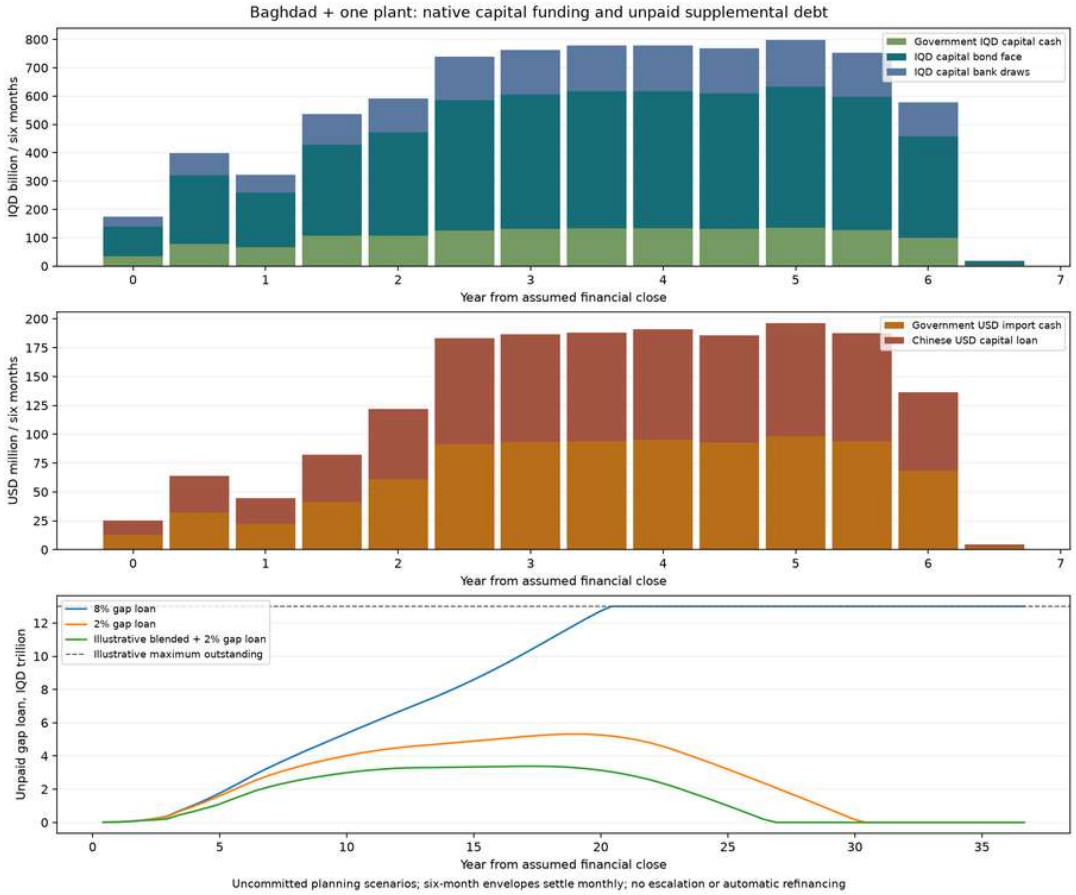


Surplus repayment comparison

Loan prepayment can carry redeployment/unwind charges: the World Bank Treasury FAQ illustrates the concept, without establishing Chinese or Iraqi loan terms. The US Treasury buyback FAQ and published purchase results illustrate issuer authority and priced buybacks rather than automatic par redemption; they do not supply an Iraqi legal mandate.

This repayment allocation does not change the unlevered project NPV or validate demand. Nominal savings over several decades are not present-value gains. CAPEX escalation, FX, lifecycle replacement, floating-rate risk and the uncommitted early funding still require appraisal.

# Six-month bond sales and capital loan requirements



Native six-month capital funding and supplemental loan balances

Each half-year is a placement/draw envelope, with monthly settlement against capital milestones. Bonds assume par proceeds and an illustrative IQD 1,000,000 denomination. Face-value requirements below use unrounded values; unit counts in CSV round upwards and separately disclose the resulting indicative face amount. Sale discounts, issuance fees and investor capacity need actual bookbuilding. Selling every half-year amount upfront changes interest/carry and grace clocks and is not simulated here.

The government USD cash and Chinese USD loan are separate; government local cash, bonds, bank draws and uncovered liquidity are native IQD. Chinese facility commitment fees retain the existing annual procurement-cohort assumption; six-month envelopes do not assert a new signing schedule. Grace starts on each actual monthly settlement. First/last repayments for a half-year series therefore differ by draw date.

| Tranche | Months from close | Government USD m | Government IQD bn | Chinese loan USD m | Bond face IQD bn | Bank loan IQD bn | Additional cash need IQD bn |
|---|---|---|---|---|---|---|---|
| BGD-H001 | 0–5 | 12.71 | 35.27 | 12.71 | 104.13 | 34.71 | 4.94 |
| BGD-H002 | 6–11 | 32.04 | 79.08 | 32.04 | 240.40 | 80.13 | 16.96 |
| BGD-H003 | 12–17 | 22.28 | 66.12 | 22.28 | 192.21 | 64.07 | 34.43 |
| BGD-H004 | 18–23 | 41.20 | 107.37 | 41.20 | 321.91 | 107.30 | 56.92 |

## Financing routes to investigate in Iraq

| Route | What it can finance | Cashflow treatment and next requirement |
|---|---|---|
| IQD green bonds / green sukuk | Qualified electric transport, solar and charging capital | Replace conventional debt. Define eligible use, segregate proceeds, obtain independent review and report allocation/impact. Sukuk requires an approved asset/usufruct, legal and Sharia structure; the model does not assume a qualified sukuk issue. |
| GCF / GEF preparation and climate capital support | Climate studies, proven incremental mitigation/adaptation expenditure and eligible capital | Grants reduce debt only when approved; concessional debt still repays. Seek an accredited entity and Iraq NDA support with an emissions/resilience baseline. No grant is booked in the reference. |
| CBI renewable-energy initiative | Qualifying solar installations under the latest participating-bank rules | Obtain bank confirmation of borrower/project eligibility, current caps and terms. This existing Iraqi route is not assumed available for the whole metro or booked as a new capital source. |
| MDB / IFC credit enhancement and IQD syndication | Mobilising Iraqi banks and institutional bond investors | Guarantees improve placement or terms, supply no standalone cash, cost fees and may create sovereign contingent liabilities. Confirm IQD availability, hedge pricing and lender limits. |
| Station-area joint development and development rights | A contracted contribution towards stations/access or unrestricted net proceeds | Independently value parcels and rights, confirm title and revenue powers, tender transparently, deduct costs and future rent foregone. Early rights proceeds can reduce peak liquidity more than late rents. |
| Parking/congestion proceeds, employer transport subscriptions and business improvement charges | Incremental local recurring cash after authorised net collection costs | Separate each revenue stream from existing fare/nonfare receipts; validate legal powers, demand, affordability, exemptions and enforcement. No unverified tax power is assumed. |
| Solar/BESS project company, energy-service or availability contracts | Private financing of an accepted energy package | Remove transferred CAPEX and related city debt once; add the PPA/lease/service payments and guarantees. Compare their NPV with existing electricity/OPEX to avoid a free-CAPEX saving. No assumed saving is booked here. |
| Manufacturer / tooling leases and supplier finance | Qualified equipment and assembly capacity | Deferred invoices or leases are debt-like obligations with priced future payments. Do not duplicate Chinese invoice credit. Factory customer receipts and actual margins need a consolidated business case. |
| Diaspora and institutional IQD issues | Local capital subscription within the bond programme | These are purchaser channels for existing bond face, not another capital source. Disclose investor FX risk, maturity and redemption; no automatic rollover or compulsory pension purchase. |
| Carbon / results-based climate receipts | Verified additional emission reductions after delivery | Treat as contingent upside until methodology, monitoring, ownership and an offtake are contracted; no carbon revenue in the reference or blended case. |

Priority: first align civil spending and production with accepted openings, then seek eligible cheaper/longer capital financing and contractual early rights proceeds. Obtain a funded recurring-revenue plan before borrowing a multi-trillion-dinar gap facility. Green finance and creative structures do not cure an unfunded timing mismatch or unsupported demand on their own.

## Primary evidence checked 3 October 2026

The GCF Iraq country profile lists two projects with USD 49.5m total GCF finance and USD 5.2m approved readiness support when checked; these are existing country programmes, not Baghdad rail allocations. The Iraq country programme provides national priorities. An additional USD 25m application target is therefore a sensitivity requiring a new proposal, not money already available.

GCF investment framework and financial instruments support the grant/concessional/guarantee concepts and require viable revenue-generating activities for loans. ICMA Green Bond Principles require a transparent use-of-proceeds process, allocation controls and impact reporting; they do not promise a reduced coupon.

The CBI renewable-energy amendment of April 2025 establishes a local financing route to investigate for eligible energy packages. Its limits and bank eligibility cannot be extrapolated into a multi-trillion-dinar metro facility. IsDB green/sustainability sukuk guidance supplies a structuring reference, not a Baghdad issuance mandate.

World Bank guarantee programme supports foreign/local-currency obligations subject to project and sovereign approvals. IFC local-currency syndications explains domestic parallel loans and hedge structures; it does not establish an IQD loan offer for OSR. IFC Iraq investment activity establishes an existing country presence, not project eligibility or earmarked money.

World Bank land-value-capture guidance and innovative revenues provide structuring examples, not Iraq borrowing/tax authority or a Baghdad parcel valuation.

World Bank integrated-fare guidance supports examining peak/off-peak, transfer and integrated ticket structures. Its Bogotá affordability study illustrates the need for household-specific demand evidence; neither calibrates the -0.30 sensitivity for Baghdad or endorses a 5% annual increase.

## Remaining modelling and term-sheet limits

- Six-month bond placement envelopes settle monthly at par; they are not advance-funded bond sales. Advance issuance changes carry, reserve and interest costs and needs a separate cash forecast.
- Full unrounded placement values reconcile; illustrative IQD 1 million unit counts round upwards and are not executable orders. No auction price, investor demand or mandate is established.
- A green label alone uses unchanged domestic pricing. The lower coupon/longer tenor and 0.5% annual guarantee fee are explicit sensitivities, not donor or lender terms.
- Climate capital grants replace domestic capital borrowing only, against candidate local expenditure. They do not pay old debt interest, imported invoices already funded 50:50, or increase government cash above 25%.
- Incremental land/rights/local receipts are zero in the reference and must be genuinely additional to existing fare, retail, rent and advertising forecasts. Net proceeds after costs, title, statutory powers and independent valuation require qualification.
- The supplemental IQD facility pays its own interest and origination fees. Surplus is swept to repayment; terminal balances are exposed rather than assumed refinanced or forgiven.
- The illustrative IQD facility has a 13 trillion maximum outstanding commitment; residual cash requirements beyond that cap remain explicitly uncovered. No committed lender or future market capacity is assumed.
- Supplemental facilities have no extra DSRA or undrawn commitment fee and no fixed amortisation before the terminal maturity; term sheets can materially increase costs. Long draw availability and the terminal balloon are uncommitted assumptions.
- City/plant cash is pooled subject to legally permitted transfers and creditor consent. Factory income/OPEX remain outside the capital-only plant appraisal; no free factory profit is credited.
- All non-Chinese debt is modelled in IQD. Foreign-funded concessional programmes need confirmed IQD on-lending or a priced hedge; an unhedged USD development loan would change the currency strategy.
- The reference has constant nominal fares, OPEX and FX. Dedicated pricing cases explicitly index fares, OPEX and income independently from financial close. Capital escalation, FX inflation pass-through and separate lifecycle replacement inflation remain outside this sensitivity; full nominal appraisal must include them.
- Pricing cases retain fixed nominal core and gap debt terms; supplier terms, floating rates and imported OPEX exposure need qualification. New net revenue targets are held nominal rather than assumed inflation-protected.
- Price elasticity is an uncalibrated response to fare relative to indexed income; no transfer, peak switching or low-income household demand survey is modelled. Off-peak trip increases are bounded by the same practical capacity, not new physical capacity.
- Early repayment is a contractual sensitivity, not an exercised call right. Bank/Chinese loan eligibility, bond call or voluntary buyback rights, notice, price and premiums require actual terms. The noncallable case forbids all early bond principal. Illustrative minimum draw ages are 6 months for bank credit, 12 for Chinese credit and 24 for bonds; these are not actual covenants.
- Cost priority is a coupon/guarantee-fee heuristic, not a globally optimal treasury strategy. Premiums, tax, remaining maturities, future draws and FX can change the best order; no refinancing or capital-issue cancellation is modelled.
- A three-month OPEX buffer is funded before discretionary repayment in every early-policy comparison. It is retained at the terminal horizon and earns no income. Original baseline cases have no such additional buffer; savings are compared with a buffered gap-only case as well as the original.

Editable options · existing capital assumptions · original city appraisal · Baghdad-only programme

# Baghdad — Iraq funding appraisal

Repository source: `cities/catalogue/west-asia/Iraq/Baghdad/engineering/finance/FUNDING-MODEL.md`

> Original catalogue or earlier scope reference. The figures and policies below retain their original assumptions; they are not the latest Baghdad staffing, depot, procurement or funding basis. See the current Baghdad recalculation and current city summary. National/portfolio totals have not been repriced with that conditional Baghdad option.

Generated from current city CAPEX and procurement milestones. All facilities and appropriations remain uncommitted.

Government capital is 25% of total city CAPEX, before Chinese credit is deducted. The residual after that contribution and proposed Chinese proceeds is split 75% IQD bonds / 25% IQD bank credit. Imported purchases use 50% government USD cash and 50% proposed Chinese credit, assuming full-basket eligibility is later qualified; the remaining government contribution is IQD. Financing fees, construction interest, reserves and operating/debt support are additional funding requirements, not included in the 25% capital contribution. See the Baghdad-only programme for the uncovered cash requirements if no additional government cash is available.

Construction cash runs through month 82; full-network operations start in month 82 after retention. This conservative rollout follows the current resource-constrained CPM, not a five-year promise.

## Capital sources and uses

USD is the comparison unit below. Chinese credit is USD debt; domestic bonds and bank credit are IQD debt. Baghdad imported purchases are funded 50% government USD cash and 50% proposed Chinese loan; the remaining government capital and local cash are IQD. The full Baghdad import basket is assumed eligible pending supplier-origin and lender qualification. Other city appraisals retain their own assumptions. Fares and local operating payments are budgeted in IQD.

| Capital source | Contract / cash currency | Native amount at model FX | USD equivalent |
|---|---|---|---|
| chinese export credit | USD | 866,880,047.75 | 866,880,047.75 |
| domestic bonds | IQD | 4,731,697,412,249.30 | 3,639,767,240.19 |
| bank credit | IQD | 1,577,232,470,749.77 | 1,213,255,746.73 |
| government import cash | USD | 866,880,047.75 | 866,880,047.75 |
| government local cash | IQD | 1,351,680,586,280.91 | 1,039,754,297.14 |
| Total city capital uses | Mixed | — | 7,626,537,379.57 |

Chinese buyer credit is proposed for eligible Chinese component invoices only. Government contributes its configured capital share, including the eligible-invoice downpayment; IQD bonds and bank credit finance the residual. The conditional ledger also calculates cash needed for fees, construction interest, reserves and operating/debt shortfalls. That additional support is uncommitted and is an unfunded requirement if Baghdad public cash is capped at its 25% capital contribution.

## Proposed instruments

| Instrument | Currency | Rate assumed | Grace from draw | Repayment |
|---|---|---|---|---|
| chinese export credit | USD | 5.0% | 48 months | 180 months |
| domestic bonds | IQD | 8.0% | 24 months | 180 months |
| bank credit | IQD | 9.0% | 0 months | 84 months |

## Chinese component allocation

These allocations divide existing imported budgets; they are not additional costs, supplier quotes or confirmed origin.

| Bucket | Component | Assumed eligible invoice USD |
|---|---|---|
| civil | other_imports_pending_lender_and_origin_qualification | 590,556,608.25 |
| stations | other_imports_pending_lender_and_origin_qualification | 195,400,000.00 |
| depots | other_imports_pending_lender_and_origin_qualification | 2,000,000.00 |
| rolling_stock | bogies | 190,276,800.00 |
| rolling_stock | traction_batteries | 142,707,600.00 |
| rolling_stock | windows | 23,784,600.00 |
| rolling_stock | doors | 47,569,200.00 |
| rolling_stock | other_imports_pending_lender_and_origin_qualification | 71,353,800.00 |
| solar_plant | solar_panels_and_inverters | 367,083,177.55 |
| signalling | other_imports_pending_lender_and_origin_qualification | 12,833,386.00 |
| charging_microgrid | solar_panels_and_inverters | 8,176,000.00 |
| charging_microgrid | station_batteries | 9,344,000.00 |

| Bucket | Component | Assumed eligible invoice USD |
|---|---|---|
| charging_microgrid | other_imports_pending_lender_and_origin_qualification | 5,840,000.00 |
| epc_overhead | other_imports_pending_lender_and_origin_qualification | 66,834,923.70 |

# Annual cash requirements

Year 1 begins at assumed financial close; NTP follows 30 working days later. Amounts below are USD millions. DSCR excludes subsidy; public cash includes capital, fees, interest, reserves and support.

| Year | CAPEX | Revenue | OPEX | Debt service | Public cash | DSCR before support |
|---|---|---|---|---|---|---|
| 1 | 319.74 | 0.00 | 0.00 | 10.17 | 91.75 | 0.00 |
| 2 | 674.06 | 0.00 | 0.00 | 47.54 | 219.55 | 0.00 |

# Sensitivities

| Scenario | Peak annual public cash USD m | Minimum operating DSCR | Peak uncovered monthly capital USD m |
|---|---|---|---|
| base low demand | 1104.51 | 0.04 | 0.00 |
| high capacity use | 1071.07 | 0.09 | 0.00 |
| capex plus 25 percent | 1386.64 | 0.03 | 0.00 |
| demand minus 40 percent | 1127.79 | 0.00 | 0.00 |
| iqd depreciation 35 percent | 932.77 | 0.03 | 0.00 |
| commissioning delay two years | 1017.20 | 0.03 | 0.00 |
| china credit unavailable | 1028.52 | 0.04 | 18.14 |
| four year bullet bonds | 1862.45 | 0.02 | 0.00 |
| government payment delay six months | 1291.63 | 0.04 | 15.65 |
| interest plus three points | 1307.66 | 0.03 | 0.00 |
| combined downside | 1276.42 | 0.00 | 0.00 |

## Assumptions and evidence

- Working-day milestones use 260 working days/year and 30 working days before NTP; holidays and an approved local calendar are pending.
- No signed Chinese loan, supplier-origin qualification, guarantee, bond mandate, bank facility, appropriation or tax/duty assessment.
- Chinese origin and lender eligibility remain unqualified proxies. Default advance is 85%; Baghdad assumes all imports can qualify for 50% USD loan / 50% government USD cash. Additional imported categories require lender and supplier approval; neither assumption is a verified lender rule.
- Domestic bonds assume a proposed MoF sovereign IQD programme; municipal borrowing powers and market demand are not assumed.
- Long amortising domestic bonds are an appraisal target; the four-year bullet sensitivity exposes redemption without automatic refinancing.
- Construction cohorts need separately approved facilities. A long rollout does not imply a lender offers decades of draw availability.
- Interest is paid on drawn native balances; mid-month draw convention, monthly repayment, fees paid by government; no interest capitalisation.
- All cash is nominal; no inflation/escalation in base. IQD revenue and OPEX are translated at scenario FX; imported energy/parts OPEX needs a separate currency survey.
- Unquoted CAPEX budgets remain nominal USD planning values. IQD tranches and appropriations convert at draw-date FX; no automatic local supplier price benefit from depreciation is assumed.
- Income used for labour and fares is the retained country-finance planning proxy, not a verified current Iraqi household median or an agreed wage/fare contract.
- Government payment delays and unavailable China credit produce explicit capital cash gaps; no committed bridge credit is assumed.
- Restricted DSRA targets six times current monthly service and uses available project cash before requesting support. Support cash is a required contribution, not a commitment; repayments and reserve balances are conditional on it. Baghdad programme caps government capital at 25% and separately discloses the additional unfunded requirement. Future-service covenant testing is pending.
- Battery renewal reserve remains inside existing rolling-stock maintenance OPEX; no second battery CAPEX is added.
- Demand is capacity-led, not a surveyed forecast. Passing reconciliation does not demonstrate affordability or bankability.

Long construction schedules can leave much of the debt already repaid by government before full-network opening. An operating DSCR above one therefore does not establish self-financing or remove the construction-period public cash burden. Uncovered capital gaps are conditional funding requirements, not actual cash receipts.

See editable assumptions, monthly cashflow, annual cashflow, and machine-readable model.

The IMF Article IV provides the historical FX anchor. CBI describes its role as fiscal agent for MoF bonds. China Exim describes export buyer credit; numeric project terms remain assumptions.

## Conditional phased-opening sensitivity

The base above withholds all fares until every capital milestone. This separate sensitivity opens completed lines after the editable commissioning lag and gates every line on shared system/depot work. The city-sized Baghdad production plant is unavailable for its first 390 working days (18 months from NTP), followed by the scheduled first-article qualification gate. Opening also requires actual civil, train, depot, power and safety acceptance, which is not established by this calculation.

Revenue and variable OPEX use each line's share of controlled trainsets. Each line has its own 50% / 75% / 100% revenue ramp. Fixed OPEX is 25% of the full-network annual budget from first opening; remaining OPEX scales with opened fleet. These are explicit uncalibrated sensitivity assumptions, not a ridership survey or verified staffing plan.

First / last planned opening: month 40 / 81 from financial close (month zero). City additional funding requirement: USD 2,780.13 million. The plant remains separate. Future surplus is retained; gross additional support is not net lifetime loss or discounted cost.

| Line | Opening month | Revenue / variable OPEX share |
|---|---|---|
| line-1 | 40 | 10.63% |

| Line | Opening month | Revenue / variable OPEX share |
|---|---|---|
| line-10 | 41 | 1.85% |
| line-11 | 43 | 1.73% |
| line-12 | 42 | 1.85% |
| line-13 | 44 | 2.22% |
| line-14 | 44 | 1.61% |
| line-2 | 50 | 11.74% |
| line-3 | 55 | 11.12% |
| line-4 | 59 | 9.39% |
| line-5 | 64 | 10.63% |
| line-6 | 69 | 11.74% |
| line-7 | 73 | 8.90% |
| line-8 | 78 | 11.00% |
| line-9 | 81 | 5.56% |

Phased monthly cashflow · phased annual cashflow

# Standalone Iraqi City Appraisals — Outside the Baghdad Programme

## Samawah — Iraq funding appraisal

Repository source: `cities/catalogue/west-asia/Iraq/Samawah/engineering/finance/FUNDING-MODEL.md`

Generated from current city CAPEX and procurement milestones. All facilities and appropriations remain uncommitted.

This standalone city appraisal is outside the Baghdad-only funding programme.

Construction cash runs through month 41; full-network operations start in month 41 after retention. This conservative rollout follows the current resource-constrained CPM, not a five-year promise.

### Capital sources and uses

USD is the comparison unit below. Chinese credit is USD debt; domestic bonds and bank credit are IQD debt. Baghdad imported purchases are funded 50% government USD cash and 50% proposed Chinese loan; the remaining government capital and local cash are IQD. The full Baghdad import basket is assumed eligible pending supplier-origin and lender qualification. Other city appraisals retain their own assumptions. Fares and local operating payments are budgeted in IQD.

| Capital source | Contract / cash currency | Native amount at model FX | USD equivalent |
|---|---|---|---|
| chinese export credit | USD | 51,727,804.18 | 51,727,804.18 |
| domestic bonds | IQD | 380,609,521,570.51 | 292,776,555.05 |
| bank credit | IQD | 126,869,840,523.50 | 97,592,185.02 |
| government | IQD | 761,219,043,141.01 | 585,553,110.11 |
| Total city capital uses | Mixed | — | 1,027,649,654.36 |

Chinese buyer credit is proposed for eligible Chinese component invoices only. Government contributes its configured capital share, including the eligible-invoice downpayment; IQD bonds and bank credit finance the residual. The conditional ledger also calculates cash needed for fees, construction interest, reserves and operating/debt shortfalls. That additional support is uncommitted and is an unfunded requirement if Baghdad public cash is capped at its 25% capital contribution.

### Proposed instruments

| Instrument | Currency | Rate assumed | Grace from draw | Repayment |
|---|---|---|---|---|
| chinese export credit | USD | 5.0% | 48 months | 180 months |
| domestic bonds | IQD | 8.0% | 24 months | 180 months |
| bank credit | IQD | 9.0% | 0 months | 84 months |

### Chinese component allocation

These allocations divide existing imported budgets; they are not additional costs, supplier quotes or confirmed origin.

| Bucket | Component | Assumed eligible invoice USD |
|---|---|---|
| rolling_stock | bogies | 22,932,000.00 |
| rolling_stock | traction_batteries | 17,199,000.00 |
| rolling_stock | windows | 2,866,500.00 |
| rolling_stock | doors | 5,733,000.00 |
| solar_plant | solar_panels_and_inverters | 11,360,740.21 |
| charging_microgrid | solar_panels_and_inverters | 357,000.00 |
| charging_microgrid | station_batteries | 408,000.00 |

### Annual cash requirements

Year 1 begins at assumed financial close; NTP follows 30 working days later. Amounts below are USD millions. DSCR excludes subsidy; public cash includes capital, fees, interest, reserves and support.

| Year | CAPEX | Revenue | OPEX | Debt service | Public cash | DSCR before support |

# Mosul — Iraq funding appraisal

Repository source: `cities/catalogue/west-asia/Iraq/Mosul/engineering/finance/FUNDING-MODEL.md`

Generated from current city CAPEX and procurement milestones. All facilities and appropriations remain uncommitted.

This standalone city appraisal is outside the Baghdad-only funding programme.

Construction cash runs through month 41; full-network operations start in month 41 after retention. This conservative rollout follows the current resource-constrained CPM, not a five-year promise.

## Capital sources and uses

USD is the comparison unit below. Chinese credit is USD debt; domestic bonds and bank credit are IQD debt. Baghdad imported purchases are funded 50% government USD cash and 50% proposed Chinese loan; the remaining government capital and local cash are IQD. The full Baghdad import basket is assumed eligible pending supplier-origin and lender qualification. Other city appraisals retain their own assumptions. Fares and local operating payments are budgeted in IQD.

| Capital source | Contract / cash currency | Native amount at model FX | USD equivalent |
|---|---|---|---|
| chinese export credit | USD | 162,437,544.94 | 162,437,544.94 |
| domestic bonds | IQD | 1,468,487,700,917.59 | 1,129,605,923.78 |
| bank credit | IQD | 489,495,900,305.86 | 376,535,307.93 |
| government | IQD | 2,936,975,401,835.19 | 2,259,211,847.57 |
| Total city capital uses | Mixed | — | 3,927,790,624.22 |

Chinese buyer credit is proposed for eligible Chinese component invoices only. Government contributes its configured capital share, including the eligible-invoice downpayment; IQD bonds and bank credit finance the residual. The conditional ledger also calculates cash needed for fees, construction interest, reserves and operating/debt shortfalls. That additional support is uncommitted and is an unfunded requirement if Baghdad public cash is capped at its 25% capital contribution.

## Proposed instruments

| Instrument | Currency | Rate assumed | Grace from draw | Repayment |
|---|---|---|---|---|
| chinese export credit | USD | 5.0% | 48 months | 180 months |
| domestic bonds | IQD | 8.0% | 24 months | 180 months |
| bank credit | IQD | 9.0% | 0 months | 84 months |

## Chinese component allocation

These allocations divide existing imported budgets; they are not additional costs, supplier quotes or confirmed origin.

| Bucket | Component | Assumed eligible invoice USD |
|---|---|---|
| rolling_stock | bogies | 48,294,400.00 |
| rolling_stock | traction_batteries | 36,220,800.00 |
| rolling_stock | windows | 6,036,800.00 |
| rolling_stock | doors | 12,073,600.00 |
| solar_plant | solar_panels_and_inverters | 81,412,394.05 |
| charging_microgrid | solar_panels_and_inverters | 3,297,000.00 |
| charging_microgrid | station_batteries | 3,768,000.00 |

## Annual cash requirements

Year 1 begins at assumed financial close; NTP follows 30 working days later. Amounts below are USD millions. DSCR excludes subsidy; public cash includes capital, fees, interest, reserves and support.

| Year | CAPEX | Revenue | OPEX | Debt service | Public cash | DSCR before support |
|---|---|---|---|---|---|---|
| 1 | 675.44 | 0.00 | 0.00 | 9.78 | 412.49 | 0.00 |
| 2 | 1475.01 | 0.00 | 0.00 | 59.83 | 928.67 | 0.00 |

## Sensitivities

| Scenario | Peak annual public cash USD m | Minimum operating DSCR | Peak uncovered monthly capital USD m |
|---|---|---|---|
| base low demand | 1104.67 | 0.16 | 0.00 |
| high capacity use | 1104.67 | 0.42 | 0.00 |
| capex plus 25 percent | 1380.84 | 0.13 | 0.00 |
| demand minus 40 percent | 1104.67 | -0.03 | 0.00 |
| iqd depreciation 35 percent | 1104.67 | 0.16 | 0.00 |
| commissioning delay two years | 1104.67 | 0.14 | 0.00 |
| china credit unavailable | 1098.73 | 0.16 | 18.67 |
| four year bullet bonds | 1102.55 | 0.17 | 0.00 |
| government payment delay six months | 1070.37 | 0.16 | 43.71 |
| interest plus three points | 1138.72 | 0.13 | 0.00 |
| combined downside | 1423.40 | -0.02 | 0.00 |

## Assumptions and evidence

- Working-day milestones use 260 working days/year and 30 working days before NTP; holidays and an approved local calendar are pending.
- No signed Chinese loan, supplier-origin qualification, guarantee, bond mandate, bank facility, appropriation or tax/duty assessment.
- Chinese origin and lender eligibility remain unqualified proxies. Default advance is 85%; Baghdad assumes all imports can qualify for 50% USD loan / 50% government USD cash. Additional imported categories require lender and supplier approval; neither assumption is a verified lender rule.
- Domestic bonds assume a proposed MoF sovereign IQD programme; municipal borrowing powers and market demand are not assumed.
- Long amortising domestic bonds are an appraisal target; the four-year bullet sensitivity exposes redemption without automatic refinancing.
- Construction cohorts need separately approved facilities. A long rollout does not imply a lender offers decades of draw availability.
- Interest is paid on drawn native balances; mid-month draw convention, monthly repayment, fees paid by government; no interest capitalisation.

- All cash is nominal; no inflation/escalation in base. IQD revenue and OPEX are translated at scenario FX; imported energy/parts OPEX needs a separate currency survey.
- Unquoted CAPEX budgets remain nominal USD planning values. IQD tranches and appropriations convert at draw-date FX; no automatic local supplier price benefit from depreciation is assumed.
- Income used for labour and fares is the retained country-finance planning proxy, not a verified current Iraqi household median or an agreed wage/fare contract.
- Government payment delays and unavailable China credit produce explicit capital cash gaps; no committed bridge credit is assumed.
- Restricted DSRA targets six times current monthly service and uses available project cash before requesting support. Support cash is a required contribution, not a commitment; repayments and reserve balances are conditional on it. Baghdad programme caps government capital at 25% and separately discloses the additional unfunded requirement. Future-service covenant testing is pending.
- Battery renewal reserve remains inside existing rolling-stock maintenance OPEX; no second battery CAPEX is added.
- Demand is capacity-led, not a surveyed forecast. Passing reconciliation does not demonstrate affordability or bankability.

Long construction schedules can leave much of the debt already repaid by government before full-network opening. An operating DSCR above one therefore does not establish self-financing or remove the construction-period public cash burden. Uncovered capital gaps are conditional funding requirements, not actual cash receipts.

See editable assumptions, monthly cashflow, annual cashflow, and machine-readable model.

The IMF Article IV provides the historical FX anchor. CBI describes its role as fiscal agent for MoF bonds. China Exim describes export buyer credit; numeric project terms remain assumptions.

# Generated City Models

## City Model Directory

City models are grouped as cities/catalogue////. These generated city models are the source of truth for city-specific network, fleet, cost, and energy figures. RFCs and worked examples provide context or methods, not competing city plans. The book uses concise city briefs to avoid repeating the generated README boilerplate.

| Region | Countries | Cities |
|---|---|---|
| central-africa | Angola (9), DR Congo (7) | 16 |
| east-africa | Kenya (15), Madagascar (1), Mozambique (10), Rwanda (3), Somalia (1), South Sudan (1), Tanzania (15), Uganda (12), Zambia (1) | 59 |
| latin-america | Bolivia (1), Ecuador (1), El Salvador (1) | 3 |
| north-africa | Morocco (12), Sudan (6), Tunisia (1) | 19 |
| south-africa | South Africa (5) | 5 |
| south-asia | Afghanistan (5), Bangladesh (10), India (17), Nepal (3), Pakistan (13), Sri Lanka (4) | 52 |
| southeast-asia | Cambodia (1), Indonesia (2), Laos (1), Myanmar (2), Philippines (1) | 7 |
| west-africa | Burkina Faso (1), Cameroon (10), Guinea (1), Mali (1), Niger (1), Nigeria (10), Senegal (1) | 25 |
| west-asia | Egypt (19), Iraq (18), Jordan (4), Lebanon (3), Palestine (3), Saudi Arabia (14), Syria (9), Yemen (9) | 79 |

# central-africa

## Angola

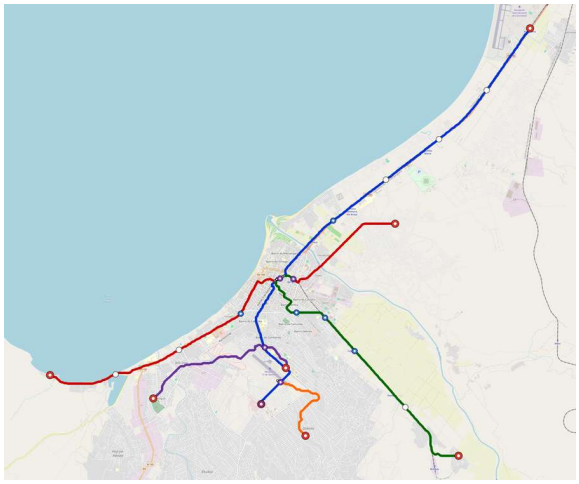
## Generated City Model - Benguela

central-africa / Angola / Benguela

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/Angola/Benguela |
| Recorded ISO / planning population | AO / 600,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 45 |
| Route length | 63.8 km |
| Fleet | 221 trainsets |
| Routing-demand cells (legacy) | 46%; not population access |
| City CAPEX incl. dedicated solar | USD 1.24bn (USD 19M / km); shared national factory excluded |
| Residents within 800 m station circles | 131,651 (2020; 28.6% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Benguela network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 23.3 km | 15 | 79 | radial |
| line-2 | 17.1 km | 12 | 54 | radial |
| line-3 | 12.4 km | 12 | 49 | radial |
| line-4 | 7.0 km | 3 | 24 | radial |
| line-5 | 4.0 km | 3 | 15 | radial |

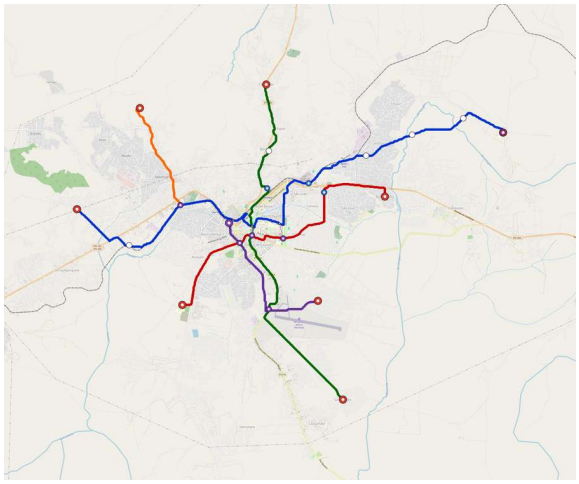
## Generated City Model - Huambo

central-africa / Angola / Huambo

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/Angola/Huambo |
| Recorded ISO / planning population | AO / 800,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 30 |
| Route length | 64.6 km |
| Fleet | 211 trainsets |
| Routing-demand cells (legacy) | 44%; not population access |
| City CAPEX incl. dedicated solar | USD 1.16bn (USD 18M / km); shared national factory excluded |
| Residents within 800 m station circles | 72,952 (2020; 20.2% of raster bbox) |
| Direct / reachable line pairs | 70.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Huambo network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 25.4 km | 11 | 81 | radial |
| line-2 | 12.2 km | 6 | 39 | radial |
| line-3 | 15.9 km | 7 | 52 | radial |
| line-4 | 6.4 km | 4 | 23 | radial |
| line-5 | 4.7 km | 2 | 16 | radial |

# Generated City Model - Lobito

central-africa / Angola / Lobito

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/Angola/Lobito |
| Recorded ISO / planning population | AO / 500,000 |
| Family | light-metro-3car |
| Lines / stations | 4 / 23 |
| Route length | 41.8 km |
| Fleet | 134 trainsets |
| Routing-demand cells (legacy) | 33%; not population access |
| City CAPEX incl. dedicated solar | USD 771M (USD 18M / km); shared national factory excluded |
| Residents within 800 m station circles | 60,489 (2020; 23.6% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.

Lobito network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 17.5 km | 8 | 53 | radial |
| line-2 | 10.0 km | 7 | 32 | radial |
| line-3 | 7.7 km | 4 | 26 | radial |
| line-4 | 6.7 km | 4 | 23 | radial |

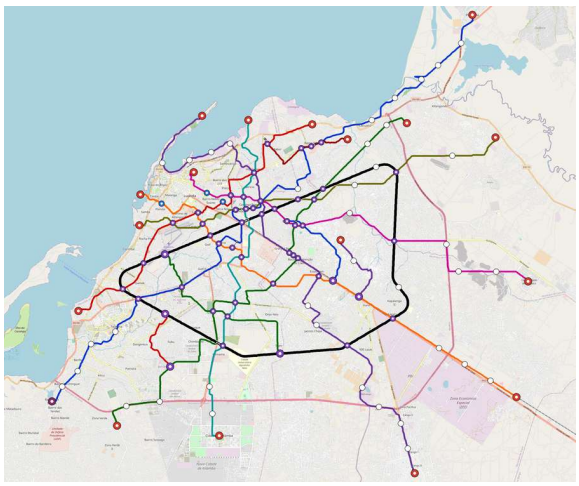
# Generated City Model - Luanda

central-africa / Angola / Luanda

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/Angola/Luanda |
| Recorded ISO / planning population | AO / 9,085,000 |
| Family | metro-6car |
| Lines / stations | 14 / 234 |
| Route length | 454.0 km |
| Fleet | 917 trainsets |
| Routing-demand cells (legacy) | 58%; not population access |
| City CAPEX incl. dedicated solar | USD 9.08bn (USD 20M / km); shared national factory excluded |
| Residents within 800 m station circles | 4,550,380 (2020; 29.2% of raster bbox) |
| Direct / reachable line pairs | 48.4% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Luanda network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 64.0 km | 43 | 163 | radial |
| line-2 | 31.2 km | 11 | 56 | radial |
| line-3 | 46.5 km | 27 | 108 | radial |
| line-4 | 56.7 km | 32 | 130 | radial |
| line-5 | 45.2 km | 17 | 83 | radial |
| line-6 | 31.8 km | 13 | 61 | radial |
| line-7 | 34.7 km | 17 | 74 | radial |
| line-8 | 33.2 km | 26 | 94 | radial |
| line-9 | 65.8 km | 21 | 31 | ring |
| line-10 | 9.0 km | 12 | 39 | radial |
| line-11 | 8.0 km | 5 | 20 | radial |
| line-12 | 6.1 km | 2 | 13 | radial |
| line-13 | 15.4 km | 5 | 30 | radial |
| line-14 | 6.6 km | 3 | 15 | radial |

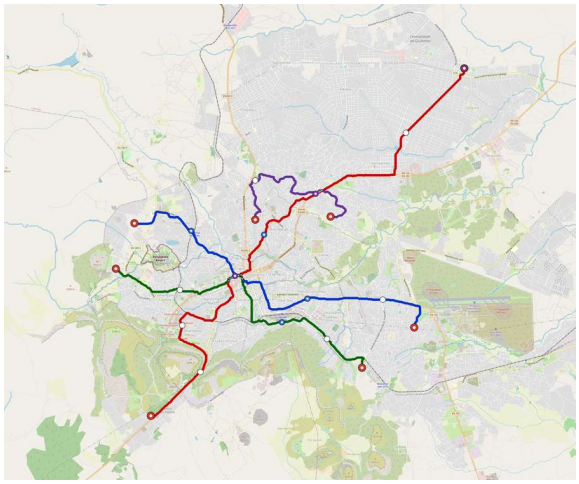
# Generated City Model - Lubango

central-africa / Angola / Lubango

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/Angola/Lubango |
| Recorded ISO / planning population | AO / 700,000 |
| Family | light-metro-3car |
| Lines / stations | 4 / 48 |
| Route length | 64.4 km |
| Fleet | 223 trainsets |
| Routing-demand cells (legacy) | 44%; not population access |
| City CAPEX incl. dedicated solar | USD 1.32bn (USD 21M / km); shared national factory excluded |
| Residents within 800 m station circles | 117,178 (2020; 20.9% of raster bbox) |
| Direct / reachable line pairs | 66.7% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Lubango network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 15.8 km | 10 | 53 | radial |
| line-2 | 26.2 km | 18 | 82 | radial |
| line-3 | 14.0 km | 15 | 60 | radial |
| line-4 | 8.4 km | 5 | 28 | radial |

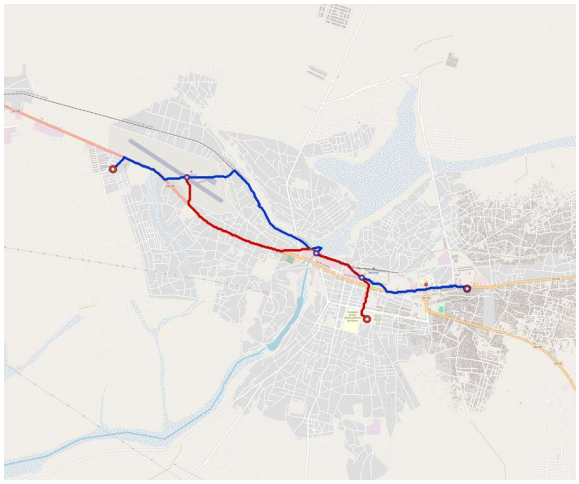
# Generated City Model - Malanje

central-africa / Angola / Malanje

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/Angola/Malanje |
| Recorded ISO / planning population | AO / 500,000 |
| Family | light-metro-3car |
| Lines / stations | 2 / 11 |
| Route length | 14.8 km |
| Fleet | 53 trainsets |
| Routing-demand cells (legacy) | 14%; not population access |
| City CAPEX incl. dedicated solar | USD 326M (USD 22M / km); shared national factory excluded |
| Residents within 800 m station circles | 25,092 (2020; 8.1% of raster bbox) |
| Direct / reachable line pairs | 100.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Malanje network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 9.1 km | 6 | 32 | radial |
| line-2 | 5.7 km | 5 | 21 | radial |

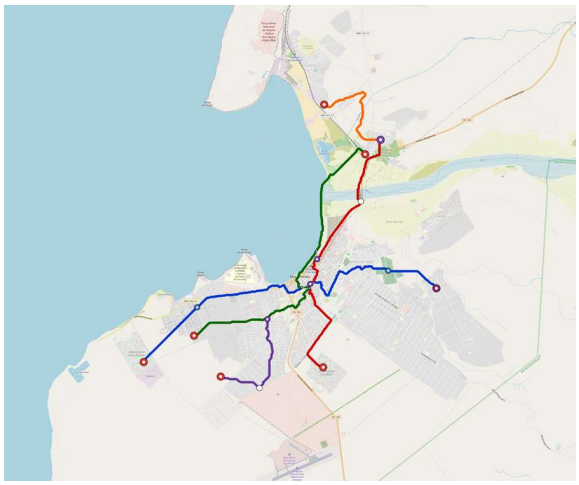
# Generated City Model - Namibe

central-africa / Angola / Namibe

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/Angola/Namibe |
| Recorded ISO / planning population | AO / 300,000 |
| Family | tram-2car |
| Lines / stations | 5 / 26 |
| Route length | 50.0 km |
| Fleet | 109 trainsets |
| Routing-demand cells (legacy) | 47%; not population access |
| City CAPEX incl. dedicated solar | USD 786M (USD 16M / km); shared national factory excluded |
| Residents within 800 m station circles | 58,894 (2020; 28.0% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Namibe network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 15.0 km | 7 | 30 | radial |
| line-2 | 12.0 km | 7 | 27 | radial |
| line-3 | 13.5 km | 7 | 29 | radial |
| line-4 | 4.7 km | 3 | 12 | radial |
| line-5 | 4.8 km | 2 | 11 | radial |

# Generated City Model - Soyo

central-africa / Angola / Soyo

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/Angola/Soyo |
| Recorded ISO / planning population | AO / 250,000 |
| Family | tram-2car |
| Lines / stations | 4 / 23 |
| Route length | 34.0 km |
| Fleet | 85 trainsets |
| Routing-demand cells (legacy) | 54%; not population access |
| City CAPEX incl. dedicated solar | USD 624M (USD 18M / km); shared national factory excluded |
| Residents within 800 m station circles | 25,961 (2020; 20.9% of raster bbox) |
| Direct / reachable line pairs | 100.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.

Soyo network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 9.4 km | 8 | 27 | radial |
| line-2 | 8.5 km | 5 | 19 | radial |
| line-3 | 11.5 km | 7 | 27 | radial |
| line-4 | 4.5 km | 3 | 12 | radial |

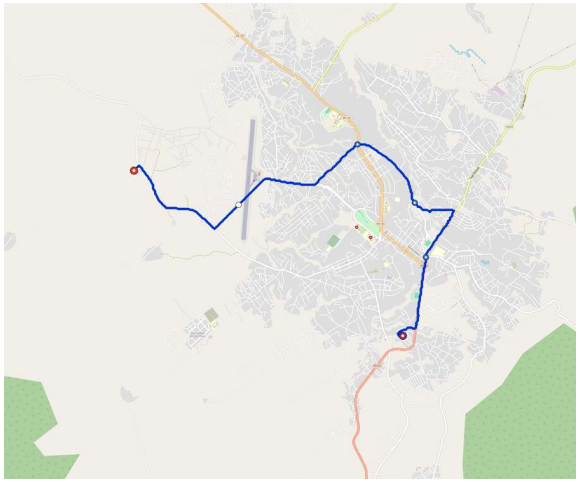
# Generated City Model - Uige

central-africa / Angola / Uige

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/Angola/Uige |
| Recorded ISO / planning population | AO / 400,000 |
| Family | light-metro-3car |
| Lines / stations | 1 / 6 |
| Route length | 12.0 km |
| Fleet | 39 trainsets |
| Routing-demand cells (legacy) | 16%; not population access |
| City CAPEX incl. dedicated solar | USD 218M (USD 18M / km); shared national factory excluded |
| Residents within 800 m station circles | 23,978 (2020; 9.8% of raster bbox) |
| Direct / reachable line pairs | 100.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Uige network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 12.0 km | 6 | 39 | radial |

# DR Congo

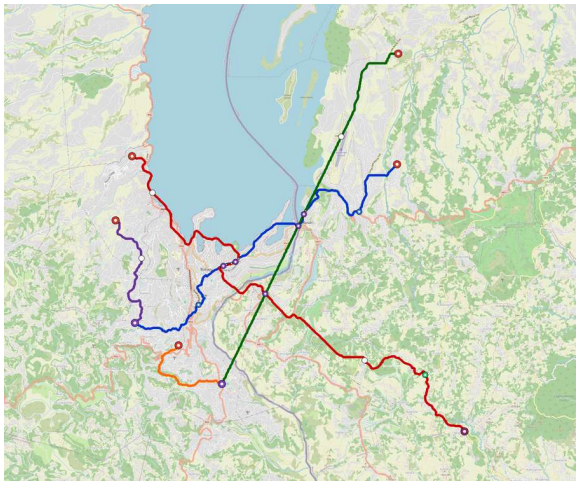
# Generated City Model - Bukavu

central-africa / DR Congo / Bukavu

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/DR Congo/Bukavu |
| Recorded ISO / planning population | CD / 1,000,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 41 |
| Route length | 72.4 km |
| Fleet | 241 trainsets |
| Routing-demand cells (legacy) | 60%; not population access |
| City CAPEX incl. dedicated solar | USD 1.46bn (USD 20M / km); shared national factory excluded |
| Residents within 800 m station circles | 346,383 (2020; 32.4% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Bukavu network map

| line-5 | 4.5 km | 2 | 16 | radial |

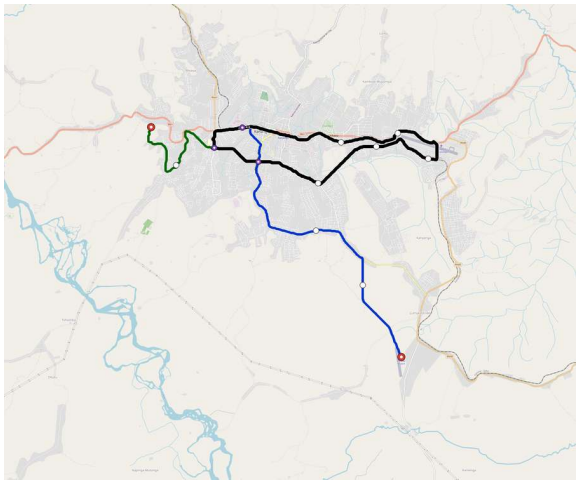
# Generated City Model - Kananga

central-africa / DR Congo / Kananga

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/DR Congo/Kananga |
| Recorded ISO / planning population | CD / 1,200,000 |
| Family | metro-4car |
| Lines / stations | 3 / 22 |
| Route length | 44.5 km |
| Fleet | 55 trainsets |
| Routing-demand cells (legacy) | 80%; not population access |
| City CAPEX incl. dedicated solar | USD 746M (USD 17M / km); shared national factory excluded |
| Residents within 800 m station circles | 210,531 (2020; 12.2% of raster bbox) |
| Direct / reachable line pairs | 66.7% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Kananga network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 14.2 km | 8 | 30 | radial |
| line-2 | 24.1 km | 11 | 12 | ring |
| line-3 | 6.2 km | 3 | 13 | radial |

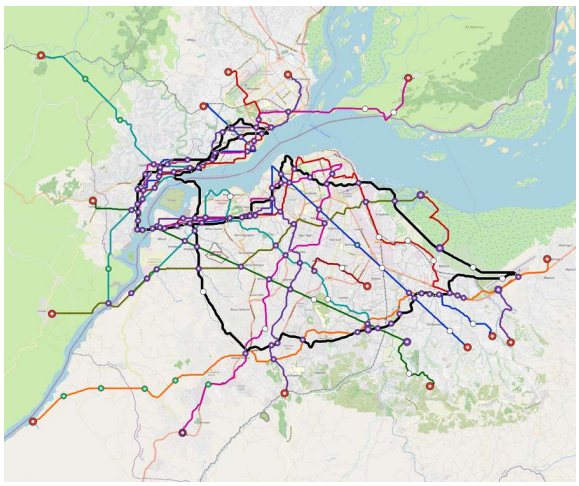
# Generated City Model - Kinshasa

central-africa / DR Congo / Kinshasa

| Metric | Value |
|---|---|
| Path | cities/catalogue/central-africa/DR Congo/Kinshasa |
| Recorded ISO / planning population | CD / 17,178,000 |
| Family | metro-6car |
| Lines / stations | 14 / 617 |
| Route length | 639.8 km |
| Fleet | 1775 trainsets |
| Routing-demand cells (legacy) | 62%; not population access |
| City CAPEX incl. dedicated solar | USD 16.87bn (USD 26M / km); shared national factory excluded |
| Residents within 800 m station circles | 3,036,815 (2020; 40.4% of raster bbox) |
| Direct / reachable line pairs | 46.2% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Kinshasa network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|

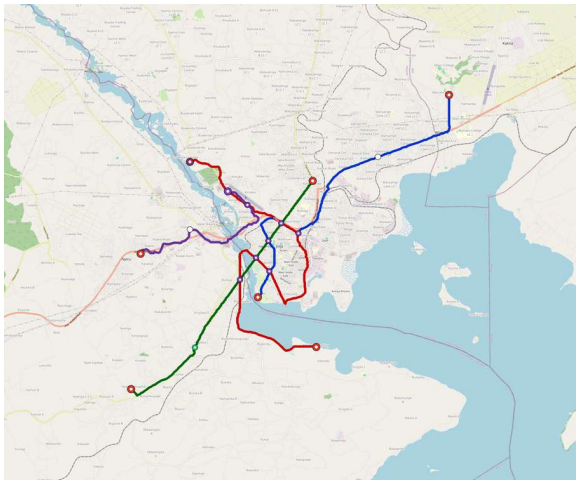
# Generated City Model - Jinja

east-africa / Uganda / Jinja

| Metric | Value |
|---|---|
| Path | cities/catalogue/east-africa/Uganda/Jinja |
| Recorded ISO / planning population | UG / 300,000 |
| Family | tram-2car |
| Lines / stations | 4 / 31 |
| Route length | 56.1 km |
| Fleet | 121 trainsets |
| Routing-demand cells (legacy) | 83%; not population access |
| City CAPEX incl. dedicated solar | USD 931M (USD 17M / km); shared national factory excluded |
| Residents within 800 m station circles | 92,904 (2020; 27.3% of raster bbox) |
| Direct / reachable line pairs | 66.7% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Jinja network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 15.2 km | 8 | 32 | radial |
| line-2 | 19.9 km | 11 | 43 | radial |

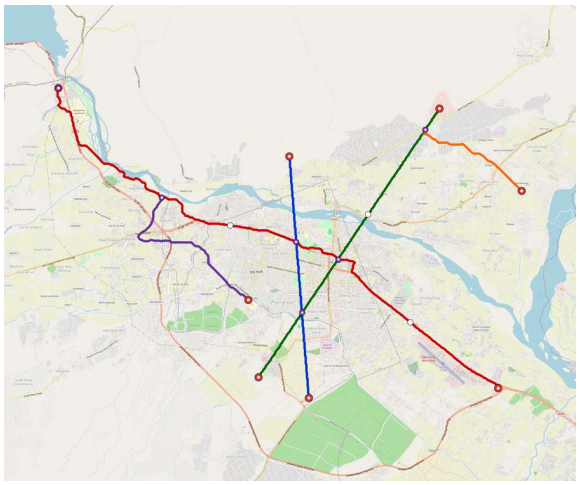
## Generated City Model - Jalalabad Af

south-asia / Afghanistan / Jalalabad-Af

| Metric | Value |
|---|---|
| Path | cities/catalogue/south-asia/Afghanistan/Jalalabad-Af |
| Recorded ISO / planning population | AF / 350,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 23 |
| Route length | 53.8 km |
| Fleet | 170 trainsets |
| Routing-demand cells (legacy) | 60%; not population access |
| City CAPEX incl. dedicated solar | USD 984M (USD 18M / km); shared national factory excluded |
| Residents within 800 m station circles | 148,581 (2020; 25.6% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Jalalabad Af network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 8.2 km | 4 | 27 | radial |
| line-2 | 23.0 km | 7 | 69 | radial |
| line-3 | 11.9 km | 7 | 39 | radial |
| line-4 | 6.4 km | 2 | 20 | radial |
| line-5 | 4.2 km | 3 | 15 | radial |

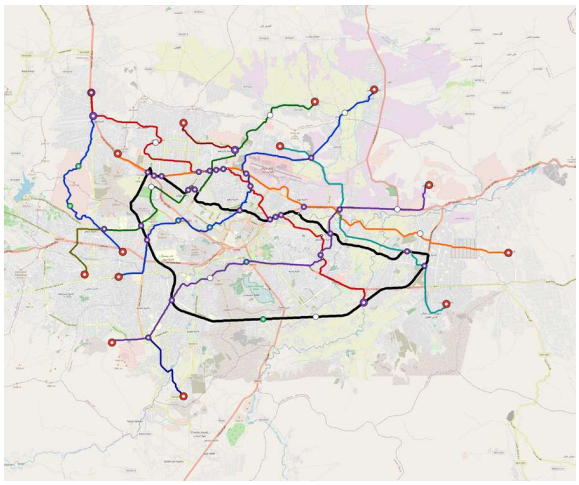
# Generated City Model - Kabul

south-asia / Afghanistan / Kabul

| Metric | Value |
|---|---|
| Path | cities/catalogue/south-asia/Afghanistan/Kabul |
| Recorded ISO / planning population | AF / 4,601,000 |
| Family | metro-6car |
| Lines / stations | 11 / 205 |
| Route length | 260.1 km |
| Fleet | 624 trainsets |
| Routing-demand cells (legacy) | 57%; not population access |
| City CAPEX incl. dedicated solar | USD 6.02bn (USD 23M / km); shared national factory excluded |
| Residents within 800 m station circles | 1,183,877 (2020; 28.6% of raster bbox) |
| Direct / reachable line pairs | 40.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Kabul network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 30.0 km | 16 | 68 | radial |
| line-2 | 34.4 km | 40 | 130 | radial |
| line-3 | 24.9 km | 23 | 80 | radial |

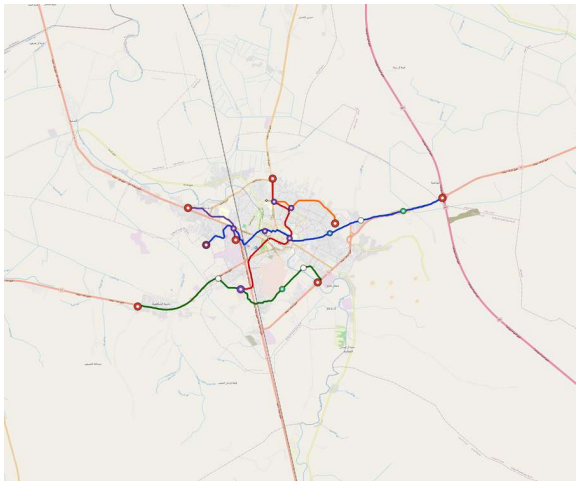
# Generated City Model - Diwaniyah

west-asia / Iraq / Diwaniyah

| Metric | Value |
|---|---|
| Path | cities/catalogue/west-asia/Iraq/Diwaniyah |
| Recorded ISO / planning population | IQ / 440,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 27 |
| Route length | 62.3 km |
| Fleet | 198 trainsets |
| Routing-demand cells (legacy) | 47%; not population access |
| City CAPEX incl. dedicated solar | USD 1.07bn (USD 17M / km); shared national factory excluded |
| Residents within 800 m station circles | 241,954 (2020; 35.1% of raster bbox) |
| Direct / reachable line pairs | 40.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Diwaniyah network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 23.1 km | 8 | 70 | radial |
| line-2 | 12.0 km | 6 | 39 | radial |
| line-3 | 16.6 km | 6 | 51 | radial |
| line-4 | 4.7 km | 3 | 17 | radial |
| line-5 | 6.0 km | 4 | 21 | radial |

# Generated City Model - Duhok

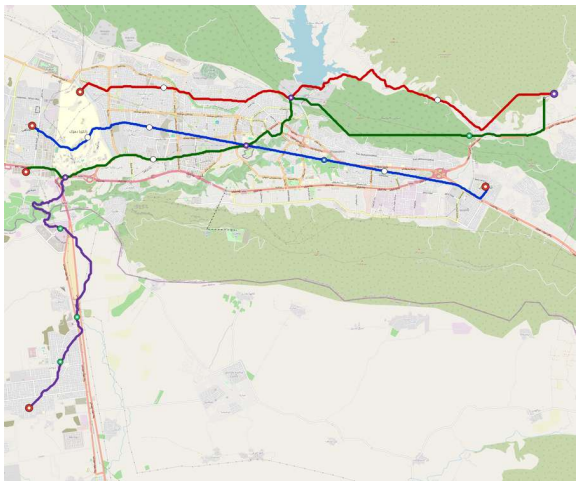
west-asia / Iraq / Duhok

| Metric | Value |
|---|---|
| Path | cities/catalogue/west-asia/Iraq/Duhok |
| Recorded ISO / planning population | IQ / 360,000 |
| Family | light-metro-3car |
| Lines / stations | 4 / 24 |

| Metric | Value |
|---|---|
| Route length | 68.4 km |
| Fleet | 213 trainsets |
| Routing-demand cells (legacy) | 58%; not population access |
| City CAPEX incl. dedicated solar | USD 1.08bn (USD 16M / km); shared national factory excluded |
| Residents within 800 m station circles | 266,787 (2020; 38.4% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Duhok network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 17.4 km | 7 | 53 | radial |
| line-2 | 18.3 km | 5 | 54 | radial |
| line-3 | 21.6 km | 7 | 67 | radial |
| line-4 | 11.1 km | 5 | 39 | radial |

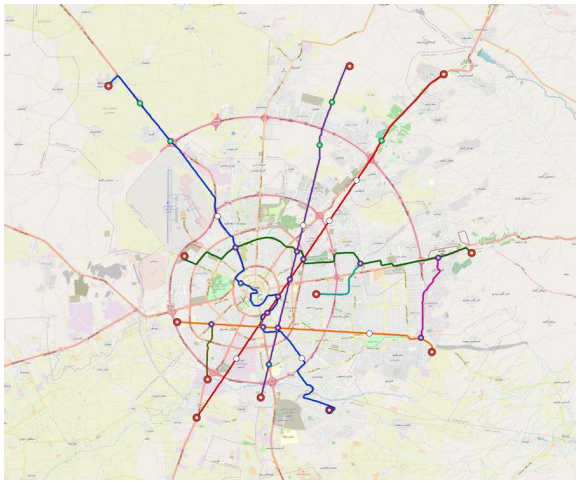
# Generated City Model - Erbil

west-asia / Iraq / Erbil

| Metric | Value |
|---|---|
| Path | cities/catalogue/west-asia/Iraq/Erbil |
| Recorded ISO / planning population | IQ / 1,952,000 |
| Family | metro-4car |
| Lines / stations | 8 / 56 |
| Route length | 152.3 km |
| Fleet | 261 trainsets |
| Routing-demand cells (legacy) | 57%; not population access |
| City CAPEX incl. dedicated solar | USD 2.35bn (USD 15M / km); shared national factory excluded |
| Residents within 800 m station circles | 250,544 (2020; 20.3% of raster bbox) |
| Direct / reachable line pairs | 46.4% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Erbil network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 38.5 km | 13 | 64 | radial |
| line-2 | 30.8 km | 12 | 51 | radial |
| line-3 | 25.8 km | 7 | 40 | radial |

# Generated City Model - Fallujah

west-asia / Iraq / Fallujah

| Metric | Value |
|---|---|
| Path | cities/catalogue/west-asia/Iraq/Fallujah |
| Recorded ISO / planning population | IQ / 360,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 23 |
| Route length | 60.2 km |
| Fleet | 195 trainsets |
| Routing-demand cells (legacy) | 60%; not population access |
| City CAPEX incl. dedicated solar | USD 1.06bn (USD 18M / km); shared national factory excluded |
| Residents within 800 m station circles | 39,150 (2020; 20.5% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.

Fallujah network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 18.0 km | 6 | 56 | radial |
| line-2 | 15.8 km | 6 | 50 | radial |
| line-3 | 14.9 km | 6 | 49 | radial |
| line-4 | 6.9 km | 3 | 24 | radial |
| line-5 | 4.6 km | 2 | 16 | radial |

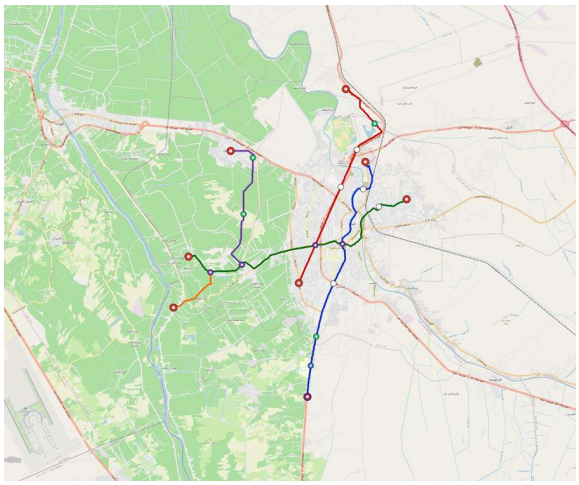
# Generated City Model - Hillah

west-asia / Iraq / Hillah

| Metric | Value |
|---|---|
| Path | cities/catalogue/west-asia/Iraq/Hillah |
| Recorded ISO / planning population | IQ / 700,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 26 |
| Route length | 74.7 km |
| Fleet | 236 trainsets |
| Routing-demand cells (legacy) | 67%; not population access |
| City CAPEX incl. dedicated solar | USD 1.19bn (USD 16M / km); shared national factory excluded |
| Residents within 800 m station circles | 245,550 (2020; 27.0% of raster bbox) |
| Direct / reachable line pairs | 40.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Hillah network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 21.4 km | 7 | 65 | radial |
| line-2 | 17.8 km | 6 | 56 | radial |
| line-3 | 21.2 km | 7 | 67 | radial |

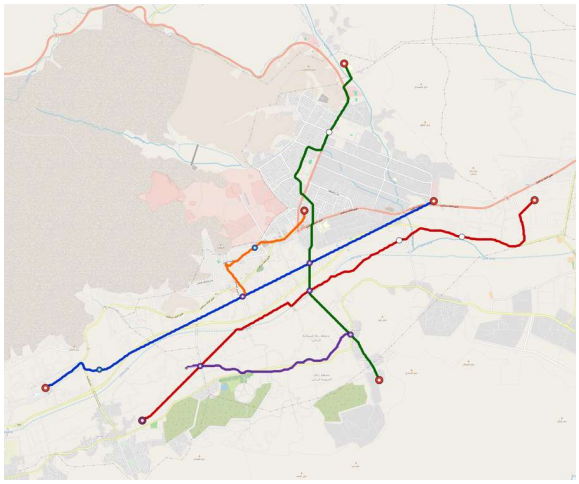
# Generated City Model - Najran

west-asia / Saudi Arabia / Najran

| Metric | Value |
|---|---|
| Path | cities/catalogue/west-asia/Saudi Arabia/Najran |
| Recorded ISO / planning population | SA / 500,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 23 |
| Route length | 69.2 km |
| Fleet | 213 trainsets |
| Routing-demand cells (legacy) | 54%; not population access |
| City CAPEX incl. dedicated solar | USD 1.28bn (USD 19M / km); shared national factory excluded |
| Residents within 800 m station circles | 54,499 (2020; 20.0% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Najran network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 19.0 km | 5 | 58 | radial |
| line-2 | 21.8 km | 6 | 64 | radial |
| line-3 | 15.3 km | 6 | 47 | radial |
| line-4 | 7.4 km | 3 | 24 | radial |
| line-5 | 5.7 km | 3 | 20 | radial |

# Generated City Model - Tabuk

west-asia / Saudi Arabia / Tabuk

| Metric | Value |
|---|---|
| Path | cities/catalogue/west-asia/Saudi Arabia/Tabuk |
| Recorded ISO / planning population | SA / 650,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 27 |
| Route length | 74.2 km |
| Fleet | 237 trainsets |
| Routing-demand cells (legacy) | 40%; not population access |
| City CAPEX incl. dedicated solar | USD 1.24bn (USD 17M / km); shared national factory excluded |
| Residents within 800 m station circles | 100,788 (2020; 18.1% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.

Tabuk network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 19.0 km | 8 | 60 | radial |
| line-2 | 18.2 km | 7 | 59 | radial |

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-3 | 25.2 km | 7 | 78 | radial |
| line-4 | 4.6 km | 2 | 16 | radial |
| line-5 | 7.2 km | 3 | 24 | radial |

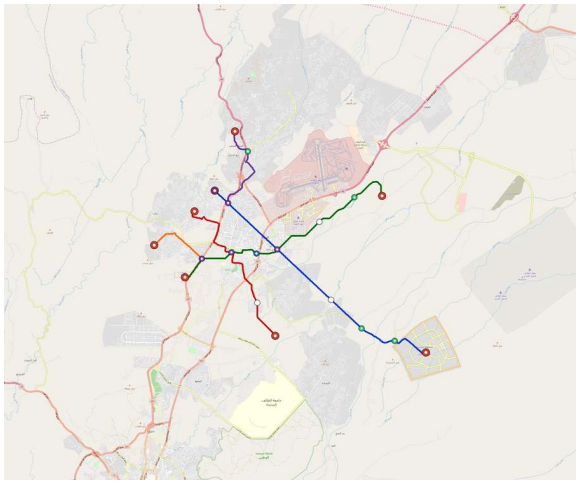
# Generated City Model - Taif

west-asia / Saudi Arabia / Taif

| Metric | Value |
|---|---|
| Path | cities/catalogue/west-asia/Saudi Arabia/Taif |
| Recorded ISO / planning population | SA / 700,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 26 |
| Route length | 70.9 km |
| Fleet | 220 trainsets |
| Routing-demand cells (legacy) | 56%; not population access |
| City CAPEX incl. dedicated solar | USD 1.14bn (USD 16M / km); shared national factory excluded |
| Residents within 800 m station circles | 68,207 (2020; 15.4% of raster bbox) |
| Direct / reachable line pairs | 40.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Taif network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 23.9 km | 7 | 73 | radial |
| line-2 | 14.5 km | 5 | 43 | radial |

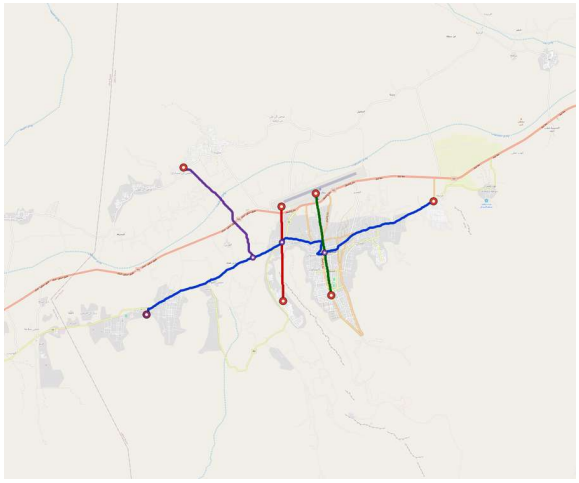
# Generated City Model - Sayun

west-asia / Yemen / Sayun

| Metric | Value |
|---|---|
| Path | cities/catalogue/west-asia/Yemen/Sayun |
| Recorded ISO / planning population | YE / 200,000 |
| Family | tram-2car |
| Lines / stations | 4 / 13 |
| Route length | 26.7 km |
| Fleet | 63 trainsets |
| Routing-demand cells (legacy) | 64%; not population access |
| City CAPEX incl. dedicated solar | USD 442M (USD 17M / km); shared national factory excluded |
| Residents within 800 m station circles | 46,368 (2020; 35.3% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Sayun network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 14.1 km | 5 | 29 | radial |
| line-2 | 3.7 km | 3 | 11 | radial |
| line-3 | 4.2 km | 3 | 12 | radial |
| line-4 | 4.7 km | 2 | 11 | radial |

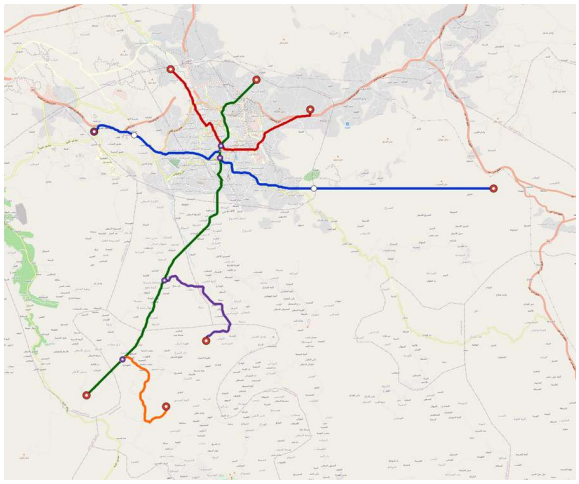
# Generated City Model - Taiz

west-asia / Yemen / Taiz

| Metric | Value |
|---|---|
| Path | cities/catalogue/west-asia/Yemen/Taiz |
| Recorded ISO / planning population | YE / 615,000 |
| Family | light-metro-3car |
| Lines / stations | 5 / 28 |
| Route length | 53.3 km |
| Fleet | 172 trainsets |
| Routing-demand cells (legacy) | 65%; not population access |
| City CAPEX incl. dedicated solar | USD 1.02bn (USD 19M / km); shared national factory excluded |
| Residents within 800 m station circles | 306,919 (2020; 25.2% of raster bbox) |
| Direct / reachable line pairs | 50.0% / 100.0% |

Native station-circle populations are historical radial access, not verified walksheds or paid-trip estimates. Reachability includes intermediate lines; physical interchange access and timetable acceptance remain open.

City evidence: population and transfers · building, support and terrain clearance.



Taiz network map

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-1 | 18.4 km | 7 | 59 | radial |
| line-2 | 8.7 km | 4 | 27 | radial |
| line-3 | 15.9 km | 11 | 50 | radial |

| Line | Length | Stations | Trainsets | Shape |
|---|---|---|---|---|
| line-4 | 5.4 km | 2 | 18 | radial |
| line-5 | 5.0 km | 4 | 18 | radial |
